William Aspinall

ENCYCLOPÆDIA BRITANNICA;

OR, A

DICTIONARY

OF

ARTS, SCIENCES, &c.

On a PLAN entirely NEW:

BY WHICH,

THE DIFFERENT SCIENCES AND ARTS

Are digested into the FORM of Distinct

TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each,
according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS ARE GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, *&c.*

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, *&c.*
throughout the WORLD;

A General HISTORY, *Ancient* and *Modern*, of the different Empires, Kingdoms, and States;

AND

An Account of the LIVES of the most Eminent Persons in every Nation,
from the earliest ages down to the present times.

THE WHOLE COMPILED FROM
THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES,
AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED
SOCIETIES, BOTH AT HOME AND ABROAD; THE MS. LECTURES OF EMINENT PROFESSORS ON DIFFERENT SCIENCES;
AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

The SECOND EDITION; greatly Improved and Enlarged.

ILLUSTRATED WITH ABOVE TWO HUNDRED COPPERPLATES.

VOL. VII.

INDOCTI DISCANT, ET AMENT MEMINISSE PERITI.

EDINBURGH:

Printed for J. BALFOUR and Co. W. GORDON, J. BELL, J. DICKSON, C. ELLIOT, W. CREECH,
J. McCLIESH, A. BELL, J. HUTTON, and C. MACFARQUHAR.

MDCCLXXXI.

A NEW

Dictionary of Arts, Sciences, &c.

MEDICINES, whatever fubftances ferve to reftore health.—Medicines are either *fimple* or *compound;* the former being prepared by nature alone; and the latter owing to the induftry of man, by varioufly mixing the fimple together. See PHARMACY.

MEDICINES are likewife diftinguifhed, from the manner of ufing them, into *external* and *internal;* and with regard to their effects, they are faid to be *emetic*, *cathartic*, *aftringent*, &c. See MATERIA MEDICA.

Pocket MEDICINES, in furgery, thofe which a furgeon ought always to carry about with him, in a box, or convenient cafe.

Thofe, according to Heifter, are the common digeftive ointment, and the brown or Egyptian ointment, for cleanfing and digefting foul ulcers; and fome vulnerary balfams, as the *linimentum Arcæi*, or the balfam of Peru, Gilead, or Copivi, or the Samaritan balfam: to thefe muft alfo be added a plafter or two; as the *diachylon* or *ftypticum Crollii*, fince one or other of thefe is almoft conftantly wanted. Neither fhould there be wanting a piece of blue vitriol for the taking down luxuriant flefh, and to ftop hæmorrhages: but if vitriol is wanting, burnt alum, red precipitate, the infernal ftone, or any other corrofive medicine, will fupply its place in corrofive intentions; and the laft will alfo ferve to open abfceffes, to make iffues, and perform many other operations of that kind.

With thefe there fhould always be kept in readinefs alfo a quantity of fcraped lint, that the furgeon may be able to give immediate affiftance to wounded perfons; fince, if he is unprepared for this, they may eafily be taken off by an hæmorrhage; a circumftance which ought alfo to prevail with him to be always provided with fuitable bandages.

MEDIETAS LINGUÆ, in law, fignifies a jury, or inqueft impanelled, of which the one half are natives of this land, and the other foreigners. This jury is never ufed except where one of the parties in a plea is a ftranger, and the other a denizen. In petit-treafon, murder, and felony, foreigners are allowed this privilege; but not in high-treafon, becaufe an alien in that cafe fhall be tried according to the rules of the common law, and not by a *medietas linguæ*. A grand jury ought not in any cafe to be of a *medietas linguæ;* and the perfon that would have the advantage of a trial in this way, is to pray the fame, otherwife it will not be permitted on a challenge of the jurors.

MEDIMNUS, in Grecian antiquity, a meafure of capacity. See MEASURE.

MEDINA-TALNARI, a famous town of Arabia Petræa, between Arabia Deferta and Arabia the Happy; celebrated for being the burial-place of Mahomet. It is feated in a plain abounding with palm-trees, in E. Long. 39. 53. N. Lat. 25. See *(Hiftory of)* ARABIA.

MEDINA-*Celi*, an ancient town of Spain, in Old Caftile, and capital of a confiderable duchy of the fame name; feated near the river Xalon, in W. Long. 2. 9. N. Lat. 41. 15.

MEDINA-*de-las-Torres*, a very ancient town of Spain, in Eftremadura, with an old caftle, and the title of a duchy. It is feated on the confines of Andalufia, at the foot of a mountain near Bajadoz.

MEDINA-*del-Campo*, a large, rich, and ancient town of Spain, in the kingdom of Leon. The great fquare is very fine, and adorned with a fuperb fountain. It is a trading place, enjoys great privileges, and is feated in a country abounding with corn and wine. W. Long. 4. 20. N. Lat. 41. 22.

MEDINA-*del-rio-Secco*, an ancient and rich town of Spain, in the kingdom of Leon, with the title of a duchy; feated on a plain, where there are fine paftures. E. Long. 4. 33. N. Lat. 42. 8.

MEDINA (Sir John), an eminent painter, was the fon of Medina de l'Afturias, a Spanifh captain, who had fettled at Bruffels; where the fon was born, and inftructed in painting by Du Chatel. He married young; and in 1686 came into England, where he drew portraits for feveral years. The earl of Leven encouraged him to go to Scotland, and procured him a fubfcription of 500l. worth of bufinefs. He painted moft of the Scotch nobility; and at Wentworth-caftle is a large piece, containing the firft duke of Argyle and his fons, the two late dukes John and Archibald, in Roman habits; the ftyle Italian, and fuperior to moft modern performers. The portraits of the profeffors in the furgeons-hall at Edinburgh were painted by him, and are commended; and in that hall are two fmall hiftory-pieces by him. He was knighted by the duke of Queenfberry, lord high-commiffioner; and was the laft knight made in Scotland before the Union. He was not, however, rich; for he had 20 children. He died in Scotland; and was buried in the church-

yard of the Gray-friars at Edinburgh in 1711, aged 52. He was capable both of hiftory and landfcape. The prints in the octavo edition of Milton were defigned by him.

MEDIOLANUM, an ancient city, the capital of the Infubres, built by the Gauls on their fettlement in that part of Italy. A *municipium*, and a place of great ftrength. The feat of the liberal arts; whence it had the name of *Novæ Athenæ*. Now *Milan*, capital of the Milanefe, fituate on the rivers Olana and Lombro, E. Long. 9. 30. N. Lat. 45. 25.

MEDIOLANUM *Aulercorum* (anc. geogr.), a town of Gallia Celtica, which afterwards took the name of the *Eburovicum Civitas* (Antonine); corrupted to *Civitas Ebroicorum*, and this laft to *Ebroica;* whence the modern appellation *Evreux*, a city of Normandy. E. Long. 1. 12. N. Lat. 49. 21.

MEDIOLANUM *Gugernorum* (anc. geogr.), a town of Gallia Belgica, now the village *Moyland*, not far from Cologne.

MEDIOLANUM *Ordovicum* (anc. geogr.), a town of Britain, now *Llan Vethlin*, a market-town in Montgomeryfhire in Wales.

MEDIOLANUM *Santonum* (anc. geogr.), which afterwards taking the name of the people, was called *Santonica Urbs;* alfo *Santones* and *Santoni:* A town of Aquitain. Now *Saintes*, capital of Saintonge in Guienne, on the river Charente. W. Long. 36. 0. N. Lat. 45. 50.

MEDITERRANEAN SEA, extends from the Straits of Gibraltar to the coaft of Syria and Paleftine, being above 2000 miles in length, but of very unequal breadth: the weft part of it feparating Europe from Africa; and the Levant, or eaft part of it, dividing Afia from Africa, Spain, France, Italy, Turky in Europe, and Natolia, or the Leffer Afia, bounding it on the north; and the empire of Morocco, Algiers, Tunis, Tripoli, Barca, and Egypt, bounding it on the fouth. The Strait of Gibraltar being about 15 or 16 miles broad, a ftrong current fets through it out of the Atlantic Ocean into the Mediterranean conftantly, which requires a good gale of wind to ftem it.

MEDITULLIUM, is ufed by anatomifts for that fpungy fubftance between the two plates of the *cranium*, and in the interftices of all laminated bones. See DIPLOE.

MEDIUM, in logic, the mean or middle term of a fyllogifm, being an argument, reafon, or confideration, for which we affirm or deny any thing; or, it is the caufe why the greater extreme is affirmed or denied of the lefs in the conclufion.

MEDIUM, in arithmetic, or *arithmetical medium* or *mean*, called in the fchools *medium rei;* that which is equally diftant from each extreme, or which exceeds the leffer extreme as much as it is exceeded by the greater, in refpect of quantity, not of proportion; thus 9 is a medium betwixt 6 and 12.

Geometrical MEDIUM, called in the fchools *medium perfonæ*, is that where the fame ratio is preferved between the firft and fecond as between the fecond and third terms; or that which exceeds in the fame ratio or quota of itfelf, as it is exceeded: thus 6 is a geometrical medium between 4 and 9.

MEDIUM, in philofophy, that fpace or region through which a body in motion paffes to any point: thus æther is fuppofed to be the medium through which the heavenly bodies move; air, the medium wherein bodies move near our earth; water, the medium wherein fifhes live and move; and glafs is alfo a medium of light, as it affords it a free paffage. That denfity or confiftency in the parts of the medium, whereby the motion of bodies in it is retarded, is called the *refiftance of the medium;* which, together with the force of gravity, is the caufe of the ceffation of the motion of projectiles.

Subtile or *Ætherial* MEDIUM. See ETHER, ELECTRICITY, FIRE, &c.

MEDIUM, in optics, any fubftance through which light is tranfmitted.

MEDLAR, in botany. See MESPILUS.

MEDULLA, MEDULLA *Oblongata*, MEDULLA *Spinalis*. } See ANAT. n° 5. 396—399.

MEDUSA, one of the three Gorgons, daughter of Ceto and a fea-god named *Phorcus*. Neptune being in love with her, forced her in the temple of Minerva; upon which that goddefs changed her hair (which was extremely fair) into ferpents, the fight of which turned the beholders into ftones: but Perfeus, armed with Mercury's ax, with which he killed Argus, cut off Medufa's head, from whofe blood fprang Pegafus and Chryfaor. Minerva is reprefented bearing the picture of Medufa's head on her fhield, to terrify her enemies.

MEDUSA, in zoology, a genus of infects belonging to the order of mollufca. The body is gelatinous, roundifh, and depreffed; and the mouth is in the centre of the under part of the body. There are twelve fpecies, all natives of the fea. The moft remarkable is the fimplex, or armlefs, with a plain circumference; four apertures beneath; no tenacula. Thefe animals inhabit all our feas; are gregarious; often feen floating with the tide in vaft numbers; feed on infects, fmall fifh, &c. which they catch with their clafpers or arms. Many fpecies, on being handled, affect with a nettle-like burning, and excite a rednefs. The ancients, and fome of the moderns, add that they have an aphrodifiac property, and in feveral languages they are called by an obfcene name. They were known to the Greeks and Romans by the names of Πνευμα Θαλασσιος, and *pulmo marinus*, or fea-lungs. They attributed medicinal virtues to them. Diofcorides informs us, that, if rubbed frefh on the difeafed part, they cured the gout in the feet, and kibed heels. Ælian fays, that they were depilatory; and, if macerated in vinegar, would take away the beard. Their phofphoric quality is well known; nor was it overlooked by the ancients. Pliny obferves, that if rubbed with a ftick it will appear to burn, and the wood to fhine all over. The fame naturalift obferves, that when they fink to the bottom of the fea, they portend a continuance of bad weather.

MEGALE POLIS, (anc. geog.), dividedly (Ptolemy, Paufanias); or conjunctly *Megalopolis*, (Strabo): A town of Arcadia, built under the aufpices of Epaminondas, after the battle of Leuctra; many inconfiderable towns being joined together in one great city, the

the better to withftand the Spartans. It was the greateft city of Arcadia, according to Strabo.

MEGAMETER. See MICROMETER.

MEGARA (anc. geog.), a noble city, and the capital of the territory of Megaris, which for many years carried on war with the Corinthians and Athenians. It had for fome time a fchool of philofophers, called the *Megarici*, fucceffors of Euclid the Socratic, a native of Megara. Their dialect was the Doric; changed from the Attic, which it formely had been, becaufe of Peleponnefian colonifts who fettled there.

MEGARA (anc. geog.) formely called *Hybla*, a town towards the eaft coaft of Sicily; extinct in Strabo's time, though the name Hybla remained on account of the excellence of its honey. It was a colony of Megareans from Greece. *Rifus Megarius* denotes a hoarfe-laugh.

MEGARIS (anc. geog.), the country of the Megareans, which Pliny makes a part of Attica; and Strabo fays, fome were of this opinion; but he himfelf makes it a diftinct part; in which Scylax, Ptolemy, and the hiftories that relate the wars of the Athenians and Megareans, agree. It had Attica to the eaft, Bæotia to the north and weft, and the Ifthmus of Corinth to the fouth.

MEGARIS, a fmall ifland in the Tufcan fea, joined to Naples by a bridge. Now called *Caftello dell' ovo*.

MEGIDDO, (Judges v. 19.) A town of Galilee, recited (Jofhua xvii. 11.) among the cities of Manaffeh, in the tribe of Iffachar or Affer, on the weft fide of Jordan. Famous for the fate of Ahaziah and Jofiah, who perifhed there: near it was an open plain, fit for drawing up an army in battle-array. It was fituate to the north, contrary to its pofition in the common maps. The Canaanites being tributary to the Ifraelities, dwelt in it, Jofhua xvii. It was rebuilt by Solomon, 1 Kings ix.

MEIBOMIUS, the name of feveral learned Germans.—*John Henry Meibomius* was profeffor of phyfic at Helmftadt, where he was born, and at Lubec; he wrote the *Life of Mæcenas*, publifhed at Leyden in 4to. 1653, with feveral other learned works.—*Henry*, his fon, was born at Lubec in 1638; became profeffor of phyfic at Helmftadt; and, befides works in his own profeffion, publifhed *Scriptores rerum Germanicorum*, 3 vol. folio, 1688; a very ufeful collection, firft begun by his father.—*Marcus Meibomius*, of the fame family, publifhed a collection of feven Greek authors who had written upon ancient mufic, with a Latin verfion by himfelf; dedicated to queen Chriftina of Sweden, who invited him to her court. But fhe engaging him one day to fing an air of ancient mufic, while fomebody was ordered to dance to it, the immoderate mirth which this occafioned in the fpectators fo difgufted him, that he immediately left the court of Sweden. His edition of the Greek mythologifts, and notes upon Diogenes Laertius in Menage's edition, fhews him to have been a man of learning; but he fuffered no little raillery for his attempt to correct the Hebrew text of the Bible, by a kind of metre he fancies he had found out in thofe ancient writings.

MEISSEN, a confiderable town of Germany, in the electorate of Saxony, and in the margravate of Mifnia, with a caftle. It formerly belonged to the bifhop, but is now fecularized, and the inhabitants are Lutherans. In this place is a famous manufactory of porcelain, E. Long. 13. 33. N. Lat. 51. 15.

MELA (Pomponius), an ancient Latin writer, was born in the province of Bætica in Spain, and flourifhed in the reign of the emperor Claudius. His three books of Cofmography, or *De fitu orbis*, are written in a concife, perfpicuous, and elegant manner; and have been thought worthy of the attention and labours of the ableft critics. Ifaac Voffius gave an edition of them in 1658, 4to. with very large and copious notes. To this edition is added *Julii Honorii oratoris excerptum cofmographiæ*, firft publifhed from the manufcript, and *Æthici cofmographia*. Gronovius afterwards publifhed another edition with illuftrations by medals. In his laft edition are added five books *De geographia*, written by fome later author; by Jornandes, as Fabricius conjectures.

MELÆNA, or BLACK FLUX, in medicine. See MEDICINE, n°495.

MELAMPYRUM, COW-WHEAT; a genus of the angiofpermia order, belonging to the didynamia clafs of plants. There are four fpecies, all of them natives of Britain, and growing fpontaneoufly among cornfields. They are excellent food for cattle; and Linnæus tells us, that where they abound the yelloweft and beft butter is made. Their feeds, when mixed with bread, give it a dufky colour; and, according to fome authors, produce a vertigo, and other diforders of the head; but this is denied by Mr Withering, though he allows that they give it a bitter tafte.

MELANCHOLY, a kind of delirium attended with gloomy thoughts, heavinefs and forrow. See MEDICINE, n° 185, 428, 429.

MELANCTHON (Philip), born at Bretten in the Palatinate in 1495, was one of the wifeft and moft able men of his age among the Reformers, though of a mild temper, difpofed to accommodate rather than inflame difputes. In his youth he made an admirable progrefs in learning, and was made Greek profeffor at Wirtemberg in 1509. Here his lectures upon Homer, and the Greek text of St Paul's epiftle to Titus, drew to him a great number of auditors, and entirely effaced the contempt to which his low ftature and mean appearance had expofed him. Melanchthon reduced the fciences to fyftems; and acquired fuch reputation, that he had fometimes 2500 auditors. He foon entered into an intimate friendfhip with Luther, who taught divinity in the fame univerfity; and in 1519 they went together to Leipfic, to difpute with Eccius. The following years he was continually engaged in various employments; he compofed feveral books; he taught divinity; took feveral journeys, in order to found colleges and vifit churches; and in 1530 drew up a confeffion of faith, which goes by the name of the *Confeffion of Augfburg*, becaufe it was prefented to the emperor at the diet held in that city. All Europe was convinced, that he was not, like Luther, backward to accommodate the differences between the various fects of Chriftians. He hated religious difputes, and was drawn into them only through the neceffity of the part he was called to act in the world; and therefore would have facrificed many things, to have produced an union among the Proteftants. For this reafon, Francis I. the French king,

wrote to desire him to come and confer with the doctors of the Sorbonne, in order to agree with them about putting an end to all controversies; but though Luther endeavoured to persuade the elector of Saxony to consent to that journey, and though Melancthon himself desired it, that prince, whether he distrusted Melancthon's moderation, or was afraid of quarrelling with the emperor Charles V. would never grant his permission. The king of England also in vain desired to see him. Melancthon, in 1529, assisted at the conferences of Spires. In 1541, he was at the famous conferences at Ratisbon. In 1543, he went to meet the archbishop of Cologn to assist him in introducing the reformation into his diocese; but that project came to nothing: and in 1548, he assisted at seven conferences on the subject of the interim of Charles V. and wrote a censure on that interim, and all the writings presented at these conferences. He was extremely affected at the dissensions raised by Flaccus Illyricus. His last conference with those of the Roman communion was at Worms, in 1557. He died at Wittemburg in 1560, and was interred near Luther. Some days before he died, he wrote upon a piece of paper the reasons which made him look upon death as a happiness; and the chief of them was, that it "delivered him from theological persecutions." Nature had given Melancthon a peaceable temper, which was but ill suited to the time he was to live in. His moderation served only to be his cross. He was like a lamb in the midst of wolves. No body liked his mildness; it looked as if he was lukewarm; and even Luther himself was sometimes angry at it.

Melancthon was a man in whom many good as well as great qualities were wonderfully united. He had great parts, great learning, great sweetness of temper, moderation, contentedness, and the like, which would have made him very happy in any other times but those in which he lived. He never affected dignities, or honours, or riches, but was rather negligent of all these things; too much so in the opinion of some, considering he had a family; and his son-in-law Sabinus, who was of a more ambitious make, was actually at variance with him upon this very article. Learning was infinitely obliged to him on many accounts; on none more than this, that, as already observed, he reduced almost all the sciences which had been taught before in a vague irregular manner, into systems. Considering the distractions of his life, and the infinity of disputes and tumults in which he was engaged, it is astonishing how he could find leisure to write so many books. Their number is prodigious, insomuch that it was thought necessary to publish a chronological catalogue of them in the year 1582. His works indeed are not correct, and he himself owned it: but as he found them useful, he chose rather to print a great number, than to finish only a few; "which however," as Bayle says, "was postponing his own glory to the advantage of others." His constitution was very weak, and required great tenderness and management; which made Luther, as hot and zealous as he was, blame him for labouring too earnestly in the vineyard.

MELANTERIA, in natural history, a very beautiful fossil, of a dense, compact, and regular texture, and of an extremely bright pale yellow, resembling nothing so much as the purest gold. It is remarkably heavy; and is sometimes found in little irregular masses of the bigness of a pigeon's egg, which are broken with a slight blow: but it is usually met with in the form of a fine gold-coloured efflorescence on vitriolic and pyritical bodies; or in loose, shattery, and friable masses of a more dusky yellow; in which latter state it so much resembles a native sulphur, that it is frequently mistaken for one: however, it is not inflammable; but calcines in the fire to a greyish powder, which by burning longer changes to a deep and fine purple.

The Greeks used it externally, as a gentle escharotic and a styptic: they made it an ingredient in their ointments for old ulcers, and used to sprinkle the powder of it on fresh wounds in order to stop the hæmorrhage.

MELASTOMA, the AMERICAN GOOSEBERRY-TREE; a genus of the monogynia order, belonging to the decandria class of plants. There are a great many species, all of them natives of the warm parts of America, and very beautiful on account of the variegation of their leaves. Most of the leaves are of two different colours on their surfaces; the under side being either white gold-colour or russet, and their upper parts of different shades of green; so that they make a fine appearance in the hot-house all the year round. There are but few of these plants in the European gardens; which may perhaps have been occasioned by the difficulty of bringing over growing plants from the West Indies; and the seeds being small when taken out from the pulp of their fruits, rarely succeed. The best way is to have the entire fruits put up in dry sand as soon as they are ripe, and forwarded by the quickest contrivance to England. They should be immediately taken out when they arrive, and the seeds sown in pots of light earth, and plunged into a moderate hot-bed of tanner's bark. When the plants come up, and are fit to be removed, they must each be planted in a small pot, and plunged into the tan-bed; and afterwards treated as other exotic plants.

MELCHITES, in church-history, the name given to the Syriac, Egyptian, and other Christians of the Levant. The Melchites, excepting some few points of little or no importance, which relate only to ceremonies and ecclesiastical discipline, are in every respect professed Greeks: but they are governed by a particular patriarch, who resides at Damas, and assumes the title of *patriarch of Antioch*. They celebrate mass in the Arabian language. The religious among the Melchites follow the rule of St Basil, the common rule of all the Greek monks. They have four fine convents distant about a day's journey from Damas, and never go out of the cloister.

MELCHISEDECH, or MELCHISEDEK, (the order of); an order of priesthood, according to the scriptures of the Old and New Testament.

The first mention of Melchisedech is in Genesis xiv. 16, 17, 18. where it is related, that, when Abraham had rescued his brother Lot and all his goods out of the hands of the five kings, he was met, upon his return, by Melchisedech, king of Salem, who "brought forth bread and wine; and he was the priest of the Most High God." It is added, that he blessed A-

bra-

braham; who acknowledged his priesthood, by giving him tythes of all he had taken from the enemy.

The next mention of Melchisedech is by the Royal Psalmist, who, speaking prophetically of the Messiah, says, "Thou art a priest for ever after the order of Melchisedech."

Lastly, St Paul applies the story of Melchisedech to our Saviour, citing the very words of the Psalmist. And, in another place, he gives this account of Melchisedech: "This Melchisedech, king of Salem, priest of the Most High God, who met Abraham returning from the slaughter of the kings, and blessed him; to whom Abraham gave a tenth part of all; first being by interpretation king of righteousness, and after that also king of Salem, which is, king of peace; without father, without mother, without descent; having neither beginning of days, nor end of life; but made like unto the Son of God, abideth a priest continually."

From these passages it appears, that Melchisedech, whoever he was, was a type of Jesus Christ, and his priesthood an image of our Saviour's.

Innumerable difficulties have been started upon the subject of Melchisedech. The first relates to his country, or the place where he reigned. Most authors take Salem to be the same as Jerusalem: but St Jerom places it near Scythopolis, where they still pretended to shew the ruins of Melchisedech's palace. He thinks it was at this place that Jacob arrived, after his passage over Jordan, when he returned from Mesopotamia.

The next difficulty relates to his person. It is generally agreed by learned men, that, when the apostle says he was *without father* and *without mother*, no more is meant than that he is introduced into the history of Abraham without acquainting us who he was or whence he came, when he lived or when he died. Nevertheless, some have taken St Paul's words literally, and contended, that he was not of human, but divine nature. Origen and Didymus took him to be an angel; and the author of the *Questions on the Old and New Testament* pretended he was the Holy Ghost, who appeared to Abraham in a human form.

About the beginning of the third century, arose the heresy of the Melchisedechians, who affirmed, that Melchisedech was not a man, but a heavenly power, superior to Jesus Christ: For Melchisedech, they said, was the intercessor and mediator of the angels; but Jesus Christ was so only for men, and his priesthood only a copy of that of Melchisedech. This heresy was revived in Egypt by one Hierax, who pretended that Melchisedech was the Holy Ghost.

The Arabic catena upon the ninth chapter of Genesis makes Melchisedech to be descended from Shem by his father, and from Japhet by his mother. Heraclas, or Heraclim, his father, was, they say, son or grandson of Phaleg, and son of Heber; and his mother, named *Salathiel*, was daughter of Gomer, son of Japheth. Cedrenus, and others, derive Melchisedech from an Egyptian stock. They say his father was called *Sidon* or *Sida*, and was the founder of the city of Sidon the capital of Phœnicia. Suidas says, he was of the cursed race of Canaan; for which reason the scripture does not mention his genealogy.

The Jews and Samaritans believed Melchisedech to be the same with the patriarch Shem; which opinion has been followed by a great number of modern writers. M. Jurieu has undertaken to prove, that he is the same as Cham or Ham. It would be endless to recount all the opinions upon this matter; we shall therefore only add, that Peter Cunæus, and Peter du Moulin, have asserted, that Melchisedech, who appeared to Abraham, was the Son of God; and that the patriarch worshipped him, and acknowledged him for the Messiah.

MELCOMB-REGIS, a town of Dorsetshire, in England, situated in W. Long. 2. 32. N. Lat. 50. 40. The streets are broad and paved; and there is an excellent harbour, by which they carry on a pretty good foreign trade.

MELEAGER, in fabulous history, the son of Æneas king of Caledonia, and Althæa the daughter of Thestius, was no sooner born than the Parcæ put a firebrand in the fire, saying, "This child shall live as long as this firebrand shall last." The three Parcæ being gone, Althæa took the brand out of the fire, and preserved it with great care. Meleager at length discovered great courage in killing the famous Caledonian boar which laid waste the country, and presented the head to Atalanta who had given the monster the first blow: but Plexippus and Toxeus, the brothers of Althæa, resolving to have the head, Meleager killed them in the quarrel, and married Atalanta, by whom he had Parthenope; but Althæa, in revenge for the death of her two brothers, threw the fatal brand on the fire, which occasioned Meleager's death.

MELEAGER, a Greek poet, the son of Eucrates, was born at Seleucia in Syria, and flourished under the reign of Seleucus VI. the last king of Syria. He was educated at Tyre; and died in the island of Coos, anciently called *Merope*. He there composed the Greek epigrams called by us the *Anthologia*. The disposition of the epigrams in this collection was often changed afterwards, and many additions have been made to them. The monk Planudes put them into the order they are in at present in the year 1380.

MELEAGRIS, in ornithology, the TURKY, a genus of birds belonging to the order of gallinæ. The head is covered with spongy caruncles; and there is likewise a membranaceous longitudinal caruncle on the throat. There are three species, *viz.* 1. The gallopavo, or North American turky of Ray, has a caruncle both on the head and throat; and the breast of the male is bearded. He lives upon grain and insects: when the cock struts, he blows up his breast, spreads and erects his feathers, relaxes the caruncle on the forehead, and the naked parts of the face and neck become intensely red.—Barbot informs us, that very few turkies are to be met with in Guinea, and those only in the hands of the chiefs of the European forts; the Negroes declining to breed any on account of their tenderness, which sufficiently proves them not to be natives of that climate. He also remarks, that neither the common poultry nor ducks are natural to Guinea, any more than the turkey. Neither is that bird a native of Asia: the first that were seen in Persia were brought from Venice by some Armenian merchants. They are bred in Ceylon, but not found wild. In fact, the turky, properly so called, was unknown to the ancient naturalists, and even to the old world, before

before the discovery of America. It was a bird peculiar to the new continent, and is now the commonest wild-fowl in the northern parts of that country. It was first seen in France, in the reign of Francis I.; and in England, in that of Henry VIII. By the date of the reign of these monarchs, the first turkies must have been brought from Mexico, the conquest of which was completed A. D. 1521. Ælian mentions a bird found in India, which some writers have suspected to be the turky; but Mr Pennant concludes, with Gesner, that it was either the peacock, or some bird of that genus. On consulting some gentlemen who had resided long in the Indies, Mr Pennant is of opinion, that though the turky is bred there, it is only considered as a domestic bird, and not a native of the country.

2. The cristata, or Brasilican pheasant of Ray, has an erect crest of feathers on the head, and violet-coloured temples; it has a caruncle on the throat, but none on the head.

Plate CLXXVI. 3. The satyra, or horned pheasant of Edwards, has two blue horns behind its eyes, and a red body spotted with black and white. It is a native of Bengal.

MELES, in zoology. See Ursus.

Meles, (anc. geog.), a fine river running by the walls of Smyrna in Ionia, with a cave at its head, where Homer is said to have written his poems. And from it Homer takes his original name *Melasigenes*, given him by his mother Crithies, as being born on its banks. (Herodotus).

MELIA, Azaderach, or the *Bead-tree;* a genus of the monogynia order, belonging to the decandria class of plants. There are three species, all of them exotic trees of the Indies, rising near 20 feet high; adorned with large pinnated or winged leaves, and clusters of pentapetalous flowers. They are all propagated by seeds sown on hot-beds.

MELIANTHUS, Honey-flower; a genus of the angiospermia order, belonging to the didynamia class of plants. There are two species. 1. The major hath a thick, ligneous, spreading root; many upright, ligneous, durable stalks, rising six or eight feet high; garnished with large pinnated leaves, of four or five pair of serrated lobes terminated by an odd one; and, from the sides and tops of the stalks, long spikes of chocolate-coloured flowers. 2. The minor, hath a root like the former; upright, ligneous, soft, durable stalks, rising four or five feet high; garnished with smaller pinnated leaves; and from the sides and ends of the branches, long, loose, pendulous bunches of flowers tinged with green, saffron colour, and red. Both the species flower about June; but rarely produce seeds in this country. They are very ornamental, both in foliage and flower, and merit admittance in every collection. They are easily propagated by suckers and cuttings. They thrive best in a dry soil, and in a sheltered warm exposure.

MELIBOEA, (anc. geog.), an island of Syria, at the mouth of the Orontes; which, before it falls into the sea, forms a spreading lake round it. This island was famous for its purple dye. Thought to be a colony of Thessalians; and hence Lucretius's epithet *Thessalicus*.

MELICA, Ropegrass; a genus of the digynia order, belonging to the triandria class of plants. There are three species; of which the most remarkable is the nutans. It is a native of several parts of Britain and the adjacent islands; and the inhabitants of some of the western islands make ropes of it for fishing-nets, as it will bear the water for long time without rotting.

MELICERES, in surgery, a kind of encysted tumours, so called when their contents are of the consistence of honey.

MELILLA, an ancient town of Africa in the kingdom of Fez, and in the province of Garet. It was taken by the Spaniards in 1469, but returned back to the Moors. W. Long. 2. 9. N. Lat. 35. 20.

MELILOT. See Trifolium.

MELINDA, a kingdom on the east coast of Africa, situated, according to some, between the third and fourth degree of South Latitude; though there is great disagreement among geographers as to its extent. It is allowed by all, however, that the coasts are very dangerous; being full of rocks and shelves, and the sea at some seasons very liable to tempests. The kingdom of Melinda is for the most part rich and fertile; producing almost all the necessaries of life except wheat and rice, both which are brought thither from Cambaya and other parts; and those who cannot purchase them make use of potatoes in their stead, which are here fine, large, and in great plenty. They likewise abound with great variety of fruit-trees, roots, plants, and other esculents, and with melons of exquisite taste. They have also great plenty of venison, game, oxen, sheep, hens, geese, and other poultry, &c. and one breed of sheep whose tails weigh between 30 and 40 pounds. The capital city is also called *Melinda*.

MELINUM, in natural history, the name of an earth, famous in the earliest ages of painting, being the only white of the great painters of antiquity; and, according to Pliny's account, one of the three colours with which alone they performed all their works. It is a fine, white, marly earth, of a very compact texture, yet remarkably light; a sort of texture which must render any earth fit for the painter's use, that is of a proper colour. It is frequently found forming a stratum in the earth, lying immediately under the vegetable mould. It is of a very smooth but not glossy surface; is very soft to the touch; adheres firmly to the tongue; is easily broken between the fingers; and stains the skin in handling. It melts readily in the mouth, and is perfectly fine; leaving not the least grittiness between the teeth: thrown into water, it makes a loud bubbling and hissing noise, and moulders away into a fine powder. It does not ferment with acids; and suffers no change in the fire. These are the characters by which the melinum of the ancients is distinguished from all other white earths. It is still found in the same place from which the painters of old had it, *viz.* the isle of Milo or Melos, from whence it had its name; and is common in most of the adjacent islands. It has of late been tried here as a paint; but is found not to make such a bright paint as the other substances now employed. It is not, however, liable, like them, to turn yellow: hence it would seem to be worth the consideration of persons in the colour-trade; especially as it might be had, in any quantities, for the carriage.

MELISSA, Baum; a genus of the gymnospermia order, belonging to the didynamia class of plants. There

There are feveral fpecies; but the moft remarkable are the following. 1. The officinalis, or common baum, hath fibrous perennial roots; many upright, fquare, branchy, annual ftalks, rifing two or three feet high: garnifhed with oblong, indented, oppofite leaves by pairs, two or three inches long, and half as broad; and, from the upper axillas, verticillate clufters of fmall white flowers, upon fingle footftalks. There is alfo a kind with variegated leaves. 2. The grandiflora, or Hetrurian calamint, hath fibrous perennial roots, and annual ftalks, rifing about a foot high; garnifhed with oblong, oval, indented, hairy oppofite leaves; and from the upper axillas verticillate clufters of large purple flowers, on forked footftalks. 3. The calamintha, or common calamint of the fhops, hath fibrous perennial roots; upright, fquare, branchy hairy ftalks, rifing a foot high; roundifh, indented, oppofite leaves; and verticillate clufters of fmall bluifh flowers, on forked footftalks as long as the flowers. All thefe fpecies are eafily propagated by offsets.

Medicinal Ufes. The firft fpecies, when in perfection, has a pleafant fmell, fomewhat of the lemon kind; and a weak, roughifh, aromatic tafte. The young fhoots have the ftrongeft flavour; the flowers, and the herb itfelf when old, or produced in very rich moift foils, or rainy feafons, is much weaker both in fmell and tafte. Baum is appropriated, by the writers on the materia medica, to the head, ftomach, and uterus; and in all diforders of thefe parts, is faid to do extraordinary fervice. So high an opinion have fome chemifts entertained of this plant, that they have expected to find in it a medicine which fhould prolong life beyond the ufual period. The prefent practice, however, holds it in no great efteem; and ranks it (where it certainly deferves to be) among the weaker corroborants. Infufions of the leaves in water fmell agreeably of the herb, but have not much tafte, though on being infpiffated they leave a confiderable quantity of a bitterifh auftere extract. Infufions of baum do not, like other aromatics, offend the head, as is complained off from fage, &c. Cold infufions in water, or fpirit, are far better than the cohobated diftilled water, and are the beft preparations from the plant. On diftilling the frefh herb with water, it impregnates the firft running pretty ftrongly with its grateful flavour. When large quantities are fubjected to the operation at once, there feparates and rifes to the furface of the aqueous fluid a fmall portion of effential oil, which fome call *ol. Syriæ*, and others *ol. Germanis*. It is of a yellowifh colour, and a very fragrant fmell.

MELISSUS of Samos, a Greek philofopher, was the fon of Rhagines and the difciple of Parmenides; and lived about 520 B. C. The Ephefians gave him the poft of admiral, and invefted him with extraordinary power. He pretended that the univerfe is infinite, immoveable, alone, and without a vacuum.

MELITE, (anc. geog.), an ifland referred to Africa by Scylax and Ptolemy; but nearer Sicily, and allotted to it by the Romans: commended for its commodious harbours; for a city well built, with artificers of every kind, efpecially weavers of fine linen; all owing to the Phœnicians, the firft colonifts. Now *Malta*; remarkable for St Paul's fhipwreck.

Melite, *Melita*, or *Melitina Infula*; an ifland on the coaft of Illyricum in the Adriatic. The *Catuli Melitæi*, (Pliny), were famous. Now *Melede*, the name of the ifland Samos.

Melite, (anc. geog.), a town of Ionia, ftruck out of the number of Ionian towns on account of the arrogance of the people, and Smyrna admitted in lieu of it. The fituation not faid.

MELITENSIS terra, the *Earth of Malta*: an earth, of which there are two very different kinds; the one of the genus of boles, the other of the marles. The latter is that known by medicinal authors under this name, the former is the Malta earth now in ufe; but both being brought from the fame place, are confufedly called by the fame name. The Maltefe marle, which is the *terra Melitenfis* of medicinal authors, is a loofe, crumbly, and very light earth, of an unequal and irregular texture; and, when expofed to the weather, foon falls into fine foft powder: but, when preferved and dried, it becomes a loofe, light mafs, of a dirty white colour, with a greyifh caft: it is rough to the touch, adheres firmly to the tongue, is very eafily crumbled to powder between the fingers, and ftains the hands. Thrown into the water, it fwells, and afterwards moulders away into a fine powder. It ferments very violently with acid menftruums. Both kinds are found in great abundance in the ifland of Malta, and the latter has been much efteemed as a remedy againft the bites of venomous animals. The other has fupplied its place in the German fhops; and is ufed there as a cordial, fudorific, and aftringent.

MELITO (canonized), bifhop of Sardis in Lydia, in the fecond century; is remarkable for the apology he prefented to the emperor Aurelius, in favour of the Chriftians; on which Eufebius and the other ancient ecclefiaftical writers beftow great praifes: but that apology and all Melito's other works, are loft.

MELITUS, Greek orator and poet, the accufer of Socrates. The Athenians, after the death of Socrates, difcovering the iniquity of the fentence they had paffed againft that great philofopher, put Melitus to death 400 B. C.

MELLER, a lake of Sweden, 80 miles long, and 30 broad; on which ftands the city of Stockholm.

MELLI, with the country of the Mundingoes, in Africa. The country formerly called *Melli*, now chiefly inhabited by the Mundingoes, who ftill retain pretty much of the character afcribed to the people of Melli, lies to the fouth of the river Gambia; on the weft it borders on the kingdom of Kabo; on the fouth it has *Melli*, properly fo called, and the mountains that part it from Guinea; and on the eaft it extends to the kingdom of Gago. A great part of this country we are little acquainted with; as is the cafe with regard to moft of the inland territories of Africa, but towards the fea-coaft this country is a little better known.

The firft place of note we meet with is Kachao, a Portuguefe colony, fituated on the river of St Domingo, which falls into the fea about 26 leagues below this town.—About 26 leagues above Kachao, on the fame fide of the river, is another trading town called *Farini*, where, in the months of October and November, one may trade for about half the quantity of wax and ivory which is traded for at Kachao. Here are alfo fome flaves to be bought.—Bot is a village near the mouth of the river Gefves, where moft of the traders buy rice; which is in great plenty there, and very good

good.—Gesves is a village on a river of the same name, on which the Portuguese have a factory. At Gesves one may trade yearly for 250 slaves, 80 or 100 quintals of wax, and as many of ivory. Near the mouth of the river of Gesves is a village called *Kurbali*, where there is a considerable trade for salt: here are also some slaves and ivory. Rio Grande, or the Great River, runs about 10 or 12 leagues to the south of the river of Gesves. About 80 leagues from the mouth of it is a nation of Negroes, who are good traders in ivory, rice, millet, and some slaves. They are called *Analons*. Over-against the mouth of Rio Grande, is a cluster of islands called *Bissago Isles*; the most considerable of which is Cassagut, being about six leagues long and two broad; its soil is very good, and produces millet, rice, and all kinds of pulse, besides orange and palm-trees, and many others. This island, with those of Carache, Canabac, and La Gallina, are the only ones where the Europeans may trade with some security. They trade, however, sometimes at the other islands, but they must be extremely cautious; and yet, after all their precautions, they will be robbed and murdered if they venture to go ashore. The river Nunho runs 16 leagues to the south of Rio Grande; it is very considerable, and comes from a vast distance in land. One may buy here 300 quintals of ivory and 100 slaves a-year. Rice grows here admirably well, and is very cheap. There are every-where sugar-canes which grow naturally; and plants of indigo, which might turn to good account. The trade is carried on here from March till August. In the river of Sierra Leone, the late Royal African company of England had, in the year 1728, two islands; the one, called *Tasso*, a large flat island, near three leagues in circumference, in which the company's slaves had a good plantation: the rest of the island is covered with wood, among which are silk cotton-trees of an unaccountable size. The other island is *Bense*, whereon stood a regular fort. It was formerly the residence of one of the English chiefs.

MELOCHIA, Jews mallow; a genus of the pentandria order, belonging to the monodelphia class of plants. There are several species; but the only remarkable one is the olitorius, or common Jews-mallow, which is a native of the warm parts of Asia and America. It is an annual plant, which rises about two feet high, dividing into several branches, garnished with leaves of different sizes and forms: some are spear-shaped, others are oval, and some almost heart-shaped: they are of a deep green, and slightly indented on their edges, having near their base two bristly reflexed segments. They have very long slender footstalks, especially those which grow on the lower part of the branches. The flowers sit close on the opposite side of the branches to the leaves, coming out singly; they are composed of five small yellow petals, and a great number of stamina surrounding the oblong germen, which is situated in the centre of the flower and afterwards turns to a rough swelling capsule two inches long, ending in a point, and having four cells filled with angular greenish seeds. This species is cultivated about the city of Aleppo in Syria, and in the East Indies, as a pot-herb; the Jews boiling the leaves, and eating them with their meat. It is supposed by Rauwolf to be the *olus Judaicum* of Avicenna, and the *corchorum* of Pliny.

MELODUNUM, (anc. geog.), Cæsar; a town of the Senones in Gallia Celtica above Lutetia; now *Melun*, in the isle of France on the Seine.

MELODY, in music, a succession of sounds ranged in such a manner, according to the laws of rhythmus and modulation, that it may form a sentiment agreeable to the ear. Vocal melody is called *singing*; and that which is performed upon instruments may be termed *symphonic melody*.

The idea of rhythmus necessarily enters into that of melody. An air is not an air but in proportion as the laws of measure and quantity are observed. The same succession of sounds is susceptible of as many different characters, as many different kinds of melody, as the various ways by which its emphatic notes, and the quantities of those which intervene, may be diversified; and the change in duration of the notes alone, may disguise that very succession in such a manner that it cannot be known. Thus, melody in itself is nothing; it is the rhythmus or measure which determines it, and there can be no air without time. If then we abstract measure from both, we cannot compare melody with harmony; for to the former it is essential, but not at all to the latter.

Melody, according to the manner in which it is considered, has a relation to two different principles. When regarded only as agreeable to the proportions of sound and the rules of modulation, it has its principle in harmony; since it is a harmonical analysis, which exhibites the different gradations of the scale, the chords peculiar to each mode, and the laws of modulation, which are the sole elements that compose an air. According to this principle, the whole power of melody is limited to that of pleasing the ear by agreeable sounds, as the eye may be pleased with an agreeable assemblage of suitable colours. But when considered as an imitative art, by which we may affect the mind with various images, excite different emotions in the heart, inflame or soothe the passions; by which, in a word, we produce different effects upon our moral faculties, which are not to be effectuated by the influence of external sense alone, we must explore another principle for melody: for in our whole internal frame there appears to be no power upon which either harmony alone, or its necessary results, can seize, to affect us in such a manner.

What then is the second principle? It is as much founded on nature as the first; but, in order to discover its foundation in nature, it will require a more accurate though simpler observation, and a more exquisite degree of sensibility in the observer. This principle is the same which varies the tone of the voice, when we speak, according as we are interested in what we say, and according to the different emotions which we feel in expressing it. It is the accent of languages which determines the melody of every nation; it is the accent which determines us to employ the emphasis of speaking while we sing, and to speak with more or less energy according as the language which we use is more or less accented. That language whose accents are the most sensible, ought to produce a more passionate and more lively melody; that which has little accentuation, or none at all, can only produce a cold and languid melody, without character

Melody. racter and without expreffion. Thefe are the true principles: in proportion as we depart from them, when we fpeak of the power of mufic upon the humanheart, we fhall become unintelligible to ourfelves and others; our words will be without meaning.

If mufic does not imprefs the foul with images but by melody, if from thence it obtains its whole power, it muft follow, that all mufical founds which are not pleafing by themfelves alone, however agreeable to harmony they may be, is not an imitative mufic; and, being incapable, even with its moft beautiful chords, either to prefent the images of things, or to excite the finer feelings, very foon cloys the ear, and leaves always the heart in cold indifference. It follows likewife, that notwithftanding the parts which harmony has introduced, and which the prefent tafte of mufic fo wantonly abufes, wherever two different melodies are heard at the fame time, they counteract each other, and deftroy the effects of both, however beautiful each may be when performed alone: from whence it may be judged with what degree of tafte the French compofers have introduced in their operas the miferable practice of accompanying one air with another, as well in finging, which is the native expreffion of pathos and fentiment, as in inftrumental performances; which is the fame thing as if whimfical orators fhould take it in their heads to recite two orations at the fame time, that the elegance of each might derive more force from the other.

So much for Rouffeau. The tranflator, however, has reafon to fear, that the caufes by which national melody is diverfified and characterifed, are more profound and permanent than the mere accentuation of language. This indeed may have great influence in determining the nature of the rhythmus, and the place of emphatic notes; but very little in regulating the nature of the emphafis and expreffion themfelves. If Rouffeau's principle be true in its full extent, he muft of neceffity acknowledge, that an air which was never fet or intended for words, however melodious, cannot be imitative: he muft likewife confefs, that what is imitative in one nation cannot be fuch in another: nor can it be denied upon his hypothefis, that the recitative, which is formed upon the mode of fpeaking, is the moft forcible of all melodies; which is abfurd. His other obfervations are at once judicious and profound. Though it is impoffible to exhibit the beauty and variety of harmony by playing the fame melody at the fame time upon different keys, admitting thofe keys to form among themfelves a perfect chord, which will of confequence preferve all the fubfequent notes in the fame intervals; yet this perfect harmony would by no means be uniformly pleafing to the ear. We muft therefore of neceffity introduce lefs perfect chords to vary and increafe the pleafure, and thefe chords in any complex fyftem of mufic muft of neceffity produce diffonances. It then becomes the bufinefs of the compofer to be careful that thefe difcords may arife as naturally from, and return as naturally to, perfect harmony as poffible. All thefe caufes muft inevitably vary the melody of the different parts; but ftill amidft all thefe difficulties, the artift ought to be zealous in preferving the melody of each as homogeneous with the others as poffible, that the refult of the whole may be in fome meafure uniform. Otherwife, by counteracting each other, the parts will reciprocally deftroy the effects one of another.

Meloe. MELOE, in zoology, a genus of infects of the order of coleoptera. The antennæ are jointed, the laft joint being oval; the breaft is roundifh; the elytra are foft and flexible; and the head is inflected and gibbous. There are 16 fpecies, principally diftinguifhed by their colour. The moft remarkable is the veficatorius, or cantharis of the fhops; which, when bruifed, is univerfally ufed as a bliftering plafter. Thefe infects are of a fhinning green colour, intermingled with more or lefs of a blue and a gold yellow. They are found adhering to different kinds of trees and herbs, in Spain, Italy, and France: the largeft and moft efteemed come from Italy.

Cantharides are extremely acrimonious: applied to the fkin, they firft inflame, and afterwards excoriate the part, raifing a more perfect blifter than any of the vegetable acrids, and occafioning a more plentiful difcharge of ferum. All the bliftering compofitions have cantharides for their bafis. The external application of cantharides is often followed by a ftrangury, accompanied with thirft and feverifh heat: this inconvenience may be remedied by foft unctuous or mucilaginous liquors liberally drank.

Cantharides taken internally often occafion a difcharge of blood by urine, with exquifite pain: if the dofe is confiderable, they feem to inflame and exulcerate the whole inteftinal canal; the ftools become mucous and purulent; the breath fetid and cadaverous; intenfe pains are felt in the lower belly; the patient faints, grows giddy, raving mad, and dies. All thefe terrible confequences have fometimes happened from a few grains. Herman relates, that he has known a quarter of a grain inflame the kidneys, and occafion bloody urine with violent pain. There are neverthelefs cafes in which this ftimulating fly, given in larger dofes, proves not only fafe, but of fingular efficacy for the cure of difeafes that yield little to medicines of a milder clafs. In cold phlegmatic fluggifh habits, where the vifcera are overloaded, and the kidneys and ureters obftructed with thick vifcid mucous matter, cantharides have excellent effects: here the abounding mucus defends the folids from the acrimony of the fly, till it is itfelf expelled; when the medicine ought to be difcontinued. Groenvelt employed cantharides with great fuccefs in dropfies, obftinate fuppreffions of urine, and ulcerations of the bladder; giving very confiderable dofes made into bolufes with camphor; and interpofing large draughts of emulfions, milk, or other emollient liquids: by this means, the exceffive irritation, which they would otherwife have occafioned, was in great meafure prevented. The camphor did not perhaps contribute fo much to this effect as is generally imagined: fince it has no fenfible quality that promifes any confiderable abatement of the acrimony of cantharides: nitre would anfwer all that the camphor is fuppofed to perform; this, with milk, or emollient mucilaginous liquors, drank in large quantity, are the beft correctors. Cantharides, in very fmall dofes, may be given with fafety alfo in other cafes. Dr Mead obferves, that the obftinate gleetings which frequently remain after the cure of venereal maladies, and which rarely yield to balfamic medicines,

cines, are effectually remedied by cantharides; and that no one remedy is more efficacious in leprous disorders; in which laft, proper purgatives are to be occafionally taken during the ufe of the cantharides. The beft and fafeft preparation of cantharides for thefe purpofes, is a fpirituous tincture; and indeed in all cafes, the tincture is far preferable, for internal ufe, to the fly in fubftance.

The virtues of cantharides are extracted by rectified fpirit of wine, proof fpirit, and water; but do not arife in diftillation. The watery and fpirituous extracts blifter as freely as the fly in fubftance; whilft the fly remaining after the feveral menftrua have performed their office, is to the tafte infipid, and does not in the leaft blifter or inflame the fkin.

MELON, in botany. See CUCUMIS.

MELOTHRIA, in botany; a genus of the monogynia order, belonging to the triandria clafs of plants. There is only one fpecies, viz. the pendula, a native of Carolina, Virginia, and alfo many of the American iflands. The plants ftrike out roots at every joint, which faften themfelves into the ground, by which means their ftalks extend to a great diftance each way. The flowers are very fmall, in fhape like thofe of the melon, of a pale fulphur colour. The fruit in the Weft Indies grows to the fize of a pea, is of an oval figure, and changes to black when ripe: thefe are by the inhabitants fometimes pickled when they are green. In Britain the fruit are much fmaller, and are fo hidden by the leaves that it is difficult to find them. The plants are too tender to be reared in this country without artificial heat.

MELPOMENE, in fabulous hiftory, one of the nine mufes, and the inventrefs of tragedy. She is commonly reprefented with a ferious countenance, and in a theatrical drefs, holding crowns and fceptres in one hand, and a dagger in the other.

MELREY, or MELROSE, a town of Scotland, in the county of Merfe, and on the confines of Tweedale, feated on the fouth-fide of the river Tweed; with an ancient abbey now in ruins. W. Long. 2. 32. N. Lat. 55. 32.

This abbey was founded by king David I. in 1136. He peopled it with Ciftertians, brought from Rivale abbey in Yorfhire, and dedicated it to the virgin Mary. At the reformation James Douglas was appointed commendator, who took down much of the building, in order to furnifh materials for a large houfe to himfelf, which ftill remains, and is dated 1590. Nothing is left of the abbey, excepting a part of the cloifter walls, elegantly carved; but the ruins of the church are of moft uncommon beauty. Part is at prefent ufed for divine fervice, the reft uncovered; but every part does great honour to the architect.—Alexander II. was buried beneath the great altar, and it is alfo the place of interment of the Douglafes and other potent families.—Its fituation is extremely pleafant.

MELT OF FISHES. In the melt of a living cod there are fuch numbers of thofe animalcules faid to be found in the femen of all-male animals, that in a drop of its juice, no larger than a grain of fand, there are contained more than 10,000 of them; and, confidering how many fuch quantities there are in the whole melt of one fuch fifh, it is not incredible, that there are more animals in one melt of it, than there are living men at one time upon the face of the earth. However ftrange and romantic fuch a conjecture muft appear, a ferious confideration and calculation will make it appear very plain. An hundred fuch grains of fand as thofe juft mentioned will make about an inch in length; therefore in a cubic inch there will be a million of fuch fands; and if there be 10,00 animals in each of thofe quantities, there muft be in the whole 150,000 millions; which is a number vaftly exceeding that of mankind, even fuppofing the whole earth as populous as Holland.

MELTING CONE, in effaying, an hollow cone of brafs or caft iron, into which melted metalline fubftances are thrown, in order to free them from their fcoriæ. When a fmall quantity of matter is melted, it will be fufficient to rub the infide of the cone with greafe; but when the quantity is very large, efpecially if it contains any thing fulphureous, this caution of tallowing the moulds is not fufficient. In this cafe the effayer has recourfe to a lute reduced to thin pap with water, which effectually prevents any injury to the cone.

MELVIL (Sir James), defcended from an honourable Scots family, being the third fon of the laird of Kaeth, was born about the middle of the 16th century. He went to France, very young, in the capacity of page to qneen Mary, then married to the dauphin; and on the death of her hufband, followed her to Scoland, where he was made gentleman of her chamber, and admitted a privy-counfellor. She employed him in her moft important concerns, till her unhappy confinement in Lochleven, all which he difcharged with the utmoft fidelity; and, from his own accounts, there is reafon to conclude, that, had fhe taken his advice, fhe might have avoided many of her misfortunes. When fhe was prifoner in England, fhe recommended him ftrongly to her fon James; with whom he continued in favour and employment until the death of queen Elizabeth: James would then have taken him to England; but Melvil, now grown old, was defirous of retiring from bufinefs, and in his retirement he drew up the memorirs of his paft life for the ufe of his fon. Thefe memoirs were accidentally found in Edinburgh caftle, in the year 1660, though nobody knew how they came to be depofited there; and were publifhed in folio in 1683.

MEMBER, in architecture, denotes any part of a building; as a frize, cornice, or the like. This word is alfo fometimes ufed for the moulding.

MEMBER *of Parliament*. See PARLIAMENT.

MEMBRANE, in anatomy, a pliable texture of fibres interwoven together in the fame plane.

MEMNON, in fabulous hiftory, was the fon of Tithonus and Aurora. Having led his troops to the affiftance of Priam, in order to raife the fiege of Troy, he was killed by Achilles; when his body being placed on a funeral pile, was, at Aurora's defire, transformed into a bird.

MEMNON *of Rhodes*, one of the generals of Darius king of Perfia, advifed that prince to lay wafte the country, in order to deprive Alexander the Great's army of fupport, and afterwards to attack Macedon; but

but this counsel was disapproved by Darius's other generals. Memnon behaved at the passage of the Granicus like an experienced general. He afterwards defended the city of Miletum with great courage; seized the islands of Chio and Lesbos; spread terror throughout all Greece; and would have put a stop to the conquests of Alexander, if he had not been prevented by death. Barsina, Memnon's widow, was taken prisoner with Darius's wife, and Alexander had a son by her named *Hercules*.

MEMOIRS, in matters of literature, a species of history, written by persons who had some share in the transactions they relate; answering to what the Romans called *Commentarii*.—The journals of the proceedings of a literary society, or a collection of matters transacted therein, are likewise called *Memoirs*.

MEMORY, a faculty of the human mind, whereby it retains and recalls the ideas it has once perceived. See METAPHYSICS, n° 42.

Memory depends very much upon the temper and constitution of the body. In some, it is not so susceptive of impressions; in others, it is not sufficiently retentive: and as the seat of the memory is in the brain, whatever is hurtful to this latter, must prejudice the former. Too much sleep clouds the brain, and too little over-heats it; therefore either of these extremes must of course hurt the memory. All intemperance likewise, and excess of passion, have the same ill effect.

When we would commit any thing to memory, our first concern should be to understand it thoroughly. For we can never retain those things long, of which we have but an imperfect knowledge. Likewise order and method in the discourse itself is a great help to the memory. Where things have a mutual dependance upon each other, and go on in a series, the thoughts pass more readily from one to another, than where they lie confused and without any connection. The mind should also be free at such times, and have nothing else to take off its attention. Nothing is a greater hindrance to the memory than a crowd of ideas, and those of different kinds, flowing in upon the mind at the same time. They justle out one another, so that but few of them settle; and if they do, it is in such a confused and disorderly manner, that when they come to be surveyed by reflection, little can be made of them.

To write down any thing is likewise a great advantage towards remembering it. For the very action of writing helps very much to imprint it upon the mind, by engaging it to a closer attention, and causing it to dwell longer upon every part than otherwise it would do only in reading. And therefore the Jewish doctors tell us, it was for this reason that the kings of Israel were enjoined always to write out a copy of the law with their own hand. And the fairer a thing is written, it is with greater ease committed to memory. This may possibly at first seem to have little in it; but if we consult experience, we shall generally find, that those things make the deepest impression upon the mind, which affect the senses in the most lively and agreeable manner. As we receive most of our ideas through them, the stronger impulse is made upon the organ, the greater attention it excites in the mind; and what we most attend to, we retain longest.

A little experience and observation will help a person to discover the strength of his memory. And care should be taken not to over-burden it. A long discourse therefore should be committed to memory by parts, so much at once as the memory can well receive and retain. These parts should not be too many, for fear of confusion. And as it is most likely we may be at a loss in passing from one part to another, it will not be amiss in a more particular manner to impress upon the the mind the beginnings of them. One letter often helps us to recover a word; that word a sentence; and the first sentence a whole argument. Some have therefore advised, for the assistance of weaker memories, to write each part of the discourse in a separate paragraph, and the first word in larger characters, which may strike the fancy like a picture when we come to those places. For every one is sensible of the powerful effect of imagery to excite and recall our ideas: and therefore it has been thought a further advantage, if the first letter of each word, written in larger characters, could be joined together in one artificial word; for then the remembrance of that word would give us the first letter of each of those initial words, which letters would help us to recollect the whole words, which was the thing designed by writing them in different characters. We find this method of bringing several ideas together into one artificial word of use in other cases. So the figures of syllogisms being distinguished by technical words, are better known, and more easily remembered; as every one perceives, who is conversant in logic.

As the mind is not at all times equally disposed for the exercise of this faculty, such seasons should be made choice of as are most proper for it. The mind is seldom fit for attention presently after meals; and to call off the spirits at such times from their proper employment in digestion, is apt to cloud the brain, and prejudice the health. Both the mind and body should be easy and undisturbed when we engage in this exercise, and therefore retirement is most fit for it: and the evening, just before we go to rest, is generally recommended as a very convenient season, both for the stillness of the night, and because the impressions will then have a longer time to settle before they come to be disturbed by the accession of others proceeding from external objects; and to call over in the morning what has been committed to the memory over-night, must, for the same reason, be very serviceable. For, to review those ideas while they continue fresh upon the mind, and unmixed with any others, must necessarily imprint them more deeply.

Some ancient writers speak of an artificial memory, and lay down rules for attaining it. Simonides the poet is said first to have discovered this, or at least to have given the occasion for it. The story they tell of him is this: Being once at a feast, he recited a poem which he had made in honour of the person who gave the entertainment. But having (as is usual in poetry) made a large digression in praise of Castor and Pollux; when he had repeated the whole poem, his patron would give him but half the sum he had promised, telling him he must get the other part from those

thofe deities who had an equal fhare in the honour of his performance. Immediately after, Simonides was told that two young men were without, and muft needs fpeak with him. He had fcarce got out of the houfe, when the room where the company was fell down, killed all the perfons in it, and fo mafhed their bodies, that, when the rubbifh was thrown off, they could not be known one from another: upon which Simonides recollecting the place where every one had fat, by that means diftinguifhed them. Hence it came to be obferved, that to fix a number of places in the mind in a certain order, was a help to the memory: As we find by experience, that, upon returning to places once familiar to us, we not only remember them, but likewife many things we both faid and did in them. This action therefore of Simonides was afterwards improved into an art, and the nature of it is this: They bid you form in your mind the idea of fome large place or building, which you may divide into a great number of diftinct parts, ranged and difpofed in a certain order. Thefe you are frequently to revolve in your thoughts, till you are able to run them over one after another without hefitation, beginning at any part. Then you are to imprefs upon your mind as many images of living creatures, or any other fenfible objects which are moft likely to affect you, and be fooneft revived in your memory. Thefe, like characters in fhort-hand, or hieroglyphics, muft ftand to denote an equal number of other words, which cannot fo eafily be remembered. When therefore you have a number of things to commit to memory in a certain order, all that you have to do is, to place thefe images regularly in the feveral parts of your building. And thus they tell you, that, by going over feveral parts of the building, the images placed in them will be revived in the mind; which of courfe will give you the things or words themfelves in the order you defire to remember them. The advantages of the images feems to be this; that, as they are more like to affect the imagination than the words for which they ftand, they will for that reafon be more eafily remembered. Thus, for inftance, if the image of a *lion* be made to fignify *ftrength*, and this word *ftrength* be one of thofe I am to remember, and is placed in the porch; when in going over the feveral parts of the building I come to the porch, I fhall fooner be reminded of that image than of the word *ftrength*. Some ancient as well as modern writers relate wonderful effects of this artifice. But they all agree it much more affifts us to remember any number of feparate and unconnected words, than a continued difcourfe; unlefs fo far as the remembrance of one word may enable us to recollect more. And in this refpect it does not much differ from fome of thofe methods above-mentioned as helps to the memory. Quintilian therefore, though he does not wholly pafs it over, yet feems to lay no great ftrefs upon it.

And, doubtlefs, the moft effectual way to gain a good memory is, its conftant and moderate exercife. —In a word, the memory, like other habits, is ftrengthened and improved by daily ufe and practice. Wherefore thofe who have moft occafion for it, as orators, fhould not fuffer it to lie idle, but conftantly employ it in treafuring up and frequently reviewing fuch things as may be of moft importance to them.— For by this means it will be more at their command, and they may put greater confidence in it upon any emergent occafion.

Another method of affifting the memory, is by forming certain words, the letters of which fhall fignify the date or æra to be remembered. In order to this, the following feries of vowels, diphthongs, and confonants, together with their correfponding numbers, muft be exactly learned; fo as to be able at pleafure to form a technical word that fhall ftand for any number, or to refolve fuch a word already formed.

a	*e*	*i*	*o*	*u*	*a*	*oi*	*ei*	*ou*	*y*
1	2	3	4	5	6	7	8	9	0
b	*d*	*t*	*f*	*l*	*s*	*p*	*k*	*n*	*z*

The firft five vowels, in order, naturally reprefent 1, 2, 3, 4, 5; the diphthong *au*=6, as being compofed of *a* and *u*, or 1+5=6; and for the like reafon, *oi*=7, and *ou*=9. The diphthong *ei* will eafily be remembered for 8, as being the initials of the word. In like manner, where the initial confonants could conveniently be retained, they are made ufe of to fignify the number, as *t* for 3, *f* for 4, *s* for 6, and *n* for 9. The reft were affigned without any particular reafon, unlefs that poffibly *p* may be more eafily remembered for 7 or *feptem*, *k* for 8 or ὀκτω, *d* for 2 or *duo*; *b* for 1, as being the firft confonant; and *l* for 5, being the Roman letter for 50, than any others that could have been put in their places.

It is to be farther obferved, that *z* and *y* being made ufe of to reprefent the cypher, where many cyphers meet together, as 1000, 1000000, &c. inftead of a repetition of *a z y z y z y*, &c. let *g* ftand for 100, *th* for a thoufand, and *m* for a million. Thus *ag* will be 100, *ig* 300, *oug* 900, &c. *ath* 1000, *am* 1000000, *loum* 59000000, &c.

Fractions may be fet down in the following manner: let *r* fignify the line feparating the numerator and denominator, the firft coming *before*, the other *after* it; as *iro* $\frac{3}{4}$, *urp* $\frac{5}{7}$, *pourag* $\frac{79}{100}$, &c. When the numerator is 1 or unit, it need not be expreffed, but begin the fraction with *r;* as *re* $\frac{1}{2}$, *ri* $\frac{1}{3}$, *ro* $\frac{1}{4}$, &c. So in decimals, *rag* $\frac{1}{100}$, *rath* $\frac{1}{1000}$.

This is the principal part of the method which confifts in expreffing numbers by artificial words. The application to hiftory and chronology is alfo performed by artificial words. The art herein confifts in making fuch a change in the ending of the name of a place, perfon, planet, coin, &c. without altering the beginning of it, as fhall readily fuggeft the thing fought, at the fame time that the beginning of the word, being preferved, fhall be a leading or prompting fyllable to the ending of it fo changed. Thus, in order to remember the years in which Cyrus, Alexander, and Julius Cefar, founded their refpective monarchies, the following words may be formed; for Cyrus, Cyr*uts;* for Alexander, Alex*ita;* for Julius Cefar, Juli*os*. *Uts* fignifies, according to the powers affigned to the letters before-mentioned, 536; *ita* is 331, and *os* is 46. Hence it will be eafy to remember, that the empire of Cyrus was founded 536 years before Chrift, that of Alexander 331, and that of Julius Cefar 46. This account is taken from a treatife, entitled *A New Method of Artificial Memory;* where the reader will find feveral

ral examples in chronology, geography, &c. of ſuch artificial words diſpoſed in verſes, which muſt be allowed to contribute much to the aſſiſtance of the memory, ſince being once learned they are ſeldom or never forgot. However, the author adviſes his reader to form the words and verſes himſelf, in the manner deſcribed above, as he will probably remember theſe better than thoſe formed by another.

We ſhall here give his table of the kings of England ſince the conqueſt; where 1000 being added to the italics in each word, expreſſes the year when they began their reigns. Thus,

Will-con*ſau*, Ruf*koi*, Hen*rag*.
Steph*il* & Henfec*kuf*, Rich*bein*, *Jann*, Heth*das* & Edd*oid*
Edſe*typ*, Edtar*tep*, Riſe*tois*, Hefo*toun*, Heti*fadque*.
Hen*ſifed*, Edquar*fauz*, Efi R*okt*, Henſep*feil*, Henoc*lyn*.
Edſex*los*, Mary*lut*, Els*luk*, Jam*ſyd*, Caroprim*ſel*.
Carſec*ſok*, Jam*ſeif*, Wil*ſeik*, An*pyd*, Geo*bo-doi*.

MEMPHIS, an ancient city, and the royal reſidence of the kings in the Higher Egypt; diſtant from the Delta to the ſouth 15 miles, according to Pliny. Situate on the weſt ſide of the Nile, over-againſt Babylon. Famous for its pyramids, the burial-places of the kings. In Strabo's time it was flouriſhing and populous, and ſecond to Alexandria. Called alſo *Moph* and *Noph*, in ſcripture.

MENAGE (Giles), in Latin *Ægidius*, a celebrated French writer, born at Angers in 1613. He finiſhed his ſtudies in that city, was made advocate, and pleaded for ſome time at Angers, Paris, and Poictiers; but, becoming at length diſguſted with the bar, turned eccleſiaſtic, and gave himſelf up entirely to the ſtudy of polite literature. He at length entered into the family of the cardinal de Retz; but diſagreeing with ſome perſons belonging to his eminence, went to live in the cloyſter of Notre Dame, where he held an aſſembly of learned men every Wedneſday. He read a great deal; had a prodigious memory; and was inceſſantly quoting in his converſation, verſes in Greek, Latin, Italian, French, &c. on which account he was often turned into ridicule by the wits, eſpecially towards the end of his days. His great memory he retained even in his old age; and what is very rare, it returned to him after ſome interruption. The reputation of his works procured him a place in the academy *della Cruſca* at Florence. He might have been a member of the French academy at its firſt inſtitution, if it had not been for his *Requeſte des Dictionnaires*: but when that was forgot, he was propoſed in 1684 to fill up a vacant place in that academy, and was excluded only by the ſuperior intereſt of his competitor Mr Bergent; for there was not one member of all thoſe who gave their votes againſt him, but owned that he deſerved the place. He would not ſuffer his friends to propoſe him again. He died at Paris in 1692, aged 79. He wrote a great number of books in proſe and verſe; the principal of which are, 1. Miſcellaneous works. 2. The Origin of the French Language. 3. The Origin of the Italian Tongue; the beſt edition of which is that of Geneva, in 1685, folio. 4. An edition of Malherbe's Poems, with Notes. 5. An edition of Diogenes Laertius, with Obſervations. 6. Remarks on the French Tongue. 7. Greek, Latin, Italian, and French poems.

MENANDER, an ancient Greek poet, was born at Athens in the ſame year with Epicurus, which was the third of the 109th olympiad. His happineſs in introducing the new comedy, and refining an art which had been ſo groſs and licentious in former times, quickly ſpread his name over the world. Pliny informs us, that the kings of Egypt and Macedon gave a noble teſtimony of his merit, by ſending ambaſſadors to invite him to their courts, and even fleets to bring him over; but that Menander was ſo much of a philoſopher, as to prefer the free enjoyment of his ſtudies to the promiſed favours of the great. Of his works, which amounted to above 100 comedies, we have had a double loſs, the originals being not only vaniſhed, but the greateſt part of them, when copied by Terence, having unfortunately periſhed by ſhipwreck before they ſaw Rome. Yet the four plays which Terence borrowed from him before that accident happened, are ſtill preſerved in the Roman habit; and it is chiefly from Terence that moſt people form their judgment of Menander, the fragments that remain of him not being ſufficient to enable them to do it. The ancients have ſaid high things of Menander; and we find the old maſters of rhetoric recommending his works, as the true patterns of every beauty and every grace of public ſpeaking. Quintilian declares, that a careful imitation of Menander only, will ſatisfy all the rules he has laid down in his Inſtitutions. It is in Menander that he would have his orator ſearch for a copiouſneſs of invention, for a happy elegance of expreſſion, and eſpecially for that univerſal genius which is able to accommodate itſelf to perſons, things, and affections.

But Julius Ceſar has left the loftieſt as well as the juſteſt praiſe of Menander's works, when he calls Terence only a *Half-Menander*. For while the virtues of the Latin poet are ſo deſervedly admired, it is impoſſible we ſhould raiſe a higher notion of excellency, than to conceive the great original ſtill ſhining with half its luſtre unreflected, and preſerving an equal part of its graces, above the power of the beſt copier in the world.

Menander died in the 3d year of the 122d olympiad, as we are taught by the ſame old inſcription from which we learn the time of his birth. His tomb, in Pauſanias's age, was to be ſeen at Athens, in the way from the Piræus to the city, cloſe by the honorary monument of Euripides. Quintilian, in his judgment of Afranius the Roman comedian, who imitated him, cenſures Menander's morals as much as he commends his writings; and his character, according to Suidas, is, that he was a very "mad fellow after women." Phædrus has given him the gait and dreſs of a moſt affected fop:

"Unguento delibutus, veſtitu adfluens,
"Veniebat greſſu delicatulo & languido."
Lib. v. fab. 2.

MENASSEH (Ben Iſrael), a celebrated rabbi, born in Portugal about the year 1604, was the ſon of Joſeph Ben Iſrael, and followed his father into Holland, where he was educated by rabbi Iſaac Uziel, under whom, he in a ſhort time made ſuch progreſs in the Hebrew tongue, that at 18 years of age he ſucceeded him in the ſynagogue of Amſterdam, in which poſt he continued ſeveral years, and married Rachel of the family of the Abarbanels, whom the Jews imagine to be deſcended from king David. He afterwards

went

went to his brother Ephraim, a rich merchant, who had fettled at Bafil; by whofe advice he entered into trade. Some time after, the hopes of a more agreeable fettlement induced him to come into England, under the protectorfhip of Cromwell; who gave him a very favourable reception, and one day entertained him at his table with feveral other learned divines. However, he foon after paffed into Zealand; and died at Middleburg about the year 1657. The Jews at Amfterdam obtained his body, and interred it at their expence. He was of the fect of the Pharifees; had a lively wit, a folid judgment, great learning, and all the virtues that can adorn private life. He wrote many works in Hebrew, Latin, Spanifh, and Englifh. The principal of thofe publifhed in Latin, are, 1. His *Conciliator;* a learned and curious work, in which he reconciles thofe paffages of Scripture which feem to contradict each other. 2. *De refurrectione mortuorum.* 3. *De termino vitæ.* 4. *Differtatio de fragilitate humana, ex lapfu Adami, deque Divino in bono opere auxilio.* 5. *Spes Ifrael.* Dr Thomas Pococke has written his life in Englifh.

MENCKE (Lewis Otto), in Latin *Menckenius*, a learned profeffor of morality at Leipfic, was born at Oldenburg in Weftphalia in 1644. He ftudied in feveral univerfities of Germany; and became an able philofopher, civilian, and divine. He was made profeffor of morality at Leipfic in 1668; and enjoyed that poft to his death. He was five times rector of the univerfity of that city, and feven times dean of the faculty of philofophy. He publifhed feveral works; but his moft confiderable, and what alone is fufficient to perpetuate his memory, is the *Acta Eruditorum* of Leipfic, of which he was the firft author, and in which he was engaged till his death. The firft volume was publifhed at Leipfic, in 4to, in 1682.

MENCKE (John Burchard), fon to the preceding. After his ftudies he travelled into England and Holland; and upon his return was appointed profeffor of hiftory at Leipfic in 1699. He gained great reputation by his lectures as well as his writings.. He died in 1732, aged 58. He wrote many pieces. His *De Charlataneriâ eruditorum declamationes duæ*, is an excellent fatire, defigned to expofe the artifices ufed by falfe fcholars to raife themfelves a name. As he named and pointed at certain perfons, it exafperated them, and they procured his book to be feized; but it fpread, and editions of it were multiplied. He likewife publifhed *Methode pour étudier l'Hiftoire, avec un catalogue des principaux hiftoriens*, &c. He made a great many additions to Mr Lenglet's book, efpecially with regard to the German hiftorians.

MENDICANTS, or BEGGING FRIARS, feveral orders of religious in Popifh countries, who having no fettled revenues, are fupported by the charitable contributions they receive from others.

This fort of friars began in the 13th century. The Waldenfes, who made profeffion of renouncing their eftates, and leading a life of poverty, gave occafion to this inftitution. Two of that fect, Bernard and Durand of Ofca, fet up a congregation in the province of Tarragon, and called it *The Poor Catholics*. The fame year, Dominick de Guzman, with nine more of his companions, founded the order of Preaching Friars, called from their founder *Dominicans*. The other three Mendicant orders are, the *Francifcans*, *Auguftins*, and *Carmelites*.

"A great many have embraced this fevere order, (fays Puffendorf), out of an opinion of a particular holinefs and merit which they believed did belong to it, or rather an ecclefiaftic ambition; the pride of mankind being fo great and natural to fome, that they did not think the commands of God fufficient, but would receive heaven rather as a defert than a gift, and were ambitious of having a preference before others even in another life."

Buchannan tells us, the Mendicants in Scotland, under an appearance of beggary, lived a very luxurious life; whence one wittily called them, not *Mendicant*, but *Manducant*, friars.

MENDOZA (Juan Gonzales de), an Auguftan friar, of the province of Caftile, was made ambaffador from the king of Spain to the emperor of China. In 1593, he was made bifhop of Liperi in Italy. In 1607 he was made bifhop of Chiapa in New Spain, and the next year was removed to the fee of Papaian in the Weft Indies. He wrote a hiftory of China in Spanifh, which has been tranflated into feveral languages.

MENECRATES, a phyfician of Syracufe, who flourifhed about 360 B. C. is famous for his fkill in his profeffion, but much more for his vanity. He would always be followed by fome of the patients whom he had cured, one dreffed like Apollo, another like Efculapius, a third like Hercules, &c. As for himfelf, he would be called *Jupiter*. He wrote a letter to Philip the father of Alexander the Great, with this fuperfcription, "Menecrates Jupiter to king Philip, Health:" When that prince ridiculed him by replying, "Philip to Menecrates, Health and Good Senfe." Menecrates compofed a book of *Remedies*, which is loft.

MENEDEMUS, a Greek philofopher, born at Erythreum, was the fon of Califthenes, and one of Phedo's followers. He was in greaft efteem, and enjoyed feveral important pofts in his own country. He feveral times defended Erythreum with great bravery, and died of grief when Antigonus became mafter of it. A perfon one day faying to him, "It is a great happinefs to have what we defire," he replied, "It is a much greater to defire nothing but what we have." He flourifhed about 300 B. C.

MENELAUS, the fon of Atreus, and the brother of Agamemnon, reigned at Sparta, when Paris deprived him of his wife Helen. This rape occafioned the famous war of Troy. See HELEN.

MENELAUS, a mathematician in the reign of the emperor Trajan, wrote three books on the *Sphere*, which have been publifhed by father Merfenne.

MENES, born at This, a town of Thebais in Upper Egypt, was the founder of the Egyptian empire. He had three fons, viz. Athotis, who ruled after him at This and Thebes; Curudes, who, in Lower Egypt founded the kingdom of Heliopoli, which afterward was the kingdom of Diofpoli; and Necherophes, who reigned at Memphis. It is thought this Menes reigned 117 years after the birth of Phaleg, fon of Heber, which was the very year of the difperfion of the people throughout the whole earth. In building Memphis, he ftopped the Nile near it, by the invention of a

MENE-

causeway 100 furlongs broad, and caused it to run thro' the mountains.

MENESTRIER (John Baptift le), a native of Dijon, and one of the moft learned and curious French antiquaries of his time, wrote, 1. A treatife on the medals, money, and ancient monuments of the Roman empreffes, in folio. 2. The moft famous medals of the ancient Roman emperors and empreffes, in quarto. He died in 1634, aged 70.

MENGRELIA, a province of Turky in Afia. See MINGRELIA.

MENIALS, domeftic or houfehold fervants, who live under their lord or mafter's roof.

MENINGES, or MENYNGES, in anatomy, a name given to the dura and pia mater of the brain. See ANATOMY, n° 394.

MENINX, an ifland in the Mediterranean, to the weft of the Syrtis Minor. Suppofed by Strabo and Polybius to be Homer's country of the Lotophagi; and hence Ptolemy and Eratofthenes denominate the ifland *Lotophagitis*, with a cognominal town *Meninx*. The country of Vibius Gallus the emperor, and of Volufianus. Now called *Gerbi* and *Zarbi*.

MENISPERMUM, MOONSEED; a genus of the decandria order, belonging to the diœcia clafs of plants. There are three fpecies, all of them climbing plants, rifing 14 feet high, and natives of warm climates; but noway remarkable for beauty. The feeds of a kind which grows in the Levant, being formed into a pafte, are regarded by the inhabitants as fpecific againft lice and cutaneous eruptions. The fame pafte is likewife ufed for the purpofe of intoxicating fifhes.

MENOCHIUS, vulgarly MENOCHIA, (James), a famous lawyer, meanly born at Pavia, but who became fo fkilful in the law, that he was called the *Baldus* and *Bartholus* of his age; all the princes of Italy foliciting him to their univerfities. He read at Padua 23 years together; and for love of his country removed to Pavia, and fucceeded Nicholas Gratiani. He hath got an immortal fame by his works, *De recuperanda poffeffione; De adipifcenda poffeffione; De præfumtionibus; De arbitrariis Judicum queftionibus & caufis conciliorum*, tom. 13. &c. He died in 1607, aged 75.

MENNITH, or MINNITH, Judges xi. 33. a town near Hefhbon, (Jerome), in Arabia Petræa; in a diftrict named *Ecofipolis*, or *twenty-towns*, (Cellarius). There is alfo a Minnith mentioned Ezekiel xxvii. as being in a good wheat country: but whether the fame with the foregoing is uncertain; though fome think, that the firft Minnith lay in the country of Ammon, (Wells).

MENNONITES, a fect of baptifts in Holland, fo called from Mennon Simonis of Friezeland, who lived in the 16th century. This fect believe, that the New Teftament is the only rule of faith; that the terms *Perfon* and *Trinity* are not to be ufed in fpeaking of the Father, Son, and Holy Ghoft; that the firft man was not created perfect; that it is unlawful to fwear or to wage war upon any occafion; that infants are not the proper fubjects of baptifm; and that minifters of the gofpel ought to receive no falary. They all unite in pleading for toleration in religion, and debar none from their affemblies who led pious lives, and own the fcriptures for the word of God. The Mennonites meet privately; and every one in the affembly has the liberty to fpeak, to expound the fcriptures, to pray and fing. They affemble twice every year, from all parts of Holland, at Rynfbourg, a village about two leagues from Leyden; at which time they receive the communion, fitting at a table, where the firft diftributes to the reft; and all fects are admitted, even the Roman Catholics, if they pleafe to come.

MENOLOGY, the Greek calendar, in which the lives of the faints in fhort, or barely their names, are cited; anfwering nearly to the MARTYROLOGY of the Latin church.

MENSA, in law-books, a term that includes in it all patrimony, and neceffaries for livelihood.

MENSALS, MENSALIA, in church-hiftory, fuch livings as were formerly united to the tables of religious houfes, and hence called *menfal benefices*. See the article BENEFICE.

MENSES, FLUORS, *Courfes*, *Catamenia*, in medicine, the monthly evacuations from the uterus of women not with child and not giving fuck.

With regard to the caufes of this evacuation, the beft phyfiologifts are entirely at a lofs.. It was long difputed whether the menftrual blood flowed from the uterus or vagina, but fome obfervations of retroverted uteri have determined in favour of the former opinion. —For the diforders which follow a fuppreffion, or too great a flow of the menfes, fee MEDICINE, n° 488, 259—264. and p. 4871.

MENSTRUUM, in chemiftry, any body which in a fluid or fubtilifed ftate is capable of interpofing its fmall parts betwixt the fmall parts of other bodies, fo as to divide them fubtilly, and form a new uniform compound of the two.

MENSURATION, in general, denotes the act or art of meafuring lines, fuperficies, or folids. See GEOMETRY.

MENTHA, MINT; a genus of the gymnofpermia order, belonging to the didynamia clafs of plants. There are many fpecies; but not more than three are cultivated for ufe, namely, the viridis or common fpearmint, the piperita or peppermint, and the pulegium or pennyroyal. All thefe are fo well known as to need no defcription; and all of them are very eafily propagated by cuttings, parting the roots, or by offsets.

Ufes. For culinary purpofes, the fpearmint is preferable to the other two; but for medicine, the peppermint and pennyroyal have in fome places almoft entirely fuperfeded it. A conferve of the leaves is very grateful, and the diftilled waters both fimple and fpirituous are univerfally thought pleafant. The leaves are ufed in fpring fallads; and the juice of them boiled up with fugar is formed into tablets. It has been imagined that cataplafms and fomentations of mint, would diffolve coagulations of milk in the breafts; but Dr Lewis fays, that the curd of milk, digefted in a ftrong infufion of mint, could not be perceived to be any otherwife affected than by common water: however, milk in which mint-leaves were fet to macerate, did not coagulate near no foon as an equal quantity of the fame milk kept by itfelf. Dr Lewis fays, that dry mint digefted in rectified fpirits of wine, gives out a tincture, which appears by day-light of a fine dark green,

green, but by candle-light of a bright red colour. The fact is, that a small quantity of this tincture is green either by day-light or by candle-light, but a large quantity of it seems impervious to common day-light; however, when held betwixt the eye and a candle, or betwixt the eye and the sun, it appears red.

The virtues of mint are those of a warm stomach and carminative: in loss of appetite, nausea, and continual reaching to vomit, there are few simples of equal efficacy. In colicky pains, the gripes to which children are subject, lienteries, and other immoderate fluxes, this plant frequently does good service. It likewise proves beneficial in many hysteric cases, and affords an useful cordial in languors and other weaknesses consequent upon delivery. The best preparation in these cases is a strong infusion of the dried herb in water, (which is much superior to the green), or rather a tincture or extract prepared with rectified spirit. These possess the whole virtues of the mint; the essential oil and distilled water contain only the aromatic part; the expressed juice only the astringency and bitterishness, together with the mucilaginous substance common to all vegetables. The peppermint is much more pungent than the others.

Pennyroyal has the same general characters with the mint, but is more acrid and less agreeable when taken into the stomach. It has long been held in great esteem, and not undeservedly, as an aperient and deobstruent, particularly in hysteric complaints and suppressions of the menses. For these purposes the distilled water is generally made use of, or, what is of equal efficacy, an infusion of the leaves. It is observable, that both water and rectified spirit extract the virtues of this herb by infusion, and likewise elevate the greatest part of them by distillation. The expressed juice with a little sugar, is not a bad medicine in the chincough.

MENTZ, an archbishopric and electorate in Germany. It lies on the banks of the river Mayne, between the electorate of Triers on the west, the Palatinate on the south, Franconia on the east, and the Wetteraw on the north. It is about 60 miles in length from north-east to south-west, and about 50 in breadth. A considerable part of the elector's revenue arises from the toll on the Rhine and the Mayne, and from the tax on the excellent wines produced in this country. The chief towns of any trade are, 1. Mentz, on the Rhine, near its confluence with the Mayne. This city claims a right to the invention of the art of printing, (see *History* of PRINTING.) Here is a very beautiful quay along the river, defended by several works well fortified with cannon. That part of the city which extends towards the river is most populous. The best vineyards for Rhenish wine being in this neighbourhood, Mentz has a flourishing trade in that commodity more particularly; and its commerce is the brisker, by reason that all the merchandize which passes up and down the Rhine stops in its harbour to change bottoms. In this neighbourhood is Hockhem, so celebrated for good wines, that the best Rhenish is from thence called *old hock*. 2. Bingen is a pleasant small town, which stands in the district called *Rhingaw*, which is so populous, that it looks like one entire town, intermixed with gardens and vinegards. The rising grounds about it produce wines that are esteemed preferable to those of Baccharac, so much in vogue heretofore. 3. Elfeld, five miles west from Mentz, is a strong fortified town, on the north side of the Rhine, and the chief of the Rhingaw.—Here is Roderheim, a place noted for the growth of the best wines in these parts. 4. Weisbaden lies between six and seven leagues from Frankfort, and about five or six miles north of Mentz: it is the metropolis of a country belonging to the branch of Nassau-Saarbrack, and is famous for its mineral waters.

MENYANTHES, MARSH-TREFOIL, or *Buckbean*; a genus of the monogynia order, belonging to the pentandria class of plants. This plant grows wild in moist marshy places in many parts of Britain. It has three oval leaves standing together upon one pedicle, which issues from the root; their taste is very bitter, and somewhat nauseous. According to Mr Lightfoot, the flowers of this plant are so extremely beautiful, that nothing but their native soil could exclude it from a place in every garden. They grow in an elegant spike; are white, dashed with pink, and fringed internally with hairs. The highlanders esteem an infusion or tea of the leaves as good to strengthen the stomach. According to Mr Withering, an infusion of the leaves is prescribed in rheumatisms and dropsies; a dram of them in powder purges and vomits, and is sometimes given to destroy worms. In a scarcity of hops, the plant is used in the north of Europe to bitter the ale. The powdered roots are sometimes used in Lapland instead of bread, but they are unpalatable. Some people say, that sheep will eat it, and that it cures them of the rot; but from the Upsal Experiments it appears, that though goats eat it, sheep sometimes will not. Cows, horses, and swine, refuse it.—As to its medical virtues, Dr Lewis informs us, that it is an efficacious aperient and deobstruent; promotes the fluid secretions; and, if liberally taken, gently loosens the belly. It has of late gained great reputation in scorbutic and scrophulous disorders; and its good effects in those cases have been warranted by experience. Inveterate cutaneous diseases have been removed by an infusion of the leaves, drank to the quantity of a pint a-day, at proper intervals, and continued for some weeks. Boerhaave relates, that he was relieved of the gout by drinking the juice mixed with whey.

MENZINI (Benedict), a celebrated Italian poet, born at Florence, was professor of eloquence at the college Della Sapienza at Rome, where he died in 1704. He wrote, 1. The art of poetry. 2. Satires, elegies, hymns, and the Lamentations of Jeremiah. 3. *Academia Tusculana*, a work in verse and prose, which passes for his masterpiece.

MEOTIS, or PALUS MEOTIS, a sea of Turky, which divides Europe from Asia; extending from Crim Tartary to the mouth of the river Don or Tanais.

MEPHITIC, a name expressing any kind of noxious vapour; but generally applied to that species of vapour called *fixed air*. See AIR, FIXED *Air*, GAS, *&c.*

MERCATOR (Gerard), one of the most celebrated geographers of his time, was born at Ruremonde in 1512. He applied himself with such industry

dustry to geography and mathematics, that he is said to have frequently forgot to eat and drink. The emperor Charles V. had a particular esteem for him, and the duke of Juliers made him his cosmographer. He composed a chronology, some geographical tables, an Atlas, &c. engraving and colouring the maps himself. He died in 1594. His method of laying down charts is still used, and bears the name of *Mercator's charts*.

MERCATOR (Nicholas), an eminent mathematician in the 17th century, was born at Holstein in Denmark; and came to England about the time of the restoration, where he lived many years. He was fellow of the Royal Society; and endeavoured to reduce astrology to rational principles, as appeared from a MS. of his in the possession of William Jones, Esq; He published several works, particularly *Cosmographia*. He gave the quadrature of the hyperbole by an infinite series; which was the first appearance in the learned world of a series of this sort drawn from the particular nature of the curve, and that in a manner very new and abstracted.

MERCATOR's *Sailing*, that performed by Mercator's chart. See NAVIGATION.

MERCHANT, a person who buys and sells commodities in gross, or deals in exchanges; or that traffics in the way of commerce, either by importation or exportation. Formerly every one who was a buyer or seller in the retail way was called a *merchant*, as they still are both in France and Holland; but here shopkeepers, or those who attend fairs or markets, have lost that appellation.

Previous to a person's engaging in a general trade, and becoming an universal dealer, he ought to treasure up such a fund of useful knowledge, as will enable him to carry it on with ease to himself, and without risking such losses as great ill-concerted undertakings would naturally expose him to. A merchant should therefore be acquainted with the following parts of commercial learning. 1. He should write properly and correctly. 2. Understand all the rules of arithmetic that have any relation to commerce. 3. Know how to keep books of double and single entry, as journals, a leger, &c. 4. Be expert in the forms of invoices, accounts of sales, policies of insurance, charter-parties, bills of lading, and bills of exchange. 5. Know the agreement between the money, weights and measures of all parts. 6. If he deals in silk, woollen, linnen, or hair manufactures, he ought to know the places where the different sorts of merchandizes are manufactured, in what manner they are made, what are the materials of which they are composed, and from whence they come, the preparations of these materials before working up, and the places to which they are sent after their fabrication. 7. He ought to know the lengths and breadths which silk, woollen, or hair-stuffs, linen, cottons, fustians, &c. ought to have according to the several statutes and regulations of the places where they are manufactured, with their different prices, according to the times and seasons; and if he can add to his knowledge the different dyes and ingredients which form the various colours, it will not be useless. 8. If he confines his trade to that of oils, wines, &c. he ought to inform himself particularly of the appearances of the succeeding crops, in order to regulate his disposing of what he has on hand; and to learn as exactly as he can, what they have produced when got in, for his direction in making the necessary purchases and engagements. 9. He ought to be acquainted with the sorts of merchandize found more in one country than another, those which are scarce, their different species and qualities, and the properest method for bringing them to a good market either by land or sea. 10. To know which are the merchandizes permitted or prohibited, as well on entering as going out of the kingdoms or states where they are made. 11. To be acquainted with the price of exchange, according to the course of different places, and what is the cause of its rise and fall. 12. To know the customs due on importation or exportation of merchandizes, according to the usage, the tarifs, and regulations, of the places to which he trades. 13. To know the best manner of folding up, embaling, or tunning, the merchandizes for their preservation. 14. To understand the price and condition of freighting and insuring ships and merchandize. 15. To be acquainted with the goodness and value of all necessaries for the construction and repairs of shipping, the different manner of their building; what the wood, the masts, cordage, cannons, sails, and all requisites, may cost. 16. To know the wages commonly given to the captains, officers, and sailors, and the manner of engaging with them. 17. He ought to understand the foreign languages, or at least as many of them as he can attain to; these may be reduced to four, viz. the Spanish, which is used not only in Spain, but on the coast of Africa, from the Canaries to the Cape of Good Hope: the Italian, which is understood on all the coasts of the Mediterranean, and in many parts of the Levant: the German, which is understood in almost all the northern countries; and the French, which is now become almost universally current. 18. He ought to be acquainted with the consular jurisdiction, with the laws, customs, and usages of the different countries he does or may trade to; and in general all the ordinances and regulations both at home and abroad that have any relation to commerce. 19. Though it is not necessary for a merchant to be very learned, it is proper that he should know something of history, particularly that of his own country; geography; hydrography, or the science of navigation; and that he be acquainted with the discoveries of the countries in which trade is established, in what manner it is settled, of the companies formed to support those establishments, and of the colonies they have sent out.

All these branches of knowledge are of great service to a merchant who carries on an extensive commerce; but if his trade and his views are more limited, his learning and knowledge may be so too: but a material requisite for forming a merchant is, his having on all occasions a strict regard to truth, and his avoiding fraud and deceit as corroding cankers that must inevitably destroy his reputation and fortune.

Trade is a thing of so universal a nature, that it is impossible for the laws of Britain, or of any other nation, to determine all the affairs relating to it: therefore all nations, as well as Great Britain, shew a particular regard to the *law-merchant*, which is a law made by the merchants among themselves: however, merchants and other strangers are subject to the laws of

Merchet, Mercia.

of the country in which they refide. Foreign merchants are to fell their merchandize at the port where they land, in grofs, and not by retail; and they are allowed to be paid in gold or filver bullion, in foreign coin or jewels, which may be exported. If a difference arifes between the king and any foreign ftate, the merchants of that ftate are allowed fix months time to fell their effects and leave the kingdom; during which time they are to remain free and unmolefted in their perfons and goods. See the articles COMMERCE, and *Mercantile* LAW.

MERCHET (MERCHETUM), a fine or compofition paid by inferior tenants to the lord, for liberty to difpofe of their daughters in marriage. No baron, or military tenant, could marry his fole daughter and heir, without fuch leave purchafed from the king, *pro maritanda filia*. And many of our fervile tenants could neither fend their fons to fchool, nor give their daughters in marriage, without exprefs leave from the fuperior lord. See Kennet's Gloffary *in Maritagium*. See alfo MARCHET.

MERCIA, the name of one of the feven kingdoms founded in England by the Saxons. Though the lateft formed, it was the largeft of them all, and grew by degrees to be by far the moft powerful. On the north it was bounded by the Humber and the Merfey, which feparated it from the kingdom of Northumberland; on the eaft by the fea, and the territories of the Eaft-Angles and Saxons; on the fouth by the river Thames; and on the weft by the rivers Severn and Dee. It comprehended well nigh 17 of our modern counties, being equal in fize to the province of Languedoc in France; very little, if at all, lefs than the kingdom of Arragon in Spain; and fuperior in fize to that of Bohemia in Germany.

Penda is regarded as its firft monarch; and the kingdom is thought to derive its name from the Saxon word *merc*, which fignifies a *march*, *bound*, or *limit*, becaufe the other kingdoms bordered upon it on every fide; and not from the river Merfey, as fome would perfuade us. Penda affumed the regal title A. D. 626, and was of the age of 50 at the time of his acceffion; after which he reigned near 30 years. He was of a moft furious and turbulent temper, breaking at different times with almoft all his neighbours, calling in the Britons to his affiftance, and fhedding more Saxon blood than had been hitherto fpilled in all their inteftine quarrels. He killed two kings of Northumberland, three of the Eaft-Angles, and compelled Kenwall king of the Weft-Saxons to quit his dominions. He was at length flain, with moft of the princes of his family, and a multitude of his fubjects, in a battle fought not far from the Leeds, by Ofwy king of Northumberland. This battle, which the Saxon chronicle tells us was fought at Winwidfield, A. D. 655, made a great change in the Saxon affairs, which the unbridled fury of Penda had thrown into great confufion. He had the year before killed Anna king of the Eaft-Angles in battle, whofe brother Ethelred notwithftanding took part with Penda. On the other hand, Peada the eldeft fon of Penda, to whom his father had given the ancient kingdom of the Mid-Angles, had two years before married the natural daughter of king Ofwy, and had been baptized at his court. At that time it fhould feem that Ofwy and Penda were upon good terms; but after the latter had conquered the Eaft-Angles, he refolved to turn his arms againft the kingdom of Northumberland. Ofwy by no means had provoked this rupture; on the contrary, Bede tells us that he offered large fums of money, and jewels of great value, to purchafe peace: thefe offers being rejected, he was reduced to the neceffity of deciding the quarrel by the fword. The river near which the battle was fought overflowing, there were more drowned than killed. Amongft thefe, as the Saxon chronicle fays, there were 30 princes of the royal line, fome of whom bore the title of *kings;* and alfo Ethelred king of the Eaft-Angles, who fought on the fide of Penda againft his family and country.

Mercia.

His fon Peada, who married the daughter of that conqueror, became a Chriftian, and was not long after murdered as is faid by the malice of his mother. His brother Wolfher becoming king of Mercia, embraced in procefs of time the faith of the Gofpel, and proved a very victorious and potent monarch; and is, with no fewer than feven of his immediate fucceffors, commonly ftyled *king of the Anglo-Saxons*, though none of them are owned in that quality by the Saxon chronicle. But though poffibly none of them might enjoy this honour, they were undoubtedly very puiffant princes, maintaining great wars, and obtaining many advantages over the fovereigns of other Saxon ftates, and efpecially the Eaft-Angles, whom they reduced. The extent of the Mercian territories was fo ample as to admit, and fo fituated as to require, the conftituting fubordinate rulers in feveral provinces; to whom, efpecially if they were of the royal line, they gave the title of *kings;* which occafions fome confufion in their hiftory. Befides the eftablifhing epifcopal fees and convents, the Saxon monarchs took other methods for improving and adorning their dominions; and as Mercia was the largeft, fo thefe methods were moft confpicuous therein. Coventry, as being fituated in the centre, was ufually, but not always, the royal refidence. Penda, who was almoft continually in a ftate of war, lived as his military operations directed, in fome great town on the frontiers. Wolther built a caftle or fortified palace for his own refidence, which bore his name. —Offa kept his court at Sutton Walls near Hereford.

In each of the provinces there refided a chief magiftrate; and if he was of the royal blood, had ufually the title of *king*. Peada, at the time he married Ofwy's daughter, had the title of *king of Leicefter*.—Ethelred made his brother Merowald king of Hereford; who, dying without iffue, bequeathed it to his younger brother Mercelm. The like honours were fometimes conferred upon the princeffes; and hence, in Mercia efpecially, we occafionally read of *vice-queens*. By thefe means the laws were better executed, the obedience of the fubjects more effectually fecured, and the fplendor of thefe refidences conftantly kept up and augmented.

At length, the crown devolving fometimes on minors, and fometimes on weak princes, inteftine factions alfo prevailing, the force of this hitherto mighty kingdom began fenfibly to decline. This falling out in the days of Egbert, the moft prudent as well as the moft potent monarch of the Weft-Saxons, he took advantage of thefe circumftances; and having en-

encouraged the East-Angles to make an attempt for the recovery of their independence, he, in a conjuncture every way favourable to his design, broke with the Mercians, and after a short war obliged them to submit. But this was not an absolute conquest, the kings of Mercia being allowed by him and his successors to retain their titles and dominions, till the the invasion of the Danes put an end to their rule, when this kingdom had subsisted above 250 years; and when the Danes were afterwards expelled by the West-Saxons, it sunk into a province, or rather was divided into many.

MERCURIAL, something consisting of, or relating to, mercury.

MERCURIALIS (Jerom), an eminent Italian physician, born at Forli in 1530, where he first practised; but afterwards was professor of medicine successively at Padua, Bologna, and Pisa. His writings in physic are very numerous; besides giving an edition of Hippocrates in Greek and Latin, with notes, which, however, did not answer the expectations of the learned. He died in 1606; and in 1644 some select pieces of his were published at Venice in one volume folio.

MERCURIALIS, MERCURY; a genus of the enneandria order, belonging to the diœcia class of plants. There are three species. 1. The annua, or French mercury, with spiked flowers, male and female. This is an annual plant, with a branching stalk about a foot high, garnished with spear-shaped leaves of a pale or yellowish green colour. The male plants have spikes of herbaceous flowers, growing on the top of the stalks: these fall off soon; but the female plants, which have testiculated flowers proceeding from the side of the stalks, are succeeded by seeds, which, if permitted to scatter, will produce plenty of plants of both sexes. 2. The perennis, mountain or dog's mercury, with spiked and testiculated flowers, grows under hedges and in woods, in many parts of Britain. This hath a perennial root, which creeps in the ground; the stalks are single, and without branches, rising ten or twelve inches high, garnished with rough leaves, placed by pairs at each joint, of a dark green colour, indented on their edges: these have their male flowers growing in spikes, upon different plants from those which produce seeds. 3. The tomentosa, or shrubby hairy mercury, is a native of the south of France, Spain, and Italy. It hath a shrubby branching stalk, growing a foot and an half high, garnished with oval leaves placed by pairs, and covered with a white down on both sides. The male flowers grow in short spikes from the side of the stalks upon different plants from the first. All the species are easily propagated by seeds, and are apt to become troublesome weeds where they have once got a footing.

Properties. The perennis, according to Mr Lightfoot, is of a soporific deleterious nature, noxious both to man and beast. There are instances of those who have eaten it by mistake instead of chenopodium, bonus Henricus, or English mercury, and have thereby slept their last. In the isle of Skye, it is called *lusglen-bracadale;* and an infusion of it is sometimes taken to bring on a salivation; but our author knows not how the experiment answers. Tournefort informs us, that the French make a syrup of the juice of the annua, two ounces of which is given as a purge; and that they use it in pessaries and clysters, mixing one quantity of honey, to one and a half of the juice. Mr Withering differs greatly from Lightfoot concerning the qualities of the perennis. "This plant, (says he), dressed like spinach, is very good eating early in the spring, and is frequently gathered for that purpose; but it is said to be hurtful to sheep. Mr Ray relates the case of a man, his wife, and three children, who experienced highly deleterious effects from eating it fried with bacon; but this was probably when the spring was more advanced, and the plant become acrimonious. Steeped in water, it affords a fine deep blue colour. Sheep and goats eat it; cows and horses refuse it.

MERCURY, in natural history. See CHEMISTRY, n° 153, 205, 250, 214. See also METALLURGY, and QUICKSILVER.

The use of mercury in medicine seems to have been little known before the 15th century. The ancients looked upon it as a corrosive poison, though of itself perfectly void of acrimony, taste, and smell; there are examples of its having been lodged for years in cavities both of bones and fleshy parts, without its having injured or affected them. Taken into the body in its crude state, and undivided, it passes through the intestines unchanged, and has not been found to produce any considerable effect. It has indeed been recommended in asthmas and disorders of the lungs; but the virtues attributed to it in these cases have not been warranted by experience.

Notwithstanding the mildness and inactivity of crude quicksilver undivided; when resolved by fire into the form of fume, or otherwise divided into very minute particles, and prevented from re-uniting by the interposition of proper substances, or combined with mineral acids, it has very powerful effects; affording the most violent poisons, and the most excellent remedies, that we are acquainted with.

The mercurial preparations, either given internally or introduced into the habit by external application, seem to liquify all the juices of the body, even those in the minutest and most remote vessels; and may be so managed as to promote excretion through all the emunctories. Hence their common use in inveterate chronic disorders proceeding from a thickness and sluggishness of the humours, and obstinate obstructions of the excretory glands; in scrophulous and cutaneous diseases; and in the venereal lues. If their power is not restrained by proper additions to certain emunctories, they tend chiefly to affect the mouth; and, after having fused the juices in the remoter parts, occasion a plentiful evacuation of them from the salival glands.

The salutary effects of mercurials do not depend on the quantity of sensible evacuation. This medicine may be gradually introduced into the habit, so as, without occasioning any remarkable discharge, to be productive of very happy effects. To answer this purpose, it should be given in very small doses, in conjunction with such substances as determine its action to the kidneys or the pores of the skin. By this method inveterate cutaneous and venereal distempers have been cured, without any other sensible excretion than a gentle increase of perspiration or urine. Where there are ulcers in any part, they discharge for some time a very fetid matter, the quantity of which becomes gradually less,

lefs, and at length the ulcer kindly heals. If the mercury fhould at any time, from cold or the like, affect the mouth, it may be reftrained by omitting a dofe, and, by warmth or fuitable medicines, promoting the perfpiration.

MERCURY, in the heathen mythology. See HERMES.

Moft of the actions and inventions of the Egyptian Mercury have likewife been afcribed to the Grecian, who was faid to be the fon of Jupiter and Maia, the daughter of Atlas. No one of all the heathen divinities had fo many functions allotted to him as this god: he had conftant employment both day and night, having been the common minifter and meffenger of the whole Pantheon; particularly of his father Jupiter, whom he ferved with indefatigable labour, and fometimes indeed in a capacity of no very honourable kind. Lucian is very pleafant upon the multitude of his avocations; and, according to the confeffion of the emperor Julian, Mercury was no hero, but rather one who infpired mankind with wit, learning, and the ornamental arts of life, than with courage. The pious emperor, however, omits fome of his attributes; for this god was not only the patron of trade, but alfo of theft and fraud.

Amphion is faid, by Paufanias, to have been the firft that erected an altar to this god; who, in return, invefted him with fuch extraordinary powers of mufic (and mafonry), as to enable him to fortify the city of Thebes in Bœotia, by the mere found of his lyre.

Horace gives us the beft part of his character.

Thou god of wit, from Atlas fprung,
Who by perfuafive power of tongue,
And graceful exercife, refin'd
The favage race of human kind,
Hail! winged meffenger of Jove,
And all th' immortal pow'rs above.
Sweet parent of the bending lyre,
Thy praife fhall all its founds infpire.
Artful and cunning to conceal
Whate'er in fportive theft you fteal,
When from the god who gilds the pole,
E'en yet a boy, his herds you ftole;
With angry voice the threat'ning pow'r
Bad thee thy fraudful prey reftore;
But of his quiver too beguil'd,
Pleas'd with the theft, Apollo fmil'd.
You were the wealthy Priam's guide,
When fafe from Agamemnon's pride,
Through hoftile camps, which round him fpread
Their watchful fires, his way he fped.
Unfpotted fpirits you confign
To bliſsful feats and joys divine;
And, pow'rful, with thy golden wand,
The light, unbodied crowd command:
Thus grateful does thy office prove
To gods below, and gods above. *Francis.*

This ode contains the fubftance of a very long hymn to Mercury, attributed to Homer. Almoft all the ancient poets relate the manner in which the Grecian Mercury difcovered the lyre; and tell us that it was an inftrument with feven ftrings; a circumftance which makes it effentially different from that faid to have been invented by the Egyptian Mercury, which had but three. However, there have been many claimants befides Mercury to the feven-ftringed lyre. See LYRE.

His moft magnificent temple was on mount Cylene, in Arcadia. He is defcribed by the poets as a fair beardlefs youth, with flaxen hair, lively blue eyes, and a fmiling countenance. He has wings fixed to his cap and fandals, and holds the caduceus (or ftaff furrounded with ferpents with two wings on the top) in his hand; and is frequently reprefented with a purfe, to fhow that he was the god of gain. The animals facred to him, were the dog, the goat, and the cock. In all the facrifices offered to him, the tongues of the victims were burnt; and thofe who efcaped imminent danger, facrificed to him a calf with milk and honey.

MERCURY, ☿ in aftronomy. See ASTRONOMY, n° 4, 20, 44, 108, 112.

MERCURY, in heraldry, a term ufed in blazoning by planets, for the purple colour ufed in the arms of fovereign princes.

MERCY-SEAT, in Jewifh antiquity. See PROPITIATORY.

MERGANSER. See MERGUS.

MERGUS, in ornithology, a genus of birds of the order of anferes; diftinguifhed by having the beak of a cylindrical figure, and hooked at the extremities, and its denticulations of a fubulated form. There are fix fpecies.

1. The cucullatus, or crefted diver of Catefby, has a globular creft, white on each fide; and the body is brown above, and white below. It is a native of America. See Plate CLXXVI. fig. 4.

2. The merganfer, or goofander, is a native of Europe. Thefe birds frequent our rivers and other frefh waters, efpecially in hard winters; they are great divers, and live on fifh. They are never feen in the fouthern parts of Great Britain during fummer; when they retire far north to breed; for in that feafon they have been fhot in the Hebrides. They are uncommonly rank, and fcarce eatable. The male weighs four pounds: its length is two feet four inches; the breadth three feet two. The bill is three inches long, narrow, and finely toothed or ferrated; the colour of that and of the irides is red. The *dun diver*, or female, is lefs than the male: the head and upper part of the neck is ferruginous; the throat white: the feathers on the hind part are long, and form a pendent creft: the back, the coverts of the wings, and the tail, are of a deep afh-colour: the greater quill-feathers are black, the leffer white; the breaft and middle of the belly are white, tinged with yellow.

3. The ferrator, or redbreafted merganfer, weighs about two pounds: the length is one foot nine inches, the breadth two feet feven; the bill is three inches long; the lower mandible red; the upper dufky; the irides a purplifh red: head and throat a fine changeable black and green: on the former a long pendent creft of the fame colour; the tail fhort and brown; the legs orange-coloured. The head and upper part of the female are of a deep rufh-colour, and the tail afh-coloured. Thefe birds breed in the northern parts of Great Britain.

4. The cafter has a crefted afh-coloured head, a white throat, and a black bill and legs. It inhabits the fouth of Europe.

5. The albellus, or fmew, weighs about 34 ounces: the length 18 inches, the breadth 26; the bill is near two inches long, and of a lead colour; the head is adorned with a long creft, white above, and black beneath: the head, neck, and whole under part of the body, are of a pure white; the tail is of a deep afh-colour, the legs a bluifh grey. The female, or *lough-diver*,

diver, is lefs then the male: the back, the fcapulars, and the tail are dufky; as, alfo the tail: the belly white.

6. The minutus, or redheaded fmew, weighs about 15 ounces; the length one foot four inches, the breadth one foot eleven: the bill is of a lead colour; the head flightly crefted, and of a ruft colour: the hind part of the neck is of a deep grey, the forepart clouded with a lighter colour of the fame kind: the back and tail are of a dufky afh-colour, the legs of a pale afh-colour.—It is a native of Europe.

MERIDIAN, in geography, a great circle fuppofed to be drawn through any part on the furface of the earth, and the two poles; and to which the fun is always perpendicular at noon.—In aftronomy, the circle is fuppofed to be in the heavens, and exactly perpendicular to the terreftrial one.

MERIONETHSIRE, a county of North-Wales, on the fouth has the county of Cardigan, on the north thofe of Carnarvon and Denbigh, on the eaft thofe of Montgomery and Denbigh, and on the weft the Irifh fea. Its length is about 35 miles, its breadth 25, and its circumference 108; containing between 4 and 50,000 acres, 637 parifhes, 3 towns, 26 rivers, and about 17000 inhabitants. The air of this county, which is more encumbered with mountains than any other in Wales, is exceeding fharp and bleak; and would be very unwholefome, if the vapours from the Irifh fea were not in a great meafure difperfed by the high winds to which this county is fubject. The foil is very rocky and barren; except in the valleys, which yield good corn, and pafture for cattle and fheep. As the country is fo mountainous, the inhabitants apply themfelves chiefly to grazing, keeping vaft flocks of fheep, deer, and goats, in the mountains, and living much upon butter, cheefe, fowl, and fifh, efpecially herrings. They have but little corn, and their black cattle are generally fold to the Englifh. The chief rivers of the county are the Dyffi or Tovy, the Avon, the Drwrydh, and the Dee, which laft runs through the lake called *Lhyn Tigid* or *Pimble Meer*, without mixing its waters with thofe of the lake, as is fuppofed: for the falmon, with which the river abounds, are never taken out of the main ftream; and the givineads, a fifh peculiar to the lake, are never found in it. This lake is very large; and winds, it is pretended, will make it overflow, but land-floods never. The fifh in the lakes, and the herbs on the rocks and mountains here, like thofe in Caernarvonfhire and other hilly parts of Wales, are faid to be much the fame as thofe of the Alps. This county lies in the diocefe of Bangor: it fends no member to parliament, except a knight of the fhire; for it has no towns of any note.—Dr Campbell is of opinion that this county is capable of much improvement, if the inhabitants underftood their own intereft and were induftrious.

MERIT, fignifies defert. This term is more particularly applied to fignify the moral goodnefs of the actions of men, and the rewards to which thofe actions intitle them.

MERLIN (Ambrofe), a famous Englifh poet, and reputed prophet, flourifhed at the end of the 5th century. Many furprifing and ridiculous thing are related of him. Several Englifh authors have reprefented him as the fon of an incubus, and as tranfporting from Ireland to England the great ftones which form Stonehenge on Salifbury plain. Extravagant prophecies and other works are alfo attributed to him, on which fome authors have written commentaries.

MERLIN, in ornithology. See FALCO.

MERLON, in fortification, is that part of a parapet which is terminated by two embrafures of a battery.

MERMAID, or MERMAN, a fea-creature frequently talked of, fuppofed half human and half a fifh.

However naturalifts may doubt of the reality of *mermen* or *mermaids*, we have teftimony enough to eftablifh it; though, how far thefe teftimonies may be authentic, we cannot take upon us to fay. In the year 1187, as Laray informs us, fuch a monfter was fifhed up in the county of Suffolk, and kept by the governor for fix months. It bore fo near a conformity with man, that nothing feemed wanting to it but fpeech. One day it took the opportunity of making its efcape; and, plunging into the fea, was never more heard of. *Hift. de Angleterre*, P. I. p. 403.

In the year 1430, after a huge tempeft, which broke down the dikes in Holland, and made way for the fea into the meadows, &c. fome girls of the town of Edam in Weft-Freezeland, going in a boat to milk their cows, perceived a mermaid embaraffed in the mud, with a very little water. They took it into their boat, and brought it with them to Edam, dreffed it in womens apparel, and taught it to fpin. It fed like one of them, but could never be brought to offer at fpeech. Some time afterwards it was brought to Haerlem, where it lived for fome years, though ftill fhowing an inclination to the water. Parival relates that they had given it fome notion of a Deity, and that it made its reverences very devoutly whenever it paffed by a crucifix. *Delices de Hollande*.

In the year 1560, near the ifland of Manar, on the weftern coaft of the ifland of Ceylon, fome fifhermen brought up, at one draught of a net, feven mer men and maids; of which, feveral Jefuits, and among the reft F. Hen. Henriques, and Dimas Bofquez phyficians to the viceroy of Goa, were witneffes. The phyfician, who examined them with a great deal of care, and made diffection thereof, afferts, that all the parts both internal and external were found perfectly conformable to thofe of men. See the *Hift. de la compagnie de Jefus*, P. II. T. IV. n° 276. where the relation is given at length.

We have another account of a merman, near the great rock called *Diamond*, on the coaft of Martinico. The perfons who faw it, gave in a precife defcription of it before a notary. They affirmed that they faw it wipe its hand over its face, and even heard it blow its nofe.

Another creature of the fame fpecies was caught in the Baltic in the year 1531, and fent as a prefent to Sigifmond king of Poland, with whom it lived three days, and was feen by all the court. Another very young one was taken near Rocca de Sintra, as related by Damian Goes.

The king of Portugal and the grand mafter of the order of St James, are faid to have had a fuit at law to determine which party thefe monfters belong to.

In Pontopidan's Natural Hiftory of Norway, alfo, we

we have accounts of mermaids; but not more remarkable or any way better attested than the above.

MERNS, or KINCARDINSHIRE, a county of Scotland, stretching 27 miles in length, and 20 in breadth, is bounded on the east by the German ocean, on the south by the river of North Esk, on the west by Angus, and on the north by the river Dee and Aberdeenshire. The country is pretty plain and level, fruitful in corn and pasturage, producing an infinite number of fir-trees, besides a great number of agreeable plantations; and along the sea-coasts there are many convenient creeks and harbours.—The people are Lowlanders, civil, hospitable, and industrious.—The name *Merns* is by some derived from that of a valiant nobleman, who, subduing the country, received it in reward from Kenneth II. Cambden supposes it to retain part of the ancient name of *Vernicones*. The other name is derived from *Kincardin*, its ancient capital, now an inconsiderable village. The stocking-trade employs the natives from the banks of the Dee to Stone-hive; from thence to the Northesk they are wholly employed in weaving.

MEROE, (anc. geog.), an island of Ethiopia beyond Egypt, in the Nile; with a cognominal town, the metropolis of the Ethiopians. Here the shadow is said to decrease twice a-year, viz. when the sun is in the 18th degree of Taurus and in the 14th of Leo, (Pliny). Josephus says, that its ancient name was *Saba*; but changed to *Meroe* by Cambyses, either after his sister or after his consort, who died there, (Strabo). All the ancients represent *Meroe* as an island, but in modern times it is a peninsula; to which greater credit is to be given, as more accurate than the ancient accounts.

MEROPS, in ornithology, a genus belonging to the order of picæ. The bill is crooked, flat, and carinated; the tongue is jagged at the point; and the feet are of the walking kind. There are six species, viz. 1. The apiaster, or bee-eater, has an iron-coloured back; the belly and tail are of a bluish green; and the throat is yellow. It inhabits the south of Europe. 2. The viridis, or Indian bee-eater, is green, with a black belt on the breast; and the throat and tail are black. 3. The congener is yellowish, with a green rump. It inhabits the south of Europe. 4. The superciliosus is green, with a white line both above and below the eyes, and a yellow throat. It is found in Madagascar. 5. The cinereus is variegated with red and yellow, with the two longest quill-feathers of the tail red. It is a native of America. 6. The cafer is grey, with a very long tail. It is a native of Ethiopia.

MERSE, a county of Scotland, called also *Berwickshire*. This last name it derives from the town of Berwick, which was the head of the shire before it fell into the hands of the English, and obtained the appellation of *Mers* or *March*, because it was one of the borders towards England. It is washed on the south and east by the river Tweed and the German Ocean, bounded on the west by Tweedale, and on the north by Lothian. It extends 24 miles from east to west, and the breadth amounts to 16. The face of the country is rough and irregular, exhibiting hills, moors, and mosses, with intermediate valleys, which are pleasant and fruitful. It is watered by many streams; and particularly by the famous Tweed, which, rising from the same hills that gave birth to the Clyde and Annan, runs with a rapid course thro' Tweedale Forest and Teviotdale, and after a course of 50 miles disembogues itself into the German Ocean. Notwithstanding the length of its course, it is not navigable above Berwick, where there is a noble bridge over it, consisting of 15 arches: there was another at Melross, where nothing but the piers now remain. A third, of five arches, is maintained at Peebles; and a fourth has some time ago been built at Kelso. The shire of Berwick is generally distinguished into the three divisions of Mers, Lammermuir, and Lauderdale. The Mers is low, pleasant, and tolerably fruitful in corn. Lammermuir is a hilly country, abounding with game, and yielding good pasture for sheep and black cattle. Lauderdale is a tract of land lying on each side of the river Lauder, agreeably varied with hill, dale, and forest, producing good store of corn and pasturage, and giving the title of earl to the family of Maitland: but the most fruitful and populous parts of Berwickshire, are those that lie along the Tweed, and on both sides of the lesser rivers White Water, Black Water, and Eye. The seats of noblemen and gentlemen abound in this county. Berwick was the chief town until it fell into the hands of the English, and was annexed to their monarchy in the reign of King Edward IV. At present the principal town is Duns.

MERSENNE (Marin), in Latin *Mersennus*, a learned French author, born at Oysé, in the province of Maine, anno 588. He studied at La Flêche at the same time with Des Cartes; with whom he contracted a strict friendship, which lasted till death. He afterwards went to Paris, and studied at the Sorbonne, and in 1611 entered himself among the Minims. He became well skilled in Hebrew, philosophy, and Mathematics. He was of a tranquil, sincere, and engaging temper; and was universally esteemed by persons illustrious for their birth, their dignity, and their learning. He taught philosophy and divinity in the convent of Nevers, and at length became superior of that convent; but being willing to apply himself to study with more freedom, he resigned all the posts he enjoyed in his order, and travelled into Germany, Italy, and the Netherlands. He wrote a great number of excellent works; the principal of which are, 1. *Quæstiones celeberrimæ in Genesim*. 2. *Harmonicorum libri*. 3. *De sonorum natura, causis, & effectibus*. 4. *Cogitata physico-mathematica*. 5. *La verité des Sciences*. 6. *Les questions innouies*. He died at Paris in 1648. He had the reputation of being one of the best men of his age. No person was more curious in penetrating into the secrets of nature, and carrying all the arts and sciences to their utmost perfection. He was in a manner the centre of all the men of learning, by the mutual correspondence which he managed between them. He omitted no means to engage them to publish their works; and the world is obliged to him for several excellent discoveries, which, had it not been for him, would perhaps have been lost.

MERULA (George), an Italian of extraordinary parts and learning, born at Alexandria in the duchy of Milan about the year 1420. He taught youth at Venice and Milan for 40 years, and laboured abundantly

ly in restoring and correcting ancient authors. He wrote, and addressed to Lewis Sforza, *Antiquitates Vicecomitum;* or "The actions of the Dukes of Milan," in 10 books; with some other things in the same way. His death, in 1494, is said not to have grieved any body; as he lived in a state of war with, and abused, almost all his cotemporary scholars.

MERULA (Paul), born at Dort in Holland, a famous lawyer, historian, and linguist, was professor of history in the university of Leyden after Lipsius. He wrote, 1. Commentaries on Ennius. 2. The life of Erasmus and Junius. 3. A cosmography. 4. A treatise of law; and died in 1607.

MERUS, (anc. geog.), a mountain of the Hither India, hanging over the city Nyssa, built by Bacchus, and situated between the rivers Cophen and Indus. The name, denoting the *thigh*, gave rise to the fable of Bacchus being inserted into Jupiter's thigh, and being born twice; because in this mountain he and his army are said to have been preserved, when disease and pestilence raged in the plains below.

MERA-DE-ASTA, formerly a large town of Andalusia, seated on the river Guadaleta, between Arcos and Xeres de la Frontera; but now only a large heap of ruins. Here the Arabs conquered Roderick the last king of the Goths, and by that victory became masters of Spain in 713.

MESCHED, a considerable town of Persia, and in the province of Khorassan; fortified with several towers, and famous for the magnificent sepulchre of Iman Risa, of the family of Ali, to whom the Persians pay great devotion. It is seated on a mountain near this town, in which are fine turquoise-stones; in E. Long. 59. 25. N. Lat. 37. 0.

MESEMBRYANTHEMUM, FIG-MARIGOLD; a genus of the pentagynia order, belonging to the pentandria class of plants. There are between 40 and 50 species; all African plants, from the Cape of Good Hope; near 40 of which are retained in our gardens for variety. Of these only one is annual, and the most remarkable of them all. It is called the *crystallium, diamond ficoides*, or *ice-plant*. It rises with a short, thick, succulent stalk, dividing low into many trailing, very spreading, succulent branches, bespangled all over with icy pimples; very pellucid and glittering; oval, undulate, alternate, papulose or pimply, glittering leaves; and from the sides of the branches, numerous, almost close fitting, white flowers, tinged with red or crimson; succeeded by plenty of seed in autumn. This singular and curious plant, being closely covered with large pellucid pimples, full of moisture shining brilliantly like diamonds, is in great esteem. It is a very tender plant while young; and is raised annually from seed by means of hot-beds. In June it will endure the open air till October, when it perishes; but if placed in a hot-house in autumn, it will often live all winter. It is commonly planted in pots for the conveniency of removing from place to place; but if planted in the full ground, it grows considerably stronger, even to luxuriance: however, when confined in pots, it flowers more abundantly.

The other species are mostly durable in stem and foliage. Some are shrubby; others pendulous, with loose straggling stems, and branches inclining to the ground; while others have no stalks at all: their leaves are universally very thick, succulent, fleshy; and of many various shapes, situations, and directions; while some are curiously punctured, or dotted with transparent points, and some have pellucid pimples, as already mentioned: they afford a very agreeable variety, at all times in the year, and merit a place in every collection. They are green-house plants, and are propagated by cuttings of their stalks and branches.

MESENTERY, in anatomy. See there, n° 355.

MESENTERITIS, or *Inflammation of the* MESENTERY. See MEDICINE, n° 296.

MESOCOLON, in anatomy. See there, n° 355, c.

MESOLOGARITHMS, according to Kepler, are the logarithms of the co-sines and co-tangents; the former of which were called by Lord Napier *anti-logarithms*, and the latter *differentials*.

MESOPOTAMIA, the ancient name of the province of DIARBECK, in Turkey in Asia. It is situated between the rivers Euphrates and Tigris; having Assyria on the east, Armenia on the north, Syria on the west, and Arabia Deserta with Babylonia on the south. In Scripture it is called *Padan Aram*.

MESOPTERYGIUS, in ichthyology, a term applied to such fishes as have only one back-fin; and that situated in the middle of the back.

MESPILUS, the MEDLAR; a genus of the pentagynia order, belonging to the icosandria class of plants. There are seven species, *viz.*

1. The Germanica, German mespilus, or common medlar, rises with a deformed tree-stem, branching irregularly 15 or 20 feet high; spear-shaped leaves, downy underneath; and large close-fitting, white flowers, singly from the sides of the branches; succeeded by large roundish brown fruit, the size of middling apples, which ripen in October, but are not eatable till beginning to decay. The varieties are, common great German medlar—smaller Nottingham medlar—pear-shaped Italian medlar. This species and varieties are all cultivated in the English gardens for the fruit: but the German or Dutch medlar, and the Nottingham kind, are the most common; and the latter of which two, though a smaller fruit, is rather preferable for richness and poignancy of flavour. These kinds of fruit are never eatable until they begin to rot; for when firm and sound, they are of a singularly austere disagreeable taste; yet having lain some time after being gathered, till they begin to assume a state of decay and become soft, they acquire a delicious flavour, extremely agreeable to many, though to others altogether unpalatable.

All the sorts ripen in the latter end of October, or beginning of November; when being gathered, some should be laid in moist bran, in several layers, to forward their decay; others on straw in the fruitery: those in the bran will begin to be ready for use in about a fortnight, and those laid on straw will come gradually forward in succession.

2. The arbutifolia, arbutus-leaved mespilus, hath a shrubby stem, branching erectly five or six feet high; lanceolate, crenated, alternate leaves, downy underneath; and from the sides and ends of the branches, small white flowers in clusters; succeeded by small, roundish, purple fruit, like haws.

3. The amelanchier, or shrubby medlar, with black fruit, rises with several shrubby, slender, hairy stems, branching

branching moderately about four feet high, having purplifh branches; oval, ferrated leaves, downy underneath; and fmall white flowers, in clufters at the ends of the branches; fucceeded by fmall black fruit.

4. The chamæ-mefpilus, or dwarf medlar, commonly called *baftard quince*, hath a fhrubby, flender, fmooth ftem, branching weakly four or five feet high, having purplifh branches; oval, ferrated, fmooth leaves, on long foot-ftalks; and from the axillas, purple flowers, collected into round heads, with narrow, purplifh, deciduous bracteæ; fucceeded by fmall red fruit.

5. The cotoneafter, commonly called *dwarf quince*, rifes with a fhrubby, fmooth ftem, branching four or five feet high, the branches flender and reddifh; oval entire leaves on fhort foot-ftalks; and from the axillas, fmall clofe-fitting purple flowers, two or three together; fucceeded by fmall, roundifh, bright-red fruit.

6. The Canadenfis, Canada fnowy mefpilus, hath a fhrubby, fmooth ftem, branching four or five feet high, with fmooth, purplifh branches; oval-oblong, ferrated, fmooth leaves, on long footftalks; and all the branches terminated by clufters of fnowy-white flowers; fucceeded by fmall, purplifh fruit, like haws.

3. The pyracantha, or ever-green thorn, rifes with a fhrubby, fpinous ftem, branching diffufely 12 or 14 feet high, the branches flender and flexible, with a dark-greenifh bark, armed with long fharp fpines; fpear-fhaped-oval, crenated, ever-green leaves; and all the fhoots terminated by numerous clufters of whitifh flowers; fucceeded by large bunches of beautiful red berries, remaining all winter, and exhibiting a very ornamental appearance.

All thefe feven fpecies of mefpilus are of the tree and fhrub kind; the firft fix forts are deciduous, the feventh an ever-green: the leaves are univerfally fimple; thofe of the mefpilus Germanica very large, the others moftly of moderate fize, and which in moft of the forts grow upon fhort foot-ftalks. They all flower abundantly every fummer, the flowers univerfally hermaphrodite, and confifting each of five large roundifh petals, 20 ftamina, and five ftyles. They are all very hardy, and fucceed in any common foil and fituation, and their propagation and culture is very eafy.

The firft fort and varieties are cultivated as fruit-trees, principally as ftandards, fometimes alfo as efpaliers for variety. The other fpecies are very proper furniture for any ornamental plantation, where they will make an agreeable variety with their different foliage; and their flowers make a fine appearance, as alfo their fruit in autumn and winter, which, if not devoured by birds, remain long on the branches, and afford a fine variety in thofe feafons. The pyracantha, being rather of flexible growth, is moft commonly trained againft walls or the fronts of houfes, both for the fupport of its flexible branches, and that it may exhibit its berries more ornamentally.

When it is defigned to have any of the common medlars as fruit-trees, they may be trained either as dwarfs, for dwarf ftandards, or for efpaliers, or trained as half or full ftandards; and managed in either of thofe modes of training nearly as other fruit-trees, particularly the apple and pear; and are raifed either by feed, by grafting, or by budding, but either of the two latter methods are the moft certain for continuing the forts without variation: obferving, after fhortening their firft fhoots from the graft or bud, where it fhall feem neceffary to force out a proper fupply of wood to form a head, to train the branches afterwards principally at full length, and let the ftandards branch out in their own way.

MESS, in a military fenfe, implies a number of foldiers, who, by laying away a certain proportion of their pay towards provifions, mefs together: fix or eight is generally the number of each mefs. Experience proves, that nothing contributes more to the health of a foldier, than a regular and well-chofen diet, and his being obliged every day to boil the pot: it corrects drunkennefs, and in a great meafure prevents gaming, and thereby defertion.

MESSANA, (anc. geog.), the firft town of Sicily on croffing over from Italy, fituate on the ftrait now called the *Faro*, (Italicus). Anciently called *Zancle*, according to Diodorus Siculus, from king Zanclus; or, according to others, from the Sicilian term *Zanclon*, denoting a fickle, alluding to the curvity of the coaft: a name appropriated by the poets; and hence *Zanclæi*, the people, (Herodotus, Paufanias). The other name *Meffana* is from the *Meffenii* of Peloponnefus, (Strabo). Thucydides afcribes its origin to Anaxilas the Meffenian, tyrant of Rhegium, who received all comers, calling the town after the name of his country. The Greeks always call it *Meffene;* the Romans *Meffana* conftantly, to diftinguifh it from *Meffene* of Peloponnefus. Now MESSINA.

MESSENA, or MESSENE, an inland town, and the capital of Meffenia, a country of Peloponnefus; erroneoufly placed by Ptolemy on the coaft. It was built by Epaminondas, who recalled all the Meffenian exiles, and gave the town the name of *Meffene*. A place vying in point of ftrength and fituation with Corinth, according to Strabo; and therefore Demetrius Pharius advifed Philip, father of Perfeus, that if he wanted to have Peloponnefus in his power, he fhould make himfelf mafter of thefe two towns, as thus he would have the ox by both horns.

MESSENIA, a country in the fouth of Peloponnefus, moftly maritime, fituate between Elea to the weft, and Laconica to the eaft. Anciently a part of Laconica under Menelaus, and called *Meffene* by Homer; interpreted by the fcholiaft, *Meffenæa Regia*. *Meffenii*, the people, reduced to a ftate of flavery and fubjection by the Spartans; *Meffenius*, the epithet.

This country is famous in hiftory, on account of the refiftance made by the Meffenians againft the Spartans, and the exploits of their hero Ariftomenes. The firft hoftilities commenced about the year 652 B. C. on what occafion is uncertain. Though the Meffenians were inferior in the knowledge of the art of war to the Spartans; yet, by keeping for fome time on the defenfive, they improved fo much, that in three years time they found themfelves in a capacity of giving battle to their enemies in the open field; nor did they appear to be in any degree inferior either in courage or conduct: the war was therefore protracted, with various fuccefs, on both fides. At laft, both confulted the oracle at Delphi; and received for anfwer, "that whoever fhould firft dedicate 100 tripods in the temple of Jupiter at Ithome, a ftrong-hold of the Meffenians, fhould be mafters of the

Meſſenia. the country." The inhabitants of Meſſenia, on hearing this, having no money to make the tripods of braſs, fell to cutting them out in wood; but before this could be accompliſhed, a Spartan having got into the city by ſtratagem, dedicated 100 little tripods of clay: which threw the Meſſenians into ſuch deſpair, that they at laſt ſubmitted to the Spartans.

The new ſubjects of Sparta were treated with the utmoſt barbarity by theſe cruel tyrants; ſo that in 685 B.C. a new war commenced under Ariſtomenes, a man of unconquerable valour, and enthuſiaſtically fond of liberty. He perceived that the Argives and Arcadians, who were called the *allies* of the Lacedæmonians, adhered to them only through fear of their power; but that in reality they hated them, and wiſhed to revenge the injuries they had done them. To theſe Ariſtomenes applied; and receiving an anſwer conformable to his wiſhes, he engaged his countrymen unanimouſly to take up arms. About a year after the revolt began, and before either party had received any auxiliaries, the Spartans and Meſſenians met at a village called *Deræ*, where an obſtinate engagement enſued. Ariſtomenes was conceived to have performed more than mortal atchievements: in gratitude therefore, reſpect being alſo had to his royal deſcent, his countrymen unanimouſly ſaluted him *king;* which title he modeſtly waved, alleging, that he took up arms to ſet them free, and not to make himſelf great: he conſented, however, to accept the title of *general*, with a power of doing whatſoever he thought requiſite for the ſervice of the public. Knowing well the ſuperſtition of the age in which he lived, he reſolved to intimidate the Spartans, by ſhowing them what he was ſure they would take for an ill omen. Diſguiſing himſelf therefore, he went privately to the city, where, in the night, he hung up a ſhield on the wall of the temple of Minerva, with this inſcription: *Ariſtomenes dedicates this, out of the ſpoils of the Spartans, to the goddeſs.* It was eaſily perceived that this war would be both long and bloody; the Lacedæmonians therefore ſent deputies to Delphi, to inquire of the oracle concerning its event: the anſwer they received was, *That it behoved the Spartans to ſeek a leader from Athens.* The Athenians, naturally envious of the Spartans, granted their requeſt indeed, but in ſuch a manner as manifeſted their ſpite; for they ſent them for a general Tyrtæus, a ſchoolmaſter and poet, lame of one foot, and who was ſuſpected to be a little out of his wits. But here their ſkill failed them; for this captain, notwithſtanding his deſpicable appearance, proved of great conſequence to Sparta, teaching them how to uſe good, and how to bear up under evil fortune.

In the mean time, Ariſtomenes had drawn together a mighty army, the Eleans, Argives, Sicyonians, and Arcadians, having ſent troops to his aſſiſtance; the Spartans in this, as in the former war, having no ally but Corinth. The Spartan kings, according to the cuſtom of their city, no ſooner took the field, than, notwithſtanding their inferiority in number, they offered the enemy battle, which Ariſtomenes readily accepted.—It was long, obſtinate, and bloody; but in the end the Meſſenians were victorious, and the Lacedæmonians put to flight, with a great ſlaughter. It is ſcarce to be conceived how much the Spartans were ſtruck with this defeat: they grew weary of the war, diſſatisfied with their kings, diffident of their own power, and, in a word, ſunk into a ſtate of general uneaſineſs and want of ſpirit. It was now that the Athenian general convinced them, that he was capable of fulfilling all the promiſes of the oracle; he encouraged them by his poems, directed them by his counſels, and recruited their broken armies with choſen men from among the Helotes. Ariſtomenes, on the other hand, acted with no leſs prudence and vigour. He thought it not enough to reſtore the reputation of the Meſſenians, if he did not alſo reſtore their wealth and power: he therefore taught them to act offenſively againſt their enemies; and, entering the territories of Sparta, he took and plundered Pharæ, a conſiderable borough in Laconia, putting all ſuch as made any reſiſtance to the ſword, carrying off at the ſame time an immenſe booty. This, however, was an injury which the Spartans could not brook with patience; they therefore ſent immediately a body of forces to overtake the Meſſenians, which accordingly they did: but Ariſtomenes routed theſe purſuers, and continued to make a mighty ſlaughter of them, till ſuch time as he was diſabled by having a ſpear thruſt in his ſide, which occaſioned his being carried out of the battle. His cure, which took up ſome time, being finiſhed, he reſolved to carry the war even to the gates of Sparta; and to that purpoſe raiſed a very great army: but, whether he found his deſign impracticable, or was really diverted by ſome dream, he gave out, that Caſtor and Pollux, with their ſiſter Helena, had appeared to him, and commanded him to deſiſt. A ſhort time after this retreat, going with a ſmall party to make an incurſion, and attempting to take priſoners ſome women who were celebrating religious rites near Egila, a village in Laconia, thoſe zealous matrons fell upon him and his ſoldiers with ſuch fury, that they put them to flight, and took him priſoner: however, he ſoon afterwards made his eſcape, and rejoined his forces. In the third year of the war, the Spartans, with a great force, entered Meſſenia, whither Ariſtocrates king of Arcadia was come, with a great body of troops, to the aſſiſtance of his allies: Ariſtomenes therefore made no difficulty of fighting when the Spartans approached; but they entering privately into a negociation with Ariſtocrates, engaged him with bribes and promiſes to betray his confederates. When the battle began, the deceitful Arcadian repreſented to the forces under his command, the mighty danger they were in, and the great difficulty there would be of retreating into their own country, in caſe the battle ſhould be loſt: he then pretended, that the ſacrifices were ominous; and, having terrified his Arcadians into the diſpoſition of mind fitteſt to ſerve his purpoſe, he not only drew them off from both wings, but, in his flight, forced through the Meſſenian ranks, and put them too in confuſion. Ariſtomenes and his troops, however, drew themſelves into cloſe order, that they might defend themſelves the beſt they could: and indeed they had need of all their valour and ſkill; for the Lacedæmonians, who expected this event, immediately attacked and ſurrounded them on all ſides. Fortune was, on this occaſion, too powerful either for the courage or the conduct of the Meſſenians; ſo that, notwithſtand-

ing their utmoft efforts, moft of their army were cut to pieces, and, amongft them, the chief of their nobility. Ariftomenes, with the poor remains of his fhattered forres, retired as well as he could; and, perceiving that it was now impoffible to maintain the war againft the Lacedæmonians upon equal terms, he exhorted his countrymen to fortify mount Era, and to make the beft difpofitions poffible for a long defence. He likewife placed garrifons in Pylus and Methone on the fea-coafts; and to thefe three places he gathered all the inhabitants, leaving the reft of Meffenia to the mercy of the Spartans. They, on the other hand, looked on the war as now in a manner finifhed; for which reafon they divided the lands among their citizens, and caufed them to be carefully cultivated, while they befieged Era. But Ariftomenes quickly convinced them that the war was far from being over: he chofe out of all the Meffenians 300 men, with whom he ravaged all the adjacent country; carried off a prodigious booty; and, when Meffenia could no longer fupply the wants of his garrifon, penetrated into Laconia, and bore away corn, wine, cattle, and whatever elfe was neceffary to the fubfiftence of his countrymen fhut up in Era: fo that at laft the Spartans were conftrained to iffue a proclamation, forbidding the cultivation, not only of the Meffenian territory in their hands, but alfo of Laconia in its vicinity; whereby they diftreffed themfelves more than their enemies, inducing at laft a famine in Sparta itfelf, which brought with it its ufual attendant, fedition. Here again all things had gone wrong, if the wifdom of the poet Tyrtæus had not fupported the Spartan courage; nor was it without much difficulty that he influenced them to continue the blockade of Era, and to maintain a flying camp for the fecurity of the country.

Ariftomenes, in fpite of all thefe precautions, committed terrible depredations with his fmall corps of 300 men. Amongft other places which he plundered, the city of Amyclæ was one; from whence he carried not only a great quantity of riches, but alfo many carriages laden with provifions. The kings of Sparta lying with their troops in its neighbourhood, as foon as they heard of this expedition, marched after Ariftomenes with the utmoft diligence; and, as the Meffenians were incumbered with their booty, came up with them before he could reach Era. In this fituation of things, Ariftomenes, prompted rather by defpair than prudence, difpofed his troops in order of battle; and, notwithftanding they were fo few, made a long and vigorous refiftance againft the whole Lacedæmonian army. At length, however, numbers prevailed: the greateft part of the Meffenians were flain on the fpot; and Ariftomenes, with about 50 of his men who furvived the flaughter, were taken prifoners; that chief having received fo many wounds, that he was fenfelefs when they carried him away. The Lacedæmonians expreffed the loudeft joy at the fight of this illuftrious captive; who, for fo many years, by his fingle abilities, had enabled his exhaufted country to defend itfelf againft the whole force of Sparta. When he was recovered of his wounds, they decreed him and all his fellow-prifoners to be thrown together into a deep cavern, which was the common punifhment of the loweft kind of offenders. This judgment was executed with the utmoft feverity, excepting that Ariftomenes had leave to put on his armour. Three days he continued in this difmal place, lying upon, and covered over with, dead bodies. The third day, he was almoft famifhed through want of food, and almoft poifoned with the ftench of corrupted carcafes, when he heard a fox gnawing a body near him. Upon this he uncovered his face, and perceiving the fox juft by him, he with one hand feized one of its hind-legs, and with the other defended his face, by catching hold of its jaw when it attempted to bite him. Following as well as he could his ftraggling guide, the fox at laft thruft his head into a little hole; and Ariftomenes then letting go his leg, he foon forced his way through, and opened a paffage to the welcome rays of light, from which the noble Meffenian had been fo long debarred. Feeble as he was, Ariftomenes wrought himfelf an outlet with his nails; and travelling by night with all the expedition he could, at length arrived fafe at Era, to the great joy and amazement of his countrymen. When this news was firft blazed abroad, the Spartans would have had it pafs for a fiction; but Ariftomenes foon put the truth of it out of doubt, by falling on the pofts of the Corinthians, who, as allies of the Spartans, had a confiderable body of troops before Era. Moft of their officers, with a multitude of private men, he flew; pillaged their camp; and, in fhort, did fo much mifchief, that the Spartans, under the pretence of an approaching feftival, agreed to a ceffation of arms for 40 days, that they might have time to bury their dead. On this occafion, Ariftomenes for the fecond time celebrated the *hecatomphonia*, or the facrifice appointed for thofe who had killed 100 of the enemy with their own hands. He had performed the fame before and after his fecond battle; and he lived to do it a third time: which muft appear wonderful to the reader, when he is informed, that, notwithftanding this truce, certain Cretan archers in the fervice of the Spartans, feized Ariftomenes as he was walking without the walls, and carried him away a prifoner. There were nine of them in all; two of them immediately flew with the news to Sparta, and feven remained to guard their prize, whom they bound, and conducted to a lone cottage inhabited only by a widow and her daughter. It fo fell out, that the young woman dreamt the night before, that fhe faw a lion without claws, bound, and dragged along by wolves; and that fhe having loofed his bonds, and given him claws, he immediately tore the wolves to pieces. As foon as Ariftomenes came into the cottage, and her mother, who knew him, had told her who he was, fhe inftantly concluded that her dream was fulfilled; and therefore plied the Cretans with drink, and, when they were afleep, took a poniard from one of them, cut the thongs with which Ariftomenes was bound, and then put it into his hands. He prefently verified her vifion, by putting all his guards to death; and then carried her and her mother to Era, where, as a reward for her fervice, he married the young woman to his fon Gorgus, then about 18 years of age.

When Era had held out near eleven years, it fell into the hands of Sparta by an accident: the fervant of one Empiramus, a Spartan commander, driving his mafter's cattle to drink at the river Neda, met frequently with the wife of a Meffenian, whom he engaged

engaged in an amour. This woman gave him notice, that her hufband's houfe was without the wall; fo that he could come to it without danger, when the good man was abroad; and fhe likewife gave him intelligence when her hufband was upon duty in the garrifon. The Spartan failed not to come at the time appointed; but they had not been long in bed before the hufhand returned, which put the houfe into great confufion: the woman, however, fecured her gallant; and then let in her hufband, whom fhe received, in appearance, with great joy, inquiring again and again by what excefs of good fortune fhe was bleffed with his return. The innocent Meffenian told her, that Ariftomenes being detained in his bed by a wound, the foldiers, knowing that he could not walk the rounds, had a grant to retire to their houfes, to avoid the inclemency of the feafon. The Spartan no fooner heard this, than he crept foftly out of doors, and haftened away to carry the news to his mafter. It fo happened, that the kings were at this time abfent from the camp, and Empiranus had the chief command of the army. As foon as he received this information, he ordered his army to begin its march, though it rained exceffively, and there was no moon-light. The fellow guided them to the ford, and managed matters fo well that they feized all the Meffenian pofts: yet, after all, they were afraid to engage; darknefs, an high wind, heavy rain, together with the dread of Ariftomenes, keeping them quiet in the places they had feized. As foon as it was light, the attack began; and Era had been quickly taken, if only the men had defended it; but the women fought with fuch fury, and, by their mingling in the fray, brought fuch an acceffion of numbers, as made the event doubtful. Three days and two nights this defperate engagement lafted: at laft, all hopes of preferving the city being loft, Ariftomenes drew off his wearied troops. Early the fourth morning, he difpofed the women and children in the centre, the Meffenian youth in the front and rear, the lefs able men in the main body: himfelf commanded the van; the rear-guard was brought up by Gorgus and Manticlus, the former the fon of Ariftomenes, the latter of Theocles, a Meffenian of great merit, who fell with much glory in this attack, fighting valiantly in the caufe of his country. When all things were ready, Ariftomenes caufed the laft barrier to be thrown open; and, brandifhing his fpear, marched directly towards the Spartan troops, in order to force a paffage. Empiramus, perceiving his intent, ordered his men to open to the right and left, and fairly gave them a paffage; fo that Ariftomenes marched off in triumph, as it were, to Arcadia.

The Arcadians, when they heard that Era was taken, were very defirous of fuccouring their old confederates in this deep diftrefs: they therefore intreated their king Ariftocrates to lead them into Meffenia. But he, corrupted by the Lacedæmonians, perfuaded them that it was too late; that the Meffenians were all cut off; and that fuch a ftep would only expofe them to the fury of the conquerors. When the thing appeared to be otherwife, and it was known that Ariftomenes was on the frontiers of Arcadia, they went in crowds to carry him provifions, and to teftify their readinefs to afford him and thofe under his command all the affiftance in their power. Ariftomenes defired to be heard before a general affembly; which being accordingly convoked, he there opened one of the boldeft and beft-laid fchemes recorded in hiftory: he faid, that he had yet 500 undaunted foldiers, who, at his command, would undertake any thing; that it was very probable moft of the Spartans were employed in pillaging Era, and that therefore he determined to march and furprife Sparta; which appeared fo fenfible, that all the affembly loudly commended his great capacity and unfhaken courage. Ariftocrates, however, took care to betray him; having, by various pretences, retarded the execution of the project. The Arcadians, who began to fufpect him, waited for and furprifed the meffengers as they came back. They took the letters from him, and read them openly in the affembly. The purport of them was, that they acknowleged his great kindnefs both now and in the battle; and promifed, that the Lacedæmonians would be grateful. As foon as the letters were read, the Arcadians fell to ftoning their king, frequently calling upon the Meffenians to affift them; which, however, they did not, waiting for Ariftomenes's orders; who, far from triumphing in this fpectacle, ftood ftill, with his eyes fixed on the ground, which he wet with his tears, his foul pierced with forrow to fee a crowned head fo fhamefully and fo defervedly put to death. The Arcadians afterwards exected a monument over him, with an infcription to perpetuate his infamy. As for the Meffenians under the command of Gorgus and Manticlus, they paffed over into Sicily; where they founded the city of Meffene, one of the moft famous in the ifland. Ariftomenes remained, however, in Greece; where he married all his daughters, except the youngeft, to perfons of great rank. A prince of Rhodes, inquiring of the oracle at Delphi whom he fhould efpoufe, that his fubjects might be happy under his pofterity, was directed to marry the daughter of the moft worthy of the Greeks; which aufwer was immediately underftood to point at the virgin daughter of Ariftomenes. Her therefore he demanded, and received; Ariftomenes accompanying him back to his dominions, where he formed a fcheme of uniting the Lydians and Medes againft the Spartans, refolving, with this view, to go into Media, and to the court of Sardis: but while he meditated thefe great things, death furprifed him, and thereby freed Lacedæmon from the moft formidable enemy fhe ever had.

MESSENGERS, are certain officers chiefly employed under the direction of the fecretaries of ftate, and always in readinefs to be fent with all kinds of difpatches foreign and domeftic. They alfo, by virtue of the fecretaries warrants, take up perfons for high treafon, or other offences againft the ftate. The prifoners they apprehend are ufually kept at their own houfes, for each of which they are allowed 6s. 8d. per day, by the government: and when they are fent abroad, they have a ftated allowance for their journey, viz. 30l. for going to Paris, Edinburgh, or Dublin; 25 l. for going to Holland, and to other places in the fame proportion; part of which money is advanced, for the expence of their journey. Their ftanding falary is 45 l. *per annum*; and their pofts, if purchafed, are efteemed worth 300l. The meffengers wait 20

at a time, monthly, and are distributed as follows, viz. four at court, five at one secretary's office, five at another, two at the third for North Britain, three at the council-office, and one at the lord chamberlain's of the household.

MESSENGERS, in Scotland. See LAW, n° clviii. 16.

MESSENGERS *of the Exchequer*, are four officers who attend the exchequer, in the nature of pursuivants, and carry the lord treasurer's letters, precepts, &c.

MESSENGER *of the Press*, a person who, by order of the court, searches printing-houses, booksellers shops, &c. in order to discover the printers or publishers of seditious books, pamphlets, &c.

MESSIAH, a word signifying one *anointed*, or installed into an office by unction. It was usual among the Jews to anoint kings, high-priests, and sometimes prophets, at the designation or installment of them, to signify emblematically the mental qualifications necessary for discharging these offices. Saul, David, Solomon, and Joash, kings of Judah, received the royal unction. Aaron and his sons received the sacerdotal, and Elisha the disciple of Elijah received the prophetic, unction.—The name MESSIAH, *Anointed*, or *Christ* (Χριστος), was given to the kings and high-priests of the Jews. The patriarchs and prophets are also called by the name of *Messiahs* or the *Lord's anointed*. See 1 Sam. xii. 3, 5. 1 Chron. xvi. 22. Ps. cv. 15.

But this name MESSIAH was principally and by way of eminence given by the Jews to their expected great Deliverer, whose coming they still vainly wait; and is a name the Christians apply to JESUS *Christ*, in whom the prophecies relating to the Messiah were accomplished. The sum of these prophecies is, That there should be a glorious person, named *Messiah*, descended from Abraham, Isaac, and Jacob, who should be born at Bethlehem, of a virgin of the family of David, then in its decline, before the Jews ceased to be a people, while the second temple was standing, and about 500 years after Ezra's time; who, though appearing in mean circumstances, should be introduced by a remarkable forerunner, whose business it should be to awaken the attention and expectation of the people. That this illustrious person called *Messiah*, should himself be eminent for the piety, wisdom, and benevolence of his character, and the miraculous works he should perform: yet that, notwithstanding all this, he should be rejected and put to death by the Jews; but should afterwards be raised from the dead, and exalted to a glorious throne, on which he should through all generations continue to rule, at the same time making intercession for sinners. That great calamities should for the present be brought on the Jews for rejecting him: whereas the kingdom of God should by his means be erected among the Gentiles, and disperse itself even unto the ends of the earth; wherever it came, destroying idolatry, and establishing true religion and righteousness. In a word, That this glorious Person should be regarded by all who believed in him, as a divine teacher, an atoning sacrifice, and a royal governor: by means of whom God would make a covenant with his people, very different from that made with Israel of old; in consequence of which they should be restored to, and established in, the divine favour, and fixed in a state of perpetual happiness. See JESUS *Christ*, and CHRISTIANITY.

MESSUAGE, MESSUAGIUM, in law, a dwelling-house, with some land adjoining assigned for its use. By the name of *messuage* may a garden, shop, mill, cottage, chamber, cellar, or the like, pass.—In Scotland, *messuage* denotes what is called in England the *manor-house*; viz. the principal dwelling-house within any barony.

METACARPUS, in anatomy. See there, n° 54.

METALEPSIS. See ORATORY, n° 59.

METALLIZATION, the natural process by which metals are formed in the bowels of the earth. See METALLURGY, sect. i.

METALS. See METALLURGY; and CHEMISTRY, n° 43, 140, 192, 236, 278, 332, 348.

METAL, in heraldry. There are two metals used in heraldry, by way of colours, viz. gold and silver, in blazon called *or* and *argent*.

In the common painting of arms these metals are represented by white and yellow, which are the natural colours of those metals. In engraving, gold is expressed by dotting the coat, &c. all over; and silver, by leaving it quite blank.

It is a general rule in heraldry, never to place metal upon metal, nor colour upon colour: so that if the field be of one of the metals, the bearing must be of some colour; and if the field be of any colour, the bearing must be of one of the metals.

METALLURGY.

METALLURGY, according to Boerhaave, comprehends the whole art of working metals, from the glebe or ore, to the utensil; in which sense, essaying, smelting, refining, parting, smithery, gilding, &c. are only branches of metallurgy. But, in the present work, Gilding, Parting, Purifying, Refining, Smithery, &c. are treated under their proper names. With others, therefore, we have chosen to restrain *Metallurgy* to those operations required to separate metals from their ores for the uses of life. These operations are of two kinds: the smaller, or Essaying; and the larger, or Smelting. But a particular description of the ores themselves seemed likewise necessary to be given; and to this place, too, we have referred a general account of metals, metallization, mines, and ores, as a proper introduction to the subject. Hence the following division into three parts. The *first* treating, 1. Of metals and metallization. 2. Of mines and ores in general. 3. Of the pyrites. 4. Of the essaying of ores in general. The *second*, Of the particular ores, and the methods of essaying them. The *third*, Of smelting of ores, or the methods of extracting metals from large quantities of ores for the purposes of commerce or manufacture.

PART I.

Sect. I. *Of Metals and Metallization.*

UNDER the general name *metal*, we comprehend here not only the metals properly fo called, but alfo the *femimetals*, or all matters which have the effential metallic properties, which we fhall here recount. Thus the word *metal* and *metallic fubftance* will be fynonimous in this article.

Metallic fubftances form a clafs of bodies, not very numerous, of very great importance in chemiftry, medicine, arts, and the ordinary affairs of life. Thefe fubftances have very peculiar properties, by which they differ from all other bodies.

The natural bodies from which metals differ the leaft are, earthy and pyritous matters, on account of their folidity and denfity. Metals and ftones are, neverthelefs, very different; the heavieft ftones which are unmetallic being much lighter than the lighteft metals. A cubic foot of marble weighs 252 pounds; and an equal bulk of tin, the lighteft of metals, weighs 516 pounds. The difference is much greater when the weight of fuch a ftone is compared with that of gold, a cubic foot of which is 1326 pounds.

Opacity is another quality which metals poffefs eminently, the opacity of metals being much greater than that of any unmetallic fubftance.

This great opacity of metals is a confequence of their denfity; and thefe two properties produce a third, peculiar alfo to metals, namely, a capacity of reflecting much more light than any other body: hence metals whofe furfaces are polifhed, form mirrors reprefenting the images of bodies more clearly than any other matter. Thus looking-glaffes produce their reflexion merely by the filvering, which is a covering of metal upon their furfaces. To this reflective property metals owe their peculiar luftre, called the *metallic luftre*.

Although the feveral metallic fubftances differ confiderably in hardnefs and fufibility, we may fay in general, that they are lefs hard and lefs fufible than pure earths.

Metals cannot unite with any earthy fubftance, not even with their own earths, when thefe are deprived of their metallic ftate: hence, when they are melted, they naturally run into globes, as much as the abfolute gravity of their mafs, and their preffure upon the containing veffels, will allow. Accordingly, the furface of a metal in fufion is always convex. A metal in that ftate always endeavours to acquire a fpherical form, which it does more perfectly as the mafs is lefs. This effect is very fenfible in quickfilver, which is nothing but a metal habitually fluid or fufed. A mafs of feveral pounds of mercury, contained in a fhallow widemouthed veffel, is fo fpread out, that its upper furface is almoft flat, and the convexity is not very fenfible but at its circumference: on the contrary, if we put very fmall maffes of mercury into the fame veffel, as, for inftance, maffes weighing a grain each, they become fo round as to feem perfect globes. This effect is partly occafioned by the inaptitude of metals to unite with the veffels containing them when in fufion, by which quality the whole affinity which fubfifts betwixt the integrant parts of thefe metals is capable of acting; and partly alfo by this affinity, which difpofes the integrant parts to come as near to each other as they can, and confequently to form a fphere.

This property is not peculiar to melted metals, but to all fluids, when contiguous to bodies folid or fluid, with which they have no tendency to unite. Thus, for inftance, maffes of water upon oily bodies, or oily maffes upon bodies moiftened with water, affume always a form fo much nearer to the fpherical as they are fmaller. Even a large drop of oil poured upon a watery liquor, fo that it fhall be furrounded with this liquor, becomes a perfect fphere.

All metals are in general foluble by all acids; but often thefe folutions require particular treatment and circumftances, which are mentioned under CHEMISTRY, fect. iv. With acids, they form a kind of neutral falts, which have all more or lefs caufticity. The affinity of metals is lefs than of abforbent earths and alkaline falts to acids; and therefore any metal may be feparated from any acid by thefe earthy and faline alkalis.

Alkaline falts are capable of acting upon all metallic fubftances, and of keeping them diffolved by proper management.

Metals may in general be united with fulphur and liver of fulphur. With fulphur, they form compounds refembling the peculiar fubftance of ores, which are generally nothing elfe than natural combinations of fulphur and metal. Metals have lefs affinity with fulphur than with acids; hence fulphur may be feparated from them by acids. Some exceptions from thefe general rules, concerning the affinity of metals to fulphur and liver of fulphur, and concerning their feparation from fulphur by acids, may be feen under the articles of the feveral metals. But thefe exceptions do probably take place, only becaufe we have not yet found the method of furmounting fome obftacles which occur in the ordinary methods of treating certain metals.

All metals may in general be united with each other, with which they form different allays which have peculiar properties; but this rule alfo is not without fome exceptions.

Metals have ftrong affinity with the inflammable principle, and are capable of receiving it fuperabundantly.

Laftly, oily fubftances feem to be capable of acting upon all metals. Some metals are eafily and copioufly diffolved by oils; and perhaps they might all be found to be entirely foluble in oils, if the methods known in chemiftry were tried for the accomplifhment of thefe folutions.

The properties abovementioned agree in general to all metallic fubftances: but, befides the properties peculiar to each metal, fome properties are common to a certain number of them; and hence they have been divided into feveral claffes.

Thofe metallic matters which, when ftruck by a hammer, or ftrongly compreffed, are extended, lengthened,

ened, and flattened, without being broken, (which property is called *ductility* or *malleability*), and which also remain fixed in the most violent and long continued fire, without diminution of weight, or other sensible alteration, are called *perfect metals*. These perfect metals are three; *gold*, *silver*, *platina*.

The metallic matters which are ductile and fixed in the fire, to a certain degree, but which are destroyed by the continued action of fire, that is, changed into an earth deprived of all the characteristic properties of metals, are called *imperfect metals*. Of this kind are four; *copper*, *iron*, *tin*, *lead*.

The metallic substances which, as well as the imperfect metals, lose their metallic properties by exposure to fire, but which also have no ductility nor fixity, are distinguished from the others by the name of *semi-metals*. Of this class are five; *regulus of antimony*, *bismuth*, *zinc*, *regulus of cobalt*, and *regulus of arsenic*.

Lastly, *mercury*, which has all the general properties of metals, makes a class separate from the others; because in purity and gravity it is similar to the perfect metals, and in volatility to the semi-metals. Its fusibility also so far surpasses that of any other metallic matter, that it is sufficient to distinguish it from all, and to give it a distinct class. We have enumerated, therefore, in all, 13 metallic substances; two of which only were unknown to the ancients, namely, platina and regulus of cobalt. We have reason to wonder that these two metallic bodies, and particularly platina, which is a perfect metal, should have remained unknown till lately.

This may give us cause to hope, that if natural history and chemistry be carefully cultivated, as they have been since the renovation of the sciences, we may still make essential discoveries in this way. Mr Cronstedt has given, in the Swedish Memoirs, a description of a metallic matter, which, as he says, appears to be a new semimetal distinct from the others. In that case, this would be the fourteenth metallic matter known, and the third lately discovered: but as, since the Memoir of Mr Cronstedt, this new semimetal has not been examined by chemists, it is yet but little known; and therefore further experiments seem requisite to decide whether it ought to be admitted as a new semimetal (A).

As chemists can only know compound bodies by being capable of separating the principles of such bodies, and even of re-uniting their principles so as to reproduce such compounds as they were originally; and as hitherto they have not been able to accomplish any such decomposition upon the perfect metals; hence, if all the other metallic substances were equally unalterable, we should be very far from having certain notions concerning metals in general: but if we except gold, silver, and platina, all the other metallic matters are susceptible of decomposition and of recomposition, at least to a certain degree; and the experiments of this kind made by chemists, and chiefly by the modern chemists, have thrown much light on this important subject.

We may observe, that even if we had not been able to decompose any metallic substance, we might still, by reflecting on the essential properties of metals, discover sufficiently well the nature of their principles.

The solidity, the consistence, and especially the gravity, which they possess in a degree so superior to all other bodies, would not have allowed us to doubt that the earthy element, of which these are the characteristical properties, enters largely into their composition, and makes their basis.

The facility with which they combine with almost all inflammable matters, and with all those which have great affinity with phlogiston, such as acids; joined to their incapacity of being allayed with meagre matters that are purely earthy or purely watery, which have no disposition to unite with phlogiston; would also have furnished very strong motives to believe, that the inflammable principle enters largely into the composition of metals.

We must acknowledge, however, that these considerations would only have furnished concerning the existence of the inflammable principle in metals, but a simple probability, very far from the complete proof we now have: but the combustibility of all metals capable of decomposition by this method, and of the subsequent reduction, with all their properties, by the rejunction of the inflammable principle, furnishes the clearest and the most satisfactory demonstration that we have in chemistry. We shall now mention what is known upon this subject, and the consequences necessarily resulting.

The destructible metals present exactly the same phenomena as all other bodies containing the inflammable principle do, in the state of combustion. When exposed to fire, without access of air, that is, in close vessels, they become red-hot, melt, or sublime, according to their nature: but they receive no alteration in their composition from fire applied in this manner, and they are afterwards found to be exactly in the same state as before. In this respect, they resemble perfectly all bodies which contain no other inflammable matter than pure phlogiston.

But when imperfect metals are exposed to fire, with access of air, as, for instance, under a muffle in a furnace which is made very hot, then they burn more or less sensibly, as their inflammable principle is more or less abundant, or more or less combined. Some of them, as iron and zinc, burn with a very lively and brilliant flame; but this flame is of the same nature as that of charcoal, of sulphur, of all bodies, the combustible principle of which is pure phlogiston, and is not in an oily state, that is, furnishes no soot capable of blackening.

Also the imperfect metals detonate with nitre, when all the circumstances which that detonation requires are united *. Their phlogiston is consumed by this method much more quickly and completely than by ordinary calcination or combustion. Their flame is also much more lively and brilliant; and some of them, as iron and zinc, are used in compositions for fireworks, from their very vivid and beautiful flame.

* See *Detonation*.

Nitre is alkalised by these metallic detonations exactly in the same manner as in its detonation by coals.

Lastly,

(A) See NICKEL. Mr Justi pretends that he has discovered a new metallic substance contained in yellow mica. This, he says, was of a blackish grey colour; but when mixed with gold heightened the lustre, without destroying the malleability of that metal, though itself is brittle.

Of Metallization.

Lastly, imperfect metals being treated with acids which have an affinity with phlogiston, that is, with the vitriolic and nitrous acids, are deprived also by these acids of a more or less considerable part of their inflammable principle; they give a sulphureous quality to vitriolic acid, and are even capable of furnishing sulphur with that acid.

Although the experiments now mentioned were the only proofs of the existence of an inflammable principle in metallic substances, these would be sufficient to establish it incontestably. But we shall see, when we continue to examine the phenomena attending the decomposition of metals, that those are not the only proofs.

If the inflammable matter which shews itself so evidently in the burning of metals, is really one of their constituent parts, their essential properties must be altered in proportion to the quantity of it taken from them: and this evidently happens upon trial; for the residuum of metallic matters, after calcination, departs from the metallic character, and approaches to the nature of mere earth. The opacity, brilliancy, ductility, gravity, fusibility, volatility, in a word, all the properties by which metallic substances differ from simple earths, diminish or entirely disappear, by taking from them their inflammable principle; so that when their calcination has been carried as far as is possible, they resemble mere earths, and have no longer any thing in common with metals. These earths can no longer be combined with acids or with metals, but are capable of uniting with pure earths. They are then called *calxes* or *metallic earths*. See CHEMISTRY, n° 44, 45.

We must observe concerning the decomposition of metals, 1. That when only a small quantity of inflammable principle is taken from metals, a small quantity only of calx is formed, and the remaining part continues in the metallic state: hence, as the portion of calcined metal can no longer remain united with the undestroyed metal, it separates in form of scales from the surface of the metal when the calcination has been performed without fusion, as generally happens to iron and to copper; or these scales float upon the surface of the melted matter when the calcination is performed during fusion, because the calx is specifically lighter than the metal; as happens to the very fusible metals, as tin, lead, and most of the semimetals.

2. The imperfect metals are not all equally easily and completely calcinable. In general, as much of their phlogiston may be easily taken from them, as is sufficient to deprive them of their metallic properties; but the remaining portion of their phlogiston cannot be so easily driven from them. Some of them, as copper, resist the first calcination more than the rest; and others, as lead and bismuth, may be very easily calcined, but only to a certain degree, and retain always obstinately the last portions of their inflammable principle; lastly, others, as tin and regulus of antimony, may not only be easily and quickly calcined, but also much more completely. All the other metals partake more or less of these properties relating to their calcination. In general, if we except the labours of alchemists, which are not much to be depended upon, we have not yet made all the proper efforts to arrive at a perfect calcination of the several metallic substances; which, however, is absolutely necessary, before we can arrive at a complete knowledge of the nature of their earths, as we shall afterwards see.

When metallic earths have lost but little of their phlogiston, and are exposed to strong fire, they melt, and are reduced to compact masses, still heavy and opake, although much less so than the metals, and always brittle and absolutely unmalleable. If the calcination has been more perfect, the metallic earths are still fusible by fire, but less easily, and convertible into brittle and transparent masses possessed of all the properties of glass, and are accordingly called *metallic glasses*. These glasses do not possess any of the properties of their metals, excepting that they are specifically heavier than other glasses, that they are capable of being attacked by acids, and that the glasses of the semimetals are somewhat less fixed than unmetallic glasses. Lastly, when the calcinaton of metals has been carried to its greatest height, their earths are absolutely fixed, and unfusible in the fire of our furnaces, and possess no longer the solubility in acids by which metals are characterised.

These are the principal changes which metals suffer by losing their phlogiston. They are thus changed into substances which have no properties but those of earth. This is a certain proof that the inflammable principle is one of their constituent parts. But we have also other proofs of this important truth. The reduction of metallic calxes into metal, by the addition of phlogiston alone, completes the proof; and the whole forms one of the clearest and most satisfactory demonstrations in all the sciences. This reduction is effected in the following manner.

If the earth of a metal be mixed with any inflammable matter, which either is or can be changed into the state of coal, together with some salt capable of facilitating fusion, but which, from its quantity or quality, is incapable of receiving the inflammable principle; and if the whole be put into a crucible, and the fusion promoted by a fire gradually raised; then an effervescence will happen, accompanied with a hissing noise, which continues a certain time, during which the fire is not to be increased; afterwards, when the whole has been well fused, and the crucible taken from the fire and cooled, we shall find at the bottom, upon breaking it, the metal, the earth of which was employed for the operation, possessed of all the properties which it had before calcination and reduction. See REDUCTION.

We cannot doubt that this wonderful transformation of an earthy substance into a metal, is solely caused by the phlogiston passing from the inflammable matter to the metallic earth: for, first, in whatever manner and with whatever substance metallic earths be treated, they cannot be ever reduced into metals without a concurrence of some substance containing phlogiston. 2dly, The nature of the substance which is to furnish phlogiston is quite indifferent, because this principle is the same in all bodies containing it. 3dly, If, after the operation, the substance furnishing the phlogiston be examined, we shall find that it has lost as much of that principle as the metallic earth has received.

The facts related concerning the decomposition and the recomposition of metals prove incontestably, that they are all composed of earth and phlogiston. But we do not yet certainly know whether these two be the only principles of metals. We might affirm this, if we could produce metals by combining phlogiston with some matter which is certainly known to be simple earth.

earth. But this hitherto has not been accomplished; for if we try to treat any earth, which has never been metallic, with inflammable matters, we shall perceive that the simple earths are not combinable with phlogiston so as to form metals. We shall even perceive that the metallic earths resist this combination, and are incapable of reduction into metal, when they have been so much calcined as very nearly to approximate the nature of simple earths.

These considerations, added to this, that we cannot easily conceive how, from only two certain principles, so many very different compounds as the several metallic substances are, should result, are capable of inducing a belief that some other principle is added to these two already mentioned in the composition of metals.

Many great chemists, and particularly Becher and Stahl, seem to be convinced of this opinion; and chiefly from the experiments concerning the mercurification of metals, they believe that this third principle exists copiously in mercury; that it is of a mercurial nature; that it also exists in marine acid, to which it gives its specific character; that by extracting this mercurial principle from marine acid, or any other body containing it copiously, and by combining it with simple earths, these may acquire a metallic character, and be rendered capable of receiving phlogiston, and of being completely metallised.

These chemists admit also, and with probability, a different proportion of metallic principles in the several metals; and believe, that particularly the principle which they call *mercurial earth*, exists more copiously and sensibly in certain metals than in others. The most mercurial metals, according to them, are mercury, silver, lead, and arsenic. Most chemists distinguish from the other metals, silver, mercury, and lead; which they call *white metals*, *lunar metals*, or *mercurial metals*.

All these considerations being united, and others too many to be mentioned, give some probability to the existence of the mercurial principle in metals. We must however acknowledge, that the existence of this principle is only merely probable; and, as Stahl observes, is not nearly so well demonstrated as that of the inflammable principle: we may even add, that we have strong motives to doubt of its existence.

To produce metals artificially has justly been reckoned one of the most difficult problems in chemistry. The reflections we shall add upon this subject will be sufficient demonstration to every sensible person, that great knowledge is requisite in that science, to attempt with any hopes of success the production even of the most imperfect semimetal. Even if we were certain that it depends only on the intimate combination of the inflammable principle with a matter simply earthy, we should labour by chance, and without any reasonable expectation of success, if we were to attempt that combination without having more knowledge than we now possess, concerning the true nature of the earthy principle which enters into the composition of metals; for we must acknowledge that chemistry has made but little progress in this matter.

Metallic substances, although they resemble each other by the general properties mentioned in the beginning of this article, differ nevertheless from each other very evidently by the properties peculiar to each. Do these differences proceed from the different proportion, and from the more or less intimate connection of the inflammable principle with the earthy principle; supposing that this latter should be essentially the same in all metals? or ought they to be attributed to the difference of earths, which in that case would be distinct and peculiar to each metal? or, lastly, do metals differ from each other, both by the nature of their earths, and by the proportion and intimacy of connection of their principles? All these things are entirely unknown; and we may easily perceive, that till they are known, we cannot discover what method to pursue in our attempts to accomplish the combinations we are now treating of.

The most essential point then is, to arrive at a knowledge of the true nature of the earths which are in metals; and the only method of arriving at this knowledge is, to reduce them to their greatest simplicity by a perfect calcination. But this cannot be accomplished but by long and difficult operations. We have seen above, that all metals are not calcinable with equal ease; that the perfect metals have not been hitherto calcined truly by any process; and that in general, the last portions of phlogiston adhere very strongly to calcinable metals.

Some metals, however, as tin and regulus of antimony, may be easily calcined so as to be rendered irreducible. By carrying the calcination still further by the methods known in chemistry, we might obtain their earths so pure, that all their essential properties may be discovered, by which they might be easily compared together. This comparison would decide whether their nature be essentially different or not.

If they were found to be composed of earths essentially the same, we might next proceed to compare metallic with unmetallic earths. If the former were found similar to some of the latter kind, we should be then assured that the earth of metals is not peculiar to them, and that ordinary unmetallic earths are susceptible of metallisation.

The greater the number of metals operated upon, the more general and certain the consequences resulting from these would be: so that, for instance, if the operation were extended to all calcinable metals; and if the result of each of these operations were, that the calxes, when perfectly dephlogisticated, do not differ from each other, and are similar to earths already known; we might conclude from analogy, and we should be almost certain, that the earths of the perfect metals are also of the same nature.

They who know the extent and difficulties of chemical operations, will easily perceive that this would be one of the most considerable. Nevertheless, after having determined this essential point, we should only have done half our work. For a knowledge of the nature of the earth of metals, and where it is to be found, would not be sufficient; we must further endeavour to find a method of combining with this earth a sufficient quantity of phlogiston, and in a manner sufficiently intimate, that a metal might be formed by such a combination. But this second difficulty is perhaps greater than the former.

We must observe here, that some famous chemical processes have been considered by many as metallisations, but which are really not so. Such is Becher's famous experiment of the *minera arenaria perpetua*, by

Of Metallization.

by which that chemift propofed to the States General to extract gold from any kind of fand. Such alfo is the procefs of Becher and of Geoffroy, to obtain iron from all clays by treating them with linfeed oil in clofe veffels. In thefe, and many other fuch proceffes, we do only obtain metal that was already formed. Every earth and fand, as the intelligent and judicious Cramer obferves, contain fome particles of gold. Clays do not commonly contain iron ready formed; but all of them contain a ferruginous earth, naturally difpofed to metallifation. See CLAY. Accordingly we muft conclude, that, by Mr Geoffroy's experiment, iron is only reduced or revived, but is not produced.

The great difficulties which occur in attempting to give a metallic quality to fimple earths have induced a belief, that the nature of metals ready formed might be more eafily changed, and the lefs perfect brought to a more perfect ftate. To effect this, which is one of the principal objects of alchemy, and is called *tranfmutation*, numberlefs trials have been made. As we have not any certain knowledge of what occafions the fpecific differences of metallic fubftances, we cannot decide whether tranfmutation be poffible or not. In fact, if each metallic fubftance have its peculiar earth, effentially different from the earths of the others, and confequently if the differences of metals proceed from the differences of their earths; then, as we cannot change the effential properties of any fimple fubftance, tranfmutation of metals muft be impoffible. But if the earths and other principles of metals be effentially the fame, if they be combined in different proportions only, and more or lefs ftrictly united, and if this be the only caufe of the fpecific difference of metals, we then fee no impoffibility in their tranfmutation.

Whatever be the caufe of the differences of metals, their tranfmutation feems to be no lefs difficult than the production of a new metallic fubftance; and perhaps it is even more difficult. Alchemifts believe that tranfmutation is poffible, and they even affirm that they have effected it. They begin by fuppofing that all metals are compofed of the fame principles; and that the imperfect metals do not differ from gold and filver, but becaufe their principles are not fo well combined, or becaufe they contain heterogeneous matters. We have then only thefe two faults to remedy, which, as they fay, may be done by a proper coction, and by feparating the pure from the impure. As we have but very vague and fuperficial notions concerning the caufes of the differences of metals, we confefs that we cannot make any reafonable conjecture upon this matter; and we fhall only advife thofe who would proceed upon good principles, to determine previoufly, if metals have each a peculiar earth, or only one common to them all. In the fecond place, if it fhould be demonftrated that the earthy principle is the fame in all metals, and if that be demonftrated as clearly as the identity of the inflammable principle in metals is proved; they muft then determine whether thefe two be the only principles in metals, whether the mercurial principle exifts, and whether it be effential to all metals or to fome only, and what is the proportion of thefe two or three principles in the feveral metallic fubftances. When we fhall clearly underftand thefe principal objects, we may then be able to determine concerning the poffibility of tranfmutation; and if the poffibility fhould be affirmed, we fhall then begin to difcover the road which we ought to purfue.

We have no reafon to believe that any other principle enters into the compofition of metals than thofe above-mentioned: no veftige is perceptible of either air or water. Some chemifts have neverthelefs advanced that they contain a faline principle. If that were true, they would alfo contain a watery principle. But all the experiments adduced to prove this opinion are either falfe, or only fhow the prefence of fome faline particles extraneous to the metals, or contained unknown to the chemifts in the fubftances employed in the experiments. For metals perfectly pure, fubjected to all trials with fubftances which do not contain and which cannot produce any thing faline, do not difcover any faline property. We muft however except arfenic, and even its regulus, thefe being fingular fubftances, in which the faline are as fenfible as the metallic properties.

Arfenic feems to be one of thofe intermediate fubftances which nature has placed in almoft all its productions betwixt two different kinds, and which partake of the properties of each kind. Arfenic thus placed betwixt metallic and faline fubftances has properties common to both thefe kinds of fubftances, without being either entirely a metal or falt. See ARSENIC.

As water feems to act to a certain degree upon iron, even without the concurrence of air, as the operation of *martial ethiops* fhews, we might thence fufpect fomething faline in that metal. Neverthelefs, what happens in that operation has not been fo well explained, that any certain confequences can be deduced. 1. The water employed ought to be perfectly pure; that is, diftilled rain-water. 2. The iron employed ought alfo to be perfectly pure, and fuch is very difficultly to be procured. 3. The operation ought to be performed in a bottle accurately clofed, that we may be affured that the air contributes nothing to the action upon the iron. 4. After the water has remained a long time, fuppofe a year, upon the iron, the water ought to be carefully filtrated and examined, to afcertain whether it really has diffolved any part of the metal.

In the mean time, we may conclude that metals do not feem to contain any faline principle. And when we confider well their general properties, they feem to be nothing elfe than earths combined more or lefs intimately with a large quantity of phlogifton. Although we can demonftrate that their inflammable principle is not in an oily ftate, and that it is pure phlogifton, they have neverthelefs an oily appearance, in this circumftance, that they adhere no more than oils to earthy and aqueous fubftances, and that they always affume a globular figure when fupported by thefe fubftances entirely free from phlogifton.

This refemblance is fo fenfible, that chemifts, before they knew the nature of phlogifton, believed that metals contained an oily and fat matter; and even now many perfons, who talk of chemiftry without underftanding it, fpeak of the *oil* or *fat* of *metals*; expreffions, which do not found well to genuine chemifts. The caufe of this quality of metals is the quantity of phlogifton which they contain. Sulphur, phofphorus, oils, and even fats, have this appearance

merely from the inflammable principle which enters into their compofition: for this property is communicated by that principle to every compound which contains a certain quantity of it. See PHLOGISTON.

When the phlogifton combines copioufly and intimately with earthy matters fo as to form metals, it probably fo difpofes them, that the primitive integrant parts of the new compound, that is, of the metal, approximate and touch each other much more than the integrant parts of fimple earths can. This is proved by the great denfity or fpecific gravity, and other general properties, of metals.

In fact, as we cannot conceive that a body fhould be tranfparent, unlefs it have pores and interftices through which rays of light can pafs; therefore the more denfe a body is, that is, the fewer fuch interftices it has, the lefs tranfparent it will be; fo that the denfeft bodies ought to be the moft opake, as in metals. The difpofition of the pores of bodies contributes alfo much to their greater or lefs tranfparency; and bodies, the pores of which are continued and ftraight, are more tranfparent than thofe whofe pores are interrupted, tranfverfe, or oblique; fo that a body may be much more tranfparent than another which is lefs denfe, as we fee that glafs is more tranfparent than charcoal. But when other circumftances are equal, the denfeft bodies are the moft opake. Therefore the opacity of bodies is proportionable to their denfity, and to the deviation of their pores from right and parallel lines.

From the great opacity of metals, they probably poffefs both thefe qualities in an eminent degree. We have feen, at the beginning of this article, that the luftre of metals, and their property of reflecting light much better than any other fubftance, are neceffary confequences of their opacity. This is alfo felf-evident, becaufe the fewer rays any body can tranfmit, the more it muft reflect.

Laftly, the ductility of metals proceeds alfo from their denfity, and from the difpofition of their pores. Phlogifton alfo appears to communicate ductility to moft of the bodies containing it; as we fee in fulphur, and in unctuous bodies, as refins, wax, &c. all which are more or lefs ductile, at leaft when heated to a certain degree. Laftly, the foftnefs, fufibility, and volatility, of which all metals partake more or lefs, and which many of them poffefs in a fuperior degree, being properties entirely contrary to thofe of the earthy principle, probably proceed from the inflammable principle. In general, if we reflect on the effential properties of the earthy and inflammable principles, we fhall eafily perceive that thefe properties, being combined and modified by each other, ought to produce the properties of metals.

The order in which metals compared with each other poffefs moft eminently their principal properties, is the fame as that in which they are here enumerated, according to Mr Macquer, beginning always with that metal in which the property is moft confiderable.

1. *Specific gravity* or *denfity*. Gold, platina, mercury, lead, filver, copper, iron, and tin.

2. *Opacity*. We cannot well compare metals with each other in this refpect, becaufe it is fo confiderable in all, that it feems complete. If, however, they differ in this refpect, the fame order will ferve for opacity as for denfity.

3. *Metallic luftre* or *brilliancy*. The fame obfervation which was made concerning the laft-mentioned property is applicable to this alfo. We muft however obferve, that as by polifh bodies are rendered brighter, and that as whitenefs contributes much to the reflexion of light, the whiteft and hardeft metals therefore reflect beft. Hence, according to Mr Macquer, platina ought to be placed firft; and then iron, or rather fteel, filver, gold, copper, tin, lead.

Hardnefs of metals may contribute much to the duration of their polifh; but certainly foft metals, if their texture be equally compact, are no lefs capable of receiving a polifh than hard metals. Some hard metallic allays have been found to be lefs liable to tarnifh than fofter compounds, and have for this reafon alfo been chiefly ufed for fpeculums. The property of reflecting light feems chiefly to depend on the clofenefs of the particles, or on the denfity, on the fmoothnefs of the furface, and on the colour being moft fimilar to the colour of the light to be reflected. The white metals, filver, mercury, tin, reflect light more abundantly than others. Gold, being the denfeft metal, and perhaps becaufe the colour of folar light has a flightly-yellowifh tinge, does alfo reflect light very copioufly. Hence fpeculums made of leaf-gold have been found to be very effectual. Iron or fteel reflects much lefs light than any of the above-mentioned metals, altho' Mr Macquer has confidered it as capable of a greater reflective power. Platina is generally in fo fmall grains, that its reflective power cannot eafily be determined. The precife degrees of that power which ought to be affigned to each of the above-mentioned metals, cannot without accurate experiments be afcertained. Perhaps, however, their reflective powers will be found to be more nearly in the following order, than in that abovementioned from Mr Macquer. Silver, quickfilver, tin, gold, copper, iron, lead.

4. *Ductility*. Gold, filver, copper, iron, tin, lead. The ductility of mercury and that of platina are not yet determined.

5. *Hardnefs*. Iron, platina, copper, filver, gold, tin, and lead.

6. *Tenacity*. By tenacity we underftand the force with which the integrant parts of metals refift their feparation. This force appears to be in a compound ratio of their ductility and hardnefs. The comparative tenacity of metals is meafured by the weight which wires of the fame diameter, made of the feveral metals, can fuftain without breaking. Gold is the moft tenacious, then iron, copper, filver, tin, lead. The tenacity of mercury is unknown: that of platina is not yet determined, but is probably confiderable.

7. *Fufibility*. Mercury, tin, lead, filver, gold, copper, iron, and laftly platina, which cannot be fufed by the greateft fire of our furnaces, but only by the folar focus, as Meffrs Macquer and Beaumé have determined.

SECT. II. *Of Mines and Ores in general.*

THE fubftances found naturally combined with metals, in the earth, are, particularly, fulphur and arfenic, fometimes feparately, but generally conjointly.

Me-

Metals combined with theſe ſubſtances are called *metals mineraliſed by ſulphur*, or *by arſenic*, or *by ſulphur and arſenic;* and theſe matters are called *mineraliſing* ſubſtances.

Beſides the ſulphur and arſenic with which metals are ſtrictly combined in the mineral ſtate, they are alſo pretty intimately combined with earthy ſubſtances, of different natures, and more or leſs divided.

Theſe different matters united together form maſſes which are compact, heavy, brittle, and frequently poſſeſſed of much metallic luſtre. Theſe ſubſtances are properly called *ores*, or the matter of mines.

Theſe ores are found in earths and ſtones of different kinds, as ſands, flints, cryſtals, ſlates, indurated clays, according to the ground in which they are contained. But two kinds of ſtones in particular ſeem to accompany ores; and have therefore been conſidered by ſeveral mineralogiſts as matrixes, in which metals are formed. One of theſe ſtones is a kind of cryſtal, generally white, milky, and ſemi-opake, ſtriking fire with ſteel, and of the claſs of vitrifiable earths. It is called QUARTZ.

The other ſtone is leſs hard, which does not ſtrike fire with ſteel, and is ſometimes milky like quartz; ſometimes tranſparent and diverſely coloured, conſiſting of rhomboidal cryſtals, which are compoſed of plates and faces. This ſtone becomes more ſoft and friable by being expoſed to fire. It is called *ſpar.* Spar is more like to gypſeous ſtones than to any other, but it differs from gypſeous ſtones in poſſeſſing a much greater denſity. Some ſpars are ſo heavy, that they exceed in this reſpect all other ſtones. See SPAR.

Theſe earthy and ſtony ſubſtances form the *matrix of the ore.*

Ores are natural compounds, containing metals allayed with different ſubſtances.

Excepting gold, and a very ſmall quantity of each of the other metals found in ſome places ſo pure as to poſſeſs all their characteriſtic properties, nature exhibits to us metals and ſemimetals differently allayed not only with each other, but alſo with ſeveral heterogeneous ſubſtances, which ſo alter and diſguiſe their qualities, that in this ſtate they cannot ſerve for any of the purpoſes for which they are proper when they are ſufficiently pure.

Ores conſiſt, 1. Of metallic ſubſtances *calcined;* or, 2. Of theſe ſubſtances combined with other matters, with which they are ſaid to be *mineraliſed.*

Calcined metallic ſubſtances, or *calciform ores*, are metallic ſubſtances deprived of phlogiſton, and in the ſtate of a calx or metallic earth. Such are all *ferruginous ochres*, which are calxes of iron.

Mineraliſed ores, are, 1. *Simple*, containing only one metallic ſubſtance: or, 2. *Compound*, containing two or more metallic ſubſtances.

Of the ſimple, and alſo of the compound ores, four kinds may be diſtinguiſhed.

1. Ores conſiſting of metallic ſubſtances mineraliſed by *ſulphur.* Such is the lead-ore called *galena*, compoſed of lead and ſulphur.

2. Ores conſiſting of metallic ſubſtances mineraliſed by *arſenic.* Such is the *white pyritis*, containing iron and arſenic.

3. Ores conſiſting of metallic ſubſtances mineraliſed *by ſulphur and by arſenic.* Such is the *red ſilver-ore*, containing ſilver, arſenic, and ſulphur.

4. Ores conſiſting of metallic ſubſtances mineraliſed by *ſaline matters.* Such are the *native vitriols.* Such alſo is probably the *corneous ſilver-ore*, which, according to Mr Cronſtedt's opinion, is a luna cornea, or ſilver combined with marine acid. Of this kind of ores, or native metallic ſalts, is perhaps the *ſedative ſalt of borax*, which from Mr Cadet's experiments, publiſhed in the Memoirs of the Royal Academy for the year 1766, is conjectured to be copper combined with marine acid, and which has been ſaid to be found native. To this claſs alſo may be referred the *ſilver mineraliſed by an alkaline ſubſtance*, which Mr Von Juſti pretends to have diſcovered.

Henckel, and after him Cramer, and the author of the Dictionary of Chemiſtry, pretend, that in mineraliſed ores, beſides the above-mentioned metallic and mineraliſing ſubſtances, are alſo contained a metallic and an unmetallic earth. But Wallerius affirms, that the exiſtence of ſuch earths cannot be ſhewn, and that ſulphur is incapable of diſſolving unmetallic earths, and even the calxes of all metallic ſubſtances, excepting thoſe of lead, biſmuth, and nickel.

Having thus defined and diſtinguiſhed the ſeveral general claſſes of ores, we proceed to ſhew how they are lodged, and where they are found.

Metals and *metalliferous ores are found* in various places.

I. They are found *under water;* in beds of rivers, lakes, and ſeas, and chiefly at the flexures of theſe: ſuch are the auriferous and ferruginous ſands, grains of native gold, ochres, and fragments of ores waſhed from mines.

II. They are found *diſſolved in water:* ſuch are the vitriolic waters containing iron, copper, or zinc.

III. They are found *upon the ſurface of the earth.* Such are many ochres; metalliferous ſtones, ſands, and clays; and lumps of ores. Mr Gmelin ſays, that in the northern parts of Aſia ores are almoſt always found upon or near the ſurface of the ground.

IV. They are found *under the ſurface of the earth.* When the quantity of theſe collected in one place is conſiderable, it is called a *mine.*

Subterranean metals and ores are differently diſpoſed in different places.

1. Some are *infixed in ſtones and earths*, formed *nodules* or *ſpots* diverſely coloured.

2. Some are equably and *uniformly diffuſed through the ſubſtance of earths and ſtones*, to which they give colour, denſity, and other properties. Such are the greateſt part of thoſe earths, ſtones, ſands, clays, cryſtals, flints, gems, and fluors, which are coloured.

3. Some form *ſtrata* in mountains. Such are the ſlates containing pyrites, copper-ore, lead-ore, ſilver-ore, or blend. Theſe lie in the ſame direction as the ſtrata of ſtones betwixt which they are placed; but they differ from the ordinary ſtrata in this circumſtance, that the thickneſs of different parts of the ſame metalliferous ſtratum is often very various; whereas the thickneſs of the ſtony ſtrata is known to be generally very uniform.

4. *Fragments of ores* are frequently found accumulated in certain ſubterranean cavities, in fiſſures of mountains, or interpoſed betwixt the ſtrata of the earth.

earth. These are loose, unconnected, frequently involved in clay, and not accreted to the contiguous rocks or strata immediately, nor by intervention of spar or of quartz, as the ores found in veins are. Tin and iron mines are frequently of the kind here described.

5. Large entire masses of ores are sometimes found in the stony strata of mountains. These are improperly called *cumulated veins*, because their length, relatively to their breadth and depth, is not considerable.

6. Some instances are mentioned of *entire mountains* consisting of ore. Such is the mountain Taberg in Smoland; and such are the mountains of Kerunavara and Luosavara in Lapland, the former of which is 1400 perches long and 100 perches broad. These mountains consist of iron-ore.

9. Lastly, and chiefly, metals and ores are found in oblong tracts, forming masses called *veins*, which lie in the stony strata composing mountains.

The direction of veins greatly varies; some being straight, and others curved. Their position also respecting the horizon is very various; some being perpendicular, some horizontal, and the rest being of the intermediate degrees of declivity.

The dimensions, the quality, and the quantity of contents, and many other circumstances of veins, are also very various. Miners distinguish the several kinds of veins by names expressive of their differences. Thus veins are said to be *deep; perpendicular; horizontal*, or *hanging*, or *dilated; rich; poor; morning, noon, evening*, and *night* veins, by which their direction towards that point of the compass where the sun is at any of these divisions of the natural day, is signified.

The stratum of earth or stone lying above a vein is called its *roof:* and the stratum under the vein is called its *floor*.

Some parts of veins are considerably thicker than others. Small veins frequently branch out from large veins, and sometimes these branches return into the trunk from which they issued. These veins from which many smaller veins depart, have been observed to be generally rich.

Veins are terminated variously: 1. By a gradual diminution, as if they had been compressed, while yet soft, by superincumbent weight; or by splitting and dividing into several smaller veins. Or, 2. They are terminated abruptly, together with their proper strata in which they lie. This abrupt termination of veins and strata is occasioned by their being crossed by new strata running transversely to the direction of the former; or by perpendicular fissures through the strata; which fissures are frequently filled with alluvial matters, or with water, or are empty. These perpendicular fissures seem to have been occasioned by some rupture or derangement of the stratum through which the vein passes, by which one part of it has been raised or depressed, or removed aside from the other, probably by earthquakes. Where the veins are terminated abruptly, it does not cease, but is only broken and disjoined; and is often recovered by searching in the analogous parts of the opposite side of the deranged stratum. A principal part of the art of miners consists in discovering the modes of these derangements from external marks, that they may know where to search for the disjoined vein.

The *contents of veins* are metals and metalliferous minerals; as, the several kinds of ores, pyrites, blends, guhrs, vitriols; the several kinds of fluors, spars, quartz, horn-blend, in which the ores are generally embedded, or inveloped, and to which therefore the name *matrix of the ore* is applied; stalactites; crystallizations of these metalliferous and stony substances encrusting the small cavities of the circumjacent rock; and lastly, water, which flows or drops through crevices in that rock.

In a vein, ores are found sometimes attached to the rock or stratum through which the vein runs, but more frequently to a matrix which adheres to the rock; and sometimes both these kinds of adhesion occur in the same vein at different places. Frequently betwixt the matrix and the rock is interposed a thin crust of stone or of earth, called by authors the *fimbria of the ore*.

The *matrix* or the stone in which the ore lies inveloped is of various kinds in different veins. And some kinds of stone seem better adapted than others to give reception to any ore, or to the ores of particular metals. Thus quartz, spar, fluors, and hornblend, give reception to all ores and metals; but slates, chiefly to copper and silver, and never to tin; calcareous and sparry matrixes, to lead, silver, and tin; and mica to iron.

Veins lie in strata of different kinds of stone; but more frequently in some kinds of stone than in others. Thus of the simple or uncompounded stones which compose strata, the following are metalliferous: *Calcareous stones; slaty sand-stone* (cos fissilis arenosus Wallerii); *feltspar* (spatum pyrimachum sive scintillans); *quartz;* sometimes *jasper;* frequently *slates;* and chiefly *micaceous* or *talky* stones; and *hornblend*, (lapis corneus Wallerii; bolus indurata particulis squamosis Cronstedt). No veins have been found in gypseous or in siliceous strata, although *chertz* and *flints* frequently contain metallic particles, and some instances have been observed of ores of silver and of tin in *alabaster*. Of compound stones, those are said to be chiefly metalliferous which consist of particles of hornblend. Veins have also been found in the *red granite;* but seldom, if ever, in any other *granite*, or in *porphyry*. In general, veins are more frequently found in soft, fissile, and friable strata, than in those which are compact and hard.

A vein sometimes passes from one stratum into the inferior contiguous stratum. Sometimes even the veins of one stratum do so correspond with those of an inferior stratum, the contiguity of which with the former is interrupted by a mass of different matter thro' which the veins do not pass, that they seem originally to have been continued from one stratum to the other. Thus in the mines of Derbyshire, where the veins lie in strata of limestone, the contiguity of which strata with each other is interrupted in some places by a blue marle or clay, and in other places by a compound stone called *toadstone;* the veins of one stratum frequently correspond with the veins of the inferior stratum of limestone, but are never continued through the interposed clay or toadstone. But we must observe, that these interposed masses, the blue marle, clay, and toadstone, have not the uniform thickness ob-

obfervable in regular ftrata, but are (efpecially the toadftone) in fome places a few feet in depth, and in others fome hundreds of yards. The above difpofition feems to indicate, that thefe feveral ftrata of limeftone have been originally contiguous; that the veins now disjoined have been once continued; that thefe ftrata of limeftone have been afterwards feparated by fome violent caufe, probably by the fame earthquakes which have in a fingular manner fhattered the ftrata of this mountainous country; that the interftices thus formed between the feparated ftrata have been filled with fuch matters as the waters could infinuate, probably with the mixed comminuted ruins of fhattered ftrata; or with the lava of neighbouring volcanoes, of which many veftiges remain.

To the above hiftorical fketch of mines, we fhall add fome conjectural remarks concerning their *formation*.

Thofe ores which are found under water (I.); upon the furface of the earth (III.); in fiffures of mountains and fubterraneous cavities, accumulated, but not accreted to the contiguous rocks, (IV. 4.); feem from their loofe, unconnected, broken appearances, to have been conveyed by alluvion.

All martial ochres have probably been feparated from vitriolic ferruginous waters (II.) either fpontaneoufly or by calcareous earth; and thefe waters feem to have acquired their metallic contents by diffolving the vitriol which is produced by the fpontaneous decompofition of martial pyrites. The ochres of copper, zinc, and perhaps of feveral other metals, have probably been precipitated from vitriolic waters by fome fubftance, as calcareous earth, more difpofed to combine with acids; and thefe vitriolic waters have probably been rendered metalliferous, by diffolving the vitriols produced by a combuftion of cupreous pyrites and of the ore of zinc called *blend;* for thefe minerals are not, as martial pyrites is, fufceptible of decompofition fpontaneoufly, that is, by air and moifture.

The metalliferous nodules and fpots (IV. 1.) feem to have been infixed in ftones while thefe were yet foft. Perhaps the metalliferous and lapideous particles were at once diffolved and fufpended in the fame aqueous menftruum, and during their concretion cryftallized diftinctly, as different falts do when diffolved in the fame fluid.

The earths and ftones uniformly coloured by metals (IV. 2.) were alfo probably in a foft ftate while they received thefe tinges. The opake-coloured ftones feem to have received their colour from metallic calxes mixed and diffufed through the foft lapideous fubftance; and the tranfparent-coloured ftones have probably received their colours from vitriolic falts, or from metallic particles diffolved in the fame water which foftened or liquefied the ftony fubftance; which metallic falts and particles were fo much diffufed, that they could not be diftinctly cryftallized. That all ftones have been once liquid and diffolved in water, appears probable not only from their regular cryftallized forms, but alfo the folubility of fome ftones, as of gypfeous and calcareous earths, in water; and from the water which we know is contained in the hardeft marbles, as well as in alabafters; to which water thefe ftones owe the cryftallization of their particles.

The veins called *cumulated* (IV. 5.), and the entire metalliferous mountains (IV. 6.), are believed by Wallerius to be analogous to the nodules (IV. 1.) Thefe metalliferous fubftances feem to have been originally formed or concreted in the places where they are found.

The metalliferous ftrata (IV. 3.) have probably been infinuated between the lapideous ftrata, after the feparation of thefe from each other by fome violent caufe; in the fame manner in which we fuppofed that the clay and toadftone have been infinuated betwixt the feveral ftrata of lime-ftone in Derbyfhire. The matters thus infinuated may have been either fluid, which would afterwards cryftallize and form entire regular maffes; or they may have been the ruins of fhattered ftrata and veins brought by waters, and there depofited; in which cafe they will appear broken and irregular. The metalliferous ftrata, although frequently confounded with the horizontal or dilated veins, may be diftinguifhed, according to Wallerius, from thefe by the following properties: 1. They are generally thinner and much broader than the veins called *dilated*. 2. They are feldom found at a greater depth than 100 perches, and generally in the neighbourhood of veins from which they probably have received their contents. 3. From their want of the thin encruftations called *fimbriæ;* which, we obferved, are frequently interpofed betwixt the rock and the ore or its matrix; and from their want of the other properties of veins.

But in *veins* properly fo called, the ftrongeft marks exift of ores having been there concreted, and not carried thither and depofited in their prefent ftate. Their regular, unbroken appearance; their accretion to the contiguous rock, either immediately, or by intervention of a matrix; the regular appearance of this matrix inveloping the ore; the frequent cryftallization of the ore, and of the other contents of the vein, indicate that ores, as well as the other folid contents, have been there concreted from a fluid to a folid ftate.

Moft authors believe that veins, and the perpendicular clefts in the ftony ftrata of mountains, called *fiffures*, have been produced by the fame caufe; or rather, they confider veins only as fiffures filled with metalliferous matters. They further believe, that fiffures have been occafioned by the exficcation of ftrata, while thefe were paffing from a fluid to a folid ftate. Wallerius thinks, that fiffures have been formed from exficcation; but that veins were channels made through the ftrata, while yet foft and fluid, by water, or by the more fluid parts of the ftrata penetrating and forcing a paffage through the more folid parts. He thinks, that thefe fluid parts conveyed thither their metalliferous and ftony contents, which were there coagulated or concreted. He fupports his opinion by obferving, that all the veins of the fame ftratum generally run parallel to each other; that they frequently bend in their courfe; that the fame vein is fometimes contracted, and fometimes dilated; that veins are frequently terminated by being fplit, or divided into inferior veins; that veins are frequently wider at bottom than at top, whereas fiffures are always wideft at top, and are very narrow below; all which appearances, he thinks, could not have been produced by exficcation. From thefe reafons,

Formation of Mines.

sons, fissures appear to have had a different, and, from the disjunction and rupture of veins crossed by fissures, they seem to have had a later origin than veins. Whether fissures could have been produced by the very gradual exsiccation of these large masses of strongly coherent matter; or whether they have been produced by the same violent causes, namely, *earthquakes*, by which the strata in which fissures are generally found have been broken and deranged, and by which metalliferous mountains themselves have been formed, or their strata raised above their original level, as some authors have with great probability conjectured, we do not pretend to determine.

Veins are seldom, if ever, found but in mountains. The reason of which may not improbably be, that in metalliferous mountains we have access to the more ancient strata of the earth, which in plains are covered with so many deposited, alluvial, and other later strata, that we can seldom, if ever, reach the former. That these mountains consist of strata which have been originally lower than the upper strata of adjacent plains, appears from an observation which has been made, that the strata of mountainous countries dip with more or less declivity as they approach the plains, till they gradually sink under the several strata of those plains, and are at last immersed beyond the reach of miners. This leading fact in the natural history of the earth has been observed by a sagacious philosopher, Mr Mitchell, in his *Conjectures concerning Earthquakes*, Phil. Transf. 1760.

That the inferior strata of the earth contain large quantities of pyritous, sulphureous, and metalliferous matters, appears, 1. From the subterranean fires in those inferior strata, which produce volcanoes, and probably earthquakes, as Mr Mitchell ingeniously conjectures. 2. From the observation, that all kinds of mountains are not equally metalliferous; but that veins especially are only found in those mountains which, being composed of very ancient strata, are called *primæval*, which form the chains and extensive ridges on the surface of the earth, which direct the course of the waters, and which consist of certain strata, the thickness of each of which, its generic qualities, and its position relatively to the other strata, are, in different parts of the chain of mountains where that stratum is found, nearly uniform and alike, notwithstanding that the numbers and the inclinations of the strata composing contiguous mountains, or even different parts of the same mountain, are often very various; and therefore that veins are seldom, if ever, found in the mountains called by authors *diluvial* and *temporary*, which are single, or detached, which consist not of strata uniformly disposed, but of alluvial masses, in which fragments of ores may be sometimes, but veins never, found. Nevertheless, single and seemingly detached mountains, in small islands, have sometimes been found to be metalliferous. But we must observe, that these mountains consist of uniform strata; that islands themselves, especially small islands, may be considered as eminent parts of sub-marine ranges of mountains, and that the mountains of such islands may be considered as apices or tops only of inferior mountains.

Those mountains are said to be most metalliferous which have a gentle ascent, a moderate height, and a broad basis, the strata of which are nearly horizontal, and not much broken and disjoined. In these mountains at least the veins are less interrupted, more extended, and consequently more valuable to miners, than the veins in lofty, craggy, irregular, and shattered mountains.

Authors dispute concerning the time in which ores have been formed; some referring it to the creation of the world, or to the first subsequent ages; and others believing that they have been gradually from all times, and are now daily, formed. From the accretion of ores and of their matrices to their proper rocks, and from the insertion of metalliferous nodules and striæ in the hardest stones, we are inclined to believe that the matter of these veins and nodules are nearly coeval with the rocks and stones in which they are inveloped. Nevertheless, we cannot doubt that small quantities at least of ores are still daily formed in veins, fissures, and other subterranean cavities. Several well-attested instances confirming this opinion are adduced by authors: Cronstedt mentions an incrustation of silver-ore that was found adhering to a thin coat of lamp-black or of soot, with which the smoke of a torch had soiled a rock in a mine at Koningsberg in Norway; and that this incrustation of silver-ore had been formed by a metalliferous water passing over the rock. Lehman affirms, that he possesses some silver-ore attached to the step of a ladder found in a mine in Hartz, which had been abandoned 200 years ago; and that several steps of ladders similarly incrusted had been found. Many other instances are mentioned by authors, of galena, pyrites, silver-ores, and other metalliferous substances, having been found adhering to wood, to fossil-coal, to stalactitical incrustations, to oyster-shells, and other recent substances. From these, and from similar instances, it is probable, that not only ochres and fragments of ores may, with other alluvial matters, be now daily deposited, but also that small quantities of mineralized ores are recently formed; although many histories mentioned by Becher, Barba, Henckel, and other authors, of the entire renovation of exhausted veins, and especially those of the growth and vegetation of metals and of ores, appear to be at least doubtful.

Various opinions have been published concerning the formation of mineralized ores. According to some, these ores were formed by congelation of the fluid masses found in mines, called *Guhrs*. Other authors believe, that ores have been formed by the condensation of certain mineral, metallic, sulphureous, and arsenical vapours, with which they suppose that mines abound. Some have even affirmed, that they have seen this vapour condense, and become in a few days changed into gold, silver, and other metallic matters. It has been above observed, that from several appearances which occur in veins, there is great reason to believe, that ores have not been carried thither and deposited in their present state, but have been there *concreted* and *crystallized*; that is, changed from a fluid to a solid state. But the fluidity of the metalliferous matters at the time of their entrance into veins, may have been occasioned either by their having been *dissolved in water*, if they were capable of such solution, or by their having been raised in form of *vapour* by subterranean fires. For the disposition to crystallize is

is acquired by every homogeneous fubftance that is fluid, whether it has received its fluidity by being melted by fire, or by being diffolved in a liquid menftruum, or by being reduced to the ftate of vapour. Thus cryftals of fulphur have been obferved to be daily formed by the fulphureous vapours which exhale in the neighbourhood of volcanoes. The volatility of the two mineralifing fubftances fulphur and arfenic, and the power which volatile bodies poffefs of elevating a certain portion of any fixed matter which happens to be united with them, render it probable, that the greateft part at leaft of mineralifed ores have been formed of vapours exhaled from fubterranean fires, through the cracks in the intervening ftrata occafioned by thofe earthquakes which have, in a fingular manner, broke and deranged the ftrata of metalliferous countries, and which, as has been above remarked, have been probably occafioned by, at leaft have certainly been always accompanied with, fubterranean fires.

SECT. III. *Of the Pyrites.*

PYRITE is a mineral refembling the true ores of metals, in the fubftances of which it is compofed, in its colour or luftre, in its great weight, and, laftly, in the parts of the earth in which it is found, fince it almoft always accompanies ores. It is, like ores, compofed of metallic fubftances, mineralized by fulphur or by arfenic, or by both thefe matters, and of an unmetallic earth intimately united with its other principles.

Notwithftanding the conformity of pyrites with ores properly fo called, fome chemifts and metallurgifts diftinguifh the former from the latter minerals; becaufe the proportion and connection of the materials compofing the pyrites differ much from thofe of ores. Thus, although fometimes pyrites contains more metal than fome ores, yet generally it contains lefs metal, and a larger quantity of mineralizing fubftances, fulphur and arfenic, and particularly of unmetallic earth. The connection of thefe matters is alfo much ftronger in pyrites than in ores, and they are accordingly much harder; fo that almoft every pyrites can ftrike fparks from fteel.

From the above property of ftriking fparks from fteel they have been called *pyrites;* which is a Greek word fignifying *fire-ftone.* Pyrites was formerly ufed for firearms, as we now ufe flints; hence it was called *carabine-ftone.* It is ftill named by fome *marcafite.* Perhaps no other kind of natural body has received fo many names. Perfons curious to known the other names lefs ufed than thofe we have mentioned, may find them in *Henckel's Pyritologia.* We think, with that celebrated chemift, that the fubject has been perplexed by this multiplicity of names; for before his great and excellent work, the notions concerning pyrites were very confufed and inaccurate.

Pyrite differs alfo from ores by its forms and pofitions in the earth. Although pyritous metals generally precede, accompany, and follow veins of ores; they do not, properly fpeaking, themfelves form the oblong and continued maffes called *veins,* as ores do; but they form maffes fometimes greater and fometimes fmaller, but always diftinct from each other. Large quantities of them are often found unaccompanied by ores. They are formed in clays, chalk, marles, marbles, plafters, alabafters, flates, fpars, quartz, granites, cryftals, in a word, in all earths and ftones. Many of them are alfo found in pit-coals and other bituminous matters.

Pyrites is alfo diftinguifhable from ores by its luftre and figure; which is almoft always regular and uniform, externally or internally, or both. Some ores indeed, like thofe of lead, many ores of filver, and fome others, have regular forms, and are in fome manner cryftallized; but this regularity of form is not fo univerfal and fo confpicuous in ores as in pyrites. The luftre of pyrites feems to be caufed by its hardnefs, and the regularity of its form by the quantity of mineralizing fubftances which it contains.

By all thefe marks we may eafily, and without analyfis, diftinguifh pyrites from true ores. When we fee a mineral that is heavy, poffeffed of metallic luftre, and of any regular form, the mafs of which appears evidently to be entire, that is, not to have been a fragment of another mafs, and which is fo hard as to be capable of ftriking fparks from fteel, we may be affured that fuch a mineral is a pyrites, and not an ore.

The clafs of pyrites is very numerous, various, and extenfive. They differ one from another in the nature and proportions of their component parts, in their forms, and in their colours. The forms of thefe minerals are exceedingly various. No folid, regular or irregular, can eafily be conceived, that is not perfectly imitated by fome kind of pyrites. They are fpherical, oval, cylindrical, pyramidal, prifmatical, cubic; they are folids with 5, 6, 7, 8, 9, 10, &c. fides. The furface of fome is angular, and confifts of many bafes of fmall pyramids; while their fubftance is compofed of thefe pyramids, the points of which all unite in the centre of the mafs.

Pyritous minerals differ alfo in their component fubftances. Some of them are called *fulphureous, martial, cupreous, arfenical,* as one or other of thefe fubftances predominate. We muft obferve with Henckel, whofe authority is very great in this fubject, that in general all pyrites are martial; as ferruginous earth is the effential and fundamental part of every pyrites. This earth is united with an unmetallic earth, with fulphur or arfenic, or with both thefe matters; in which cafe, the fulphur always predominates over the arfenic, as Henckel obferves. He confiders thefe as the only effential principles of pyrites; and believes that all the other matters, metallic or unmetallic, which are found in it, are only accidental; amongft which he even includes copper, although fo much of it exifts in fome kinds of pyrites, that thefe are treated as ores of copper, and fometimes contain even 50lb. of copper each quintal. Many other metals, even gold and filver, are fometimes combined in pyrites; but thefe are lefs frequent, and the precious metals always in very fmall quantities; they are therefore juftly to be confidered as accidental to pyrites. The different fubftances compofing pyrites fenfibly affect its colours. Henckel diftinguifhes them in general into three colours, white, yellowifh or a pale yellow, and yellow. He informs us, that thefe three colours are often fo blended one with another, that they cannot be eafily diftinguifhed unlefs when compared together.

The white pyrites contain moft arfenic, and are fimilar to cobalt and other minerals abounding in arfenic. The Germans call them *mifpickel* or *mifpilt.* Iron and

and arſenic form the greateſt part of this pyrites. As arſenic has the property of whitening copper; ſome pyritous minerals almoſt white, like that of Chemnitz in Miſnia, are found to contain 40 pounds of copper per quintal, and which are ſo much whitened by the arſenic, that they are very like white pyrites. But Henckel obſerves, that theſe pyritous matters are very rare, and are never ſo white as the true white pyrites, which is only ferruginous and arſenical.

Yellowiſh pyrites is chiefly compoſed of ſulphur and iron. Very little copper and arſenic are mixed with any pyrites of this colour, and moſt of them contain none of theſe two metallic ſubſtances. This is the moſt common kind of pyrites: it is to be found almoſt every where. Its forms are chiefly round, ſpherical, oval, flattened, cylindrical; and it is compoſed internally of needles or radii, which unite in the centre, or in the axis of the ſolid.

Yellow pyrites receives its colour from the copper and ſulphur which enter into its compoſition. Its colour, however, is inclined to a green; but is ſufficiently yellow to diſtinguiſh it from the other two kinds of pyrites, particularly when they are compared together. To make this compariſon well, the pyrites muſt be broken, and the internal ſurfaces muſt be placed near each other. The reaſon of this precaution is, that the colour of minerals is altered by expoſure to the air.

Perſons accuſtomed to theſe minerals can eaſily diſtinguiſh them. The chief difficulty is, to diſtinguiſh white pyrites from cobalt and other minerals; which alſo contain ſome copper and much arſenic.

Hence then we ſee, that arſenic is the cauſe of whiteneſs in pyrites, and is contained in every pyrites of that colour; that copper is the principal cauſe of the yellow colour of pyrites; and that every pyrites which is evidently yellow contains copper; that ſulphur and iron produce a pale-yellow colour, which is alſo produced by copper and arſenic; hence ſome difficulty may ariſe in diſtinguiſhing pyrites by its colours. We may alſo obſerve, that ſulphur and arſenic, without any other ſubſtance, form a yellow compound, as we ſee from the example of orpiment or yellow arſenic. Thus, although the colours of the pyrites enable us to diſtinguiſh its different kinds, and to know their nature at firſt ſight, particularly when we have been accuſtomed to obſerve them; yet we cannot be entirely certain concerning the true nature of theſe minerals, and even of all minerals in general; that is, to know preciſely the kinds and proportions of their component ſubſtances, but by chemical analyſis and decompoſition.

Beſides the above-mentioned matters which compoſe pyrites, it alſo contains a conſiderable quantity of unmetallic earth; that is, an earth which cannot by any proceſs be reduced to metal. Henckel, Cramer, and all thoſe who have examined this matter, mention this earth, and prove its exiſtence.

We ought to obſerve, that this earth is combined with the other principles of the pyrites, and not merely interpoſed betwixt its parts. It muſt therefore be diſtinguiſhed from other earthy and ſtony matters mixed accidentally with pyrites, and which do not make a part of the pyrites, ſince they may be ſeparated by mechanical means, and without decompoſing that mineral: but the earth of which we now treat is intimately united with the other conſtituent parts of the pyrites, is even a conſtituent part of pyrites, and eſſential to the exiſtence of this mineral, and cannot be ſeparated but by a total decompoſition of it.

According to Henckel, this unmetallic earth abounds much in the white pyrites, ſince he found from the analyſes which he made, that the iron, which is the only metal exiſting in theſe pyrites, is only about $\frac{1}{16}$th part of the fixed ſubſtance that remains after the arſenic has been expelled by torrefaction or ſublimation.

A much larger quantity of iron is in the pale-yellow pyrites, according to Henckel. The proportion of iron is generally about twelve pounds to a quintal of pyrites, and ſometimes 50 or 60 pounds: this is therefore called *martial pyrites*. It contains about $\frac{1}{4}$ of its weight of ſulphur, and the reſt is unmetallic earth.

The quantity of unmetallic earth contained in the yellow or cupreous pyrites, which are alſo martial, ſince, as we have obſerved, iron is an eſſential part of every pyrites, has not yet been determined. They probably contain ſome of that earth, tho' perhaps leſs of it than the others.

The nature of this unmetallic earth of pyrites has not been well examined. Henckel thinks that it is an earth diſpoſed already by nature to metallization, but not ſufficiently elaborated to be conſidered as a metallic earth. This opinion is not improbable; but as alum may be obtained from many pyrites, may we not ſuſpect that this unmetallic earth is of the nature of the baſis of alum or argillaceous earth? Perhaps alſo this earth is different in different kinds of pyrites. The ſubject deſerves to be well examined.

Although pyrites is not ſo valuable as true ores, becauſe in general it contains leſs metal, and but exceedingly little of the precious metals; and becauſe its metallic contents are ſo difficult to be extracted, that, excepting cupreous pyrites, which is called *pyritous copper ore*, it is not worked for the ſake of the contained metal; yet it is applied to other purpoſes, and furniſhes us with many uſeful ſubſtances; for from it we obtain all our green and blue vitriols, much ſulphur, arſenic, and orpiment. *See the principal proceſſes by which theſe ſubſtances are extracted from pyrites, under the* ſection SMELTING *of* ORES.

As all pyrites contain iron, and moſt of them contain alſo ſulphur; as the pyrite moſt frequently found contains only theſe two ſubſtances with the unmetallic earth; and as iron and ſulphur have a ſingular action upon each other when they are well mixed together and moiſtened; hence many kinds of pyrites, particularly thoſe which contain only the principles now mentioned, ſuſtain a ſingular alteration, and even a total decompoſition, when expoſed during a certain time to the combined action of air and water. The moiſture gradually penetrates them, divides and attenuates their parts; the acid of the ſulphur particularly attacks the martial earth, and alſo the unmetallic earth, its inflammable principle is ſeparated from it, and is diſſipated. While theſe alterations happen, the pyrites changes its nature. The acid of the ſulphur which is decompoſed, forms with the fixed principles of the pyrites, vitriolic, aluminous, and ſelenitic ſalts; ſo that a pyrites, which was once a ſhining, compact, very hard mineral, becomes in a certain time a greyiſh, ſaline,

line, powdery mafs, the tafte of which is faline, auftere, and ftyptic.

Laftly, if this mafs be lixiviated with water, cryftals of vitriol, and fometimes of alum, according to the nature of the pyrites employed, may be obtained by evaporation and cryftallization.

This alteration and fpontaneous decompofition of pyrites, is called *efflorefcence* and *vitriolization;* becaufe the pyrites become covered with a faline powder, and becaufe vitriol is always formed. This vitriolization is more or lefs quickly accomplifhed in pyrites according to its nature. It is a kind of fermentation excited by moifture amongft the conftituent parts of thefe minerals; and it is fo violent in thofe which are moft difpofed to it, that is, in the pale-yellow pyrites, which contain chiefly fulphur and iron, that when the quantity of thefe is confiderable, not only a fulphureous vapour and heat may be perceived, but alfo the whole kindles and burns intenfely. The fame phenomena are obfervable, and the fame refults are formed, by mixing well together, and moiftening a large quantity of filings of iron and powdered fulphur; which experiment Lemeri has made, to explain the caufes of fubterranean fires and volcanos.

We cannot doubt that, as the earth contains very large maffes of pyrites of this kind, they muft undergo the fame changes when air and moifture penetrate the cavities containing them; and the beft natural philofophers agree, that very probably this furprifing decompofition of pyrites is the caufe of fubterranean fires, of volcanos, and of mineral waters, vitriolic, aluminous, fulphureous, hot and cold.

No other pyrites is fubject to this fpontaneous decompofition when expofed to humid air, but that which is both martial and fulphureous; that is, the pale-yellow pyrites. The arfenical pyrites, or that which contains little or no fulphur, is not changed by expofure to air. This latter kind is harder, heavier, and more compact, than the former. The pyrites which is angular and regularly fhaped, is chiefly of this kind. Mr Wallerius, in his Mineralogy, propofes to diftinguifh this kind of pyrites by the name of *marcafite.* When cut, it may be polifhed fo well as to give a luftre almoft equal to that of diamonds, but without refracting or decompofing the light; for it is perfectly opake. It has been employed fome years paft in the manufacture of toys, as of buckles, necklaces, &c. and is called in commerce *marcafite.*

We cannot, however, concur with Mr Macquer, (from whom the above is taken), in thinking that there is fufficient reafon for confidering the minerals called *pyrites*, as a diftinct clafs of fubftances from ores. They have indeed no mark by which they can certainly and conftantly be diftinguifhed from thefe. The hardnefs or property of ftriking ignited fparks from fteel is not common to all the fubftances generally called *pyrites;* for we find fome of thefe enumerated by mineralogifts which have not that property. Wallerius even mentions a pyrites which contains no iron, altho' that metal is thought by Henckel to be effential to pyrites. The diftinction of pyrites from ores has been chiefly introduced by miners; becaufe the greateft part of the former minerals contain fo little metal, and fo much of the mineralizing fubftances, fulphur, or arfenic, that they are feldom fmelted. Neverthelefs, fome kinds of pyrites are found which contain fo much copper, that they are fmelted with great profit. Accordingly, fome later mineralogifts confider the cupreous yellow pyrites as an ore of copper, the pale-yellow martial pyrites as an ore of iron; and the white arfenical pyrites as an ore of arfenic. See Ores *of* Copper, Iron, and of Arsenic, *infra.*

Sect. IV. *Effaying of Ores in general.*

Essays are chemical operations made in fmall, to determine the quantity of metal or other matter which is contained in minerals; or to difcover the value or purity of any mafs of gold or filver. The former kind is the fubject of the prefent fection; the latter is treated under the word Essays, in the order of the alphabet.

Before effays of ores can be well made, a preliminary knowledge of the nature of the feveral metallic minerals ought to be attained. Each metal has its proper and improper ores, which have peculiar characters and appearances: hence perfons accuftomed to fee them, know pretty nearly, by the appearance, weight, and other obvious qualities, what metal is contained in a mineral. A good effayer ought to be very intelligent in this matter, that he may at once know what the proper operations are which are requifite to the effay of any given mineral.

As metals are very unequally diftributed in their ores, we fhould be apt to make falfe and deceitful effays, if we did not ufe all poffible precautions that the proportionable quantity of metal produced by an effay fhall be nearly the medium contained in the whole ore. This is effected by taking pieces of the mineral from the feveral veins of the mine if there be feveral, or from different places of the fame vein. All thefe minerals are to be fhook together with their matrixes. The whole is to be well mixed together, and a convenient quantity of this mixture is to be taken for the effay. This is called the *lotting* of the ore.

As effays, particularly the firft, are generally made in fmall, effayers have very fmall weights correfponding to the weights ufed in the great; that is, to the quintal or hundred pounds weight, to pounds, ounces, drams, &c. The effay quintal and its fubdivifions, vary according to the difference of weights in different countries; and this occafions fome confufion, when thefe weights are to be adjufted to each other. Tables of thefe weights are found in treatifes of effaying; and particularly in that written by Schlutter, and tranflated and rendered more complete by Hellot, which contains all the details neceffary for the fubject.

The cuftom is to take, for the effay quintal, a real weight of a gros, or dram, which in France is equal to 72 grains; but as the whole dram reprefents 100 pounds, each grain reprefents a pound and a fraction of a pound; and hence fome difficulty and confufion arife in making the fubdivifions. A better method is that of Mr Hellot, which is to make the fictitious or effay quintal equal to 100 real grains, and then each grain reprefents a real pound. This effay quintal is fufficiently exact for ores of lead, tin, copper, iron, antimony, bifmuth, and mercury. But for ores of filver and gold, another reprefentation is convenient: for thefe metals, as Mr Hellot fays, are generally in fo fmall quantity, that the button or fmall piece of metal ob

obtained in the essay could not be accurately weighed if 100 real grains were made to represent a quintal; and the difficulty of separating the gold from so small a quantity would be still greater. These motives have induced Mr Hellot to use for these ores a fictitious quintal 16 times bigger; that is, equal to 1600 real grains, which represent 1600 ounces; that is, 100lb. or quintal. The ounce being represented by a grain, its several subdivisions must be represented by fractions of a grain. Thus 12 grains of the fictitious quintal correspond with $\frac{5}{48}$ of a real grain (B); and this latter quantity may be accurately weighed in essay-balances, which when well made are sensible to a much less weight. See *(Essay)* BALANCE.

When a quintal of an ore to be essayed has been weighed, and lotted, as we described above, it is to be roasted in a test under a muffle. It is to be washed, if necessary; and, in short, the same operations are to be made in small which are usually done in great. Additions also are to be made, and in proper proportions, according to the peculiar nature of the ore. The fluxes generally mixed with the ore in essays are three, four, or five parts of black flux; one, two, or three parts of calcined borax; and one half of that quantity of decrepitated common salt. The more refractory the ore is, the more necessary is the addition of these fluxes: then the whole mixture is to be fused either in a forge, or in a melting or essay furnace.

To make essays well, all possible attention and accuracy are to be employed. This object cannot be too much attended to; for the least inaccuracy in weighing, or loss of the smallest quantity of matter, might cause errors, so much greater, as the disproportion betwixt the weights employed and those represented is greater. The most minute accuracy therefore is necessary in these operations. For instance, the essay-balances ought to be small, and exceedingly just. The ore ought not to be weighed till it has been reduced to gross powder fit for roasting; because some of it is always lost in this pulverization. When the ore is roasted, it ought to be covered with an inverted test; because most ores are apt to crackle and disperse when first heated. To make the fusion good and complete, the precise degree of fire which is requisite ought to be employed; and when it is finished, the crucible ought to be struck two or three times with some instrument, to facilitate the disengagement of the parts of the regulus from the scoria, and to occasion their descent and union into one button of metal. The crucible ought not to be broken, nor its contents examined, till it is perfectly cold.

Upon breaking the crucible, we may know that the fusion has been good, if the scoria be neat, compact, and equal; if it has not overflowed or penetrated the crucible; if it contain no metallic grains; and if its surface be smooth, and hollowed in the middle. The regulus or button ought to be well collected, without holes or bubbles, and to have a neat convex surface; it is then to be separated from the scoria, well scraped and cleaned; and, lastly, is to be weighed. If the operation has been well made, its weight shews the quantity of metal which every real quintal of ore will yield in the great. If the perfect success of this essay be in any respect doubtful, it ought to be repeated; but the best method at all times is, to make several essays of the same ore. Some small differences are always found, however well the essays may have been made. By taking the medium of the results of the several operations, we may approach as nearly as possible the true product of the ore.

Lastly, as mines are not worked, nor founderies established (which cannot be done without considerable expence), till the ore has been essayed, ten or twelve real pounds of the ore ought to be previously essayed; and essayers ought to be furnished with necessary furnaces and instruments for these larger essays.

In Part II. to the several articles of the ores of metals, we shall add the most approved methods of essaying these ores. We shall here only further observe in general, that the methods commonly practised for essaying ores of imperfect metals, and semimetals especially, are insufficient to procure the whole quantity of metal contained in ores, or even so much as is obtained in the smelting of large quantities of ores; and that therefore the result of essays is not be considered as the precise quantity contained in an ore, but generally only as an inaccurate approximation to that quantity. M. Gellert ascribes one cause of the want of success of these operations to the alkaline salts employed as fluxes to the ores, by which most metallic calxes are partially soluble, but more especially so when any of the sulphur of the ore remains; which, by uniting with these salts, forms a hepar of sulphur which is the most powerful of all solvents. He proposes therefore to omit the black flux, and other alkaline salts, and to add nothing to the ore but powder of charcoal, and some fusible glass. This method, he says, he learned from Mr Cramer, and has himself used with much success in the essays of iron and copper: but finding that other imperfect metallic substances could not sustain the heat necessary to effect the fusion and vitrification of the unmetallic parts of the ore without being partly dissipated, he found it necessary to add in the essays of these latter metallic matters some borax, by which the fusion might be completed with less heat. As we consider this as a considerable improvement in the art of essaying ores, we shall, to the articles of the several ores, add not only the processes commonly prescribed, but all those of Mr Gellert, according to the method here mentioned.

PART

(B) The pounds, of which 100 is here supposed to make a quintal, are called *Paris pounds*, one of which contains 1269 Troy grains.

PART II.

Containing a summary description of the principal Ores of each Metal, and the methods of Effaying them.

Sect. I. *Ores of Gold.*

§ 1. PRoperly fpeaking, no ores of gold exift: for as this metal cannot be allayed with arfenic, nor with fulphur, it is never found directly mineralifed by thefe fubftances, as the other metals are. In the fecond place, if it be mineralifed indirectly by the union it contracts with other metals naturally combined with fulphur and arfenic, fo fmall a quantity of it only is found in thefe ores, that they fcarcely even deferve the name of *improper ores of gold.*

Hence gold is found either in its natural ftate, of a certain degree of purity, poffeffed of all its properties; or engaged with fome other metals in certain minerals.

The gold which is found alone is called *native* or *virgin gold.* This is generally incrufted, and fixed in different kinds of ftones, principally in flints and quartz. Mr Cramer fays, that the yellow brilliant fpots of the blue ftone, called *lapis lazuli*, are native gold; but thefe are very fmall.

Gold is alfo found in fat and muddy earths; and Mr Cramer affirms, that fcarcely any fand can be found which does not contain gold; but he acknowledges, at the fame time, that the quantity is too fmall to compenfate for the expence of obtaining it.

Laftly, the largeft quantity of native gold is to be found in the fands of fome rivers. It is chiefly collected in hollows at the bottom of thefe rivers, and at their feveral bendings. The gold is collected in thefe places by a natural operation, fimilar to that of wafhing of ores.

A confiderable quantity of gold is in the fand of feveral rivers in France: fo that perfons who collect it find enough to compenfate their trouble. Mr Reaumur, in a memoir that he gave in the year 1718 concerning the rivers of France which contain gold, enumerates ten of them; namely, the Rhine, the Rhone, the Doux, the Ceze, and the Gardon; the Arriege; the Garonne; two ftreams which flow into the Arriege, called *Ferriet* and *Benagues*; laftly, the Salat, the fource of which is in the Pyrenean mountains.

The Ceze is the river which furnifhes the largeft quantity of gold at certain times. Mr Reaumur obferves, that its particles are larger than thofe of the Rhine and of the Rhone; and fays, that in fome days a peafant will find gold to the value of a piftole, and in others will fcarcely find any.

The native gold found in rivers or elfewhere is never perfectly pure, or of twenty-four karats. It always contains a certain quantity of allay, which is generally filver. The gold of the French rivers, according to Mr Reaumur's trials, was found to be from eighteen to twenty-two karats, that of the Ceze being the loweft, and that of the Arriege being the pureft.

Although gold, however, as above obferved from Macquer, cannot be directly diffolved by fulphur, yet it probably may be mineralifed by the intervention of other metallic matters. Thus, although no proper ore of gold exifts, yet it is found in feveral mineral fubftances, in which it is always accompanied, as Cramer affirms, with a much larger quantity of filver; to which latter metal that author attributes its mineralifed ftate. The minerals containing gold are blend, cupreous and arfenical pyrites, ore of antimony, cinnabar, white ore of arfenic, vitreous and other filver ores, and the lead-ore called *galena*,

Gold is more frequently imbedded in quartz than in any other matrix, but it is alfo found in limeftone and in hornblend. Gold mines are in general very precarious, as they do not form regular veins, nor is the gold uniformly diftributed through a matrix.

Becher and Cramer think, that no fand is entirely free from gold. The yellow, red, black, and violet-coloured ferruginous fands, are faid to contain moft gold. Mr Hellot relates, that in a eleven effays of one kind of fand, from a quintal, or 921,600 grains, were obtained each time from 848 to 844 grains of noble metal, exclufive of the gold which remained in the fcoria; and that of the metal thus obtained two thirds were gold, and the remaining third was filver. He fays, that parcels of fand taken up at very fmall diftances from each other contained very unequal proportions of gold.

The gold found in fands is generally lefs pure than that which is imbedded in a folid matrix. Reaumur fays, that a piece of gold, weighting 448 ounces, was fhewn to the Royal Academy at Paris, which was found upon effay to have different finenefs in different parts of the mafs.

§ 2. *Ores and earths containing gold may be effayed* by the methods directed for the extraction of gold from large quantities of thefe auriferous matters, (fee Part III.): or they may in general be effayed by being fufed in a cupel or teft, placed under the muffle of an effay-furnace, or in a crucible placed in an air-furnace, with eight or ten times their quantity of lead if they be eafily fufible, and with a larger quantity of lead if they be difficultly fufible; and by fcorifying the earthy matters, while the lead becomes impregnated with the noble metals. Thefe operations are entirely fimilar to thofe employed for the feparation of filver from its ores by precipitation with lead; *a detail of which fee fubjoined under the fection* Ores *of* Silver, [*Proceffes* I. III. IV. V. VI.]. Thefe metals are afterwards to be feparated from the lead by cupellation, in the manner directed in the article Essay (*of the value of filver and of gold*). The gold is then to be feparated from the filver by the proceffes defcribed in the article Parting.

The quantity of lead to be added to the ore in this effay muft be fuch as renders the fcoria very thin, that the whole gold may be imbibed by the lead. Some iron ores containing gold cannot be reduced into

Platina and Silver.

into a ſcoria ſufficiently thin with ſixteen times their quantity of lead unleſs the heat be at the ſame time conſiderably increaſed. When the ore is exceedingly refractory, the ſcoriſication ought to be promoted by adding to it four times its quantity of tartar, twice its quantity of nitre, and four times its quantity of litharge. This mixture is to be put in a good eſſay-crucible, and covered with the ſea-ſalt. The crucible is to be ſet in a forge-hearth, and expoſed gradually to heat, till the ſcoria has acquired ſufficient fluidity, and the lead has imbibed the noble metal.

See the methods which have been uſed for eſſaying auriferous ſands, under Part III.

Sect. II. *Ores of Platina.*

Platina is very rare, and has been but lately diſcovered. As, like gold, it cannot be allayed with ſulphur or with arſenic, probably no *ore*, properly ſo called, exiſts of this metal. Accordingly in the only mines of platina which we know, namely, the gold mines of Santafe near Carthagena, the platina is found native like the gold, and in its metallic ſtate.

Sect. III. *Ores of Silver.*

§ 1. Next to gold, ſilver is the metal moſt frequently found in its metallic ſtate, that is, not mineraliſed by ſulphur or by arſenic. This ſilver, called alſo *native* or *virgin*, generally affects ſome regular form, and conſiſts of filaments or vegetations of various figures. It is found in form of plates, of fibres, or of grains, or cryſtallized. It lies generally in quartz, flint, ſpar, ſlate, cobalt, and in ſilver-ores. It is ſometimes enveloped in a thin ſtony cruſt. It is generally allayed with ſome gold: but ſilver, like all the other metals, is much more frequently found mineraliſed by ſulphur and by arſenic.

Three principal proper ores of ſilver are known, which are very rich, but very rare. Theſe are;

1. The *vitreous ſilver ore*. This ore has no determinate figure, and has nearly the colour, ſoftneſs, and fuſibility of lead. It is very heavy, and contains three quarters of its weight of pure ſilver. In this ore the ſilver is minerallized by ſulphur alone. Some expert artiſts imitate it very well by combining ſulphur with ſilver by fuſion in a crucible.

This ore, according to Cronſtedt, is either in form of plates or of fibres, or is cryſtallized, or has no determinate figure. It may be imitated by adding about five parts of ſulphur to one part of melted ſilver; in which operation moſt of the ſulphur is conſumed: or it may be imitated by expoſing a plate of ſilver red-hot to the fumes of burning ſulphur.

2. The *horny* or *corneous ſilver ore*. This ore is ſo called from its colour and ſemitranſparency, by which it reſembles horn or colophony. This ore, being ſuddenly heated, crackles, as almoſt all ores do, and melts with a gentle heat. Two-thirds of it are ſilver, which is mineraliſed by ſulphur and arſenic. This ore is very rare. Wallerius ſays, after Woodward, that it is found at Johaun-Georgen-Stadt in Saxony.

Corneous ore has various colours; white, pearly, brown, yellow, greeniſh, or reddiſh. It is foliated and ſemitranſparent. It is ſomewhat ductile, and fuſible with the flame of a candle. When heated, it emits, as Wallerius ſays, a ſulphureous and blue flame, and, according to Cramer, alſo a very ſmall quantity of an arſenical fume. Wallerius ſays, that it contains two-thirds of ſilver, with a conſiderable quantity of ſulphur, and a ſmall quantity of arſenic. Lehman thinks that it is ſilver united with a little arſenic. But Mr Cronſtedt ſays, that it is a luna cornea, or ſilver combined with marine acid; and that it is incapable of being decompoſed but by ſubſtances which can unite with that acid. This latter opinion ſeems to be the moſt probable; as the ore, according to its deſcription, is ſimilar to luna cornea, and as it cannot be imitated by any mixture of ſulphur and of arſenic with ſilver. The blue flame, and the ſmell ſlightly arſenical, which are emitted from heated corneous ore, are alſo obſervable from every combination of marine acid with a ſubſtance containing phlogiſton.

Ores of Silver.

3. *Red ſilver ore*, called alſo *roſiclare*. Its colour is more or leſs red; it is ſometimes cryſtallized, very heavy, and is fuſible like the above-mentioned ores. In this ore the ſilver is mineraliſed by arſenic and by ſulphur, but chiefly by the former. It alſo contains a little iron, and furniſhes two-thirds of its weight of ſilver. Its red colour may proceed either from the iron it contains; or from the mixture of arſenic and ſulphur; or, laſtly, from the particular manner in which the arſenic is united with the ſilver, an example of which we have in the red precipitate of ſilver made by the neutral arſenical ſalt.

Red ſilver ore is either plated or ſolid, or cryſtallized, and frequently ſemitranſparent. Its colour is various, from a dark grey to a deep red, according to the proportions of the two mineraliſing ſubſtances. It crackles and breaks in the fire, exhales an arſenical fume, and is readily fuſed. It is found generally in quartz, ſpar, cryſtal, hornblend.

Beſides the three ſilver ores above deſcribed, the following ores contain ſilver mixed with other metals.

1. *Grey ſilver ore*. This contains copper and ſilver mineraliſed by arſenic and ſulphur, and generally more of the former than of the latter metal; but as it is valued chiefly for the ſilver, it has been generally enumerated amongſt ſilver ores.

2. *White ſilver ore* is an arſenical pyrites containing ſilver.

3. *Black ſilver ore* contains ſulphur, arſenic, copper, iron, ſometimes lead, and about a fourth part of ſilver, according to Wallerius.

4. *Plumoſe ſilver ore* is white or black, ſtriated like plum-alum, or like ore of antimony. It is ſilver mineraliſed by ſulphur, arſenic, and antimony.

5. *Pech-blend*. In this blend ſilver, gold, and zinc, are mineraliſed by ſulphur, probably by intervention of iron, by which the gold and zinc are rendered capable of uniting with the ſulphur.

6. Silver is frequently found in *galena;* and ſometimes in *martial pyrites;* in the *red ore of arſenic;* in various *ores of copper, lead, tin, iron*, and eſpecially *cobalt;* in *blends;* in *yellow* or *red earths;* in *black* and *blue baſaltes;* and alſo in *ſtrata of ſtones* which do not appear externally to contain any mineral ſubſtance.

7. *Liquid ſilver ore*, or *guhr of ſilver*, is a grey or whitiſh liquid maſs, which contains, as Wallerius ſays, either native ſilver, or ſome fluid ſubſtance capable of producing it. Mr Cronſtedt mentions, in the Swediſh

Essaying of Ores of Silver.

dish Memoirs, a water flowing through a mine in Norway containing silver. Another instance is also mentioned of a silver guhr, in the *Act. Erud. Upsal.* 1720.

8. Mr Von Justi pretends, that he has found silver mineralised by an *alkaline substance;* but he has not spoken sufficiently distinctly concerning it, to know whether he means a saline or earthy alkaline matter. Henckel also pretends, that by treating calcareous earth or certain clays with pyrites, silver may be obtained.

§ 2. *Ores of silver may be essayed* by the same methods which are employed for the extraction of that metal from large quantites of ores; which methods are different, and suited to the different qualities of the different ores. See Part III. Or, in general, ores and earths containing silver may be essayed by the following processes, which are copied from Dr Mortimer's English edition of *Cramer's Art of Essaying Metals, Part II. Process* 1.

PROCESS I.

To precipitate Silver by means of Lead from fusible Ores.

"Pound the ore in a very clean iron mortar into fine powder: of this weigh one docimastical centner or quintal, and eight of the like centners of granulated lead.

"Then have at hand the docimastical test, which must not as yet have served to any operation: pour into it about half of the granulated lead, and spread it with your finger thro' the cavity of it.

"Put upon this lead the pounded ore; and then cover it quite with the remainder of the granulated lead.

"Put the test thus loaded under the muffle of an essay-furnace, and in the hinder part of it: then make your fire, and encrease it gradually. If you look thro' the holes of either of the sliders, you will soon see that the pounded ore will be raised out of the melted lead, and swim upon it. A little after, it will grow clammy, melt, and be thrown towards the border of the test: then the surface of the lead will appear in the middle of the test like a bright disc, and you will see it smoak and boil: so soon as you see this, it will be proper to diminish the fire a small matter for a quarter of an hour; so that the boiling of the lead may almost cease. Then again, increase the fire to such a degree, that all may turn into a thin fluid, and the lead may be seen, as before, smoking and boiling with great violence. The surface of it will then diminish by degrees, and be covered over with a mass of scorias. Finally, have at hand an iron hook ready heated, wherewith the whole mass must be stirred, especially towards the border; that in case any small parcels of the ore not yet dissolved should be adherent there, they may be brought down, taking great care not to stir any the least thing out of the test.

"Now, if what is adherent to the hook during the stirring, when you raise it above the test, melts quickly again, and the extremity of the hook grown cold is covered with a thin, smooth, shining crust; it is a sign that the scorification is perfect; and it will be the more so as the said crust adherent to the hook shall be coloured equally on every side: but in case, while the scorias are stirred, you perceive any considerable clamminess in them, and when they adhere in good quantity to the hook, though red-hot, and are inequally tinged, and seem dusty or rough with grains interspersed here and there; it is a sign that the ore is not entirely turned into scorias. In this case, you must with a hammer strike off what is adherent to the hook, pulverize it, and with a laddle put it again into the test, without any loss or mixture of any foreign body, and continue the fire in the same degree till the scoria has acquired its perfection and the abovementioned qualities. This once obtained, take the test with a pair of tongs out of the fire, and pour the lead, together with the scoria swimming upon it, into a cone made hot and rubbed with tallow. Thus will the first operation of the process be performed, which does not commonly indeed last above three quarters of an hour.

"With a hammer strike the scorias off from the regulus grown cold, and again examine whether they have the characteristics of a perfect scorification; if they have, you may thence conclude, that the silver has been precipitated out of the ore turned to scorias, and received by the lead.

"When the scorification lasts longer than we mentioned, the lead at last turns to scorias or litharge, and the silver remains at the bottom of the vessel: but the fire must be moderately supplied, and the vessels be extremely good, to produce this effect; for they seldom resist to the strength of the scorias long enough; so that the whole scorification may be brought to an end; which has afterwards this inconveniency, that the silver is dissipated by grains in the small hollows of the corroded ore, and can hardly be well collected again, when the ore has but little silver in it. Nay, there is still more time to be consumed to obtain the perfect destruction of the lead, by means of the combined actions of the fire and air, because the scorias swimming at the top retard it considerably.

"In this process, the sulphur and the arsenic of the silver-ore, when the ore is broken small, and extended widely in a small quantity, are in part easily dissipated by the fire, and in part absorbed by the lead; the lighter part of which, swimming upon the heavier, becomes very clammy by means of the sulphur which is in the ore; but when this is dissipated by the violence of fire, it turns into glass or scorias: but when arsenic is predominant in the ore, the plumbeous part turns immediately into a very penetrating and very fusible glass, having a dissolving efficacy, unless the arsenic lies hidden in a white pyrite or cobalt. For this reason, the fixed part of the ore, which is no silver, is dissolved by that glass, melts, and assumes the form of scorias. The unmetallic earths and the pure copper or lead ores thereto adherent are of this kind. The silver then remains immutable; and being freed of these heterogeneous bodies, which are partly dissipated and partly melted, it is precipitated and received by the remaining regulus of lead. Therefore this process is completed by three distinct operations; viz. 1. By roasting. 2. By scorification. 3. By the melting precipitation of the silver, which is the result of the two former operations.

"The

Effaying of Ores of Silver.

" The ore muft be pulverifed very fine, in order to increafe the furface, that the diffipation of the volatiles and the diffolution by litharge may be fooner effected. This pulverifing muft then be done before the ore is weighed, becaufe there is always fome part of the ore adherent to the mortar or iron plate on which it is made fine; which part being loft, the operation is not exact. Erker was in the right when he prefcribed eight centners of lead for the fubduing of fufible ores. Neverthelefs, it muft be owned, that this quantity is fuperfluous in fome cafes. However, as the fluxibility of the filver-ore depends from the abfence of ftones, pyrites, &c. it is eafy to fee, that there are an infinite number of degrees of fluxibility which it would be needlefs to determine exactly, and moft commonly very difficult to determine by the bare fight. Befides, a little more lead does not render the procefs imperfect; on the contrary, if you ufe too fmall a quantity of lead, the fcorification is never completely made. Nay, there are a great many ores, containing fulphur and arfenic in plenty, that deftroy a confiderable quantity of lead: fuch are the red filver-ore, and that wherein there is a great deal of the fteel-grained lead-ore. If the fire muft be fometimes diminifhed in the middle of the procefs, it is in order to hinder the too much attenuated litharge, which is continually generated out of the lead, from penetrating the pores of the teft, and from corroding it; which is eafily done when the fire is over-ftrong; for then the furface of the veffel which is contiguous to the lead contracts cavities, or, being totally confumed by fmall holes, lets the regulus flow out of it. The veffels that are moft fubject to this inconvenience are thofe in the materials of which lime, plafter, and chalk are mixed. Nay, thefe bodies, which are of their nature refractory, being eroded during their fcorification, at the fame time communicate a great clamminefs to the fcoria; fo that a great quantity of the mafs remains adherent to the teft in the form of protuberances, when you pour it out; whereby a great many grains of the regulus are detained."

PROCESS II.

The regulus obtained by the procefs I. contains all the filver of the ore, and the unfcorified part of the lead. The filver may be afterwards feparated from the lead, and obtained pure by *cupellation;* which procefs is defcribed under the article Essay *(of the value of Silver.)*

PROCESS III.

If the filver-ore cannot be wafhed clean, or if it be rendered refractory by a mixture of unmetallic earths and ftones, the fcorification of thefe earthy matters frequently cannot be completed by the procefs I. Cramer therefore directs, that fuch ores fhall be treated in the following manner.

" Bruife the ore into an impalpable powder, by grinding in a mortar; to a docimaftical centner of it, add a like quantity of glafs of lead finely pulverifed; for the more exactly thefe two are mixed together, the more eafily the fcorification afterwards fucceeds. Put this mixture, together with 12 centners of lead, into the teft, according to procefs I. then put the teft under the muffle.

" Make firft under it a ftrong fire, till the lead boils very well; when you fee it fo, diminifh the violence of the heat, as was directed in the firft procefs; but keep it thus diminifhed a little longer: then, finally, again increafe the fire to fuch a degree, till you perceive the figns of a perfect fcorification and fufion. *See the whole procefs I.* Now this procefs lafts a little longer than the foregoing, and requires a greater fire towards the end.

" It fometimes happens that a very refractory ore cannot be diffolved by litharge; and that a mafs, which has the clamminefs of pitch, fwims upon the regulus and upon the fcorias themfelves which are already fubdued in part: when you fee this, fhut the vents of the furnace to diminifh the fire; then gently touch this refractory body with a fmall iron cold hook, to which it will immediately ftick; take it off foftly, not to lofe any thing; pound it into a fine powder, adding a little glafs of lead, and put it again into the teft; then continue the fcorification till it is brought to its perfection. But you muft always examine the fcoria of your refractory ore, to fee whether there may not be fome grains of regulus difperfed in it: for fometimes the fcorias that grow clammy retain fomething of the metal; which if you fufpect, pound the fcorias into a fine duft, and thus the grains of metal will appear if there are any left, becaufe they can never be pounded fine. The filver is feparated from this regulus by cupelling, as in Procefs II.

" All earths and ftones are refractory in the fire: for, although fome of them melt naturally in the fire, as thofe that are vitrifiable do; neverthelefs, all the others, a very few excepted, melt much more difficultly than metals, and never become fo thin in the fufion as is required for the fufficient precipitation of a precious metal. But litharge itfelf does not conveniently diffolve thefe refractory matters by the help of fire alone, unlefs you add fome mechanical mixture to them; for the very moment the faid litharge penetrates through the interftices of the refractory ore, and begins to diffolve it, a tenacious mafs is produced, which hardly admits any farther dilution by the litharge. You may fee it plain, if you make coloured glaffes with metallic calxes; if you pour carelefly upon them a calx that gives a colour, you will never obtain that they may be equally dyed on every fide, even although you fhould torture them for whole days together in a great fire. Nay, glafs already made can never be diluted by only pouring falts and litharge upon it. Wherefore, you muft ufe the artifice of glafs-makers, who, in the making of the moft perfect glaffes, take great care, before they put the fpecies of their ingredients into the fire, to have a mechanical mixture precede, or at leaft accede during the fufion itfelf, which is done here by pounding glafs of lead mixed with the ore: but if you think that your glafs of lead is not fufficiently fufible, you may add to it litharge melted firft, and then pounded into a fine powder.

" As this fcorification requires a longer and a greater fire than the foregoing, and as a greater quantity of litharge is moreover requifite to fubdue the refractory fcoria; it is eafy to fee why a much greater quantity of lead muft be ufed here than in Procefs I.; and, although lefs lead is often fufficient, it

it is neverthelefs proper always to ufe the greateft quantity that can be neceffary; left, for inftance, it fhould be neceffary to try fo many times the lead alone, to make it evident how much filver the lead when alone leaves in the coppel. Nor need you fear left any thing of the filver be taken away by the lead, provided the coppels be good, and the coppelling duly put in execution: for you can hardly collect a ponderable quantity of filver out of the collected fume of the lead, which rifes during the coppelling, as well as out of the litharge that is withdrawn into the coppel."

PROCESS IV.

If the ore be rendered refractory by pyrites, Cramer directs that the filver fhould be precipitated by lead in the following manner. *(Art of Affaying*, Part II. proc. 4.)

" Break your ore into a rough powder, and put a centner of it into the teft: put upon this another teft in the manner of a tile; put it under the muffle hardly red-hot: increafe the fire by degrees. There will always be a crackling: which being ended, take away the upper-teft; for when the veffels have been red-hot about one minute, the ore ceafes to fplit. Leave the ore under the muffle till the arfenic and the fulphur are for the moft part evaporated; which you will know from the ceffation of the vifible fmoke, of the fmell of garlic, or the acid; then take away the teft, and leave it in a place not too cold, that it may cool of itfelf.

" Pour out, without any diffipation, the roafted ore, and with a knife take away what is adherent to the veffel; pound it to a moft fubtile powder, and grind it together with an equal weight of glafs of lead; and, finally, fcorify the whole collected ore in the fame teft wherein the tefting was made, unlefs it has contracted chinks, as was defcribed in Procefs III.

" *Remarks*. Yellow pyrites-ores contain a very great quantity of fulphur, even greater than is neceffary to faturate the metal that lies hidden in them. For which reafon this fuperfluous fulphur diffipates in a middling fire; but if it had been mixed with lead, it would have rendered it refractory, nor could it afterwards be diffipated from it without a confiderable deftruction of the lead. The white arfenical pyrites turn alfo a great quantity of lead into glafs, on account of the abundance of the arfenic they contain. For which reafon thefe ores muft be previoufly roafted, that the fulphur and arfenic may be diffipated. Nor need you fear left any part of the filver be carried away with the arfenic; for when arfenic is feparated from any fixed body, by a certain degree of fire, it carries nothing of that body away with it."

PROCESS V.

SILVER may be precipitated from its ore by cupellation only, in the following Procefs, given by Cramer, [*Art of Affaying, Part* II. *Proc.* 9.]

" Pound one centner of ore; roaft it in the manner directed in the laft procefs; beat it to a moft fubtle powder; and if it melts with difficulty on the fire, grind it together with one centner of litharge, which is not neceffary when the ore melts eafily: then divide the mixture or the powder of the ore alone into five or fix parts, and wrap up every one of them feverally in fuch bits of paper as can contain no more than this fmall portion.

" Put a very large coppel under the muffle; roaft it well firft, and then put into it fixteen centners of lead: when the lead begins to fmoke and boil, put upon it one of the faid portions with the fmall paper it was wrapt up in, and diminifh the fire immediately, in the fame manner as if you would make a fcorification in a teft, but in a leffer time. The fmall paper, which turns prefently to afhes, goes off of itfelf, and does not fenfibly increafe the mafs of the fcorias. The ore proceeding therefrom is caft on the border, and turns to fcorias very foon. Increafe the fire again immediately, and, at the fame time, put another portion of the ore into the coppel, as was juft now faid. The fame effects will be produced. Go on in the fame manner, till all the portions are thrown in and confumed in the lead. Finally, deftroy the remaining lead with a ftronger fire.

" The filver that was in the ore and in the lead will remain in the coppel. If you deduct from it the bead proceeding from the lead, you will have the weight of the filver contained in the ore. If the ore employed was eafy to be melted, all the fcoria vanifhes; but if it was refractory or not fufible, all the fcoria does not always go away, but there remains fomething of it now and then in the form of duft. A great many ores and metals may be tried in this way, except only fuch as fplit and corrode the coppels. There are likewife fome of them which muft be previoufly prepared in the fame manner as is required to render them fit for going through a fcorification. *See the foregoing Proceffes.*

" *Remarks*. The ore thrown at feveral times upon lead boiling in a coppel may be diffolved without the foregoing fcorification: but this is very far from having an equal fuccefs with all kinds of ores; for there are ores and metals which refift very much to their diffolution by litharge; and which being on this account thrown on the border, are not fufficiently diffolved; becaufe the litharge fteals away foon into the coppel. Neverthelefs, there are fome others which vanifh entirely by this method, except the filver and gold that was contained in them.

" A previous roafting is neceffary, firft, for the reafons mentioned, and then becaufe the ore thrown upon boiling lead fhould not crackle and leap out; for, having once paffed the fire, it bears the moft fudden heat."

PROCESS VI.

Silver may be precipitated out of the fame bodies as were mentioned in the foregoing proceffes by fcorification in a crucible. [*Cramer, Proc.* 15.]

" The body out of which you intend to precipitate filver muft be previoufly prepared for a fcorification by pounding and roafting, as mentioned in the former proceffes. Then, in the fame manner, and with the fame quantity of lead, put it into a crucible ftrictly examined, that it be entire, folid, not fpeckled with black fpots, like the fcoria of iron, efpecially at its inferior parts, and capable of containing three times as

Effaying of Ores of Silver.

as much. Add befides glafs gall and common falt, both very dry, and enough, that when the whole is melted, the falts may fwim at top at the height of about half an inch.

"Put the crucible thus loaded into a wind-furnace; fhut it clofe with a tile; put coals round it, but not higher than the upper border of the crucible. Then light them with burning coals, and increafe the fire till the whole melts very thin, which will be done by a middling fire, maintained always equal, and never greater: leave it thus for about one quarter of an hour, that the fcorification may be perfectly made. Take off the tile and ftir the mafs with an iron wire, and a little after pour it out into the mould. When the regulus is cleaned from fcorias, try it in a teft by coppelling it.

"*Remarks.* The fcorification of any ore whatever, or of any body fetched out of ores, may indeed be made by this apparatus, as well as in a teft under a muffle: but it ferves chiefly to the end that a greater quantity of metal may be melted from it with profit. For you may put many common pounds of it at one fingle time into the crucible; but then you need not obferve the proportion of lead prefcribed in the foregoing procefs; nay, a quantity of lead two or three times lefs is fufficient, according to the different qualities of the object. But the mafs will certainly be fpilt, unlefs you choofe a very good crucible; for there is no veffel charged with litharge, that can bear a ftrong fire having a draught of wind, without giving way through it to the litharge.

"You add glafs-gall and common falt, that they may forward the fcorification, by fwimming at top; for the refractory fcoria rejected by the litharge, and adhering between this and the falts that fwim at top, is foon brought to a flux, and the precipitation of the filver is thereby accelerated. They alfo hinder in a manner a fmall burning coal fallen into the crucible, from fetting the litharge a boiling, which troubles the operation; for the litharge or glafs of lead, efpecially that which is made without any addition, fo foon as the phlogifton gets into it, raifes into a foamy mafs, confifting of a multitude of fmall bubbles very difficult to be confined, unlefs the phlogifton be entirely confumed, and the litharge reduced to lead, which fometimes raifes above the border of the veffel."

Copper Ores.

Native metallic filver may be feparated from the ftones and earths with which it is intermixed, by *amalgamation with mercury*, which operation is to be performed in the fame manner as for the feparation of native gold; a detail of which fee in Part III. fect. iii.

The *corneous ore*, if it really be, as Cronftedt fays, a luna cornea, ought to be treated in fome of the methods directed for the reduction of luna cornea. See CHEMISTRY, n° 366, 367.

SECT. IV. *Ores of Copper.*

§ 1. COPPER is found under ground in three different forms. 1. Native or virgin copper diverfely ramified, which is much more rare than native filver. This native copper is not fo ductile as copper purified by fufions from the ore (A). 2. Copper is found in form of calx, of verdigreafe, of precipitates. Such are the minerals called *filky copper ores*, and feveral white and green earths. Thefe matters are only copper almoft pure and but little mineralifed, but which has been corroded, diffolved, precipitated, calcined by faline matters, by the action of the air, of water, and of earths (B). 3. Copper is frequently in a truly mineral ftate, that is, combined with fulphur, and with arfenic, with other metallic matters mixed with earths, and enveloped in different matrixes. Thefe are the true copper ores. They have no regular forms except they partake of the nature of pyrites. Their colours are very different, which depend chiefly on the proportion of the mineral fubftances compofing them. Laftly, in almoft all of them we may perceive green or blue colours, which always indicate an erofion or calcination of the copper. Moft copper ores contain alfo fome iron or ferruginous earth, to which the ochrey colour is to be attributed, which might make us believe them to be ores of iron. Ores which contain much iron are the moft difficultly fufible.

Copper ores have almoft all a yellow, golden, and fhining colour, by which they are eafily diftinguifhed. Some of them are coloured with irifes, and frequently have fpots of verdegrife, by which alfo they are diftinguifhable from other ores.

Many copper ores are alfo rich in filver. Such is that called the *white copper ore*, the colour of which is rather occafioned by arfenic than by filver, altho' it contains fo much filver as to be enumerated by feveral mine-

(A) *Native Copper* is folid; or confifting of friable maffes, formed by precipitation of cupreous vitriolic waters, called *cement* or *ziment copper*; or forming cryftallized cubes, or grains, leaves, branches, or filaments.

(B) *Calciform ores* are either pure calxes of copper, or are mixed with heterogeneous matters. 1. The *pure* are, loofe friable ochre, called *cæruleum montanum*, mountain-blue, and *viride montanum*, mountain-green; and the *red indurated calx*, called improperly *glafs copper ore*. 2. *Mixed* calciform ores are thofe in which the calx of copper is mixed; with *calcareous earth*, forming a mountain blue; with *iron*, forming a black calx; with *gypfum*, an indurated green ore, called *malachites*; and with *quartz*, a red ore.

(C) Copper is *mineralifed*, 1. By *fulphur*, forming the *grey copper ore*, improperly called *vitreous* (minera cupri vitrea Wallerii). 2. By *fulphurated iron*, forming the *hepatic copper ore* (minera cupri hepatica Wallerii) of a brown yellow colour. It is a kind of cupreous pyrites, and is called by Cronftedt *minera cupri pyritacea*. Sometimes it is of a blackifh grey colour, and is then called *pyrites cupri grifeus* (minera cupri grifea Wallerii); fometimes of a reddifh yellow, and tarnifhed with blue irifes on its furface, when it is called *minera cupri lazurea*; when of a yellowifh green colour, it is the *pyrites cupri flavo-viridefcens* (cuprum fulphure & ferro mineralifatum Wallerii); and when of a pale yellow colour, it is the *pyrites cupri palidè flavus*. Moft of the above pyritaceous ores contain alfo fome arfenic, but their fulphur is predominant. 3. *Copper mineralifed by fulphur, iron, and arfenic. White copper ore* (Minera cupri alba Wall.) This ore contains alfo fome filver. 4. *Copper diffolved by vitriolic acid. Native blue vitriol.* 5. *Copper united with bitumens. Copper-coal ore.* This is a pit-coal, from the afhes of which copper is obtainable. 6. Copper is alfo found in the mineral called *kupfer nickel*.

Essaying of Ores of Copper.

mineralogists amongst silver ores.

Lastly, the pyrites of a golden yellow colour which contains copper and sulphur, and the white pyrites which contains copper and arsenic, are considered as copper ores by several chemists and naturalists. Henckel and Cramer remark, that no proper ore of copper is known which does not contain a considerable quantity of arsenic.

§. 2. *Ores of copper* may be *essayed* in methods similar to those employed for smelting of large quantities of ores, (Part III.) or they may in general be essayed by the following processes.

PROCESS I.

To reduce and precipitate copper from a pure and fusible ore in a close vessel.

"Mix one, or, if you have small weights, two docimastical centners of ore beat extremely fine, with six centners of the black flux; and having put them into a crucible or pot, cover them one inch high with common salt, and press them down with your finger: but let the capacity of the vessel be such, that it may be only half full; shut the vessel close, put it into the furnace; heap coals upon it, so that it may be covered over with them a few inches high; govern the fire in such a manner, that it may first grow slightly red-hot. Soon after you will hear your common salt crackle; and then there will be a gentle hissing noise. So long as this lasts, keep the same degree of fire till it is quite over. Then increase suddenly the fire, either with the funnel and cover put upon the furnace, or with a pair of bellows applied to the hole of the bottom part, that the vessel may grow very red-hot. Thus you will reduce and precipitate your copper in about a quarter of an hour: then take out the vessel, and strike with a few blows the pavement upon which you put it, that all the small grains of copper may be collected in one mass.

"Break the vessel, when grown cold, in two, from top to bottom, as nearly as you can: if the whole process has been well performed, you will find a solid, perfectly yellow and malleable regulus adhering to the bottom of the vessel, with scorias remaining at top of a brown colour, solid, hard, and shining, from which the regulus must be separated with several gentle blows of a hammer; this done, weigh it, after having wiped off all the filthiness.

A soft, dusty, and very black, scoria, is a sign of a fire not sufficiently strong. Small neat grains of copper reduced but not precipitated, and adhering still to scorias, especially not very far from the bottom, and an unequal and ramificated regulus, are signs of the same thing. A solid, hard, shining, red-coloured scoria, especially about the regulus, or even the regulus itself when covered with a like small crust, are signs of an excess in the degree and duration of the fire.

"*Remarks.* All the ores which are easily melted in the fire are not the objects of this process; for they must also be very pure. Such are the vitreous copper ores." (Mr Cramer means, it is presumed, the red calciform ore called improperly *glass ore*, and not the *minera cupri vitrea* of Wallerius, which being composed of copper mineralised by sulphur, could not be treated properly by this process, in which no previous roasting is required. The sulphur of this ore would with the alkali of the black flux form a hepar, from which the metal would not precipitate.) "But especially the green and azure-coloured ores, and the *cæruleum* and *viride montanum*, which are not very different from them. But if there is a great quantity of arsenic, sulphur, or of the ore of another metal and semimetal joined to the ore of copper, then you will never obtain a malleable regulus of pure copper, tho' ores are not always rendered refractory by the presence of these."

PROCESS II.

To reduce and precipitate copper out of ores rendered refractory by earth and stones that cannot be washed off.

"Beat your ore into a most subtil powder, of which weigh one or two centners, and mix as much sandiver to them. This done, add four times as much of the black flux with respect to the ore; for by this means, the sterile terrestrial parts are better disposed to a scorification, and the reducing and precipitating flux may act more freely upon the metallic particles freed from all their incumbrances.

"As for the rest, make the apparatus as in last process: but you must make the fire a little stronger for about half an hour together. When the vessel is grown cold and broken, examine the scorias, whether they are as they ought to be. The regulus will be as fine and ductile as the foregoing.

"*Remarks.* As these copper ores hardly conceal any sulphur and arsenic in them, the roasting would be of no effect, and much copper would be lost. For no metallic calx, except those of gold and silver, improperly so called, can be roasted, without you find a part of the metal lost after the reduction.

PROCESS III.

To precipitate copper out of an ore (D) *that contains iron.*

"Do all according to last process. But you will find, after the vessel is broken, a regulus upon no account so fine, but less ductile, wherein the genuine colour of the copper does not perfectly appear, and which must be further purified.

"*Remarks.* The fire used in this operation is not so strong that the iron should turn to a regulus. But as copper is the menstruum of iron, which is of itself very refractory in the fire; for this reason, while the ore and the flux are most intimately mixed and confounded by trituration, the greatest part of the iron being dissolved by the copper, turns into a regulus along with it."

PROCESS IV.

The roasting of a pyritose, sulphureous, arsenical, semimetallic, copper ore.

"Break two docimastical centners of the ore to a coarse powder, put them into a test covered with a tile,

(D) Mr Cramer still means the calciform ores only, and not the mineralised ores of copper.

tile, and place them under the muffle of a docimaftical furnace. But the fire muft be fo gentle, that the muffle may be but faintly red-hot. When the ore has decrepitated, open the teft, and continue the fire for a few minutes; then increafe it by degrees, that you may fee the ore perpetually fmoking a little: in the mean time, it is alfo proper now and then to ftir it up with an iron hook. The fhining particles will affume a dark red or blackifh colour. This done, take out the teft, that it may grow cold. If the fmall grains are not melted, nor ftrongly adherent to each other, hitherto all will be well; but if they run again into one fingle cake, the procefs muft be made again with another portion of the ore, in a more gentle fire.

"When the ore is grown cold, beat it to a powder fomewhat finer, and roaft it by the fame method as before; then take it out, and if the powder is not melted yet, beat it again to a moft fubtil powder; in this you are to take care that nothing be loft.

"Roaft the powder in a fire fomewhat ftronger, but for a few minutes only. If you do not then find the ore any way inclined to melt, add a little tallow, and burn it away under the muffle, and do the fame another time again, till, the fire being very bright, you no longer perceive any fulphureous, arfenical, unpleafant fmell, or any fmoke; and there remains nothing but a thin, foft powder, of a dark red, or blackifh colour.

"*Remarks.* Every pyrites contains iron, with an unmetallic earth: to which fulphur, or arfenic, and moft commonly both, always join. Befides, there is copper in many pyrites; but fometimes more, and fometimes lefs: fome of them are altogether deftitute of copper; therefore, fo much as pyrites differ with regard to the proportion of their conftituent particles, fo much do they differ as to their difpofition in the fire. For inftance, the more copper there is in pyrites, the more it inclines to colliquation. The more fulphur and arfenic it has in it, the more quickly the melting of it will be procured, and the reverfe: the more iron and unmetallic earth it contains, the more it proves refractory in the fire. Now if fuch pyrites melt in the roafting, as happens to fome of them if they grow but red-hot, the fulphur and arfenic that lies hidden therein are fo ftrictly united with the fixed part, that you would in vain attempt to diffipate them. Nay, in this cafe, when it is reduced again into a powder, it requires a much greater time and accuracy in the regimen of the fire to perform the operation. For this reafon, it is much better to repeat it with new pyrites. But you can roaft no more than the double quantity at once of the ore you have a mind to employ in the foregoing experiment; to the end that, the precipitation by fufion not fucceeding, there may remain ftill another portion entire; left you fhould be obliged to repeat a tedious roafting. If you fee the figns of a ferreous refractory pyrites, the operation muft be performed with a greater fire, and much more quickly. However, take care not to do it with too violent a fire: for a great deal of copper is confumed not only by the arfenic, but alfo by the fulphur; and this happens even in veffels fhut very clofe, when the fulphur is expelled by a fire not quite fo ftrong; which a reiterated and milder fublimation of the fulphur in a veffel both very clean and well clofed will clearly fhew.

"When the greateft part of the fulphur and the arfenic is diffipated by fuch caufes as promote colliquation, you may make a ftronger fire: but then it is proper to add a little of fome fat body; for this diffolves mineral fulphur: it changes the mixture of it in fome part, which, for inftance, confifts in a certain proportion of acid and phlogifton; and at the fame time hinders the metallic earth from being reduced into copper, by being burnt to an excefs. From thefe effects, the reafon is plain, why affayers produce lefs metals in the trying of veins of copper, lead, and tin, than fkilful fmelters do in large operations. For the former perform the roafting under a muffle, with a clear fire, and without any oily reducing menftruum; whereas the latter perform it in the middle of charcoal or of wood, which perpetually emit a reductive phlogifton.

"The darker and blacker the powder of the roafted ore appears, the more copper you may expect from it. But the redder it looks, the lefs copper and the more iron it affords; for roafted copper diffolved by fulphur or the acid of it is very black, and iron, on the contrary, very red.

PROCESS V.

The precipitation of copper out of roafted ore of the laft procefs.

"Divide the roafted ore into two parts: each of them fhall go for a centner: add to it the fame weight of fandiver, and four times as much of the black flux, and mix them well together. As for the reft, do all according to the procefs I.: the precipitated regulus will be half malleable, fometimes quite brittle, now and then pretty much like pure copper in its colour, but fometimes whitifh, and even blackifh. Whence it is moft commonly called *black copper*, tho' it is not always of fo dark a dye.

"It is eafy to conceive, that there is as great a difference between the feveral kinds of that metal called *black copper*, as there is between the pyritofe and other copper ores accidentally mixed with other metallic and femi-metallic bodies. For all the metals, the ores of which are intermixed with the copper ores, being reduced, are precipitated together with the copper, which is brought about by means of the black flux. Wherefore iron, lead, tin, the reguline part of antimony, bifmuth, moft commonly are mixed with black copper in a multitude of different proportions. Nay, it is felf-evident, that gold and filver, which are diffolvable by all thefe matters, are collected in fuch a regulus when they have been firft hidden in the ore. Befides, fulphur and arfenic are not always altogether abfent. For they can hardly be expelled fo perfectly by the many preceding roaftings, but there remain fome veftiges of them, which are not diffipated by a fudden melting, efpecially in a clofe veffel, wherein the flux fwimming at top hinders the action of the air. Nay, arfenic is rather fixed by the black flux, and affumes a reguline femi-metallic form, while it is at the fame time preferved from diffipating by the copper.

PRO-

Effaying of Ores of Copper.

PROCESS VI.

To reduce black copper into pure copper by fcorification.

" SEPARATE a fpecimen of your black copper, of the weight of two fmall docimaftical centners at leaft; and do it in the fame manner, and with the fame precautions, as if you would detect a quantity of filver in black copper.

" Then with lute and coal-duft, make a bed in the cavity of a teft moiftened: when this bed is dry, put it under the muffle of the docimaftical furnace, in the open orifice of which there muft be bright burning coals, wherewith the teft muft likewife be furrounded on all parts. When the whole is perfectly red-hot, put your copper into the fire, alone, if it contains lead; but if it is altogether deftitute of it, add a fmall quantity of glafs of lead, and with a pair of hand-bellows increafe the fire, that the whole may melt with all fpeed: this done, let the fire be made a little violent, and fuch as will fuffice to keep the metallic mafs well melted; and not much greater. The melted mafs will boil, and fcorias will be produced, that will gather at the circumference. All the heterogeneous matters being at laft partly diffipated, and partly turned to fcorias, the furface of the pure melted copper will appear. So foon as you fee it, take the pot out of the fire, and extinguifh it in water: then examine it in a balance, and if lead has been at firft mixed with your black-copper, add to the regulus remaining of the pure copper, one 15th part of its weight which the copper has loft by means of the lead, then break it with a vice; and thus you will be able to judge by its colour and malleability, and by the furface of it after it is broken, whether the purifying of it has been well performed or no. But whatever caution you may ufe in the performing of this procefs, the product will neverthelefs be always lefs in proportion than what you can get by a greater operation, provided the copper be well purified in the fmall trial.

" *Remarks.* This is the laft purifying of copper, whereby the feparation of the heterogeneous bodies begun in the foregoing procefs is completed as perfectly as it poffibly can be. For, except gold and filver, all the other metals and femimetals are partly diffipated and partly burnt, together with the fulphur and arfenic. For in the fufion they either turn of themfelves to fcoria or fumes, or this is performed by means of iron, which chiefly abforbs femimetals, fulphur and arfenic, and the deftruction of it is at the fame time accelerated by them. Thus the copper is precipitated out of them pure; for it is felf-evident, that the unmetallic earth is expelled, the copper being reduced from a vitrefcent terreftrial to a metallic ftate, and the arfenic being diffipated by means of which the faid earth has been joined to the coarfer regulufes of the firft fufion. But there is at the fame time a good quantity of the copper that gets into the fcorias: however, a great part of it may be reduced out of them by repeating the fufion.

" The fire in this procefs muft be applied with all imaginable fpeed, to make it foon run: for if you neglect this, much of your copper is burnt; becaufe copper that is only red-hot, cleaves much fooner, and in much greater quantity, into half-fcorified fcales, than it is diminifhed in the fame time when melted. However, too impetuous a fire, and one much greater than is neceffary for the fufion of it, deftroys a much greater quantity of it than a fire fufficient only to put it in fufion would do. For this reafon, when the purifying is finifhed, the body melted muft be extinguifhed in water together with the veffel, left, being already grown hard, it fhould ftill remain hot for a while; which muft be done very carefully to prevent dangerous explofions.

" The fcoria of the above procefs frequently contains copper. To extract which, let two or three docimaftical centners of the fcoria, if it be charged with fulphur, be beat to a fubtil powder, and mix it, either alone, or, if its refractory nature requires it, with fome very fufible common pounded glafs without a reducing faline flux, and melt it in a clofe veffel, and in a fire having a draught of air; by which you will obtain a regulus.

" But when the fcoria has little or no fulphur at all in it, take one centner of it, and with the black flux manage it as you do the fufible copper ore, (procefs I.) by which you will have a pure regulus."

PROCESS VII.

The following procefs is tranflated from Mr Gellert's *Elements of Effaying*, and defcribes a new method of effaying ores, concerning which, fee the fection *Of Effaying in general*, p. 4922, col. 2.

To effay copper ores.

ROAST a quintal of ore [in the manner defcribed in procefs IV.]; add to it an equal quantity of borax, half a quintal of fufible glafs, and a quarter of a quintal of pitch: put the mixture in a crucible, the inner furface of which has been previoufly rubbed with a fluid pafte of charcoal-duft and water: cover the whole with pounded glafs mixed with a little borax, or with decrepitated fea-falt: put a lid on the crucible, which you will place in an air-furnace, or in a blaft-furnace: when the fire fhall have extended to the bottom of the coals, let it be excited brifkly during half an hour, that the crucible may be of a brifk red colour: then withdraw the crucible, and when it is cold break it: obferve if the fcoria be well made: feparate the regulus, which ought to be femi-ductile; and weigh it. This regulus is black copper; which muft be purified, as in procefs VI.

If the ore be very poor, and inveloped in much earthy and ftony matters; to a quintal of it, a quintal and a half of borax, a quarter of a quintal of pitch, and ten pounds of calx of lead or minium, muft be added. The calx of lead will be revived, and will unite with the fcattered particles of the copper, and together with thefe will fall to the bottom of the crucible, forming a compound regulus. When the ores of copper are very rich, half a quintal of borax and a quarter of a quintal of glafs will be fufficient for the reduction. If the ore is charged with much antimony, a half or three quarters of a quintal of clean iron-filings may be added; otherwife the large quantity of antimony might deftroy the copper, efpecially if the ore contained no lead. If iron be contained in copper ore, as in pyrites, fome pounds of antimony, or of its regulus, may be

Essaying of Ores of Copper.

be added in the essay; as these substances more readily unite with iron than with copper, and therefore disengage the latter metal from the former.

PROCESS VII.

To essay Ores of Copper by humid Solution.

Some pyrites and ores contain so small a quantity of copper, that it cannot be separated by the above processes, but is destroyed by the repeated roastings and fusions. These, and indeed any copper-ores, may be essayed by humid solution, or by menstruums.

1. By roasting a sulphureous ore, the sulphur is burnt or decomposed, its phlogiston with part of the acid evaporating, while the remaining part of the acid combines with the metals, especially with the copper and iron contained in the ore. Accordingly, from an ore thus roasted, a vitriolic solution may be obtained by lixiviation with warm water, especially if the ore has been exposed, during a few days after it has been roasted, to a moist air; as the water thus gradually applied unites better with the combination of the metallic calxes with the concentrated vitriolic acid of the sulphur: but all the copper is not thus reduced by one operation to a vitriol. More sulphur must therefore be combined with the residuous ore by fusion, and must be again burnt off, that the remaining part of the copper may be attacked by some of the acid of the sulphur. By repeating this operation, almost all the copper and iron will be reduced to a vitriolic lixivium, from which the copper may be separated and precipitated by adding clean pieces of iron.

2. Copper-ores may be more easily essayed by humid solution in the following manner:

Roast the mineralized ores in the manner directed in Process IV. and pulverise them. If the ores be calciform, they do not require a previous roasting. Put this powder into a matrass capable of containing ten times the quantity of the ore; pour upon the ore some water: set the matrass in a sand-bath, that the water may boil: pour off the lixivium: add to the residuous ore more water, with some vitriolic or marine acid: digest as before in the sand-bath, and add this lixivium to the former: repeat this operation, till you find that the acid liquor dissolves no more metal.

By adding clean plates of iron you may precipitate the copper, which ought then to be collected, fused with a little borax and charcoal dust, and weighed.

We may remark, that although copper is not soluble by a dilute vitriolic acid, yet the calx of it obtained by roasting the ore, and also the calciform ores, are readily soluble in that acid.

3. Stahl advises to essay copper-ores by boiling them, after they have been roasted and powdered, in water, together with tartar and common salt, or with alum and common salt: but we have not found this method so effectual as the preceding.

PROCESS VIII.

Dr Fordyce's method of essaying copper ores, by means of Aqua Regia. [Phil. Trans. for 1781, vol. lxxx. art. 3.]

This method consists only in pouring a quantity of an aqua regia composed of equal parts of the nitrous and muriatic acids upon a small quantity of the ore in powder, till a fresh affusion of the menstruum shews no green or blue tinge; by which means all the metalline part of the ore will be dissolved. It is then to be precipitated by means of a solution of fixed alkali, or volatile alkali cautiously managed will answer the same purpose. The metal then appears in form of a green precipitate called *green verditer;* but is mixed with what calcareous earth might have been contained in the ore; which the acids would dissolve, and the fixed alkali, if that kind was used, would precipitate. The caustic volatile alkali would not throw down this earth, and is therefore to be preferred to any other; but care must be taken to hit the point of saturation very exactly with it, as it violently dissolves the metal if added in too great quantity. Dr Fordyce orders this green calx to be dissolved in vitriolic acid, and then, by adding a piece of clean iron to the solution, all the copper contained in the ore will be obtained in its metallic form.

This method can be subject to no fallacy, unless the ore contains aluminous matter, in which case some of the earth of alum will be mixed with the metal, as that earth will be precipitated by fixed alkali, by caustic volatile alkali, and by iron. This, however, may very effectually be prevented by dissolving the green calx first in volatile alkali, and then in vitriolic acid. It is even probable, that by reducing the ore to a very fine powder, and treating it with caustic alkali, all the metal might be separated from the ore, without the trouble of using aqua regia. For the principles on which this method is conducted, see the article Chemistry *passim.*

Sect. V. *Ores of Lead.*

Lead is seldom found native (E) and malleable. Neither, says Mr Macquer (F), is it found in form of calx or precipitate, as copper is, because it is much less liable to lose its phlogiston by the action of air and water: therefore almost all lead is found naturally mineralized.

Lead is generally mineralized by sulphur (G). Its ores have a dark white, but a shining metallic colour. These

(E) Cronstedt doubts whether any native lead has been found. Linnæus says, he has seen what externally appeared to be such.

(F) But he is mistaken. As lead unites strongly with vitriolic acid, we might expect to meet ochres of this metal as well as of copper. Accordingly, we find some calciform ores of lead. 1. A pure calx of lead, in form of a friable ochre, *cerussa nativa,* found on the surface of galena; or it is indurated with a radiated or fibrous texture, of a white or yellowish green colour, and resembling spar; it is called *spatum plumbi, sparry lead-ore,* and *lead-spar.* 2. A calx of lead is found mixed with calx of arsenic, forming the ore called *arsenicated lead-spar.* Sometimes also that calx is mixed with calcareous earth.

(G) Lead is mineralised, 1. With sulphur; such are the several kinds of steel-grained and tesselated galenas, which also contain generally some silver. 2. With sulphurated iron and silver. It is fine-grained or tesselated, and is distin-

Ores of Lead These ores, although they form irregular masses, are internally regularly disposed, and seem to be composed of cubes of different sizes applied to each other, but not adherent. These ores are generally distinguished by the name of *Galena*. They commonly contain about three quarters of lead and a quarter of sulphur. They are accordingly heavy and fusible, although much less so than pure lead.

Most lead-ores contain silver; none but those of Willach in Carinthia are known to be quite free from it: some of them contain so much of it, that they are considered as improper ores of silver. The smaller the cubes of galena are, the larger quantity of silver has been remarked to be generally contained.

§ 2. *Lead ores may be essayed*, 1. By means of the black flux, in the manner directed by Mr Cramer, as follows:

"Let one or more quintals of this ore be grossly powdered, and roasted in a test till no more sulphureous vapours be exhaled, and then reduced to a finer powder; it is then to be accurately mixed with twice its weight of black flux, a fourth part of its weight of clean filings of iron and of borax. The mixture is to be put into a good crucible, or rather into a test; it is then to be covered with a thickness of two or three fingers of decrepitated sea-salt; the crucible is to be closed, and placed in a melting furnace, which is to be filled with unlighted charcoal, so that the top of the crucible shall be covered with it. Lighted coals are then to be thrown upon the unkindled charcoal, and the whole is left to kindle slowly, till the crucible be red-hot; soon after which a hissing noise proceeds from the crucible, which is occasioned by the reduction of the lead: the same degree of fire is to be maintained while this noise continues, and is afterwards to be suddenly increased, so as to make a perfect fusion; in which state it is to be continued during a quarter of an hour; after which it is to be extinguished; and the operation is then finished."—The filings of iron are added to the mixture, to absorb the sulphur, a certain quantity of which generally remains united with the lead-ore, notwithstanding the roasting. We need not fear lest this metal should unite with the lead and alter its purity; because, although the sulphur should not hinder it, these two metals cannot be united. The refractory quality of the iron does not impede the fusion; for the union it forms with the sulphur renders it so fusible, that it becomes itself a kind of flux.—This addition of iron in the essay of lead-ores would be useless, if the ores were sufficiently roasted, so that no sulphur should remain.

Or, 2. By the following process of Mr Gellert.

"Mix a quintal of roasted-lead ore with a quintal of calcined borax, half a quintal of glass finely pulverised, a quarter of a quintal of pitch, and as much of clean iron-filings: put this mixture into a crucible wetted with charcoal-dust and water: place the crucible before the nozzle of the bellows of a forge, and when it is red raise the fire during 15 or 20 minutes; then withdraw the crucible, and break it when cold."

Some very fusible ores, such as the galena of Derbyshire, may be essayed, as large quantities of it are smelted, without previous roasting, and without addition, merely by fusion during a certain time. For this purpose nothing more is requisite than to keep the ore melted in a crucible with a moderate heat, till all the sulphur is destroyed, and the metal be collected. To prevent the destruction of any part of the metal after it is separated from the sulphur, some charcoal dust may be thrown over the ore, when put into the crucible; but if the galena be mixed with pyrites, especially arsenical pyrites, it requires much roasting and saline fluxes.

Sect. VI. *Tin Ores.*

Ores of Tin § 1. Tin is very seldom found pure, but almost always mineralized, and chiefly by arsenic.

The richest ore of tin is of an irregular form, of a black or tarnished colour, and almost the heaviest of all ores. The cause of this extraordinary weight is, that it contains much more arsenic than sulphur, whereas most ores contain more sulphur than arsenic.

The most common tin ore is of the colour of rust, which proceeds from a quantity of iron, or of iron-ore mixed with it. The tin-ores of Saxony and Bohemia appear to be all of this kind.

One kind of tin-ore is semi-transparent and like spar. Lastly, several kinds of garnets are enumerated by mineralogists among tin-ores, because they actually contain tin.

The county of Cornwall, in England, is very rich in tin-ores; and the tin contained in them is very pure. From tin-mines in the East Indies tin is brought, called *Malacca tin*. No mines of tin have been dicovered in France; only in Bretagne garnets are found which contain some tin.

Native tin is said to have been found in Saxony and Malacca. Its ores are all of the calciform kind, excepting black-lead, which appears to be tin mineralized by sulphur and iron.

The calciform ores of tin are, 1. Tin-stone, which is of a blackish-brown colour, and of no determinate figure; and tin-grains, or crystals of tin, which resemble garnets, and are of a spherical or polygonal figure, which they have probably acquired by the attrition of their angles. The tin-stone seems to consist of attrited tin-grains. This ore is calx of tin united with calx of arsenic, and frequently with calx of iron. 2. Garnets are said to contain calx of tin united with calx of iron. 3. Manganese is said also to contain tin.

§ 2. *Ores of tin may be essayed* in the same manner, according to Cramer, as he directed for the essay of lead-ores, *supra*. He further makes upon this essay the following remarks.

1. Tin-ore, on account of its greater gravity, admits better of being separated, by elutriation or washing, from earths, stones, and lighter ores. 2. A most exact separation of earths and stones ought to be made, because the scorification of these by fluxes requires such a heat as would destroy the reduced tin. 3. The iron ought to be separated by a magnet. 4. By a previous roasting, the arsenic is dissipated, which would otherwise carry off a great deal of tin along with it in a melting

distinguished from the former by yielding a black slag when scorified, whereas the former yields a yellow slag. 3. With sulphurated antimony and silver. *Plumbum stibiatum Linnæi.* Its colour is similar to that of galena, and its texture is striated. 4. With sulphur and arsenic. This cure is soft, almost malleable, like lead. From this ore lead may be melted by the flame of a candle.

Ores of Iron

ing heat, would change another part of it into afhes, and would vitiate the remaining tin. 5. The effay of tin is very precarious and uncertain; becaufe tin once reduced is eafily deftructible by the fire, and by the faline fluxes requifite for the reduction.

Mr Gellert directs, that ores of tin fhould be effayed in the following manner:

"Mix a quintal of tin-ore, wafhed, pulverized, and twice roafted, with half a quintal of calcined borax, and half a quintal of pulverized pitch: thefe are to be put into a crucible moiftened with charcoal-duft and water, and the crucible placed in an air-furnace: after the pitch is burnt, give a violent fire during a quarter of an hour; and then withdraw your crucible. If the ore be not very well wafhed from the earthy matters, as it ought to be, a larger quantity of borax is requifite, with fome powdered glafs, by which the too quick fufion of the borax is retarded, and the precipitation of the earthy matters is prevented. If the ore contains iron, to the above mixture may be added fome alkaline falt.

SECT. VII. *Ores of Iron.*

§. 1. IRON is feldom found in its metallic ftate, and free from admixture; though Cramer gives an account of an ore which needs only to be put into a forge, and heated to a welding heat. Several fands and earths alfo have the appearance of iron, and are even attractable by a magnet. The ore mentioned by Cramer is found vitrified; with moderate blows the fcorias are thrown out, and a mafs of iron obtained, which, by being put into the forge again, gives tough iron without any other procefs. But in general this metal is found in the ftate of a calx; or, though it is combined with a great quantity of the principle of inflammability, it has feldom enough of the metallic form; and it is very often intermixed with a certain proportion of fulphur. The minerals wrought for iron are three, viz. iron-ore, iron-ftone, and bog-ore.

The iron ore is found in veins as the ores of other metals are, and the appearance is very various; fometimes it has a rufty iron colour refembling that of iron; fometimes it has a reddifh caft; often it is formed into a fort of cryftallizations which are protuberant knobs on the outfide; and thefe confift of fibres tending to a common centre; and it is of a dark colour like coagulated blood. It is called *hæmatites*, or *blood-ftone;* and confifts of a calx of iron with a fmall quantity of vitriolic acid.

Iron-ftone in this country is clay found in ftrata with coal; but which contains a large quantity of iron, fo as to make the working profitable. Sometimes it has little appearance of iron; but, when burnt with a certain degree of heat, it becomes of a deep red.

The bog-ore is an ochre of iron, and is found generally in low fituations, and in fprings containing a fmall quantity of iron, which flowing over thefe grounds depofits it in the form of ochre; and after a number of ages it proves a rich mine of iron, and it is extracted from a calx of this kind in many parts of the world. There is alfo a particular kind of fpar found in different countries of a pale blue colour, fo that from its firft appearance we would expect copper; but it contains a fmall quantity of iron, and is a combination of the metal with inflammable matter, as in Pruffian blue.

Effaying of Ores of Iron.

The loadftone is a noted iron ore. It is always found in veins, and it is alleged that it is only poffeffed of its magnetic qualities when near the furface. In appearance, it does not differ from many of the ores of iron, and treated as an ore, it affords a confiderable quantity of metal.

Neither is iron generally mineralized fo diftinctly as other metals are, unlefs in pyrites and ores of other metals.

Moft of the minerals called *iron ores* have an earthy, rufty, yellowifh, or brownifh appearance, which proceeds from the facility with which the true iron ores are decompofed.

Iron is the moft common and moft abundant of all metals. In Europe, at leaft, we cannot find an earth, a fand, a chalk, a clay, a vitrifiable or calcinable ftone, or even the afhes of any fubftance, which do not contain an earth convertible into iron. All earths and ftones which are naturally yellow or red, and all thofe which acquire thefe colours by calcination, receive them from the ferruginous earth mixed with them. The yellow and red ochres confift almoft folely of this earth: the black and heavy fands are generally very ferruginous.

The iron ore moft commonly found is a ftone of the colour of ruft, of an intermediate weight betwixt thofe of ores in general and of unmetallic ftones. This ore has no determinate form, and eafily furnifhes an iron of good quality.

Blood-ftone or hematites, fanguine or red chalk, and emery, are iron ores; fome of which, for inftance blood-ftone, are almoft all iron. Moft of thefe fubftances require but a flight calcination to be rendered very attractable by a magnet, and foluble in aqua fortis; but the iron obtained from them is of a bad quality, and they are therefore neglected. Iron from the hematites is very brittle; that obtained from ochres is red-fhort. All thefe iron ores are fo refractory, that they can fcarcely be fufed.

Iron ores are very various in their form; or rather they have no determinate form. Sometimes they are earths, fometimes ftones, fometimes grains. Accordingly, thofe naturalifts who attend only to the external form of things in claffing and fubdividing minerals, have been obliged to multiply the names of iron ores: hence they are called *iron ores in form of peafe, of beans, of coriander feeds, of pepper-corns, of cinnamon,* &c. which Mr Cramer treats as ridiculous trifles,

§. 2. *Ores of iron may be effayed* by the following procefs.

PROCESS I.

[CRAMER's *Art of Affaying*, Proc. 54.]

To reduce a precipitate iron out of its ore in a clofe veffel.

"ROAST for a few minutes in a teft under a muffle, and with a pretty ftrong fire, two centners of the fmall weight of your iron ore grofsly pulverifed; that the volatiles may be diffipated in part, and the ore itfelf be foftened in cafe it fhould be too hard. When it is

Effaying of Ores of Iron.

is grown cold, beat it extremely fine, and roaft it a fecond time, as you do the copper-ore, but in a much ftronger fire, till it no longer emits any fmell; then let it grow cold again. Compofe a flux of three parts of the white flux, with one part of fufible pulverifed glafs, or of the like fterile unfulphureous fcorias, and add fandiver and coal-duft, of each one half-part; add of this flux three times the quantity of your roafted ore, and mix the whole very well together; then choofe a very good crucible, well rubbed with lute within, to ftop the pores that may be here and there unfeen; put into it the ore mixed with the flux; cover it over with common falt; and fhut it clofe with a tile, and with lute applied to the points.

"Put the wind-furnace upon its bottom-part, having a bed made of coal-duft. Introduce befides into the furnace a fmall grate fupported on its iron bars, and a ftone upon it, whereon the crucible may ftand as on a fupport: furround the whole with hard coals, not very large, and light them at top. When the veffel begins to grow red, which is indicated by the common falt's ceafing to crackle, ftop with grofs lute the holes of the bottom-part, except that in which the nozzle of the bellows is received: blow the fire, and excite it with great force, adding now and then frefh fuel, that the veffel may never be naked at top: having thus continued your fire in its full ftrength for three quarters of an hour, or for a whole hour, take next the veffel out of it, and ftrike feveral times the pavement upon which it is fet, that the fmall grains of iron which happen to be difperfed may be collected into a regulus, which you will find after having broken the veffel.

"When the regulus is weighed, try its malleability: then make it red-hot; and when fo, ftrike it with a hammer: if it bears the ftrokes of a hammer, both when red-hot and when cold, and extends a little, you may pronounce your iron very good; but if, when either hot or cold, it proves brittle, you may judge it to be not quite pure, but ftill in a femi-mineral condition.

"*Remarks.* The arfenic, but efpecially the fulphur, muft be diffipated by roafting: for the former renders the iron brittle; and the latter not only does the fame, but, being managed in a clofe veffel, with a faline alkaline flux, turns to liver of fulphur; to the action of which iron yielding in every refpect, it can upon no account be precipitated; and if not the whole, a great part of it, at leaft, is retained by the fulphureous fcoria; fo that in this cafe you commonly in vain look for a regulus.

"The iron obtained from this firft precipitation has hardly ever the requifite ductility, but is rather brittle: the reafon of which is, that the fulphur and arfenic remain in it; for notwithftanding that the greateft part of thefe is diffipated by roafting, yet fome part adheres fo ftrictly, that it can never be feparated but with abforbent, terreftrial, alkaline ingredients, that change the nature of the fulphur. For which reafon, in larger operations, they add quicklime, or marble ftones that turn into quicklime; which, while they abforb the faid minerals, are, by it, and by help of the deftroyed part of the iron, brought to a fufion, and turn to a vitrified fcoria; although, at other times, they refift fo much by their own nature a vitrification. Another caufe of the brittlenefs of iron is the unmetallic earth, when it is not yet feparated from it; for the iron ore contains a great quantity of it, and in the melting remains joined with the reguline part: whence the iron is rendered very coarfe and brittle. Some iron ores are altogether untractable: neverthelefs, the regulufes produced out of them, when broken, have fometimes a neat femi-metallic look; which proceeds undoubtedly from a mixture of a fmall quantity of fome other metal or femi-metal."

PROCESS II.

[The following Procefs for effaying iron ores, and ferruginous ftones and earths, is extracted from Mr Gellert's *Elements of Effaying.*]

"Roast two quintals of iron ore, or of ferruginous earth: divide the roafted matter into two equal parts; to each of which add half a quintal of pulverifed glafs, if the fubftance be fufible and contain much metal; but if otherwife, add alfo half a quintal of calcined borax. If the roafting has entirely difengaged the fulphur and arfenic, an eighth part, or even half a quintal, of quicklime may be added. With the above matters, mix twelve pounds of charcoal-powder.

"Take a crucible, and cover the bottom and fides of its inner furface with a pafte made of three parts of charcoal-duft and one part of clay beat together. In the hollow left in this pafte put the above mixture; prefs it lightly down; cover it with pulverifed glafs; and put on the lid of the crucible.

"Place two fuch crucibles at the diftance of about four fingers from the air-pipe, in fuch a manner that the air fhall pafs betwixt them at about the third part of the height from the bottom: fill the fpace betwixt the two crucibles with coals of a moderate fize: throw lighted coals upon them, that the fire may defcend and make them red-hot from top to bottom: at firft let the bellows blow foftly, and afterwards ftrongly during an hour, or an hour and a quarter: then take away the crucible, and break it when cold. A regulus will be found in the bottom, and fometimes fome fmall grains of iron in the fcoria, which muft be feparated and weighed along with the regulus: then try the regulus, whether it can be extended under the hammer, when hot and when cold.

"*Remarks.* To difengage a metal from the earthy matters mixed with it by fire, we muft change thefe matters into fcoria or glafs. This change may be effected by adding fome fubftance capable of diffolving thefe matters; that is, of converting them into a fcoria or glafs, from which the metallic matters may, by their weight, feparate and form a regulus at bottom. Fixed alkali, which is an ingredient of the black and of the white flux, is a powerful folvent of earths and ftones: but the alkali does alfo diffolve iron, efpecially when this is in a calcined or earthy ftate; and this folution is fo much more complete, as the fire is longer applied. Hence, in ordinary effays, where an alkaline falt is ufed, little or no regulus of iron is obtained. Now, glafs acts upon and diffolves earths and ftones; but not, or very little, iron: confequently glafs is the beft flux for fuch effays, and experience confirms this affertion. If the ore contains but little iron, we may alfo

Ores of Mercury.

alſo add to the glaſs ſome borax; but borax cannot be employed ſingly, becauſe it very ſoon fuſes, and ſeparates from the ore before the metal is revived. Quicklime is added, not only to abſorb the ſulphur and arſenic remaining in the ore, but alſo becauſe it diſſolves and vitrifies the ſtony and earthy matters of iron ores, which are generally argillaceous. For which reaſon, in the large operations for ſmelting iron ore, quicklime, and even in certain caſes gypſum, are commonly added to facilitate the fuſion.

The reduction of iron-ore, and even the fuſion of iron, requires a violent and long-continued heat: therefore, in this operation, we muſt not employ an inflammable ſubſtance, as pitch, that is ſoon conſumed, but charcoal pulveriſed, which in cloſe veſſels is not ſenſibly waſted. Too much charcoal muſt not be added, elſe it will prevent the action of the glaſs upon the earthy matter of the ore, and conſequently the ſeparation of the metallic part. Experiments have taught me, that one part of charcoal-duſt to eight parts of oar was the beſt proportion.

When iron is ſurrounded by charcoal, it is not decompoſed or deſtroyed: hence the iron of the ore, which ſinks into the hollow made of paſte of charcoal-duſt and clay, remains there unhurt. The clay is added in this paſte to render it more compact, and to keep the fluid iron collected together.

The air is directed betwixt the crucibles; becauſe if it was thrown directly upon them, they would ſcarcely be able to reſiſt the heat. The ſpace betwixt the air-pipe and the crucibles ought to be conſtantly filled with charcoal, to prevent the cold air from touching the crucibles. Ductile and malleable iron is ſeldom obtained in this firſt operation. The ſulphur and arſenic, and frequently alſo an earthy matter adhering to the iron, prevent theſe qualities.

Sect. VIII. *Ores of Mercury.*

§ 1. Mercury is ſometimes found pure, fluid, and in its proper metallic ſtate, only mixed with earths and ſtones. Such are the ores of mercury found near Montpelier, in Tuſcany, and in other places.

But the largeſt quantity of the mercury found in the earth is mineraliſed by ſulphur, and conſequently is in the form of cinnabar.

Mercury is never mineraliſed by arſenic. The richeſt mine of mercury is that of Almaden, in Spain.

Linnæus and Cronſtedt mention a ſingular ore, in which the mercury is *mineraliſed by ſulphur and by copper*. It is ſaid to be of a blackiſh-grey colour, of a glaſſy texture, and brittle. When the mercury and ſulphur are expelled by fire, the copper is diſcovered by giving an opake red colour to glaſs of borax, which, by continuance and increaſe of heat, becomes green and tranſparent.

§ 2. Cramer directs, that *ores of mercury ſhould be eſſayed* by the following Proceſſes.

PROCESS I.

To ſeparate Mercury out of an unſulphureous Ore by Diſtillation.

"Take a lump of the pulveriſed ore, one common pound, which muſt ſtand for one centner: put it into a glaſs retort perfectly clean, well loricated, or coated up to half the length of its neck: this muſt be very long, and turned backwards with ſuch a declivity, that a glaſs recipient may be perpendicularly applied to it: but you muſt chooſe a retort ſmall enough, that the belly of it may be filled hardly two-thirds with the ore: this retort muſt be placed ſo, that nothing of the fluid adherent to the neck of it may fall into the cavity of the belly, but that the whole may run forward into the recipient. Finally, have a ſmall recipient full of cold water: let it be perpendicularly ſituated, and receive the neck of the retort in ſuch manner that the extremity of it be hardly one half-inch immerſed into the water.

Eſſaying of Ores of Mercury.

"Let the retort be ſurrounded with hot burning coals placed at ſome diſtance in form of a circle, leſt the veſſel ſhould burſt by too ſudden a heat: then by degrees bring the burning coals nearer and nearer, and at laſt ſurround the whole retort with them and with freſh charcoal, that it may grow ſlightly red-hot: this fire having been continued for an hour, let the retort cool of itſelf: then ſtrike the neck of it gently, that the large drops which are always adherent to it may fall into the recipient: let the recipient be taken away, and the water ſeparated from the mercury by filtration, and let the mercury be weighed. This operation may be more conveniently performed in a ſand-bath; in which caſe the pot containing the ſand muſt be middling red-hot, and the retort be able to touch the bottom of it immediately; nor is it then neceſſary that the retort be loricated."

PROCESS II.

To revive Mercury from a ſulphureous Cinnabar-ore.

"Beat your ore extremely fine, and mix it exactly with an equal portion of iron-filings, not ruſty; proceed to diſtill it with the ſame apparatus as in the former proceſs, but urge it with the ſtrongeſt fire that can be made.

"Cinnabar may be ſeparated from ſtones by ſublimation thus: Beat it to a fine powder, and put it into a ſmall narrow glaſs or earthen cucurbit, the belly of which it muſt not fill more than one-third part: ſtop the orifice at top; this muſt be very narrow, to hinder the free action of the air. Put this ſmall cucurbit in an earthen pot above two inches wide in diameter, and gather ſand around this pot about as high as the pulveriſed ore riſes in the cucurbit. Then put it upon burning coals in ſuch manner that the bottom of the pot may be middling red-hot. Thus will your cinnabar aſcend and form a ſolid ponderous ring, which muſt be got out by breaking the veſſel."

Sect. IX. *Ore of the Regulus of Antimony.*

Native regulus of antimony was firſt obſerved by Mr Swab, in Sweden, in the mine of Salberg, and deſcribed by him in the memoirs of the Swediſh Academy in 1749. Mr Wallerius mentions it in his Mineralogy.

Regulus of antimony is generally united with ſulphur, with which it forms antimony, which ought to be conſidered as a true ore of the regulus of antimony.

Another ore of regulus of antimony is alſo known, of

Ores of Antimony. of a red colour, in which the regulus is mineralifed both by arfenic and by fulphur. This ore refembles fome iron ores, and fome kinds of blend. It is diftinguifhed by its great fufibility, which is fuch, that it may be eafily melted by the flame of a candle.

The *native regulus* of antimony, by Von Sweb, is faid by that author to have differed from the regulus of antimony obtained from ores, in thefe two properties, that it was capable of being eafily amalgamated with mercury, and that its calx fhot into cryftals during the cooling.

Befides the ores of regulus of antimony enumerated above, this femimetal is alfo found in ores of other metallic fubftances, as in the *plumofe filver-ore*, and in the *ftibiated lead-ore*.

§ 2. The *ores of antimony may be effayed* by the following proceffes defcribed by Mr Cramer.

PROCESS I.

To obtain antimony from its ore.

"Choose a melting crucible, or an earthen pot not glazed, that may contain fome common pounds of the ore of antimony, broken into fmall bits. Bore at the bottom of the crucible fome fmall holes, two lines in diameter. Let the bottom of the veffel be received by the orifice of a fmaller one, upon which it muft be put; and when the ore is put into it, let it be covered with a tile, and all the joints be ftopped with lute.

"Put thefe veffels upon the pavement of a heath, and put ftones all around them at the diftance of fix inches. Fill this intermediate fpace with afhes, fo high that the inferior pot be covered to the upper brim. Then put frefh and burning coals upon it, and with a pair of hand-bellows excite the fire, till the upper veffels grow red-hot: take off the fire a quarter of an hour after; and when the veffels are grown cold, open them. You will find that the melted antimony has run through the holes made at the bottom of the upper veffel into the inferior one, where it is collected."

PROCESS II.

To roaft crude antimony, or its ore, with or without addition.

"Choose an earthen, flat, low difh, not glazed; and if it cannot bear being made middling red-hot, cover it over with a coat of lute without. Spread it thinly over with crude antimony, or with its ore, beaten to a pretty coarfe powder, not exceeding a few ounces at once. Put the difh upon a fire-pan, having a few burning coals in it: increafe the fire till it begins to fmoke a little. Meanwhile you muft inceffantly move the powder with a piece of new tobacco-pipe; for this caufes the fulphur to evaporate the fooner. If you increafe the fire a little too foon, the powder immediately gathers into large clots, or even begins to melt. When this happens, take it immediately off the fire before it melts entirely. Then pulverife it again, and finally make a gentle fire under it. Your black fhining powder will affume an afh-colour almoft like that of earth, and become more refractory in the fire; wherefore you may then increafe the fire till your powder grows middling red-hot, and let it laft till it ceafes to fmoke. If you add to your crude antimony pulverifed, half or an equal quantity of charcoal-duft, and perform the reft as above, the roafting will be done more conveniently: for it does not gather fo eafily into clots, and melts with much greater difficulty. When part of the fulphur is evaporated, add fome fat to it at feveral times. Thus you will fooner finifh the operation, and the remaining calx will not be burnt to excefs. However, if it be thus expofed to too violent and long-lafting a fire, a great quantity of it evaporates; nor does it ceafe entirely to fmoke in a great fire. And it will be enough, if, growing middling red-hot, it does no longer emit the unpleafant fmell of the acid of fulphur."

PROCESS III.

To reduce a calx of antimony into a femi-metallic regulus.

"Mix fome calx of antimony with a quarter part of the black flux, and put it into the crucible. Cover the veffel with a tile; make the fire as quickly as the veffel can bear it, but not greater than is neceffary to melt the flux. When the whole has been well in fufion for half a quarter of an hour (which may be tried with a tobacco-pipe, taking off the tile) pour it into the melting cone, which muft be warm and done over with tallow. Then immediately ftrike the cone feveral times. You will find, when the cone is inverted, a regulus, above which is a faline fcoria."

The methods of *calcining antimony by means of nitre*, are defcribed under Chemistry, n° 489—459; and thofe of obtaining a *regulus of antimony* without a previous calcination or roafting, by throwing a mixture of powdered antimony, tartar, and nitre, into a red-hot crucible, and by fufing this mixture, and of obtaining a *martial regulus of antimony*, are defcribed at the article Regulus.

Sect. X. *Ores of Bifmuth.*

Ores of Bifmuth. § 1. Bismuth is found *native*, refembling the regulus of bifmuth.

An *ochre* of bifmuth, of a whitifh yellow colour, is mentioned by Cronftedt; and is different from the ore improperly called *flowers of bifmuth*, which is a calx of cobalt.

Bifmuth is mineralifed, 1. By *fulphur*. This ore has the appearance of galena. 2. With *fulphurated iron*. Bifmuth is found alfo in cobalts, and in fome ores of filver.

§ 2. *Ores of Bifmuth* may be *effayed* by the following procefs.

PROCESS I.

To melt bifmuth from its ore.

"Bismuth ore may be melted with the fame apparatus as was directed for the fufion of crude antimony out of its ore. Or you may beat your ore to a very fine powder, with the black flux, fandiver, and common falt, in a clofe veffel, like the ore of lead, or of tin, and melt it in a middling fire, having a draught of air. But as this femi-metal is deftructible and volatile, you muft as quick as poffible apply to it that degree of fire which the flux requires to be melted; and

Ores of Cobalt.

and so soon as it is well melted, the vessel must be taken out of the fire; and when it is grown quite cold and broken, you will find your regulus."

Mr Gellert directs that ores of bismuth should be essayed by fusing a quintal of pulverised ore with half a quintal of calcined borax and half a quintal of pulverised glass, in order to vitrify the adherent earths and stones which invelop the bismuth. But probably the heat requisite for this vitrification would volatilise part of the bismuth.

If the ore be of the kinds above described, mineralised by sulphur, or by sulphur and iron, a previous roasting would be expedient, which may be performed in the same manner as is directed for the roasting of antimony.

SECT. XI. *Ores of the Regulus of Cobalt.*

COBALT is a grey-coloured mineral, with more or less of a metallic appearance. Its grain is close; it is compact and heavy, and frequently covered with an efflorescence of peach-coloured flowers. Of this several kinds are known*. All the true cobalts contain the semi-metal called *regulus* of cobalt, the calx of which becomes blue by vitrification. This regulus is mineralised in cobalt by sulphur, and especially by a large quantity of arsenic. Some cobalts also contain bismuth and silver.

* See *Cobalt.*

Authors have given the name of *cobalt* to many minerals, although they do not contain the semi-metal above-mentioned, but only because they externally resemble the ore of the regulus of cobalt. But these minerals can only be considered as false cobalts. They are distinguishable from true cobalt by trying whether they can yield the blue glass called *smalt*, and the sympathetic ink. The red efflorescence is also a mark by which true cobalt is distinguishable from the false: but this efflorescence only happens when the ore has been exposed to a moist air.

The principal mines of cobalt are in Saxony, where they are dug for the sake of obtaining zaffre, azure-blue or smalt, and arsenic. Very fine cobalt is also found in the Pyrenean mountains. It has been likewise found in Cornwall and Scotland. And that it is in the eastern parts of Asia, appears from the blue colouring on old oriental porcelain: but probably the mines discovered in these countries are nearly exhausted, as considerable quantities of zaffre and smalt are exported from Europe to China.

Cobalt is heavier than most other ores, from the large quantity of arsenic it contains; and in this respect it resembles the ore of tin.

Besides the grey or ash-coloured cobalt above described, which is the most frequent, other cobalts are found of various colours and textures, mixed with various substances. Wallerius enumerates six species of cobalts. 1. The *ash-coloured ore*, which is regulus of cobalt mineralised by arsenic, consisting of shining leaden-coloured grains. Some ores of this kind are compact resembling steel, and others are of a loose texture and friable. 3. The *specular ore* is black, shining like a mirror, and laminated. This species is very rare; and is supposed by Wallerius to be a foliated spar, or selenites mixed with cobalt. 3. The *vitreous*, or *slag-like ore*, is of a bluish, shining colour, compact, or spongy. 4. *Crystallized ore*, is a grey, deep-coloured cobalt, consisting of clusters of cubical, pyramidal, prismatic crystals. 5. *Flowers of cobalt*, red, yellow, or violet. These flowers seem to be formed from some of the above-described compact ores, decomposed by exposure to moist air. This decomposition is similar to that which happens to ferruginous and cupreous pyrites. 6. The *earthy cobalt* is of a greenish white, or of a yellow colour, and of a soft and friable texture. This species seems to be an ochre of cobalt; and is formed perhaps from the flowers of cobalt further decomposed, in the same manner as a martial ochre is formed from the saline efflorescence of decomposing pyrites, when this efflorescence is further decomposed by exposure to moist air; by which the vitriolic acid contained in it is expelled, and the efflorescence is changed from a saline state to that of an ochre or calx.

Ores of Zinc.

Besides these proper ores, cobalt is also found in a blue clay along with native silver, in ores of bismuth, and in the mineral called *kupfernickel*. See NICKEL.

The *essay* of cobalt is described at the article REGULUS *of Cobalt*.

SECT. XII. *Ores of Zinc.*

§ 1. THE proper ore of zinc is a substance which has rather an earthy or stony than metallic appearance, and is called *calamy*, *calamine*, or *lapis calaminaris*. This stone, although metallic, is but moderately heavy, and has not the brilliancy of most other ores. Its colour is yellow, and like that of rust. It is also less dense than other metallic minerals. It seems to be an ore naturally decomposed. The calamine is not worked directly to obtain zinc from it, because this would only succeed in close vessels, and consequently with small quantities, according to Mr Margraaf's process. But it is successfully employed for the conversion of copper into brass by cementation, by which the existence of zinc in that stone is sufficiently proved.

Mr Wallerius enumerates also amongst the ores of zinc a very compounded mineral, consisting of zinc, sulphur, iron, and arsenic. This mineral, called *blend*, resembles externally the ore of lead, and hence has been called *false galena*. These blends have different forms and colours; but are chiefly red, like the red ore of antimony.

Zinc is obtained from certain minerals in the East Indies, of which we know little.

Calciform ores of zinc, according to Cronstedt, are pure or mixed. The pure are indurated, and sometimes crystallised, resembling lead-spar. The mixed ore contains also some calx of iron. This is *calamine*. It is whitish, yellowish, reddish, or brown.

Zinc is *mineralised*, 1. By *sulphurated iron*. *Ore of zinc*. Wallerius says, lead is sometimes contained in this ore. It is white, blue, or brown. 2. By *sulphur, arsenic, and iron*. *Blend*, or *pseudo-galena*, or *false-galena*, or *black-jack*. These are of various colours, white, yellowish, brown, reddish, greenish, black. They consist of scales, or are tessellated. Mr Cronstedt thinks, that in blends the zinc is mineralised in the state of a calx, and in the ore of zinc in its metallic state.

§ 2. Although the minerals above enumerated have been known, from their property of converting copper into brass, to be ores of zinc, yet the method of essaying

Ores of Zinc.

faying them fo as to obtain the contained zinc was not known, or at leaft not publifhed, before Mr Margraaf's Memoir of the Berlin Academy for the year 1746, upon that fubject. That very able chemift has fhewn, that zinc may be obtained from its ores, from the flowers, or from any other calx of zinc, by treating thefe with charcoal-duft, in clofe veffels, to prevent the combuftion of the zinc, which happens immediately upon its reduction when expofed to air. For this purpofe, he put a quantity of finely powdered calamine, or roafted blend, or other calx of zinc, well mixed with an eighth part of charcoal-duft, into a ftrong, luted earthen retort, to which he fitted a receiver. Having placed his retort in a furnace and raifed the fire, he applied a violent heat during two hours. When the veffels were cold and broken, he found the zinc in its metallic form adhering to the neck of the retort.

The chief difficulty in this operation is to get an earthen retort fufficiently compact to retain the vapour of the zinc, (for it eafily pervades the Heffian crucibles, Stourbridge melting-pots, and fimilar veffels, as may be feen from the quantity of flowers which appear upon their outer furface, when zinc or its calxes and any inflammable matter have been expofed to heat within thefe veffels) and at the fame time fufficiently ftrong to refift the violent fire which Mr Margraaf requires.

A pretty exact effay of an ore of zinc may be made in the following manner.

Mix a quantity of pulverifed roafted ore or calx of zinc with an eighth part of charcoal-duft. Put this mixture into a crucible capable of containing thrice the quantity. Diffufe equally amongft this mixture a quantity of fmall grains or thin plates of copper equal to that of the calamine or ore employed, and upon the whole lay another equal quantity of grains or plates of copper; and laftly, cover this latter portion of copper with charcoal-duft. Lute a lid upon the crucible; and apply a red heat during an hour or two. The copper or part of it will unite with the vapour of the zinc, and be thereby converted into brafs. By comparing the weight of all the metal after the operation, with the weight of the copper employed; the weight acquired, and confequently the quantity of zinc united with the copper, will be known. The copper which has not been converted into brafs, or more copper with frefh charcoal-duft, may be again added in the fame manner to the remaining ore, and the operation repeated with a heat fomewhat more intenfe, that any zinc remaining in the ore may be thus extracted. A curious circumftance is, that a much greater heat is required to obtain zinc from its ore, by diftillation, than in the operation now defcribed of making brafs; in which the feparation of the zinc from its ore feems to be facilitated by its difpofition to unite with copper.

Sect. XIII. *Ores of Arfenic.*

Ores of Arfenic.

§ 1. The minerals which contain the largeft quantity of arfenic are cobalts and white pyrites; although it is alfo contained in other ores, it being one of the mineralifing fubftances. But as cobalt muft be roafted to obtain the fulphur it contains, the arfenic alfo which rifes during this torrefaction is collected, as we fhall fee in Part III. (Smelting of Ores,) and the particular articles of each of the metallic fubftances mentioned in this article.

I. Regulus of arfenic is found native. It is of a leaden colour; it burns with a fmall flame; and is diffipated, leaving generally a very fmall quantity of calx of bifmuth, or of calx of cobalt, and a very little filver. When it is of a folid and teftaceous texture, it has been improperly called *teftaceous cobalt*, in German *fcherbencobalt*. II. Calx of arfenic is found in form of powder; native flowers of arfenic, or of indurated femitranfparent cryftals; native cryftalline arfenic. III. Calx of arfenic is mixed, 1. With fulphur: when yellow, it is called *orpiment;* when red, it is called *native realgar:* the difference of colour depends on the proportion of the two component parts. 2. With calx of tin; tin-grains. 3. With fulphur and filver, in the red filver ore. 4. With calx of lead, in the lead-fpar. 5. With calx of cobalt, in the efflorefcence of cobalt. IV. Arfenic is mineralifed, 1. With fulphurated iron; arfenical pyrites. 2. With iron only; white pyrites, or mifspickle. 3. With cobalt, in almoft all cobalt-ores. 4. With filver. 5. With copper. 6. With antimony.

§ 2. Arfenic may be feparated from its ore or earthy matter with which it happens to be mixed, by fublimation, according to the following procefs by Mr Cramer.

"Do every thing as was faid about mercury, or fulphur; but let the veffel which is put into the fire with the ore in it be of earth or ftone, and the recipient be of glafs, and of a middling capacity. Nor is it neceffary that this fhould be filled with water, fo it be but well luted. The fire muft likewife be ftronger, and continued longer than for the extracting of fulphur. Neverthelefs every kind of arfenic cannot be extracted in a confined fire: for it adheres to the matrix more ftrongly than fulphur and mercury. You will find in the part of the veffel which is more remote from the fire, pulverulent and fubtle flowers of arfenic; but there will adhere to the pofterior of the neck of the retort fmall folid maffes, fhining like fmall cryftals, tranfparent, fometimes gathered into a folid fublimate, and perfectly white, if the ore of the arfenic was perfectly pure; which, neverthelefs, happens very feldom. The flowers are moft commonly thin, and of a grey colour: which proceeds from the phlogifton mixed with the mafs. They are often of a citron or of a golden colour, which is a fign that there is in the mixture fome mineral fulphur; and if the fublimate be red or yellow, it is a fign of much fulphur.

"As all the arfenic contained in the ore is not expelled in clofe veffels, you muft weigh the refiduum; then roaft it in a crucible till it fmokes no longer, or rather in an earthen flat veffel not glazed, and in a ftrong fire to be ftirred now and then with a poker, and then weigh it when grown cold: you will be able thus to know how much arfenic remained in the clofe veffel, unlefs the ore contain bifmuth."

If the arfenic be fulphurated, it may be purified by triturating it with mercury or with fixed alkali, and by fubliming the arfenic from the remaining fulphurated mercury or alkali. The method of obtaining a regulus of arfenic is defcribed at the article Regulus *of Arfenic*.

PART III.

SMELTING OF ORES.

Sulphur-works.

HAVING ſhown the nature of the principal metallic minerals, and the ſubſtances of which they are compoſed; and alſo explained the proceſſes by which an exact analyſis of theſe compound minerals may be made, and the nature and quantity of the contained metals may be known; in order to complete what relates to this important ſubject, we ſhall deſcribe in this Part the principal operations by which metals, &c. are obtained "in the great," as it is called, or for commercial purpoſes. What we ſhall ſay upon this ſubject will chiefly be extracted from a *Treatiſe on the Smelting of Ores, by Schlutter*, tranſlated from the German into French by M. Hellot; becauſe this, of all the modern works upon that ſubject, appears to be the moſt exact. We ſhall firſt deſcribe the operations upon pyritous matters for the extraction of ſulphur, &c. and afterwards the operations by which metallic ſubſtances are extracted from *ores* properly ſo called.

SECT. I. *Extraction of Sulphur from Pyrites and other Minerals.*

IN order to obtain ſulphur from pyrites, this mineral ought to be expoſed to a heat ſufficient to ſublime the ſulphur, or to make it diſtill in veſſels, which muſt be cloſe, to prevent its burning.

Sulphur is extracted from pyrites at a work at Schwartzemberg, in Saxony, in the high country of the mines; and in Bohemia, at a place called *Alten-Sattel*.

The furnaces employed for this operation are oblong, like vaulted galleries; and in the vaulted roofs are made ſeveral openings. Theſe are called *furnaces for extracting ſulphur*.

In theſe furnaces are placed earthen-ware tubes, filled with pyrites broken into pieces of the ſize of ſmall nuts. Each of theſe tubes contains about 50 pounds of pyrites. They are placed in the furnace almoſt horizontally, and have ſcarcely more than an inch of deſcent. The ends, which come out of the furnace five or ſix inches, become gradually narrower. Within each tube is fixed a piece of baked earth, in form of a ſtar, at the place where it begins to become narrower, in order to prevent the pyrites from falling out, or choaking the mouth of the tube. To each tube is fitted a receiver, covered with a leaden plate, pierced with a ſmall hole to give air to the ſulphur. The other end of the tube is exactly cloſed. A moderate fire is made with wood, and in eight hours the ſulphur of the pyrites is found to have paſſed into the receivers.

The reſiduum of the pyrites, after the diſtillation, is drawn out at the large end, and freſh pyrites is put in its place. From this reſiduum, which is called *burnings of ſulphur*, vitriol is extracted.

The 11 tubes, into which were put, at three ſeveral diſtillations, in all nine quintals or 900 pounds of pyrites, yield from 100 to 150 pounds of crude ſulphur, which is ſo impure as to require to be purified by a ſecond diſtillation.

Sulphur-works.

This purification of crude ſulphur is alſo done in a furnace in form of a gallery, in which five iron cucurbits are arranged on each ſide. Theſe cucurbits are placed in a ſloping direction, and contain about eight quintals and a half of crude ſulphur. To them are luted earthen tubes, ſo diſpoſed as to anſwer the purpoſe of capitals. The noſe of each of theſe tubes is inſerted into an earthen pot called the *fore-runner*. This pot has three openings; namely, that which receives the noſe of the tube; a ſecond ſmaller hole, which is left open to give air; and a third in its lower-part, which is ſtopped with a wooden peg.

When the preparations are made, a fire is lighted about ſeven o'clock in the evening, and is a little abated as ſoon as the ſulphur begins to diſtil. At three o'clock in the morning, the wooden pegs which ſtop the lower holes of the fore-runners are for the firſt time drawn out, and the ſulphur flows out of each of them into an earthen pot with two handles, placed below for its reception. In this diſtillation the fire muſt be moderated and prudently conducted; otherwiſe leſs ſulphur would be obtained, and it alſo would be of a grey colour, and not of the fine yellow which it ought to have when pure. The ordinary loſs in the purification of eight quintals of crude ſulphur is, at moſt, one quintal.

When all the ſulphur has flowed out, and has cooled a little in the earthen pots, it is caſt into moulds made of beech-tree, which have been previouſly dipt in water and ſet to drain. As ſoon as the ſulphur is cooled in the moulds, they are opened, and the cylinders of ſulphur are taken out and put up in caſks. Theſe are called *roll-brimſtone*.

As ſulphur is not only in pyrites, but alſo in moſt metallic minerals, it is evident that it might be obtained by works in the great from the different ores which contain much of it, and from which it muſt be ſeparated previouſly to their fuſion: but as ſulphur is of little value, the trouble of collecting it from ores is ſeldom taken. Smelters are generally ſatisfied with freeing their ores from it, by expoſing them to a fire ſufficient to expel it. This operation is called *torrefaction*, or *roaſting of ores*.

There are, however, ores which contain ſo much ſulphur, that part of it is actually collected in the ordinary operation of roaſting, without much trouble for that purpoſe. Such is the ore of Ramelſberg in the country of Hartz.

This ore, which is of lead, containing ſilver, is partly very pure, and partly mixed with cupreous pyrites and ſilver; hence it is neceſſary to roaſt it.

The roaſting is performed by laying alternate ſtrata of ore and wood upon each other in an open field, taking care to diminiſh the ſize of the ſtrata as they riſe higher; ſo that the whole maſs ſhall be a quadrangular pyramid truncated above, whoſe baſe is about 31 feet ſquare. Below, ſome paſſages are left open, to give free entrance to the air; and the ſides and

and top of the pyramid are covered over with ſmall ore, to concentrate the heat and make it laſt longer. In the centre of this pyramid there is a channel which deſcends vertically from the top to the baſe. When all is properly arranged, ladlefuls of red-hot ſcoria from the ſmelting-furnace are thrown down the channel, by which means the ſhrubs and wood placed below for that purpoſe are kindled, and the fire is from them communicated to all the wood of the pile, which continues burning till the third day. At that time the ſulphur of the mineral becomes capable of burning ſpontaneouſly, and of continuing the fire after the wood is conſumed.

When this roaſting has been continued 15 days, the mineral becomes greaſy; that is, it is covered over with a kind of varniſh: 20 or 25 holes or hollows are then made in the upper-part of the pile in which the ſulphur is collected. From theſe cavities the ſulphur is taken out thrice every day, and thrown into water. This ſulphur is not pure, but crude; and is therefore ſent to the manufacturers of ſulphur, to be purified in the manner above-related.

As this ore of Ramelſberg is very ſulphureous, the firſt roaſting, which we are now deſcribing, laſts three months; and during this time, if much rain has not fallen, or if the operation has not failed by the pile falling down or cracking, by which the air has ſo much free acceſs, that the ſulphur is burnt and conſumed, from 10 to 20 quintals of crude ſulphur are by this method collected.

The ſulphur of this ore, like that of moſt others, was formerly neglected, till, in the year 1570, a perſon employed in the mines called *Chriſtopher Sauder*, diſcovered the method of collecting it, nearly as it is done at preſent.

Metallic minerals are not the only ſubſtances from which ſulphur is extracted. This matter is diffuſed in the earth in ſuch quantities, that the metals cannot abſorb it all. Some ſulphur is found quite pure, and in different forms, principally in the neighbourhood of volcanos, in caverns, and in mineral waters. Such are the opaque kind called *virgin ſulphur;* the tranſparent kind called *ſulphur of Quito;* and the native flowers of ſulphur, as thoſe of the waters of Aix-la-Chapelle. It is alſo found mixed with different earths. Here we may obſerve, that all thoſe kinds of ſulphur which are not mineralized by metallic ſubſtances, are found near volcanoes, or hot mineral waters, and conſequently in places where nature ſeems to have formed great ſubterranean laboratories, in which ſulphureous minerals may be analyſed and decompoſed, and the ſulphur ſeparated, in the manner in which it is done in ſmall in our works and laboratories. However that be, certainly one of the beſt and moſt famous ſulphur-mines in the world is that called *Solfatara.* The Abbé Nollet has publiſhed, in the Memoirs of the Academy, ſome intereſting obſervations upon this ſubject, which we ſhall here abridge.

Near Puzzoli, in Italy, is that great and famous mine of ſulphur and alum called at preſent *Solfatara.* It is a ſmall oval plain, the greateſt diameter of which is about 400 yards, raiſed about 300 yards above the level of the ſea. It is ſurrounded by high hills and great rocks, which fall to pieces, and whoſe fragments form very ſteep banks. Almoſt all the ground is bare and white, like marle; and is every-where ſenſibly warmer than the atmoſphere in the greateſt heat of ſummer, ſo that the feet of perſons walking there are burnt through their ſhoes. It is impoſſible not to obſerve the ſulphur there; for every-where may be perceived by the ſmell a ſulphureous vapour, which riſes to a conſiderable height, and gives reaſon to believe that there is a ſubterraneous fire below, from which that vapour proceeds.

Near the middle of this field there is a kind of baſon three or four feet lower than the reſt of the plain, in which a ſound may be perceived when a perſon walks on it, as if there were under his feet ſome great cavity, the roof of which was very thin. After that, the lake Agnano is perceived, whoſe waters ſeem to boil. Theſe waters are indeed hot, but not ſo hot as boiling water. This kind of ebullition proceeds from vapours which riſe from the bottom of the lake, which being ſet in motion by the action of ſubterranean fires, have force enough to raiſe all that maſs of water. Near this lake there are pits, not very deep, from which ſulphureous vapours are exhaled. Perſons who have the itch, come to theſe pits, and receive the vapours in order to be cured. Finally, there are ſome deeper excavations, whence a ſoft ſtone is procured which yields ſulphur. From theſe cavities vapours exhale, and iſſue out with noiſe, and which are nothing elſe than ſulphur ſubliming through the crevices. This ſulphur adheres to the ſides of the rocks, where it forms enormous maſſes: in calm weather, the vapours may be evidently ſeen to riſe 25 or 30 feet from the ſurface of the earth.

Theſe vapours, attaching themſelves to the ſides of rocks, form enormous groups of ſulphur, which ſometimes fall down by their own weight, and render theſe places of dangerous acceſs.

In entering the Solfatara, there are warehouſes and buildings erected for the refining of ſulphur.

Under a great ſhed, or hangar, ſupported by a wall behind, and open on the other three ſides, the ſulphur is procured by diſtillation from the ſoft ſtones we mentioned above. Theſe ſtones are dug from under ground; and thoſe which lie on the ſurface of the earth are neglected. Theſe laſt are, however, covered with a ſulphur ready formed, and of a yellow colour: but the workmen ſay they have loſt their ſtrength, and that the ſulphur obtained from them is not of ſo good a quality as the ſulphur obtained from the ſtones which are dug out of the ground.

Theſe laſt mentioned are broken into lumps, and put into pots of earthen ware, containing each about 20 pints Paris meaſure. The mouths of theſe pots are as wide as their bottoms; but their bellies, or middle parts, are wider. They are covered with a lid of the ſame earth, well luted, and are arranged in two parallel lines along two brick walls, which form the two ſides of a furnace. The pots are placed within theſe walls; ſo that the centre of each pot is in the centre of the thickneſs of the wall, and that one end of the pots overhangs the wall within, while the other end overhangs the wall without. In each furnace ten of theſe pots are placed; that is, five in each of the two walls which form the two ſides of the furnace. Be-

twixt

twixt thefe walls there is a fpace of 15 or 18 inches; which fpace is covered by a vault refting on the two walls. The whole forms a furnace feven feet long, two feet and a half high, open at one end, and fhut at the other, excepting a fmall chimney through which the fmoke paffes.

Each of thefe pots has a mouth in its upper part without the furnace, in order to admit a tube of 18 lines in diameter and a foot in length, which communicates with another pot of the fame fize placed without the building, and pierced with a round hole in its bafe of 15 or 18 lines diameter. Laftly, to each of thefe laft-mentioned pots there is a wooden tub placed below, in a bench made for that purpofe.

Four or five of thefe furnaces are built under one hangar, or fhed. Fires are kindled in each of them at the fame time; and they are thrown down after each diftillation, either that the pots may be renewed, or that the refiduums may be more eafily taken out.

The fire being kindled in the furnace, heats the firft pots containing the fulphureous ftones. The fulphur rifes in fumes into the upper part of the pot, whence it paffes through the pipe of communication into the external veffel. There the vapours are condenfed, become liquid, and flow through the hole below into the tub, from which the fulphur is eafily turned out, becaufe the form of the veffel is that of a truncated cone whofe narrower end is placed below, and becaufe the hoops of the tub are fo faftened that they may be occafionally loofened. The mafs of fulphur is then carried to the buildings mentioned before, where it is remelted for its purification, and caft into rolls, fuch as we receive it.

Extraction of Alum *from pyritous fubftances and from aluminous earths.* See Chemistry, n° 129.

Sect. II. *Smelting of Ores in general.*

§ 1. As ores confift of metallic matters combined with fulphur and arfenic, and are befides intermixed with earthy and ftony fubftances of all kinds, the intention of all the operations upon thefe compound bodies is to feparate thefe different fubftances from each other. This is effected by feveral operations founded on the known properties of thofe fubftances. We now proceed to give a general idea of thefe feveral operations.

Firft of all, the ore is to be feparated from the earths and ftones accidentally adherent to it; and when thefe foreign fubftances are in large maffes, and are not very intimately mixed in fmall particles with the ore, this feparation may be accomplifhed by mechanical means. This ought always to be the firft operation, unlefs the adherent fubftance be capable of ferving as a flux to the ore. If the unmetallic earths be intimately mixed with the ore, this muft neceffarily be broken and divided into fmall particles. This operation is performed by a machine which moves peftles, called *bocards* or *ftampers*. After this operation, when the parts of the mineral are fpecifically heavier than thofe of the unmetallic earth or ftone, thefe latter may be feparated from the ore by wafhing in canals through which water flows. With regard to this wafhing of ores, it is neceffary to obferve, that it cannot fucceed but when the ore is fenfibly heavier than the foreign matters. But the contrary happens frequently, as well becaufe quartz and fpar are naturally very ponderous, as becaufe the metallic matter is proportionably fo much lighter as it is combined with more fulphur.

When an ore happens to be of this kind, it is neceffary to begin by roafting it, in order to deprive it of the greateft part of its fulphur.

It happens frequently that the pyritous matters accompanying the ore are fo hard that they can fcarcely be pounded. In this cafe it is neceffary to roaft it entirely, or partly, and to throw it red-hot into cold water; by which the ftones are fplit, and rendered much more capable of being pulverized.

Thus it happens very frequently, that roafting is the firft operation to which an ore is expofed.

When the fubftance of the ore is very fufible, this firft operation may be difpenfed with, and the matter may be immediately fufed without any previous roafting, or at leaft with a very flight one. For, to effect this fufion, it is neceffary that it retain a great quantity of its fulphur, which, with the other fluxes added, ferves to deftroy or convert into fcoria a confiderable part of the ftony matter of the mineral, and to reduce the reft into a brittle fubftance, which is called the *matt of lead*, or of *copper*, or other metal contained in the ore. This matt is therefore an intermediate matter betwixt the mineral and the metal; for the metal is there concentrated, and mixed with lefs ufelefs matter than it was in the ore. But as this matt is always fulphureous, the metal which it contains cannot have its metallic properties. Therefore it muft be roafted feveral times to evaporate the fulphur, before it is remelted, when the pure metal is required. This fufion of an ore not roafted, or but flightly roafted, is called *crude fufion.*

We may here obferve upon the fubject of wafhing and roafting of ores, that as arfenic is heavier than fulphur, and has nearly the weight of metals, the ores in which it prevails are generally very heavy, and confequently are fufceptible of being wafhed, which is a great advantage. But on the other fide, as arfenic is capable of volatilifing, fcorifying, and deftroying many metals, thefe ores have difadvantages in the roafting and fufion, in both which confiderable lofs is caufed by the arfenic. Some ores contain, befides arfenic, other volatile femi-metals, fuch as antimony and zinc. Thefe are almoft untractable, and are therefore neglected. They are called *mineræ rapaces*, "rapacious ores."

When the metal has been freed as much as is poffible from foreign matters by thefe preliminary operations, it is to be completely purified by fufions more or lefs frequently repeated; in which proper additions are made, either to abforb the reft of the fulphur and arfenic, or to complete the vitrification or fcorification of the unmetallic ftones and earth.

Laftly, as ores frequently contain feveral different metals, thefe are to be feparated from each other by proceffes fuited to the properties of thefe metals, of which we fhall fpeak more particularly as we proceed in our examination of the ores of each metal.

§ 2. To facilitate the extraction of metallic fubftances from the ores and minerals containing them, fome operations previous to the fufion or fmelting of thefe

Roasting of Ores.

these ores and minerals are generally neceſſary. These operations conſiſt of, 1. The *ſeparation* of the ores and metallic matters from the adhering unmetallic earths and ſtones, by hammers and other mechanical inſtruments, and by waſhing with water. 2. Their *diviſion* or reduction into ſmaller parts by contuſion and trituration, that by another waſhing with water they may be more perfectly cleanſed from extraneous matters, and rendered fitter for the ſubſequent operations, calcination or roaſting, and fuſion. 3. *Roaſting* or *calcination;* the uſes of which operation are, to expel the volatile, uſeleſs, or noxious ſubſtances, as water, vitriolic acid, ſulphur, and arſenic; to render the ore more friable, and fitter for the ſubſequent contuſion and fuſion; and, laſtly, to calcine and deſtroy the viler metals, for inſtance the iron of copper-ores, by means of the fire, and of the ſulphur and arſenic. Stones, as quartz and flints, containing metallic veins or particles, are frequently made red-hot, and then extinguiſhed in cold water, that they may be rendered ſufficiently friable and pulverable, to allow the ſeparation of the metallic particles.

Roaſting is unneceſſary for native metals; for ſome of the richer gold and ſilver ores; for ſome lead-ores, the ſulphur of which may be ſeparated during the fuſion; and for many calciform ores, as theſe do not generally contain any ſulphur and arſenic.

In the roaſting of ores, the following attentions muſt be given, 1. To reduce the mineral previouſly into ſmall lumps, that the ſurface may be increaſed; but they muſt not be ſo ſmall, nor placed ſo compactly, as to prevent the paſſage of the air and flame. 2. The larger pieces muſt be placed at the bottom of the pile, where the greateſt heat is. 3. The heat muſt be gradually applied, that the ſulphur may not be melted, which would greatly retard its expulſion; and that the ſpars, fluors, and ſtones, intermixed with the ore, may not crack, fly, and be diſperſed. 4. The ores not thoroughly roaſted by one operation muſt be expoſed to a ſecond. 5. The fire may be increaſed towards the end, that the noxious matters more ſtrongly adhering may be expelled. 6. Fuel which yields much flame, as wood and foſſil coals free from ſulphur, is ſaid to be preferable to charcoal or coaks. Sometimes cold water is thrown on the calcined ore at the end of the operation, while the ore is yet hot, to render it more friable.

No general rule can be given concerning the duration or degree of the fire, theſe being very various according to the difference of the ores. A roaſting during a few hours or days is ſufficient for many ores; while ſome, ſuch as the ore of Rammelſberg, require that it ſhould be continued during ſeveral months.

Schlutter enumerates five methods of roaſting ores. 1. By conſtructing a pile of ores and fuel placed in alternate ſtrata, in the open air, without any furnace. 2. By confining ſuch a pile within walls, but without a roof. 3. By placing the pile under a roof, without lateral walls. 4. By placing the pile in a furnace conſiſting of walls and a roof. 5. By roaſting the ore in a reverberatory furnace, in which it muſt be continually ſtirred with an iron rod.

Several kinds of fuſions of ores may be diſtinguiſhed. 1. When a ſulphureous ore is mixed with much earthy matter, from which it cannot be eaſily ſeparated by mechanical operations, it is frequently melted, in order to diſengage it from theſe earthy matters, and to concentrate its metallic contents. By this fuſion, ſome of the ſulphur is diſſipated, and the ore is reduced to a ſtate intermediate betwixt that of ore and of metal. It is then called a *matt (lapis ſulphureo-metallicus);* and is to be afterwards treated like a pure ore by the ſecond kind of fuſion, which is properly the ſmelting, or extraction of the metal by fuſion. 2. By this fuſion or ſmelting, the metal is extracted from the ore previouſly prepared by the above operations, if theſe be neceſſary. The ores of ſome very fuſible metals, as of biſmuth, may be ſmelted by applying a heat ſufficient only to melt the metals, which are thereby ſeparated from the adhering extraneous matters. This ſeparation of metals by fuſion, without the vitrification of extraneous matters, may be called *eliquation*. Generally, a complete fuſion of the ore and vitrification of the earthy matters are neceſſary for the perfect ſeparation of the contained metals. By this method, metals are obtained from their ores, ſometimes pure, and ſometimes mixed with other metallic ſubſtances, from which they muſt be afterwards ſeparated; as we ſhall ſee, when we treat of the extraction of particular metals. To procure this ſeparation of metals from ores, theſe muſt be ſo thinly liquefied, that the ſmall metallic particles may diſengage themſelves from the ſcoria; but it muſt not be ſo thin as to allow the metal to precipitate before it be perfectly diſengaged from any adhering extraneous matter, or to pervade and deſtroy the containing veſſels and furnace. Some ores are ſufficiently fuſible; but others require certain additions called *fluxes*, to promote their fuſion and the vitrification of their unmetallic parts; and alſo to render the ſcoria ſufficiently thin to allow the ſeparation of the metallic particles.

Fuſion of Ores.

Different fluxes are ſuitable to different ores, according to the quality of the ore, and of the matrix, or ſtone adherent to it.

The matrixes of two different ores of the ſame metal frequently ſerve as fluxes to each other; as, for inſtance, an argillaceous matrix with one that is calcareous; theſe two earths being diſpoſed to vitrification when mixed, though each of them is ſingly unfuſible. For this reaſon, two or more different ores to be ſmelted are frequently mixed together.

The ores alſo of different metals require different fluxes. Thus calcareous earth is found to be beſt ſuited to iron-ores, and ſpars and ſcoria to fuſible ores of copper.

The fluxes moſt frequently employed in the ſmelting of ores are, calcareous earth, fluors or vitreous ſpars, quartz and ſand, fuſible ſtones, as ſlates, baſaltes, the ſeveral kinds of ſcoria, and pyrites.

Calcareous earth is uſed to facilitate the fuſion of ores of iron, and of ſome of the poorer ores of copper, and, in general, of ores mixed with argillaceous earths, or with feltſpar. This earth has been ſometimes added with a view of ſeparating the ſulphur, to which it very readily unites: but by this union the ſulphur is detained, and a hepar is formed, which readily diſſolves iron and other metals, and ſo firmly adheres to them, that they cannot be ſeparated without more difficulty than they could from the original ore. This addition is therefore not to be made till the ſulphur be previ-ouſly

Of Fluors. ously well expelled.

Fluors or *fusible spars* facilitate the fusion of most metallic minerals, and also of calcareous and argillaceous earths, of steatites, asbestus, and some other unfusible stones, but not of siliceous earths without a mixture of calcareous earth.

Quartz is sometimes added in the fusion of ferruginous copper ores, the use of which is said chiefly to be, to enable the ore to receive a greater heat, and to give a more perfect vitrification to the ferruginous scoria.

The *fusible stones*, as *slates*, *basaltes*, are so tenacious and thick when fused, that they cannot be considered properly as fluxes, but as matters added to lessen the too great liquidity of some very fusible minerals.

The *scoria* obtained in the fusion of an ore is frequently useful to facilitate the fusion of an ore of the same metal, and sometimes even of ores of other metals.

Sulphurated pyrites greatly promote the fusibility of the scoria of metals, from the sulphur it contains. It is chiefly added to difficultly-fusible copper-ores, to form the sulphureous compounds called *matts*, that the ores thus brought into fusion may be separated from the adhering earthy matters, and that the ferruginous matter contained in them may be destroyed, during the subsequent calcination and fusion, by means of the sulphur.

As in the ores called *calciform*, the metallic matter exists in a calcined state; and as calcination reduces the metals of mineralized ores (excepting the perfect metals) to that state also; therefore all calciform and calcined ores require the addition of some inflammable substance, to reduce them to a metallic state. In great works, the charcoal or other fuel used to maintain the fire produces also this effect.

Metals are sometimes added in the fusion of ores of other more valuable metals, to absorb from these sulphur or arsenic. Thus iron is added to sulphurated, cupreous, and silver ores. Metals are also added in the fusion of ores of other more valuable metals, to unite with and collect the small particles of these dispersed through much earthy matter, and thus to assist their precipitation. With these intentions, lead is frequently added to ores and minerals containing gold, silver, or copper.

Ores of metals are also sometimes added to assist the precipitation of more valuable metals. Thus antimony is frequently added to assist the precipitation of gold intermixed with other metallic matters. Thus far of smelting of ores in general.

Sect. III. *Operations on Ores of Native Gold and Silver, by Washing and by Mercury.*

Earths and sand are at first separated by washing with water; by which operation the greatest part of what is not gold, being lighter, is carried off. After this a second washing is made with mercury, which having the property of uniting with gold, seizes this metal, amalgamates with it, and separates it exactly from the earthy matters, with all which it can form no union.

The mercury thus charged with gold is pressed through shamoy leather, and the gold is retained united with a part of the mercury, from which it may be easily disengaged by exposure to a proper degree of heat, which dissipates and evaporates the mercury, while the gold, being fixed, remains.

Washing of Ores of Gold.

This is the foundation of all the operations by which gold is obtained from the rich mines of Peru belonging to the Spaniards. These operations consist in washings, triturations, and amalgams in the great by help of machines.

The ores of native silver are much rarer and less abundant than those of gold. But if any of this kind were found sufficiently rich, they might be treated with mercury exactly in the same manner as the ores of native gold.

Gold is frequently contained in the ores of other metals, either in a native or mineralised state, and in sands, especially those which are black and ferruginous. See Part II. sect. of *Ores of Gold.*

If *gold be contained in ores of other metals*, these metals together with the gold may be first extracted by the ordinary processes for smelting these ores; and the gold may be then separated from the metallic mass thus obtained, by mixing and fusing this mass with a quantity of lead, and by the process of cupellation described in the articles Essay *of the value of silver*, and Refining. Generally, the operations for obtaining gold from ores of imperfect metals are precisely the same as those for obtaining silver, to which therefore we refer. Most frequently a quantity of silver also is contained in these ores; and in this case the perfect metal obtained by cupellation is an allay of gold and silver, which must be afterwards separated by the processes called *parting*. See Parting.

Many trials have been made to procure the small quantity of gold contained in the *ferruginous sands*, at a moderate expence (see Part II. sect. of *Ores of Gold*); but as no work of this kind is now established, we may presume they have not been successful. The best essays of this kind have been made, according to Schlutter, in the following manner.

The sand is to be made red-hot, and extinguished in cold water four times, by which its colour is changed from the original yellow, red, or black, to a reddish-brown. It is observed to emit, during the first and second calcinations, an arsenical smell; and this smell may be produced again in the following calcinations by adding some inflammable matter. Let an ounce of the calcined sand be mixed with two ounces of granulated lead, and one ounce of black flux, and put into a Hessian crucible, with half an ounce of decrepitated sea-salt upon the surface of the mixture. The crucible is to be placed in a good blast-furnace, and a strong fire is to be excited. The matter contained in the crucible is to be frequently stirred with an iron-rod, and the heat is to be continued till the scoria is thin and perfectly fused. When the crucible is broken, a regulus of lead will be found, containing the gold and silver of the sand. By this method Mr Leberecht obtained, in eleven essays, from 840 to 844 grains of perfect metal from a quintal of sand. Of the perfect metal obtained, from a fourth to a third part was gold. Some parcels of sand have yielded more than 1000 grains, and some not more than 350 grains, per quintal. Instead of the granulated lead, and the black flux, which is too expensive for great operations, some have added, to an ounce of the sand, two ounces of litharge and

and a little powder of charcoal, by which they have obtained the fame quantity of perfect metal. The fcoria in thefe effays has been always found to contain fome perfect metal.

The Hungarian copper ores, from which gold and filver are profitably extracted, contain a lefs quantity of thefe perfect metals than many ferruginous fands. But they may be formed into a matt, by fufion with pyrites, of which treatment the fands are incapable. From this matt, the gold and filver, along with the copper of the ore, may be precipitated, and feparated from the fulphur of the pyrites, by addition of iron, which being more difpofed than the other metals to unite with fulphur, difengages thefe metals, and allows them to precipitate.

Sect. IV. *Smelting of Ores of Silver.*

§ 1. As filver, even in its proper ores, is always allayed with fome other metals from which it is intended to be feparated after that the filver-ore has been well roafted, it muft be mixed with a greater or lefs quantity of lead previous to its fufion.

Lead has the fame effect in fufion of gold and filver as mercury has upon thefe metals by its natural fluidity; that is to fay, it unites with them, and feparates them from unmetallic matters, which, being lighter, rife always to the furface. But lead has the further advantage of procuring, by its own vitrification, that of all metallic fubftances, excepting gold and filver. Hence it follows, that when gold and filver are obtained by means of mercury, they ftill remain allayed with other metallic fubftances; whereas when they are obtained by fufion and fcorification with lead, they are then pure, and not allayed with any metals but with each other.

In proportion as the lead, which has been united to the gold and filver of the ore, is fcorified by the action of the fire, and promotes the fcorification of the other metallic matters, it feparates the perfect metals, and carries with it all the others to the furface. There it meets the unmetallic fubftances, which it likewife vitrifies, and which it changes into a perfect fcoria, fluid, and fuch as a fcoria ought to be to admit all the perfect metal contained in it to precipitate.

When all heterogeneous matters have been thus difengaged by fcorification with lead, the perfect metals, to which fome lead ftill remains united, are to be further purified by the ordinary operation of the cupel.

The common rule for the fufion and fcorification of filver-ore with lead, is to add to the ore a quantity of lead fo much greater as there is more matter to be fcorified, and as thefe matters are more refractory and of more difficult fufion. Silver ores, or thofe treated as fuch, are often rendered refractory by ferruginous earths, pyritous matters, or cobalts, containing always a confiderable quantity of an earth which is unmetallic, very fubtile, and very refractory, and which renders a confiderable augmentation of the quantity of lead neceffary.

The quantity of lead which is commonly added to fufible filver ores, that do not contain lead, is eight times the quantity of the ore. But when the ore is refractory, it is neceffary to add twelve times the quantity of lead, and even more; alfo glafs of lead, and fluxes, fuch as the white and black fluxes; to which however borax and powder of charcoal are preferable, on account of the liver of fulphur formed by thefe alkaline fluxes.

It is neceffary to obferve, that faline fluxes are only ufed in fmall operations, on account of their dearnefs. To thefe are fubftituted, in the great operations, of which we now treat, fandiver, fufible fcoria, and other matters of little value.

The greateft part of filver now employed in commerce is not obtained from the proper ores of filver, which are very fcarce; but from lead, and even copper ores, which are more or lefs rich in filver. To give an idea of the manner of treating thefe kinds of ores, from which filver is extracted in the great works, we fhall briefly defcribe here, after Schlutter, the fmelting of the ore of Rammelfberg, which contains, as we have already faid, feveral different kinds of metals, but particularly lead and filver.

When this mineral has been difengaged from its fulphur as much as poffible by three very long roaftings, it is melted in the Lower Hartz in Saxony, in a particular kind of furnace, called a *furnace for fmelting upon a hollow or caffe*. The mafonry of this furnace is compofed of large thick flates, capable of fuftaining great heat, and cemented together by clay. The interior part of the furnace is three feet and a half long, and two feet broad at the back part, and one foot only in the front. Its height is nine feet eight inches. It has a foundation of mafonry in the ground; and in this foundation channels are made for the evaporation of the moifture. Thefe channels are covered over with ftones called *covering ftones*. The hollow or caffe, which is made above thefe, is formed of bricks, upon which are placed, firft, a bed of clay; then a bed of fmall ore and fifted vitriols; and, laftly, a bed of charcoal-powder beat down, called *light brafque*. The anterior wall of the furnace is thinner than the others, and is called the *chemife*. The back wall, which is pierced to give paffage to the pipes of two large wooden bellows, is called the *middle wall*. When the furnace is thus prepared, charcoal is thrown into the hollow, or caffe; which being kindled, the fire is to be continued during three hours, before the matters to be fufed are added. Then thefe matters are thrown in, which are not the pure ore, but a mixture of feveral fubftances, all of which are fomewhat profitable. The quantity of thefe matters is fufficient for one day's work; that is, for a fufion of eighteen hours; and it confifts of, 1. Twelve fchorbens or meafures of well roafted Rammelfberg ore; (the fchorben is a meafure whofe contents are two feet five inches long, one foot feven inches broad, and a little more than a foot deep: it is equal to 32 quintals of that country, Cologn weight, at 123 pounds each quintal.) 2. Six meafures of fcoria produced by the fmelting of the ore of Upper Hartz, which is refractory, and what workmen call *cold*. 3. Two meafures of knobben, which is an impure fcoria containing fome lead and filver, which has been formerly thrown away as ufelefs, and is now collected by women and children. Befides thefe, other matters are added, containing lead and filver, as the tefts employed in refining, the drofs of lead, impure litharge, and

Smelting of Ores of Silver.

and any rubbiſh containing metal, which was left in the furnace after the foregoing fuſion. All theſe matters being mixed together, are thrown into the furnace: and to each meaſure of this mixture a meaſure of charcoal is added. The fuſion is then begun by help of bellows; and as it proceeds, the lead falls through the light braſque, or charcoal-bed, into the hollow, or caſſe, where it is preſerved from burning under the powder of charcoal. The ſcoria, on the other hand, being lighter and leſs fluid, is ſkimmed off from time to time by means of ladles, that it may not prevent the reſt of the lead from falling down into the hollow. Thus, while the fuſion laſts, freſh matters and freſh charcoal are alternately added, till the whole quantity intended for one fuſion, or, as they call it, one *day*, be thrown in.

There are ſeveral eſſential things to be remarked in this operation, which is very well contrived. Firſt, The mixture of matters from which a little lead and ſilver is procured, which would otherwiſe be loſt; and which have alſo this advantage, that they retard the fuſion of the Ramelſberg ore, which, however well roaſted it has been, retains always enough of the ſulphur and iron of the pyrites mixed with it, to render it too fuſible or too fluid, ſo that without the addition of thoſe matters nothing would be obtained but a matt. It is even neceſſary, notwithſtanding theſe additions, not to haſten the fuſion too much, but to give time for the ore to mix with other matters, elſe it would melt and flow of itſelf before the reſt. Secondly, The fuſion of the ore through charcoal, which is practiſed in moſt ſmelting-houſes, and for almoſt all ores, is an excellent method, the principal advantage of which is the ſaving of fuel. The action of the burning charcoal directed immediately upon the mineral, at the ſame time that it melts it more readily and efficacioully, alſo ſupplies it with the phlogiſton neceſſary to bring it to a perfect ſtate.

From the Ramelſberg ore after its firſt roaſting, a *white vitriol* is obtained and prepared at Goſlar *, whoſe baſis was *zinc:* which proves that this ore contains alſo a certain quantity of this ſemi-metal. As this ore is ſmelted in a country where the art is well underſtood of extracting every thing which a mineral contains, ſo in this fuſion *zinc* and *cadmia* are obtained in the following manner: When the furnace is prepared for the fuſion, it is neceſſary to cloſe it up in the fore-part, before the fuſion is begun.

* See *Chemiſtry*, n° 157.

"Firſt of all, a gritt-ſtone is to be placed, ſupported at the height of three inches. This ſtone is as long as the furnace is broad, and the height of it is level with the hole where the bellows-pipe enters. It is faſtened on each ſide of the furnace, externally and internally, with clay. Upon this ſtone a kind of receptacle, or, as it is called, the *ſeat of the zinc*, is made in the following manner: A flat ſlaty ſtone is choſen, as long as the furnace is broad, and eight inches in breadth. This is placed on the gritt-ſtone above-mentioned, in ſuch a manner that it inclines conſiderably towards the front of the furnace, and that its bottom touches cloſely the gritt-ſtone. It is faſtened with clay, which is alſo laid upon the ſeat of the zinc. Upon this ſeat, which is to receive the zinc, two round pieces of charcoal are placed, and alſo a ſtone called the *zinc ſtone*, which is about a foot and a half in length, and cloſes one part of the front of the furnace. This ſtone alſo is faſtened on each of its ſides with clay. Clay is likewiſe put under the ſtone betwixt the two pieces of charcoal, which hinder it from touching the ſeat of the zinc. The under-part of this ſtone is but ſlightly luted, that the workmen may make an opening for the zinc to flow out. Thus is made the ſeat or receptacle of the zinc to detain this metallic ſubſtance, which would otherwiſe fall into the hotteſt part of the fire, called by the workmen the *melting-place*, and would be there burnt: whereas it is collected upon this receptacle during the fuſion, where it is ſheltered from the action of the bellows, and conſequently from too great heat.

"When all the matter to be fuſed in one day is put into the furnace, the blaſt of air is continued till that matter has ſunk down. When it is half-way down the furnace, they draw out the ſcoria, that more of the ore and other matters may be expoſed to the greateſt heat. As ſoon as the ſcoria is cooled and fixed a little, two ſhovel-fulls of ſmall wet ſcoria or ſand is thrown cloſe to the furnace, and beat down with the ſhovel; then the workmen open the ſeat or receptacle of zinc, and ſtrike upon the zinc-ſtone to make the ſemi-metal flow out. As ſoon as the pureſt part of it has flowed out, it is ſprinkled with water and carried away. Then the workmen ſeparate entirely the zinc-ſtone from the wall of the furnace, and they continue to give it little ſtrokes, that the ſmall particles of zinc diſperſed among the charcoal may fall down. This being done, the ſtone is removed; and the zinc is ſeparated from the charcoal by an iron inſtrument, is cleaned, and remelted along with the zinc that flowed out at firſt, and is caſt into round cakes. The reaſon why the zinc is withdrawn before the bellows ceaſe to blow, is, that if it was left till the charcoal on the ſeat or receptacle was conſumed, it would be moſtly burnt, and little would be obtained. Thus after the zinc is withdrawn, the fuſion is finiſhed by blowing the bellows till the end."

Thus the zinc is ſeparated from the ore of Ramelſberg, and is not confounded in the hollow or caſſe with the lead and ſilver, becauſe, being a volatile ſemi-metal, it cannot ſupport the activity of the fire without riſing into vapours, which are condenſed in the place leaſt hot, that is to ſay, upon the ſtones expreſsly prepared for that purpoſe; and which, being much thinner than the other walls of the furnace, are continually cooled by the external air.

It is alſo in this furnace, and after the fuſion of the Ramelſberg ore, that the *cadmia of zinc*, or the *cadmia of furnaces*, is obtained. This ore is compoſed of ſulphureous and ferruginous pyrites, of true lead-ore containing ſilver, and a very hard and compact matter of a dark browniſh-grey colour, which is probably a *lapis calaminaris*, or an ore of zinc. Theſe ſeveral matters of the Ramelſberg ore are not ſeparated from each other, either for the roaſting or for the fuſion. Thus there is zinc in all the parts of the roaſted ore; and much more of it would be obtained, if it was not ſo eaſily inflammable. All the zinc which is obtained is preſerved from burning by falling, while

Smelting of Ores of Silver.

while in fusion, behind the chemise or fore-part of the furnace, which is, as has been said, a kind of schistus or slate, called by the workmen *steel-stone*. But the part of this semi-metal which falls in the middle of the furnace, near the middle-wall, or towards the sides, being exposed to the greatest heat of the fire, is there burnt; and its smoke or flowers attaching itself on all sides to the walls of the furnace, undergo there a semi-fusion, which renders this matter so hard and so thick, that it must be taken away after every fourth fusion, or, at most, after every sixth fusion. That which is found attached to the highest part of the furnace is the best and purest. The rest is altered by a mixture of a portion of lead which it has carried up with it; and which, from its great weight and fixity, has hindered the zinc from rising so high as it would have done alone. Therefore, with this kind of impure cadmia, ductile brass cannot be made.

Almost all the zinc we have, as well as the cadmia of the furnaces, is obtained from the Ramelsberg ore, by the process described, and consequently is not the produce of a pure ore of zinc, or *lapis calaminaris*, which is never fused for that purpose. Before Mr Margraaf, although it was well known that this ore contained zinc, and that it was employed for the making of brass, a convenient process for extracting zinc from it was not known; because, when treated by fusion with fluxes, like other ores, it does not yield any zinc; which proceeds partly from the refractory quality of the earth contained in the calamine, that cannot be fused without a very violent fire; and also from the volatility and combustibility of the zinc, which for this reason cannot be collected at the bottom of a crucible, as a regulus under a scoria, like most metals.

M. Margraaf has remedied these inconveniences by distilling *lapis calaminaris*, mixed with charcoal, in a retort, to which is joined a receiver containing some water, and consequently in close vessels, where the zinc, by the help of a very strong fire indeed, is sublimed in its metallic form without burning. He also by the same method reduced into zinc the *flowers of zinc*, or *pompholix*, *cadmia of the furnaces*, *tutty*, which is also a kind of cadmia; in a word, all matters capable of producing zinc by combination with phlogiston.—But it is evident that such operations as these are rather fit to supply proofs for chemical theory, than to be put in practice for works in great. M. Margraaf has observed, that the zinc which he obtained by this process was less brittle than what is obtained from the fusion of ores; which may proceed from its greater purity, or from its better combination with phlogiston.

Zinc is obtained, not only in the method used at Goslar above-described; but is also extracted in great works, from *lapis calaminaris* and calcined blend, by a distillation similar to that by which M. Margraaf has essayed ores of zinc. The first work of that kind was erected in Sweden by Mr Von Swab, in the year 1738. The ore employed was a kind of blend; this ore, when calcined, powdered, and mixed with charcoal, was put into iron or stone retorts, and the zinc was obtained by distillation. In Bristol a work is established in which zinc is obtained by distillation *by descent*.

Fining of Silver.

After this digression which we have now made concerning the operation in the great by which zinc and cadmia are obtained, and which we could not insert elsewhere, because of the necessary relation it has with the smelting of the Rammelsberg ore, we proceed to the other operations of the same ore; that is to say, to the *finery*, by which the silver is separated from the lead, which are mixed together, forming what is called the *work*.

This operation differs from the *fining of essay*, or *in small*, principally in this circumstance, that in the latter method of fining all the litharge is absorbed into the cupel, whereas in the former method the greatest part of this litharge is withdrawn.

The fining in great of the work of Ramelsburg is performed in a furnace called a *reverberatory furnace*. This furnace is so constructed that the flame of wood burning in a cavity called the *fire-place*, is determined by a current of air (which is introduced through the ash-hole, and which goes out at an opening on one side of that part of the furnace where the work is, that is, where the lead and silver are) to circulate above, and to give the convenient degree of heat, when the fire is properly managed. In this furnace a great cupel, called a *test*, is disposed. This test is made of the ashes of beech-wood, well lixiviated in the usual manner. In some founderies different matters are added, as sand, spar, calcined gypsum, quicklime, clay. When the test is well prepared and dried, all the work is put at once upon the cold test, to the quantity of 64 quintals for one operation. Then the fire is lighted in the fire-place with faggots; but the fusion is not urged too fast, 1. That the test may have time to dry; 2. Because the work of the Ramelsberg ore is allayed by the mixture of several metallic matters, which it is proper to separate from it, otherwise they would spoil the litharge and the lead procured from it. These metallic matters are, copper, iron, zinc, and matt. As these heterogeneous substances are hard and refractory, they do not melt so soon as the work, that is, as the lead and silver; and when the work is melted, they swim upon its surface like a skin, which is to be taken off. These impurities are called the *scum*, or the *first-waste*. What remains forms a second scum, which appears when the work is at its greatest degree of heat, but before the litharge begins to form itself. It is a scoria which is to be carefully taken off. It is called the *second waste*.

When the operation is at this point, it is continued by the help of bellows, the wind of which is directed, not upon the wood or fuel, but upon the very surface of the metal, by means of iron-plates put for that purpose before the blast-hole, which are called *papillons*. This blast does not so much increase the intensity of the fire, as it facilitates the combustion of the lead, and throws the litharge that is not imbibed by the test towards a channel, called the *litharge way*, through which it flows. The litharge becomes fixed out of the furnace: the matter which is found in the middle of the largest pieces, and which amounts to about a half or a third of the whole, is friable, and falls into powder like sand. This is put into barrels containing each five quintals of it; and is called *saleable litharge*, because it is sold in that state. The other part which remains solid is called *cold litharge*, and is again melted

and

Various processes for extracting Silver.

and reduced into lead. The fusion is called *cold fusion*, and the lead obtained from it *cold lead*, which is good and saleable when the work has been well cleared from the heterogeneous matters mentioned above. The tests and cupels impregnated with litharge are added in the fusion of the ore, as we have already related.

When two thirds, or nearly that quantity, of the lead are converted into litharge, no more of it is formed. The silver then appears covered with a white skin, which the finers call *lightening*, and the metal *lightened* or *fined silver*.

The silver obtained by this process of fining is not yet altogether pure. It still contains some lead, frequently to the quantity of four drams in each marc, or eight ounces. It is delivered to the workmen, who complete its purification by the ordinary method. This last operation is the refining, and the workmen employed to do it are called *refiners*. A fining of 64 quintals of work, yields from 8 to 10 mercs of fined silver, and from 35 to 40 quintals of litharge; that is, from 12 to 18 of saleable litharge, from 22 to 23 of cold litharge, from 20 to 22 quintals of impregnated test, and from 6 to 7 quintals of lead-dross. The operation lasts from 16 to 18 hours.

§ 2. Ores containing silver may be divided into four kinds, 1. Pure, or those which are not much compounded with other metals. 2. Galenical, in which the silver is mixed with much galena, or ore of lead mineralised by sulphur. 3. Pyritous, in which the silver is mixed with the martial pyrites. 4. Cupreous; in which the silver is contained in copper ores. To extract the silver from these several kinds of ores, different operations are necessary.

Native silver is separated from its adhering earths and stones by amalgamation with mercury, in the manner directed for the separation of gold; or by fusion with lead, from which it may be afterwards separated by cupellation.

Pure ores seldom require a previous calcination; but, when bruised and cleansed from extraneous matters, may be fused directly, and incorporated with a quantity of lead; unless they contain a large proportion of sulphur and arsenic, in which case a calcination may be useful. The lead employed must be in a calcined or vitrified state, which, being mixed with the ore, and gradually reduced by the phlogiston of the charcoal added to it, may be more effectually united with the silver of the ore, than if lead itself had been added, which would too quickly precipitate to the bottom of the containing vessel or furnace. The silver is to be afterwards separated from the lead by cupellation.

Galenical ores, especially those in which pyrites is intermixed, require a calcination, which ought to be performed in an oven, or reverberatory furnace. They are then to be fused together with some inflammable matter, as charcoal, by which the lead is revived, and, together with the silver, is precipitated.

Pyritous ores must be first melted, so as to form a matt. If the sulphur is not sufficient for this kind of fusion, more sulphurated pyrites may be added. This matt contains, besides silver and sulphur, also various metals, as lead, iron, and sometimes cobalt. The matt must be exposed to repeated calcinations till the sulphur is dissipated. By these calcinations most of the iron is destroyed. The calcined matt is to be fused with litharge, and the silver incorporated with the revived lead; from which, and from the other imperfect metals with which it may be mixed, it must afterwards be separated by cupellation.

The silver contained in cupreous ores may be obtained, either, 1. By separating it from the copper itself, after this has been extracted along with the silver, in the usual manner, from the ore; or, 2. By precipitating it immediately, from the other matters of the ore.

1. It may be separated from the copper by two methods. One of these is by adding lead, and scorifying the imperfect metals. By this method much of the copper would be destroyed, and it is therefore not to be used unless the quantity of silver relatively to the copper be considerable. Another method by which silver may be separated from copper is, by eliquation; that is, by mixing the mass of copper and silver with a quantity of lead, and applying such a heat as shall be just sufficient to make the lead eliquate from the copper, together with the silver, which being more strongly disposed to unite with the lead than with the copper, is thus incorporated with the former metal, and separated from the latter.

2. Silver may also be extracted from these cupreous ores by precipitation. For this purpose, let the ore, previously bruised and cleansed, be formed into a matt, that the earthy matters may be well separated. Let the matt be then fused with a strong heat; and when the scoria has been removed, and the heat is diminished, add to it some clean galena, litharge, and granulated lead. When the fire has been raised, and the additions well incorporated with the matt, let some cast or filed iron be thrown into the liquid mass, which, being more disposed than lead is to unite with sulphur, will separate and precipitate the latter metal, and along with it the silver or gold contained in the matt. This method was introduced by Scheffer, and is practised at Adelfors in Smoland. In this work the proportion of the several materials is, four quintals of matt, two quintals of black copper containing some lead with the perfect metal, one quintal of galena, one quintal of litharge, a fifth part of a quintal of granulated lead, and an equal quantity of cast iron.

The silver in this, and in all other instances where it is united with lead, is to be afterwards separated from the lead by cupellation; which process is described at the articles Essay *of the Value of Silver*, and Refining.

Sect. V. *Smelting of Ores of Copper.*

§ 1. The smelting in great of copper ores, and even of several ores of silver and lead, excepting that of Ramelsberg, is performed in furnaces not essentially different from that already described; but in this respect only, that the scoria and metal are not drawn out of the furnace, but flow spontaneously, as soon as they are melted, into receiving basons, where the metal is freed from the scoria. These furnaces are generally called *pierced furnaces*.

Instead of a light brasque, or bed of charcoal-powder, under which the metal lies hid, the bottom of these furnaces is covered with a bason composed of heavy

heavy brafque, which is a mixture of charcoal-powder and clay. In the front of the furnace, and at the bottom of the chemife, there is a hole, called the *eye*, through which the melted matter flows, and runs along a trench or furrow, called the *trace*, into one or more receiving bafons, made of earth, fcoria, fand, &c. There the metal is feparated from the fcoria, by making it flow from thefe bafons into another lateral one. Thefe furnaces are alfo called *crooked furnaces*.

Different names are given to them according to fome difference in their conftruction. For inftance, thofe which have two eyes, and two traces, through which the melted matter flows alternately into two bafons, are called *fpectacle-furnaces*. Their greater or lefs height gives occafion alfo to the diftinction of *high furnaces*, and *middle furnaces*.

The high furnaces are of modern invention. They were firft introduced at Mansfeldt in the year 1727; and they are now ufed in almoft all countries where ores are fmelted, as in Saxony, Bohemia, Hungary, &c. Their chief advantage confifts in fimplifying and diminifhing the labour. This advantage is effected by the great height of the furnace, which allows the ore to remain there a long time before it falls down into the hotteft part of the fire and is melted. Confequently, it fuffers fucceffively different degrees of heat; and, before it is melted, it undergoes a roafting which cofts nothing: therefore the high furnaces are chiefly employed for crude fufions; and particularly for the flate-copper ore. Thefe furnaces are above 18 feet high. A too great height is attended with an inconvenience, befides the trouble of fupplying it with ore and fuel, which is, that the charcoal is moftly confumed before it gets down where the greateft heat is required, and is then rendered incapable of maintaining a fire fufficiently intenfe.

All the furnaces which we have mentioned are fupplied with large bellows, moved by the arbor of a wheel, which is turned round by a current of water.

The only kind of furnace for fmelting ores where bellows are not employed, is what is called a *reverberatory furnace*. The Germans call it a *wind-furnace*. It is alfo diftinguifhed by the name of *Englifh furnace*, becaufe the invention of it is attributed to an Englifh phyfician of the name of *Wright*, who was well verfed in chemiftry; and becaufe the ufe of it was firft introduced in England about the end of the laft century, where it is much employed, as well as in feveral other countries, as at Konigfberg, in Norway.

The length of thefe furnaces is about 18 feet, comprehending the mafonry: their breadth is 12 feet, and their height nine feet and a half. The hearth is raifed three feet above the level of the foundery: on one fide is the fire-place, under which is an afh-hole hollowed in the earth; on the other fide is a bafon made, which is kept covered with fire when there is occafion: on the anterior fide of this furnace there is a chimney, which receives the flame after it has paffed over the mineral that is laid upon the hearth. This hearth, which is in the interior part of the furnace, is made of a clay capable of fuftaining the fire. The advantage of this furnace is, that bellows are not neceffary; and confequently it may be conftructed where there is no current of water, and wherever the mine happens to be. This furnace has a hole in its front, through which the fcoria is drawn out; and a bafon, as we have faid, on one fide, made with fand, in which are oblong traces for the reception of the matt, and of the black copper, when they flow out of the furnace.

Copper is generally mineralifed, not only by fulphur and arfenic, but alfo by femimetals and pyritous matters, and is frequently mixed with other metals. As this metal has great affinity with fulphur and arfenic, it is almoft impoffible to difengage it from them entirely by roafting: hence, in the fmelting in great, nothing is obtained by the firft operation but a copper matt, which contains all the principles of the ore, excepting the earthy and ftony parts, particularly when the ore is fmelted crude and unroafted. Afterwards this matt muft be again roafted and fufed. The produce of this fecond fufion begins ftill more to refemble copper, but is not malleable. It continues mixed with almoft all the minerals, particularly with the metals. As it is frequently of a black colour, it is always called *black copper*, when it is unmalleable, whatever its colour happens really to be.

As, of all the imperfect metals, copper is moft difficultly burnt and fcorified, it is again remelted feveral times, in order to burn and fcorify the metallic fubftances mixed with it; and this is done till the copper is perfectly pure, which is then called *red* or *refined copper*, and thefe laft fufions are called the *fining* and *refining* of it: red copper contains no metals but gold and filver, if any of thefe happened to be in the ore.

In order to avoid all thefe fufions, it has been propofed to treat in the humid way certain copper ores, particularly thofe which are very pyritous. This method confifts in making blue vitriol from the ore, by roafting and lixiviating it, and in precipitating pure copper from this lixivium, which is called *cement-water*, by means of iron: but it is not much practifed, becaufe it has been obferved, that all the copper contained in the ore was not procured by this means.

As expence is not much regarded in fmall effays and experiments, thefe fufions are much abridged and facilitated by adding at firft faline and glaffy fluxes; and then by refining the black copper with lead in the cupel, as gold and filver are done. In this method of refining, it is to be moft carefully obferved, that the metal be fufed as quickly as poffible, and expofed to no more heat than is neceffary, left it be calcined.

When the black copper contains fome iron, but not a great deal, the lead prefently feparates the iron from it, and makes it rife to the furface of the copper: but if the iron be in too large a proportion, it prevents the lead from uniting with the copper. Thefe two phenomena depend on the fame caufe, which is, that lead and iron cannot unite.

Frequently copper ores contain alfo a quantity of filver fufficient to make its extraction by particular proceffes profitable. It was long before any procefs could be thought of for this purpofe which was not too expenfive and troublefome: but at length it is accomplifhed by the excellent operation called *eliquation*.

The

Smelting of Ores of Copper.

The copper from which filver has been feparated by eliquation muft be refined after this operation, as it is generally black copper from which filver is extracted: but even if it had not been black copper which was employed for this operation, it would require to be refined on account of a little lead it always retains. It is therefore carried to the refiners furnace, when this operation is performed by help of bellows, the blaft of which is thrown upon the furface of the melted metal. As in this refining of copper the precife time when it becomes pure cannot be known, becaufe fcoria is always formed on its furface, it is neceffary to ufe an effay-iron, the polifhed end of which being dipt in melted copper, fhews that this metal is pure when the copper adhering to the iron falls off as foon as it is dipt in cold water.

When this mark of the purity of the copper has been obferved, its furface ought to be well cleaned; and as foon as it begins to fix, it muft be fprinkled with a broom or befom dipped in cold water. The furface of the copper which is then fixing, being fuddenly cooled by the water, detaches itfelf from the reft of the metal, is taken hold off by tongs, and is thrown red-hot into cold water. By again fprinkling water on the mafs of copper, it is all of it reduced into plates which are called *rofettes*, and thefe plates are what is called *rofette-copper*.

§ 2. The copper of pyritous cupreous ores cannot be obtained without feveral operations, which vary according to the nature of the ores. Thefe operations are chiefly roaftings and fufions. By the firft fufion a matt is produced, which is afterwards to be roafted; and thus the fufions and roaftings are to be alternately applied, till by the laft fufion copper is obtained. Thefe methods of treating pyritous copper ores depend on the two following facts: 1. Sulphur is more difpofed to unite with iron than with copper. 2. The iron of thefe ores is deftructible by the burning fulphur during the roafting or the fufion of the ores, while the copper is not injured. This fact appears from experiments mentioned by Scheffer and by Wallerius, and from the daily practice of fmelting cupreous ores.

From thefe facts we learn, 1. That fulphur may be employed to feparate and deftroy iron mixed with copper. 2. That iron may be employed to feparate the fulphur from copper, as is fometimes done in the effay of fulphurated copper-ores. 3. That by adjufting the proportion of the iron and fulphur to each other in the fmelting of copper-ores, thefe two fubftances may be made to deftroy each other, and to procure a feparation of the copper: and this adjuftment may be effected, by adding fulphur or fulphureous pyrites to the copper-ore, when the quantity of fulphur contained in this ore relatively to the iron is too fmall; or by adding iron when the fulphur predominates; or by roafting, by which the fuperfluous fulphur may be expelled, and no more left than is fufficient for the deftruction of the iron contained in the ore. We fhall apply thefe principles to the following cafes.

1. When the quantity of fulphur and of iron in a copper-ore is fmall, and efpecially when the iron does not too much abound, a previous roafting will at once calcine the iron, and expel moft of the fulphur; fo that by one fufion the calcined iron may be fcorified, and black copper may be obtained. If the fulphur has not been fufficiently expelled, a fecond roafting and fufion are requifite; for the whole quantity of fulphur ought not to be expelled during the firft roafting: but as much ought to be left as is fufficient for the fcorification of the calcined iron; otherwife this might, during the fufion, be again revived and united with the copper.

2. If, in a copper-ore, the quantity of iron be too great, relatively to the fulphur, fome fulphurated pyrites, efpecially that kind which contains copper, ought to be added, that a matt may be obtained, and that the iron may be calcined and fcorified.

3. When the quantity of fulphur and iron is very great, that is, when the ore is very pyritous and poor, it ought to be firft formed into a matt; by which it is feparated from the adherent earths and ftones, and the bulk is diminifhed: then by repeated and alternate roaftings and fufions, the copper may be obtained.

4. When the quantity of fulphur in an ore is greater than is fufficient for the forming a matt, the fuperfluous quantity ought to be previoufly expelled by roafting.

The copper thus at firft obtained is never pure, but is generally mixed with fulphur or with iron. It is called *black copper*. This may be refined in furnaces, or on hearths.

In the former method, to the copper when melted a fmall quantity of lead is added, which unites with the fulphur, and is fcorified together with the iron, and floats upon the furface of the melted copper. This purification of copper by means of lead is fimilar to the refining of filver by cupellation; and is founded on the property of lead, by which it is more difpofed to unite with fulphur than copper is; and on a property of copper, by which it is lefs liable than any other imperfect metal to be fcorified by lead. But as copper is alfo capable of being fcorified by lead, this operation muft be no longer continued, and no more lead muft be employed, than is fufficient for the feparation of the fulphur, and for the fcorification of the iron.

The copper might alfo be purified from any remaining fulphur by adding a fufficient quantity of iron to engage the fulpur. Thus Mr Scheffer found, that by adding to fulphurated copper from $\frac{1}{20}$th to $\frac{1}{40}$th of old caft iron, he rendered the copper pure and ductile. See his Differtation on the Parting of Metals amongft the *Swedifh Memoirs* for the year 1752. In this purification, the quantity of iron added ought not to be too little, elfe all the fulphur will not be feparated; and it ought not to be too great, elfe the fuperfluous quantity will unite with and injure the purity of the copper. The fufion and fcorification, with addition of lead, feems to be the beft method for the laft purification of copper.

Sect. VI. *Smelting*, &c. *of Ores of Iron.*

Notwithstanding the great importance of this fubject, and the labours of Reaumur, Swedenborgius, and of fome other authors, we have ftill a very imperfect knowledge of the caufes of the differences of the feveral kinds of ores, of the methods of fmelting beft adapted to thefe differences, of the caufes of the good and bad qualities of different kinds of iron, and of the means of fo meliorating this metal that we may obtain tough and ductile iron from any of its ores.

Sweden-

Manufacturing of Iron.

Swedenborgius has very induſtriouſly and exactly deſcribed the different proceſſes now uſed in moſt parts of Europe for the ſmelting of ores of iron, for the forging of that metal, and for the converſion of it into ſteel: but we do not find that he or any other author have, by experiments and diſcoveries, contributed much to the illuſtration or to the improvement of this part of metallurgy, unleſs, perhaps, we except thoſe of Mr Reaumur, concerning the ſoftening of caſt iron by cementation with earthy ſubſtances.

The ores of iron are known to vary much in their appearance, in their contents, in their degrees of fuſibility, in the methods neceſſary for the extraction of their contained metal, and in the qualities of the metal when extracted.

Moſt ores require to be roaſted previouſly to their fuſion; ſome more ſlightly, and others with a more violent and longer-continued fire. Thoſe which contain much ſulphur, arſenic, or vitriolic acid, require a long-continued and repeated roaſting, that the volatile matters may be expelled. Of this kind is the black-iron ore, from which the Swediſh iron is ſaid to be obtained.

Some ores require a very ſlight roaſting only, that they may be dried and rendered friable. Such are the ores called *bog ores*, and others, which being in a calcined ſtate, and containing little ſulphureous matter, would, by a further calcination, be rendered leſs capable of being reduced to a metallic ſtate.

The roaſting of ores of iron is performed by kindling piles, conſiſting of ſtrata of fuel and of ore placed alternately upon one another, or in furnaces ſimilar to thoſe commonly employed for the calcination of limeſtone.

Some authors adviſe the addition of a calcareous earth to ſulphureous ores during the roaſting, that the ſulphur may be abſorbed by this earth when converted into quicklime. But we may obſerve, that the quicklime cannot abſorb the ſulphur or ſulphureous acid, till theſe be firſt extricated from the ore, and does therefore only prevent the diſſipation of theſe volatile matters; and, ſecondly, that the ſulphur thus united with the quicklime forms a hepar of ſulphur, which will unite with and diſſolve the ore during its fuſion, and prevent the precipitation of the metal.

The next operation is the *fuſion* or *ſmelting* of the ore. This is generally performed in furnaces or towers, from 20 to 30 feet high, in the bottom of which is a baſon for the reception of the fluid metal. When the furnace is ſufficiently heated, which muſt be done at firſt very gradually, to prevent the cracking of the walls; a quantity of the ore is to be thrown in, from time to time, at the top of the furnace, along with a certain quantity of fuel and of lime-ſtone, or whatever other flux is employed. While the fuel below is conſumed by the fire excited by the wind of the bellows, the ore, together with its proportionable quantity of fuel and of flux, ſink gradually down, till they are expoſed to the greateſt heat in the furnace. There the ore and the flux are fuſed, the metallic particles are revived by the fuel, are precipitated by means of their weight through the ſcoria formed of the lighter earthy parts of the flux and of the ore, and unite in the baſon at the bottom of the furnace, forming a maſs of fluid metal covered by a glaſſy ſcoria. When a ſufficient quantity of this fluid metal is collected, which is generally twice or thrice in 24 hours, an aperture is made, through which the metal flows into a channel or groove made in a bed of ſand; and from thence into ſmaller lateral or connected channels, or other moulds. There it is cooled, becomes ſolid, and retains the forms of the channels or moulds into which it flows. The piece of iron formed in the large channel is called a *ſow*, and thoſe formed in the ſmaller channels are called *pigs*. Sometimes the fluid iron is taken out of the furnace by means of ladles, and poured into moulds ready prepared, of ſand or of clay, and is thus formed into the various utenſils and inſtruments for which caſt iron is a proper material.

The *ſcoria* muſt be, from time to time, allowed to flow out, when a conſiderable quantity of it is formed, through an aperture made in the front of the furnace for that purpoſe. A ſufficient quantity of it muſt, however, be always left to cover the ſurface of the melted iron, elſe the ore which would fall upon it, before the ſeparation of its metallic from its unmetallic parts, would leſſen the fluidity and injure the purity of the melted metal. This ſcoria ought to have a certain degree of fluidity; for if it be too thick, the revived metallic particles will not be able to overcome its tenacity, and collect together into drops, nor be precipitated. Accordingly, a ſcoria not ſufficiently fluid, is always found to contain much metal. If the ſcoria be too thin, the metallic particles of the ore will be precipitated before they are ſufficiently metallized, and ſeparated from the earthy and unmetallic parts. A due degree of fluidity is given to the ſcoria by applying a proper heat, and by adding fluxes ſuited to the ore.

Some ores are fuſible without addition, and others cannot be ſmelted without the addition of ſubſtances capable of facilitating their fuſion.

The *fuſible ores* are thoſe which contain ſulphur, arſenic, or are mixed with ſome fuſible earth.

The *ores difficultly fuſible* are thoſe which contain no mixture of other ſubſtance. Such are moſt of the ores which contain iron in a ſtate nearly metallic. As iron itſelf, when purified from all heterogeneous matters, is ſcarcely fuſible without addition, ſo the metal contained in theſe purer kinds of ores cannot be eaſily extracted without the addition of ſome fuſible ſubſtance. 2. Thoſe which are mixed with ſome very refractory ſubſtance. Some of theſe refractory ores contain arſenic; but as this ſubſtance facilitates the fuſion of iron, we may preſume that their refractory quality depends upon a mixture of ſome unmetallic earth or other unfuſible ſubſtance. The earth which is mixed with the common calciform ores is in conſiderable quantity; and is ſometimes calcareous, ſometimes ſiliceous, and ſometimes argillaceous.

Perhaps the fuſibility of different ores depends greatly on the degree of calcination to which the metal contained in them has been reduced; ſince we have reaſon to believe, that, by a very perfect calcination, ſome metals at leaſt may be reduced to the ſtate of an earth almoſt unfuſible, and incapable of metallization; and ſince we know, that in every calcination and ſubſequent reduction of a given quantity of any imperfect

imperfect metal, a fenfible part of that quantity is always loft or deftroyed, however carefully thefe operations may have been performed. That fome of thefe ores are already too much calcined, appears from the inftance above-mentioned of the *bog ores*, which are injured by roafting; and even the great height of the common fmelting furnaces, although advantageous to many ores that require much roafting, is faid to be injurious to thofe which are already too much calcined, by expofing them to a further calcination, during their very gradual defcent, before they arrive at the hotteft part of the furnace, where they are fufed.

But as too violent calcination renders fome ores difficultly fufible, fo too flight calcination of other ores injures the purity of the metal, by leaving much of the fulphureous or other volatile matter, which ought to have been expelled.

Various *fubftances are added to affift the fufion of ores difficultly fufible*. Thefe are, 1. *Ores* of a fufible quality, or which, being mixed with others of a different quality, become fufible: accordingly, in the great works for fmelting ores of iron, two or more different kinds of ore are commonly mixed, to facilitate the fufion, and alfo to meliorate the quality of the iron. Thus an ore yielding an iron which is brittle when hot, which quality is called *red-fhort*, and another ore which produces iron brittle when cold, or *cold-fhort*, are often mixed together; not, as fometimes fuppofed, that thefe qualities are mutually deftructive of each other, but that each of them is diminifhed in the mixed mafs of iron, as much as this mafs is larger than the part of the mafs originally poffeffed of that quality. Thus, if from two fuch ores the mafs of iron obtained confifts of equal parts of cold-fhort and of red-fhort iron, it will have both thefe qualities, but will be only half as *cold-fhort* as iron obtained folely from one of the ores, and half as *red-fhort* as iron obtained only from the other ore. 2. *Earths* and *ftones* are alfo generally added to facilitate the fufion of iron ores. Thefe are fuch as are fufible, or become fufible when mixed with the ore, or with the earth adhering to it. Authors direct that, if this earth be of an argillaceous nature, limeftone or fome calcareous earth fhould be added; and that, if the adherent earth be calcareous, an argillaceous or filiceous earth fhould be added; becaufe thefe two earths, though fingly unfufible, yet, when mixed, mutually promote the fufion of each other: but as limeftone is almoft always added in the fmelting of iron ores, and as in fome of thefe, at leaft, no argillaceous earth appears to be contained, we are inclined to believe, that it generally facilitates the fufion, not merely by uniting with thofe earths, but by uniting with that part of the ore which is moft perfectly calcined, and leaft difpofed to metallization; fince we know, that by mixing a calciform or roafted ore of iron with calcareous earth, without any inflammable matter, thefe two fubftances may be totally vitrified. See *Experiments made upon quicklime and upon iron, by Mr Brandt, in the Swedifh Memoirs for the years* 1749 *and* 1751. Calcareous earth does indeed fo powerfully facilitate the fufion of iron ores, that it deferves to be confidered whether workmen do not generally ufe too great a quantity of it, in order to haften the operation. For when the fcoria is rendered too thin, much earthy or unmetallized matter is precipitated, and the caft iron produced is of too vitreous a quality, and not fufficiently approximated to its true metallic ftate.

Some authors pretend, that a principal ufe of the addition of limeftone in the fmelting of iron ores is to abforb the fulphur, or vitriolic acid, of thefe ores: but, as we have already obferved, a hepar of fulphur is formed by that mixture of calcareous earth and fulphur, which is capable of diffolving iron in a metallic ftate; and thus the quantity of metal obtained from an ore not fufficiently divefted of its fulphur, or vitriolic acid, (which, by uniting with the fuel, is formed into a fulphur during the fmelting,) muft be confiderably diminifhed, though rendered purer, by addition of calcareous earth: hence the utility appears of previoufly expelling the fulphur and vitriolic acid from the ore by a fufficient roafting. 3. The *fcoria* of former fmeltings is frequently added to affift the fufion of the ore; and, when the fcoria contains much iron, as fometimes happens in ill-conducted operations, it alfo increafes the quantity of metal obtained.

The quantity of thefe fufible matters to be added varies according to the nature of the ore; but ought in general to be fuch, that the fcoria fhall have its requifite degree of thinnefs, as is mentioned above.

The *fuel* ufed in moft parts of Europe for the fmelting of ores of iron is charcoal. Lately, in feveral works in England and Scotland, iron ore has been fmelted by means of pit-coal, previoufly reduced to cinders or *coaks*, by a kind of calcination fimilar to the operation for converting wood into charcoal, by which the aqueous and fulphureous parts of the coal are expelled, while only the more fixed bituminous parts are left behind. In France, pit-coal not calcined has been tried for this purpofe, but unfuccefsfully. The ufe of *peat* has alfo been introduced in fome parts of England.

The quality of the iron depends confiderably upon the quality and alfo upon the quantity of the fuel employed. Charcoal is fitter than coaks for producing an iron capable of being rendered malleable by forging.

The quantity of fuel, or the intenfity of the heat, muft be fuited to the greater or lefs fufibility of the ore. Sulphureous, and other ores eafily fufible, require lefs fuel than ores difficultly fufible. In general, if the *quantity of fuel be too fmall*, and the heat not fufficiently intenfe, all the iron will not be reduced, and much of it will remain in the fcoria, which will not be fufficiently thin. This defect of fuel may be known by the blacknefs and compactnefs of the fcoria; by the qualities of the iron obtained, which in this cafe is hard, white, light, intermixed with fcoria, fmooth in its texture, without fcales or grains, rough and convex in its furface, and liable to great lofs of weight by being forged; and, laftly, it may be known by obferving the colour and appearance of the drops of metal falling down from the fmelted ore, and of the fcoria upon the furface of the fluid metal, both which are darker-coloured than when more fuel is ufed. When the *quantity of fuel is fufficiently large*, and the heat is intenfe enough, the iron is darker-coloured,

Manufacturing of Iron.

coloured, denser, more tenacious, contains less scoria, and is therefore less fusible, and loses less of its weight by being forged. Its surface is also smoother and somewhat concave; and its texture is generally granulated. The scoria, in this case, is of a lighter colour, and less dense. The drops falling down from the smelted ore and the liquid scoria in the furnace appear hotter and of a brighter colour. When the quantity of fuel is too great, and the heat too intense, the iron will appear to have a still darker colour, and more conspicuous grains or plates, and the scoria will be lighter, whiter, and more spungy. The drops falling from the smelted ore, and the fluid scoria, will appear to a person looking into the furnace through the blast-hole to be very white and shining hot. The quantity of charcoal necessary to produce five hundred weight of iron, when the ore is rich, the furnace well contrived, and the operation skilfully conducted, is computed to be about 40 cubic feet; but is much more in contrary circumstances.

The *time, during which the fluid metal ought to be kept in fusion* before it is allowed to flow out of the furnace, must be also attended to. How long that time is, and whether it ought not to vary according to the qualities of ores and other circumstances, we cannot determine. In some works the metal is allowed to flow out of the furnace every six or eight, and in others only every 10 or 12, hours. Some workmen imagine, that a considerable time is necessary for the concoction of the metal. This is certain, that the iron undergoes some change by being kept in a fluid state; and that if its fusion be prolonged much beyond the usual time, it is rendered less fluid, and also its cohesion, when it becomes cold, is thereby greatly diminished. The marquis de Courtivron says, that the cohesion may be restored to iron in this state, by adding to it some vitrescible earth, which he considers as one of the constituent parts of iron, and which he thinks is destroyed by the fusion too long continued. That the fusibility of cast iron does depend on an admixture of some vitrescible earth, appears probable from the great quantity of scoria forced out of iron during its conversion into malleable or forged iron, and from the loss of fusibility which it suffers nearly in proportion to its loss of scoria. The quantity of iron daily obtained from such a furnace as is above described, is from two to five tons in 24 hours, according to the richness and fusibility of the ore, to the construction of the furnace, to the adjustment of the due quantity of flux and of fuel, and to the skill employed in conducting the operation.

The *quality of the iron* is judged by observing the appearances during its flowing from the furnace, and when it is fixed and cold. If the fluid iron, while it flows, emits many and large sparkles; if many brown spots appear on it while it is yet red-hot; if, when it is fixed and cold, its corners and edges are thick and rough, and its surface is spotted; it is known to have a red-short quality. If, in flowing, the iron seems covered with a thin glassy crust, and if, when cold, its texture be whitish, it is believed to be cold-short. Mr Reaumur says, that dark-coloured cast iron is more impure than that which is white. The marquis de Courtivron is of a contrary opinion. But no certain rules for judging of the quality of iron before it be forged can be given. From brittle cast iron, sometimes ductile forged iron is produced. Cast iron with brilliant plates and points, when forged, becomes sometimes red-short and sometimes cold-short. Large shining plates, large cavities called *eyes*, want of sufficient density, are almost certain marks of bad iron; but whether it will be cold or red-short cannot be affirmed till it be forged. Whiteness of colour, brittleness, closeness of texture, and hardness, are given to almost any cast iron by sudden cooling; and we may observe, that in general the whither the metal is, the harder it is also, whether these properties proceed from the quality of the iron, or from sudden cooling; and that, therefore, the darker-coloured iron is fitter for being cast into moulds, because it is capable in some measure of being filed and polished, especially after it has been exposed during several hours to a red-heat in a reverberatory furnace, and very gradually cooled. This operation, called by workmen *annealing*, changes the texture of the metal, renders it softer, and more capable of being filed than before, and also considerably less brittle.

Mr Reaumur found, that by cementing cast iron with absorbent earths in a red-heat, the metal may be rendered softer, tougher, and consequently a fit material for many utensils formerly made of forged iron. Whether cementation with absorbent earths gives to cast iron a greater degree of these properties than the annealing commonly practised, has not been yet determined.

In Navarre, and in some of the southern parts of France, iron-ore is smelted in furnaces much smaller, and of a very different construction form those above described. A furnace of this kind consists of a wide-mouthed copper-caldron, the inner surface of which is lined with masonry a foot thick. The mouth of the caldron is nearly of an oval or elliptic form. The space or cavity contained by the masonry is the furnace in which the ore is smelted. The depth of this cavity is equal to two feet and a half: the larger diameter of the oval mouth of the cavity is about eight feet, and its smaller diameter is about six feet: the space of the furnace is gradually contracted towards the bottom, the greatest diameter of which does not exceed six feet: eighteen inches above the bottom is a cylindrical channel in one of the longer sides of the caldron and masonry, through which the nozzle of the bellows passes. This channel, and also the bellows-pipe, are so inclined, that the wind is directed towards the lowest point of the opposite side of the furnace. Another cylindrical channel is in one of the shorter sides of the furnace, at the height of a few inches from the bottom, which is generally kept closed, and is opened occasionally to give passage to the scoria; and above this is a third channel in the same side of the furnace, through which an iron instrument is occasionally introduced to stir the fluid metal, and to assist, as is said, the separation of the scoria from it. The greatest height of this channel is at its external aperture on the outside of the furnace, and its smaller height is at its internal aperture; so that the instrument may be directed towards the bottom of the furnace; but the second channel below it has a contrary inclination, that, when an opening is made, the scoria may flow out of the furnace into a bason

Manufacturing of Iron.

bason placed for its reception. When the furnace is heated sufficiently, the workmen begin to throw into it alternate changes of charcoal, and of ore previously roasted. They take care to throw the charcoal chiefly on that side at which the wind enters, and the ore at the opposite side. At the end of about four hours a mass of iron is collected at the bottom of the furnace, which is generally about 600 weight; the bellows are then stopt: and when the mass of iron is become solid, the workmen raise it from the bottom of the furnace, and place it, while yet soft, under a large hammer, where it is forged. The iron produced in these furnaces is of the best quality; the quantity is also very considerable, in proportion to the quantity of ore, and to the quantity of fuel employed. In these furnaces no limestone or other substance is used to facilitate the fusion of the ore. We should receive much instruction concerning the smelting of iron-ore, if we knew upon what part of the process, or circumstance, the excellence of the iron obtained in these furnaces depends; whether on the quality of the ore; on the disuse of any kind of flux, by which the proportion of vitreous or earthy matter, intermixed with the metallic particles, is diminished; on the forging while the iron is yet soft and hot, as the Marquis de Courtivron thinks; or on some other cause, not observed.

The iron thus produced by smelting ores is very far from being a pure metal; and though its fusibility renders it very useful for the formation of cannon, pots, and a great variety of utensils, yet it wants the strength, toughness, and malleability, which it is capable of receiving by further operations.

Cast-iron seems to contain a large quantity of vitreous or earthy matter mixed with the pure iron; which matter is probably the chief cause of its fusibility, brittleness, hardness, and other properties by which it differs from forged iron. The sulphur, arsenic, and other impurities of the ore, which are sometimes contained in cast-iron, are probably only accidental, and may be the causes of the red-short quality, and of other properties of certain kinds of iron: but the earthy matter above-mentioned seems principally to distinguish cast-iron from forged or malleable iron; for, first, by depriving the former of this earthy matter, it is rendered malleable, as in the common process hereafter to be discribed; and, secondly, by fusing malleable iron with earthy and vitrescible matters, it loses its malleability, and is restored to the state and properties of cast-iron.

The earthy vitreous matter contained in cast-iron consists probably of some of the ferruginous earth or calx of the ore not sufficiently metallised, and also of some unmetallic earth. Perhaps it is only a part of the scoria which adheres to, and is precipitated with, the metallic particles, from which it is more and more separated, as the heat applied is more intense, and as the fusion is longer continued.

To separate these impurities from cast-iron, and to unite the metallic parts more closely and compactly, and thus to give it the ductility and tenacity which render this metal more useful than any other, are the effects produced by the following operations.

The first of these operations is a fusion of the iron, by which much of its impurities is separated in form of scoria; and by the second operation, a further and more complete separation of these impurities, and also a closer compaction of the metallic particles, are effected by the application of mechanical force or pressure, by means of large hammers.

Some differences in the construction of the forge or furnace, in which the *fusion* or *refining of cast-iron* is performed, in the method of conducting the operation, and in other circumstances, are observed to occur in different places. We shall describe from Swedenborgius the *German method*.

The fusion of the cast-iron, which is to be rendered malleable, is performed upon the hearth of a forge similar to that used by blacksmiths: at one side of this hearth is formed a cavity or fire-place, which is intended to contain the fuel and the iron to be melted: this fire-place is 20 inches long, 18 inches broad, and 12 or 14 inches deep: it is bounded on three sides by three plates of cast-iron placed upright; and on the fourth side, which is the front, or that part nearest to which the workmen stand, by a large forge-hammer, through the eye of which the scoria is at certain times allowed to flow. The floor also of the fire-place is another cast-iron plate. The thickness of these plates is from two to four inches. One of the upright side-plates rests against a wall, in an aperture through which a copper tube, called the *tuyere*, is luted with clay. This tube is a kind of case or covering for the pipe of a pair of bellows placed behind the wall, and its direction is therefore parallel to that of the bellows-pipe; but it advances about half a foot further than this pipe into the fire-place; and thus gives greater force to the air, which it keeps concentrated, or prevents the divergency of the air, till it is required to act. The tube rests upon the edge of the side-plate which leans against the wall, nearer to the back-part than to the front of the fire-place, and in such an oblique direction, that the wind shall be impelled towards the furthest part of the floor of the fire-place, or where this floor is intersected by the opposite side-plate. The obliquity of the tuyere ought to vary according to the quality of the iron: and therefore, in every operation, it may be shifted till its proper position is found. The more nearly its direction approaches to a horizontal plane, the more intense is the heat; but a larger quantity of fuel is consumed than is even proportional to the increase of heat, because the flame is not then so well confined. When the iron is easily fusible, great heat is not required: the tuyere may then decline considerably from the horizontal plane, and thus fuel may be saved. This tuyere, tho' made of copper, a metal more easily fusible than iron, is preserved from fusion by the constant passage of cold air through it. It must be carefully kept open, and cleansed from the scoria, which would be apt to block up its cavity, by which not only the heat would be too much diminished for the success of the operation, but the tube itself would be melted.

To prepare for the fusion, a quantity of scoria of a former operation is thrown into the fire-place, till one-third part of this be full; and the remaining two-thirds of the fire-place are to be filled with smaller scoria, coal-dust, and sparks ejected from hot iron. These matters, being fusible, form a bath for the reception of the iron when melted. Upon this bed of scoria, the mass of cast-iron to be melted is placed; so-

fo that one end of it fhall be within the fire-place, oppofite to the tuyere, and at the diftance of about four or five inches from its aperture; and the other end fhall ftand without the fire-place, to be pufhed in, as the former is melted. The upper fide of the mafs of iron ought to be in the fame horizontal plane as the upper part of the orifice of the tuyere, that the wind may, by means of the obliquity of its courfe, ftrike upon and pafs along the under-fide of the mafs: but if the iron be difficultly fufible, the tuyere is to be difpofed more horizontally, fo that the wind fhall ftrike directly upon the mafs of iron; and that one part of the blaft fhall graze along the upper furface, and the other part along the under furface of the iron. The mafs of iron weighs generally from 200 to 400 pounds. Sometimes two or three fmaller maffes are put one above another, fo as not to touch. When thefe are of different qualities, the cold-fhort piece is placed undermoft, that being more unfufible than the red-fhort. The iron being placed, charcoal-powder is thrown on both fides, and coals are accumulated above, fo as to cover entirely the iron.

The coals are then to be kindled, and the bellows are made to blow, at firft flowly, and afterwards with more and more force. The iron is gradually liquefied, and flows down in drops through the melted fcoria to the bottom of the fire-place; during which the workmen frequently turn the iron, fo that the end oppofed to the blaft of wind may be equally expofed to heat, and uniformly fufed. While the coals are confumed, more are thrown on, fo that the whole may be kept quite covered. During the operation, a workman frequently founds the bottom and corners of the fire-place by means of a bar or poker, raifes up any mafs of metal which he finds adhering to thefe, and expofes them to the greateft heat, that they may be more perfectly fufed.

When all the iron is fufed, no more coals are to be added; but the melted mafs is to remain half uncovered for fome time; during which the iron boils and bubbles, and its furface fwells and rifes higher and higher. When the iron has rifen as high as the upper edge of the fire-place, the coals upon its furface muft be removed; and by thus expofing it to cold air, its ebullition and fwelling fubfide. In this ftate, or coction, the iron is kept during half an hour or more, by adding occafionally pieces of good coal, which maintain a fufficient heat, without covering entirely the furface of the mafs. During this coction, the workmen allow the orifice of the tuyere to be half ftopped up by the fcoria, that the air may not blow upon the iron with all its force, by which it would be too much cooled. Accordingly, when they think that the coction has continued fufficiently long, they clear the paffage of the tuyere, and the mafs is foon cooled by the cold air. At the fame time alfo, they open a paffage in the eye of the hammer placed in the front of the fire-place, through which fome of the fcoria is allowed to flow out. When the iron has become folid, the bellows are ftopt, the coals are removed, and the mafs is left during an hour; and then the workmen raife it from the fire-place, turn it upfide down, and proceed to the fecond coction or fufion of the iron.

From this fecond operation, the mafs is to be fo placed, that one part of it fhall reft upon the tuyere, and the other upon the fcoria remaining in the fire-place. This fcoria is to be difpofed in an oblique direction parallel to the tuyere, by which means the wind of the bellows is obliged to pafs along the under fide of the mafs of iron. About the fides of the mafs, charcoal-powder and burnt afhes are thrown; but towards the tuyere, dry and entire pieces of coals are placed, to maintain the fire. When thefe are kindled, more coals are added, and the fire is gradually excited. The workman attends to the direction of the flame, that it pafs equally along the under furface of the iron, quite to the further extremity, and that it do not efcape at the fides, nor be reverberated back towards the tuyere, by which this copper tube might be melted. During this fufion, pieces of iron are apt to be feparated from the mafs, and to fall down unfufed to the bottom and corners of the fire-place. Thefe are carefully to be fearched for, and expofed to the greateft heat till they are melted. When the whofe mafs is thus brought into perfect fufion, the coals are removed; and the wind blowing on its furface, whirls and diffipates the fmall remaining pieces of fcoria, and fparks thrown out from the fluid iron. This jet of fire continues about feven or eight minutes, and the whole operation about two hours. In this fecond fufion the fcoria is to be thrice removed, by opening a paffage through the eye of the hammer. The firft time of removing the fcoria is about 20 minutes from the kindling of the fire, the fecond time is about 40 minutes after the firft, and the third time is near the end of the operation.

The mafs is then removed from the hearth, and put upon the ground of the forge, where it is cleanfed from fcoria, and beat into a more uniform fhape. It is then placed on an anvil, where, by being forged, it receives a form nearly cubical. This mafs is to be divided into five, fix, or more pieces, by means of a wedge; and thefe are to be heated and forged till they are reduced to the form of the bars commonly fold.

In fome forges, the iron is fufed only once, and in others it fuffers three fufions, by which it is faid to be rendered very pure. Where only one fufion is practifed, it is called the *French method*. In this, no greater quantity of iron is fufed at once than is fufficient to make one bar. The fire-place is of confiderable lefs dimenfions, and efpecially is lefs deep, than in the German method above defcribed. The fire is alfo more intenfe, and the proportion of fuel confumed to the iron is greater. The iron, when melted, is not kept in a ftate of ebullition as is above defcribed; but this ebullition is prevented by ftirring the fluid mafs with an iron bar, till it is coagulated, and becomes folid.

By thefe operations, fufion and forging, the iron lofes about $\frac{3}{13}$ parts of its former weight, fometimes more and fometimes lefs, according to the quality of the caft-iron employed; it is purified from the vitreous and earthy parts which were intermixed with it, its metallic particles are more clofely compacted, its texture is changed, and it is rendered more denfe, foft, and malleable, tough, and difficultly fufible.

The degrees, however, of thefe qualities vary much in different kinds of iron. Thus fome iron is tough and malleable, both when it is hot and when it is cold. This

This is the beſt and moſt uſeful iron. It may be known generally by the equable ſurface of the forged bar, which is free from tranſverſe fiſſures or cracks in the edges, and by a clear, white, ſmall-grained, or rather fibrous texture. Another kind is tough when it is heated, but brittle when it is cold. This is called *cold ſhort* iron; and is generally known by a texture conſiſting of large, ſhining plates, without any fibres. It is leſs liable to ruſt than other iron. A third kind of iron, called *red-ſhort*, is brittle when hot, and malleable when cold. On the ſurface and edges of the bars of this kind of iron, tranſverſe cracks or fiſſures may be ſeen; and its internal colour is dull and dark. It is very liable to ruſt. Laſtly, ſome iron is brittle both when hot and when cold.

Moſt authors agree, that the red-ſhort quality of iron proceeds from ſome ſulphur or vitriolic acid being contained in it, becauſe ſulphur is known to produce this effect when added to iron, and becauſe the iron obtained from pyritous and other ſulphurated ores has generally this quality.

The cauſe of the cold-ſhort quality of iron is not ſo well aſcertained. Some imagine, that it proceeds from a mixture of arſenic or of antimony. But this opinion ſeems to be improbable, when we conſider that theſe metallic ſubſtances may in a great meaſure be diſſipated by roaſting, whereas the ores which yield a cold-ſhort iron are injured by much roaſting; that no arſenic or antimony are obſervable in moſt, if in any, of theſe ores; and laſtly, that theſe ſemi-metals would render the iron brittle both when hot and when cold. Cramer and other authors impute this vicious quality to a mixture of an unmetallic earth or vitreous matter; and affirm, that it may be deſtroyed by cementation with phlogiſton, and by forging. And laſtly, others aſcribe the cold-ſhort quality of iron to a defect of phlogiſton, or, as Swedenborgius ſays, of ſulphur. To aſcertain the cauſes of the bad qualities of iron, and to diſcover practical remedies, are ſtill deſiderata in metallurgy.

In one bar frequently two or more different kinds of iron may be obſerved, which run all along its whole length; and ſcarcely a bar is ever found of entirely pure and homogeneous iron. This difference probably proceeds from the practice we have mentioned of mixing different kinds of ores together, in the ſmelting; and alſo from the practice of mixing two or more pigs of caſt iron of different qualities in the finery of theſe; by which means, the red-ſhort and cold-ſhort qualities of the different kinds are not, as we have already remarked, mutually counteracted or deſtroyed by each other, but each of theſe qualities is diminiſhed in the mixed maſs of iron, as much as this maſs is larger than the part of the maſs originally poſſeſſed of that quality: that is, if equal parts of red-ſhort and of cold-ſhort iron be mixed together, the mixed maſs will be only half as red-ſhort as the former part, and half as cold-ſhort as the latter. For theſe different kinds of iron ſeem as if they were only capable of being interwoven and diffuſed thro' each other, but not of being intimately united or combined.

The quality of forged iron may be known by the texture which appears on breaking a bar. The beſt and tougheſt iron is that which has the moſt fibrous texture, and is of a clear greyiſh colour. This fibrous appearance is given by the reſiſtance which the particles of the iron make to their rupture. The next beſt iron is that whoſe texture conſiſts of clear, whitiſh, ſmall grains, intermixed with fibres. Theſe two kinds are malleable, both when hot and when cold, and have great tenacity. *Cold-ſhort iron* is known by a texture conſiſting of large, ſhining plates, without fibres: and *red-ſhort iron* is diſtinguiſhed by its dark dull colour, and by the tranſverſe cracks and fiſſures on the ſurface and edges of the bars. The quality of iron may be much improved by violent compreſſion, as by forging and rolling; eſpecially when it is not long expoſed to too violent heat, which is known to injure, and at length to deſtroy its metallic properties.

For the converſion of iron into *ſteel*, ſee the article Steel.

Sect. VII. *Of the Smelting of Tin Ores.*

The tin-ores commonly ſmelted are thoſe which conſiſt of calx of tin combined with calx of arſenic and ſometimes with calx of iron. Theſe are either pure, as the tin-grains, or intermixed with ſpars, ſtones, pyrites, ores of copper, iron, or of other metals.

The impure ores muſt be cleanſed as much as is poſſible from all heterogeneous matters. This cleanſing is more neceſſary in ores of tin than of any other metal; becauſe in the ſmelting of tin-ores a leſs intenſe heat muſt be given than is ſufficient for the ſcorification of earthy matters, leſt the tin be calcined. Tin-ores previouſly bruiſed may be cleanſed by waſhing, for which operation their great weight and hardneſs render them well adapted. If they be intermixed with very hard ſtones or ferruginous ores, a ſlight roaſting will render theſe impure matters more friable, and conſequently fitter to be ſeparated from the tin-ores. Sometimes theſe operations, the roaſting, contuſion, and lotion, muſt be repeated. By roaſting, the ferruginous particles are ſo far revived, that they may be ſeparated by magnets.

The ore, thus cleanſed from adhering heterogeneous matters, is to be roaſted in an oven or reverberatory furnace with a fire rather intenſe than long continued, during which it muſt be frequently ſtirred to prevent its fuſion. By this operation, the arſenic is expelled, and in ſome works is collected in chambers built purpoſely above the calcining furnace.

Laſtly, the ore cleanſed and roaſted is to be fuſed, and reduced to a metallic ſtate. In this fuſion, attention muſt be given to the following particulars. 1. No more heat is to be applied than is ſufficient for the reduction of the ore; becauſe this metal is fuſible with very little heat, and is very eaſily calcinable. 2. To prevent this calcination of the reduced metal, a larger quantity of charcoal is uſed in this than in moſt other fuſions. 3. The ſcoria muſt be frequently removed, leſt ſome of the tin ſhould be involved in it, and the melted metal muſt be covered with charcoal powder to prevent the calcination of its ſurface. 4. No flux or other ſubſtance, excepting the ſcoria of former ſmeltings which contains ſome tin, are to be added, to facilitate the fuſion.

Sect. VIII. *Smelting of Ores of Lead.*

Ores of lead are either pure, that is, containing no

Smelting of Tin ores.

no mixture of other metal; or they are mixed with silver, copper, or pyrites. The methods of treating ores of lead containing silver and copper, are described in the sections of *Smelting of Ores of Silver* and *of Copper;* and in the former of these an instance is given of the method of smelting the ore of Rammelsberg, which contains all these three metals.

Pure ores of lead, and those which contain so small a quantity only of silver as not to compensate for the expence of extracting the nobler metal, may be smelted in furnaces, and by operations similar to those used at Rammelsberg, or in the following methods. 1. From the lead-ore of Willach in Carinthia, a great part of the lead is obtained by a kind of eliquation, during the roasting of the ore. For this purpose, the ore is thrown upon several strata or layers of wood, placed in a calcining or reverberatory furnace. By kindling this wood, a great part of the lead flows out of the ore, through the layers of fuel, into a bason placed for its reception. The ore which is thus roasted is beat into smaller pieces, and exposed to a second operation similar to the former, by which more metal is eliquated; and the remaining ore is afterwards ground, washed, and smelted, in the ordinary method.

The lead of Willach is the purest of any known. Schlutter ascribes its great purity to the method used in extracting it, by which the most fusible, and consequently the purest part of the contained lead is separated from any less fusible metal which happens to be mixed with it, and which remains in the roasted ore. This method requires a very large quantity of wood.

2. In England, lead ores are smelted either upon a hearth, or in a reverberatory furnace called *a cupel.*

In the first of these methods, charcoal is employed as fuel, and the fire is excited by bellows. Small quantities of fuel and of ore are thrown alternately and frequently upon the hearth. The fusion is very quickly effected; and the lead flows from the hearth as fast as it is separated from the ore.

3. In the second method practised in England, pitcoal is used as fuel. The ore is melted by means of the flame passing over its surface; its sulphur is burnt and dissipated, while the metal is separated from the scoria, and collected at the bottom of the furnace. When the ore is well cleansed and pure, no addition is requisite; but when it is mixed with calcareous or earthy matrix, a kind of fluor or fusible spar found in the mines is generally added to render the scoria more fluid, and thereby to assist the precipitation of the metal. When the fusion has been continued about eight hours, a passage in the side of the furnace is opened, through which the liquid lead flows into an iron cistern. But immediately before the lead is allowed to flow out of the furnace, the workmen throw upon the liquid mass a quantity of slacked quicklime, which renders the scoria so thick and tenacious, that it may be drawn out of the furnace by rakes. Schlutter mentions this addition of quicklime in the smelting of lead ores in England, but thinks that it is intended to facilitate the fusion of the ores; whereas it really has a contrary effect, and is never added till near the end of the operation, when the scoria is to be raked from the surface of the metal.

Smelting of ores of Semimetals.

Sect. IX. *Of the Smelting of Ores of Semimetals.*

Antimony is obtained by a kind of eliquation from the minerals containing it, as is described in the article Antimony; and the regulus of antimony is procured from antimony, by the processes described in the same article, and in the article Regulus *of* Antimony.

Arsenic, saffre, and *bismuth,* are obtained generally from one ore, namely, that called *cobalt.* The arsenic of the ore is separated by roasting, and adheres to the internal surface of a chimney, which is extended horizontally about 200 or 300 feet in length, and in the sides of which are several doors, by means of which the arsenic, when the operation is finished, may be swept out and collected. These chimneys are generally bent in a zig-zag direction, that they may better retard and stop the arsenical flowers. These flowers are of various colours, white, grey, red, yellow, according to the quantity of sulphur or other impurity, with which they happen to be mixed. They are afterwards purified by repeated sublimations; while some alkaline or other substances are added to detain the sulphur, and to assist the purification.

In the same roasting of the ore by which the arsenic is expelled, the bismuth, or at least the greatest part of this semi-metal which is contained in the ore, being very fusible, and having no disposition to unite with the regulus of cobalt, which remains in the ore, is separated by eliquation.

The remaining part of the roasted ore consists chiefly of calx of regulus of cobalt, which not being volatile, as the arsenic is, nor so easily fusible as bismuth is, has been neither volatilized nor melted. It contains also some bismuth, and a small quantity of arsenic, together with any silver or other fixed metal which happened to be contained in the ore. This roasted ore being reduced to a fine powder, and mixed with three or four times its weight of fine sand, is the powder called *saffre* or *zaffre.* Or the roasted ore is sometimes fused See *Zaffre*.
with about thrice its quantity of pure sand and as much pure pot-ash, by which a blue glass, called *smalt,* See *Smalt*.
is produced; and a metallic mass, called *speiss,* is collected at the bottom of the vessel in which the matters are fused. The metallic mass or speiss is composed of very different substances, according to the contents of the ore and the methods of treating it. The matters which it contains at different times are, nickel, regulus of cobalt, bismuth, arsenic, sulphur, copper, and silver.

Bismuth is seldom procured from any other ores but that of cobalt. It might, however, be extracted from its proper ores, if a sufficient quantity of these were found, by the same method by which it is obtained from cobalt, namely, by eliquation.

Mercury, when native, and inveloped in much earthy or other matter, from which it cannot be separated merely by washing, is distilled either by ascent or by descent. When it is mineralised by sulphur, that is, when it is contained in cinnabar, some intermediate substance, as quicklime, or iron, must be added in the distillation, to disengage it from the sulphur.

The rich ore of Almaden in Spain is a cinnabar, with which a calcareous stone happens to be so blend-

Smelting of ores of Semimetals.

ed, that no addition is required to disengage the mercury from the sulphur. The distillation is there performed in a furnace consisting of two cavities, one of which is placed above another. The lower cavity is the fire-place, and contains the fuel, resting upon a grate, through the bars of which the air enters, maintains the fire, and passes into a chimney, placed at one side of the fire-place immediately above the door thro' which fuel is to be introduced. The roof of this fire-place, which is vaulted and pierced with several holes, is also the floor of the upper cavity. Into this upper cavity, the mineral from which mercury is to be distilled is introduced, through a door in one of the sides of the furnace. In the opposite wall of this cavity are eight openings, all at the same height. To each of these openings is adapted a file of aludels connected and luted together, extending 60 feet in length. These aludels, which are earthen vessels open at each end, and wider in the middle than at either extremity, are supported upon an inclined terras; and the aludel of each file, that is most distant from the furnace, terminates in a chamber built of bricks, which has two doors, and two chimneys.

When the upper cavity is filled sufficiently with the mineral, a fire is made below, which is continued during 12 or 14 hours. The heat is communicated thro' the holes of the vaulted roof of the fire-place to the mineral in the upper cavity, by which means the mercury is volatilised, and its vapour passes into the aludels, where much of it is condensed, and the rest is discharged into the brick-chamber, in which it circulates till it also is condensed. If any air or smoke passes through the aludels along with the vapour of the mercury, they escape thro' the two chimneys of the chamber. Three days after the operation, when the apparatus is sufficiently cooled, the aludels are unluted, the doors of the chamber are opened, and the mercury is collected.

Metamorphosis, Metaphor.

METAMORPHOSIS, in general, denotes the changing of something into a different form; in which sense it includes the transformation of insects, as well as the mythological changes related by the ancient poets.

Mythological metamorphoses were held to be of two kinds, apparent and real: thus, that of Jupiter into a bull, was only apparent; whereas that of Lycaon into a wolf, was supposed to be real.

Most of the ancient metamorphoses include some allegorical meaning, relating either to physics or morality: some authors are even of opinion that a great part of the ancient philosophy is couched under them; and Lord Bacon and Dr Hook have attempted to unriddle several of them.

METAPHOR, in rhetoric. See ORATORY, n° 50.

METAPHOR *and Allegory*, in poetry.—A metaphor differs from a simile, in form only, not in substance: in a simile the two subjects are kept distinct in the expression, as well as in the thought; in a metaphor, the two subjects are kept distinct in the thought only, not in the expression. A hero resembles a lion, and upon that resemblance many similies have been raised by Homer and other poets. But instead of resembling a lion, let us take the aid of the imagination, and feign or figure the hero to be a lion: by that variation the simile is converted into a metaphor; which is carried on by describing all the qualities of a lion that resemble those of the hero. The fundamental pleasure here, that of resemblance, belongs to the thought. An additional pleasure arises from the expression: the poet, by figuring his hero to be a lion, goes on to describe the lion in appearance, but in reality the hero; and his description is peculiarly beautiful, by expressing the virtues and qualities of the hero in new terms, which, properly speaking, belong not to him, but to the lion. This will better be understood by examples. A family connected with a common parent, resembles a tree, the trunk and branches of which are connected with a common root: but let us suppose, that a family is figured, not barely to be like a tree, but to be a tree; and then the simile will be converted into a metaphor, in the following manner.

Metaphor.

Edward's sev'n sons, whereof thyself art one,
Were sev'n fair branches, springing from one root;
Some of these branches by the dest'nies cut:
But Thomas, my dear lord, my life, my Glo'ster,
One flourishing branch of his most royal root,
Is hack'd down, and his summer-leaves all faded,
By Envy's hand and Murder's bloody axe.
Richard II. *act* i. *sc.* 3.

Figuring human life to be a voyage at sea:

There is a tide in the affairs of men,
Which, taken at the flood, leads one to Fortune:
Omitted, all the voyage of their life
Is bound in shallows and in miseries.
On such a full sea are we now afloat;
And we must take the current when it serves,
Or lose our ventures. *Julius Cæsar, act* iv. *sc.* 5.

Figuring glory and honour to be a garland of flowers:

* *Hotspur.* ——————Wou'd to heav'n,
Thy name in arms were now as great as mine!
Pr. Henry. I'll make it greater, ere I part from thee;
And all the budding honours on thy crest
I'll crop, to make a garland for my head.
First part of Henry IV. *act* v. *sc.* 9.

Figuring a man who hath acquired great reputation and honour to be a tree full of fruit:

——————Oh, boys, this story
The world may read in me: my body's mark'd
With Roman swords; and my report was once
First with the best of note. Cymbeline lov'd me;
And when a soldier was the theme, my name
Was not far off: then was I as a tree,
Whose boughs did bend with fruit. But in one night,
A storm or robbery, call it what you will,
Shook down my mellow hangings, nay my leaves;
And left me bare to weather.
Cymbeline, act iii. *sc.* 3.

"Blest be thy soul, thou king of shells, said Swaran of the dark-brown shield. In peace, thou art the gale of spring; in war, the mountain-storm. Take now my hand in friendship, thou noble king of Morven."
Fingal.

"Thou

Metaphor.

"Thou dwelleft in the foul of Malvina, fon of mighty Offian. My fighs arife with the beam of the eaft: my tears defcend with the drops of night. I was a lovely tree in thy prefence, Ofcar, with all my branches round me: but thy death came like a blaft from the defart, and laid my green head low; the fpring returned with its fhowers, but no leaf of mine arofe."

Fingal.

An *allegory* differs from a metaphor; and what lord Kaim's calls a *figure of fpeech* differs from both. A metaphor is defined above to be an act of the imagination, figuring one thing to be another. An allegory requires no fuch operation, nor is one thing figured to be another: it confifts in choofing a fubject having properties or circumftances refembling thofe of the principal fubject; and the former is defcribed in fuch a manner as to reprefent the latter: the fubject thus reprefented is kept out of view: we are left to difcover it by reflection; and we are pleafed with the difcovery, becaufe it is our own work. (See the word ALLEGORY.) Quintilian gives the following inftance of an allegory,

O navis, referent in mare te novi
Fluctus. O quid agis? fortiter occupa portum.
Horat. lib. i. *ode* 14.

and explains it elegantly in the following words: "Totufque ille Horatii locus, quo navim pro republica, fluctuum tempeftates pro bellis civilibus, portum pro pace atque concordia, dicit."

In a *figure of fpeech*, there is no fiction of the imagination employed, as in a metaphor; nor a reprefentative fubject introduced, as in an allegory. This figure, as its name implies, regards the expreffion only, not the thought; and it may be defined, the ufing a word in a fenfe different from what is proper to it. Thus youth, or the beginning of life, is expreffed figuratively by *morning of life:* morning is the beginning of the day; and in that view it is employed to fignify the beginning of any other feries, life efpecially, the progrefs of which is reckoned by days. See FIGURE *of Speech*.

Metaphor and *allegory* are fo much connected, that it feemed proper to handle them together: the rules, particularly for diftinguifhing the good from the bad, are common to both. We fhall therefore proceed to thefe rules, after adding fome examples to illuftrate the nature of an *allegory*, which, with a view to this article, was but flightly illuftrated under its proper name.

Horace, fpeaking of his love to Pyrrha, which was now extinguifhed, expreffeth himfelf thus:

———Me tabulâ facer
Votivâ paries indicat uvida
Sufpendiffe potenti
Veftimenta maris Deo. *Carm. lib.* i. *ode* 5.

Again:

Phœbus volentem prælia me loqui,
Victas et urbes, increpuit lyrâ:
Ne parva Tyrrhenum per æquor
Vela darem. *Carm. lib.* v. *ode* 15.

Queen. Great Lords, wife men ne'er fit and wail their lofs,
But cheerly feek how to redrefs their harms.
What though the maft be now blown overboard,
The cable broke, the holding-anchor loft,
And half our failors fwallowed in the flood?
Yet lives our pilot ftill. Is't meet that he
Should leave the helm, and, like a fearful lad,
With tearful eyes add water to the fea,
And give more ftrength to that which hath too much;
While in his moan the fhip fplits on the rock,
Which induftry and courage might have fav'd?
Ah, what a fhame! ah, what a fault were this!
Third part Henry VI. *act* v. *fc.* 5.

Oroonoko. Ha! thou haft rous'd
The lion in his den; he ftalks abroad,
And the wide foreft trembles at his roar.
I find the danger now. *Oroonoko, act* iii. *fc.* 2.

"My well-beloved hath a vineyard in a very fruitful hill. He fenced it, gathered out the ftones thereof, planted it with the choiceft vine, built a tower in the midft of it, and alfo made a wine-prefs therein; he looked that it fhould bring forth grapes, and it brought forth wild grapes. And now, O inhabitants of Jerufalem, and men of Judah, judge, I pray you, betwixt me and my vineyard. What could have been done more to my vineyard, that I have not done? Wherefore, when I looked that it fhould bring forth grapes, brought it forth wild grapes? And now go to, I will tell you what I will do to my vineyard: I will take away the hedge thereof, and it fhall be eaten up; and break down the wall thereof, and it fhall be trodden down. And I will lay it wafte: it fhall not be pruned, nor digged, but there fhall come up briars and thorns: I will alfo command the clouds that they rain no rain upon it. For the vineyard of the Lord of hofts is the houfe of Ifrael, and the men of Judah his pleafant plant." *Ifaiah*, v. 1.

The rules that govern metaphors and allegories are of two kinds. The conftruction of thefe figures comes under the firft kind: the propriety or impropriety of introduction comes under the other.—To begin with rules of the firft kind; fome of which coincide with thofe already given for fimilies; fome are peculiar to metaphors and allegories:

In the firft place, it has been obferved, that a fimile cannot be agreeable where the refemblance is either too ftrong or too faint. This holds equally in metaphor and allegory; and the reafon is the fame in all. In the following inftances, the refemblance is too faint to be agreeable.

Malcolm.————But there's no bottom, none,
In my voluptuoufnefs: your wives, your daughters,
Your matrons, and your maids, could not fill up
The ciftern of my luft. *Macbeth, act* iv. *fc.* iv.

The beft way to judge of this metaphor, is to convert it into a fimile; which would be bad, becaufe there is fcarce any refemblance between luft and a ciftern, or betwixt enormous luft and a large ciftern.

Again:

He cannot buckle his diftemper'd caufe
Within the belt of rule. *Macbeth, Act* v. *fc.* 2.

There is no refemblance between a diftempered caufe and any body that can be confined within a belt.

Again:

Steep me in poverty to the very lips.
Othello, Act iv. *fc.* 9.

Poverty here muft be conceived a fluid, which it refembles not in any manner.

Metaphor. Speaking to Bolingbroke banifh'd for fix years:

> The fullen paffage of thy weary fteps
> Efteem a foil, wherein thou art to fet
> The precious jewel of thy home-return.
> *Richard* II. *act* ii. *fc.* 6.

Again:

> Here is a letter, lady,
> And every word in it a gaping wound
> Iffuing life-blood.
> *Merchant of Venice, Act* iii. *fc.* 3.

> Tantæ *molis* erat Romanam condere gentem.
> *Æneid.* i. 37.

The following metaphor is ftrained beyond all endurance: Timur-bec, known to us by the name of *Tamerlane the Great*, writes to Bajazet emperor of the Ottomans in the following terms:

" Where is the monarch who dares refift us? where is the potentate who doth not glory in being numbered among our attendants? As for thee, defcended from a Turcoman failor, fince the veffel of thy unbounded ambition hath been wreck'd in the gulf of thy felf-love, it would be proper, that thou fhouldft take in the fails of thy temerity, and caft the anchor of repentance in the port of fincerity and juftice, which is the port of fafety; left the tempeft of our vengeance make thee perifh in the fea of the punifhment thou deferveft."

Such ftrained figures, as obferved above, are not unfrequent in the firft dawn of refinement: the mind in a new enjoyment knows no bounds, and is generally carried to excefs, till tafte and experience difcover the proper limits.

Secondly, Whatever refemblance fubjects may have, it is wrong to put one for another, where they bear no mutual proportion. Upon comparing a very high to a very low fubject, the fimile takes on an air of burlefque: and the fame will be the effect, where the one is imagined to be the other, as in a metaphor; or made to reprefent the other, as in an allegory.

Thirdly, Thefe figures, a metaphor efpecially, ought not to be crowded with many minute circumftances; for in that cafe it is fcarcely poffible to avoid obfcurity. A metaphor above all ought to be fhort: it is difficult, for any time, to fupport a lively image of a thing being what we know it is not; and for that reafon, a metaphor drawn out to any length, inftead of illuftrating or enlivening the principal fubject, becomes difagreeable by overftraining the mind. Here Cowley is extrememely licentious: take the following inftance.

> Great and wife conqu'ror, who, where-e'er
> Thou com'ft, doft fortify, and fettle there!
> Who canft defend as well as get;
> And never hadft one quarter beat up yet;
> Now thou art in, thou ne'er will part
> With one inch of my vanquifh'd heart;
> For fince thou tookft it by affault from me,
> 'Tis garrifon'd fo ftrong with thoughts of thee
> It fears no beauteous enemy.

For the fame reafon, however agreeable long allegories may at firft be by their novelty, they never afford any lafting pleafure: witnefs the *Fairy Queen*, which with great power of expreffion, variety of images, and melody of verfification, is fcarce ever read a fecond time.

In the fourth place, the comparifon carried on in a fimile, being in a metaphor funk by imagining the principal fubject to be that very thing which it only refembles; an opportunity is furnifhed to defcribe it in terms taken ftrictly or literally with refpect to its imagined nature. This fuggefts another rule, That in conftructing a metaphor, the writer ought to make ufe of fuch words only as are applicable literally to the imagined nature of his fubject: figurative words ought carefully to be avoided; for fuch complicated figures, inftead of fetting the principal fubject in a ftrong light, involve it in a cloud; and it is well if the reader, without rejecting by the lump, endeavour patiently to gather the plain meaning, regardlefs of the figures:

> A ftubborn and unconquerable flame
> Creeps in his veins, and drinks the ftreams of life.
> *Lady Jane Gray, act* i. *fc.* 1.

Copied from Ovid,

> Sorbent avidæ præcordia flammæ.
> *Metarmorph. lib.* ix. 172.

Let us analyfe this expreffion. That a fever may be imagined a flame, we admit; though more than one ftep is neceffary to come at the refemblance: a fever, by heating the body, refembles fire; and it is no ftretch to imagine a fever to be a fire: again, by a figure of fpeech, flame may be put for fire, becaufe they are commonly conjoined; and therefore a fever may be termed a *flame*. But now, admitting a fever to be a flame, its effects ought to be explained in words that agree literally to a flame. This rule is not obferved here; for a flame drinks figuratively only, not properly.

King Henry to his fon prince Henry:

> Thou hid'ft a thoufand daggers in thy thoughts,
> Which thou haft whetted on thy ftony heart
> To ftab at half an hour of my frail life.
> *Second part Henry* IV. *act* iv. *fc.* 11.

Such faulty metaphors are pleafantly ridiculed in the *Rehearfal:*

" *Phyfician.* Sir, to conclude, the place you fill has more than amply exacted the talents of a wary pilot; and all thefe threatening ftorms, which, like impregnate clouds, hover o'er our heads, will, when they once are grafp'd but by the eye of reafon, melt into fruitful fhowers of bleffings on the people.

" *Bayes.* Pray mark that allegory. Is not that good?

" *Johnfon.* Yes, that grafping of a ftorm with the eye is admirable." *Act* ii. *fc.* 1.

Fifthly, The jumbling different metaphors in the fame fentence, beginning with one metaphor and ending with another, commonly called a *mixt metaphor*, ought never to be indulged.

> *K. Henry.*——Will you again unknit
> This churlifh knot of all-abhorred war,
> And move in that obedient orb again,
> Where you did give a fair and natural light?
> *Firft part Henry* VI. *act* v. *fc.* 1.

> Whether 'tis nobler in the mind, to fuffer
> The ftings and arrows of outrageous fortune;
> Or to take arms againft a fea of troubles,
> And by oppofing end them.
> *Hamlet, act* iii. *fc.* 2.

In the fixth place, It is unpleafant to join different metaphors in the fame period, even where they are preferved

preserved diſtinct: for when the ſubject is imagined to be firſt one thing and then another in the ſame period without interval, the mind is diſtracted by the rapid tranſition; and when the imagination is put on ſuch hard duty, its images are too faint to produce any good effect:

At regina gravi jamdudum ſaucia cura,
Vulnus alit venis, et cæco carpitur igni.
Æneid. iv. 1.

——————Eſt mollis flamma medullas
Interea, et tacitum vivit ſub pectore vulnus.
Æneid. iv. 66.

Motum ex Metello conſule civicum,
Bellique cauſas, et vitia, et modos,
Ludumque fortunæ, graveſque
Principum amicitias, et arma
Nondum expiatis uncta cruoribus,
Periculoſæ plenum opus aleæ,
Tractas, et incedis per ignes
Suppoſitos cineri doloſo.
Horat. Carm. lib. ii. *ode* 1.

In the laſt place, It is ſtill worſe to jumble together metaphorical and natural expreſſion, ſo as that the period muſt be underſtood in part metaphorically in part literally; for the imagination cannot follow with ſufficient eaſe changes ſo ſudden and unprepared: a metaphor begun and not carried on, hath no beauty; and inſtead of light, there is nothing but obſcurity and confuſion. Inſtances of ſuch incorrect compoſition are without number: we ſhall, for a ſpecimen, ſelect a few from different authors.

Speaking of Britain.

This precious ſtone ſet in the ſea,
Which ſerves it in the office of a wall,
Or as a moat defenſive to a houſe
Againſt the envy of leſs happier lands.
Richard II. *act* ii. *ſc.* 1.

In the firſt line Britain is figured to be a precious ſtone: in the following lines, Britain, diveſted of her metaphorical dreſs, is preſented to the reader in her natural appearance.

Theſe growing feathers pluck'd from Cæſar's wing,
Will make him fly an ordinary pitch,
Who elſe would ſoar above the view of men,
And keep us all in ſervile fearfulneſs.
Julius Cæſar, act i. *ſc.* 1.

Rebus anguſtis animoſus atque
Fortis adpare: ſapienter idem
Contrahes vento nimium ſecundo
Turgida vela. *Hor.*

The following is a miſerable jumble of expreſſions, ariſing from an unſteady view of the ſubject, between its figurative and natural appearance:

But now from gath'ring clouds deſtruction pours,
Which ruins with mad rage our halcyon hours:
Miſts from black jealouſies the tempeſt form,
Whilſt late diviſions reinforce the ſtorm.
Diſpenſary, canto iii.

To thee the world its preſent homage pays,
The harveſt early, but mature the praiſe.
Pope's imitation of Horace, B. ii.

Oui, ſa pudeur ne'ſt que franche grimace,
Qu'une ombre de vertu qui garde mal la place,
Et qui s'evanouit, comme l'on peut ſavoir,
Aux rayons du ſoleil qu'une bourſe fait voir.
Moliere, L'Etourdi, act iii. *ſc.* 2.

Et ſon ſeu, depourvû de ſenſe et de lecture,
S'éteint à chaque pas, faut de nourriture.
Boileau, L'art poetique, chant. iii. l. 319.

Dryden, in his dedication of the tranſlation of *Juvenal*, ſays, "When thus, as I may ſay, before the uſe of the loadſtone, or knowledge of the compaſs, I was ſailing in a vaſt ocean, without other help than the pole-ſtar of the ancients, and the rules of the French ſtage among the moderns, &c."

"There is a time when factions, by the vehemence of their own fermentation, ſtun and diſable one another."
Bolingbroke.

This fault of jumbling the figure and plain expreſſion into one confuſed maſs, is not leſs common in allegory than in metaphor. Take the following examples.

——————Heu! quoties fidem,
Mutatoſque Deos flebit, et aſpera
Nigris æquora ventis
Emirabitur inſolens,
Qui nunc te fruitur credulus aureâ:
Qui ſemper vacuam, ſemper amabilem
Sperat, neſcius auræ
Fallacis. *Horat. Carm. lib.* i. *ode* 5.

Pour moi ſur cette mer, qu'ici bas nous courons,
Je ſonge à me pourvoir d'eſquif et d'avirons,
A regler mes deſirs, à prévenir l'orage,
Et ſauver, s'il ſe peut, ma Raiſon du naufrage.
Boileau, epitre 5.

Lord Halifax, ſpeaking of the ancient fabuliſts: "They (ſays he) wrote in ſigns, and ſpoke in parables: all their fables carry a double meaning: the ſtory is one, and entire; the characters the ſame throughout; not broken or changed, and always conformable to the nature of the creature they introduce. They never tell you, that the dog which ſnapped at a ſhadow, loſt his troop of horſe; that would be unintelligible. This is his (Dryden's) new way of telling a ſtory, and confounding the moral and the fable together." After inſtancing from the hind and panther, he goes on thus: "What relation has the hind to our Saviour? or what notion have we of a panther's Bible? If you ſay he means the church, how does the church feed on lawns, or range in the foreſt? Let it be always a church, or always a cloven-footed beaſt; for we cannot bear his ſhifting the ſcene every line."

A few words more upon allegory. Nothing gives greater pleaſure than this figure, when the repreſentative ſubject bears a ſtrong analogy, in all its circumſtances, to that which is repreſented: but the choice is ſeldom ſo lucky; the analogy being generally ſo faint and obſcure, as to puzzle and not pleaſe. An allegory is ſtill more difficult in painting than in poetry: the former can ſhow no reſemblance but what appears to the eye; the latter hath many other reſources for ſhowing the reſemblance. And therefore, with reſpect to what the Abbé du Bos terms *mixt allegorical compoſitions*, theſe may do in poetry; becauſe, in writing, the allegory can eaſily be diſtinguiſhed from the hiſtorical part: no perſon, for example, miſtakes Virgil's Fame for

for a real being. But ſuch a mixture in a picture is intolerable; becauſe in a picture the objects muſt appear all of the ſame kind, wholly real or wholly emblematical. For this reaſon, the hiſtory of Mary de Medicis, in the palace of Luxembourg, painted by Rubens, is unpleaſant by a perpetual jumble of real and allegorical perſonages, which produce a diſcordance of parts, and an obſcurity upon the whole: witneſs, in particular, the tablature repreſenting the arrival of Mary de Medicis at Marſeilles; where, together with the real perſonages, the Nereids and Tritons appear ſounding their ſhells: ſuch a mixture of fiction and reality in the ſame group, is ſtrangely abſurd. The picture of Alexander and Roxana, deſcribed by Lucian, is gay and fanciful; but it ſuffers by the allegorical figures. It is not in the wit of man to invent an allegorical repreſentation deviating farther from any ſhadow of reſemblance, than one exhibited by Lewis XIV. anno 1664; in which an enormous chariot, intended to repreſent that of the ſun, is dragged along, ſurrounded with men and women, repreſenting the four ages of the world, the celeſtial ſigns, the ſeaſons, the hours, &c.; a monſtrous compoſition, and yet ſcarce more abſurd than Guido's tablature of Aurora.

In an allegory, as well as in a metaphor, terms ought to be choſen that properly and literally are applicable to the repreſentative ſubject: nor ought any circumſtance to be added that is not proper to the repreſentative ſubject, however juſtly it may be applicable properly or figuratively to the pricipal. The following allegory is therefore faulty.

Ferus et Cupido,
Semper ardentes acuens ſagittas
Cote *cruentâ*. *Horat. lib.* ii. *ode* 8.

For though blood may ſuggeſt the cruelty of love, it is an improper or immaterial circumſtance in the repreſentative ſubject: water, not blood, is proper for a whetſtone.

We proceed to the next head, which is, to examine in what circumſtrnces theſe figures are proper, in what improper. This inquiry is not altogether ſuperſeded by what is ſaid upon the ſame ſubject in the article COMPARISON; becauſe, upon trial, it will be foud, that a ſhort metaphor or allegory may be proper, where a ſimile, drawn out to a greater length and in its nature more ſolemn, would ſcarce be reliſhed.

And, in the firſt place, a metaphor, like a ſimile, is excluded from common converſation, and from the deſcription of ordinary incidents.

Second, in expreſſing any ſevere paſſion that totally occupies the mind, metaphor is unnatural.

The following example, of deep deſpair, beſide the highly figurative ſtyle, hath more the air of raving than of ſenſe:

Caliſta. Is it the voice of thunder, or my father?
Madneſs! Confuſion! let the ſtorm come on,
Let the tumultuous roar drive all upon me,
Daſh my devoted bark; ye ſurges, break it;
'Tis for my ruin that the tempeſt riſes.
When I am loſt, ſunk to the bottom low,
Peace ſhall return, and all be calm again.
Fair Penitent, act 4.

The following metaphor is ſweet and lively; but it ſuits not the fiery temper of Chamont, inflamed with paſſion: parables are not the language of wrath venting itſelf without reſtraint:

Chamont. You took her up a little tender flower,
Juſt ſprouted on a bank, which the next froſt
Had nipp'd; and with a careful loving hand,
Tranſplanted her into your own fair garden,
Where the ſun always ſhines: there long ſhe flouriſh'd,
Grew ſweet to ſenſe, and lovely to the eye;
Till at the laſt a cruel ſpoiler came,
Cropt this fair roſe, and rifled all its ſweetneſs,
Than caſt it like a loathſome weed away.
Orphan, act 4.

The following ſpeech, full of imagery, is not natural in grief and dejection of mind.

Gonſalez. O my ſon! from the blind dotage
Of a father's fondneſs theſe ills aroſe.
For thee I've been ambitious, baſe and bloody:
For thee I've plung'd into this ſea of ſin;
Stemming the tide with only one weak hand,
While t'other bore the crown, (to wreathe thy brow),
Whoſe weight has ſunk me ere I reach'd the ſhore.
Mourning Bride, act 5. *ſc* 6.

There is an enchanting picture of deep diſtreſs in Macbeth, where Macduff is repreſented lamenting his wife and children, inhumanly murdered by the tyrant. Stung to the heart with the news, he queſtions the meſſenger over and over: not that he doubted the fact, but that his heart revolted againſt ſo cruel a misfortune. After ſtruggling ſome time with his grief, he turns from his wife and children to their ſavage butcher; and then gives vent to his reſentment, but ſtill with manlineſs and dignity:

O, I could play the woman with mine eyes,
And braggart with my tongue. But, gentle Heav'n!
Cut ſhort all intermiſſion; front to front
Bring thou this fiend of Scotland and myſelf;
Within my ſword's length ſet him.——If he 'ſcape,
Then Heav'n forgive him too.

Metaphorical expreſſion, indeed, may ſometimes be uſed with grace where a regular ſimile would be intolerable: but there are ſituations ſo ſevere and diſpiriting, as not to admit even the ſlighteſt metaphor. It requires great delicacy of taſte to determine with firmneſs, whether the preſent caſe be of that nature: perhaps it is; yet who could wiſh a ſingle word of this admirable ſcene altered?

But metaphorical language is proper when a man ſtruggles to bear with dignity or decency a misfortune however great; the ſtruggle agitates and animates the mind:

Wolſey. Farewell, a long farewell, to all my greatneſs!
This is the ſtate of man; to-day he puts forth
The tender leaves of hope; to-morrow bloſſoms,
And bears his bluſhing honours thick upon him;
The third day comes a froſt, a killing froſt,
And when he thinks, good eaſy man, full ſurely
His greatneſs is a ripening, nips his root,
And then he falls as I do.
Henry VIII. *act* 3. *ſc.* 6.

METAPHRAST, a tranſlator, or perſon who renders an author into another form or another language, word for word.

METAPHYSICS.

METAPHYSICS.

METAPHYSICS is that part of philofophy which confiders the nature and properties of thinking beings.

Ariftotle, after treating on phyfics, begins his next book, (in which he pretends to elevate the mind above corporeal objects, to fix it on the contemplation of God, of angels, and of things fpiritual, and to enable it to judge of the principles of fciences by abftraction,) with the Greek words μετα τα φυσικα, *poft phyficam*, i. e. *after phyfics*. His difciples, and fucceeding philofophers, have formed, of thefe two, one word, METAPHYSICS, by which they mean that fcience of which we have juft now given the definition.

Metaphyfics is divided, according to the objects that it confiders, into fix principal parts, which are called, 1. *Ontology*. 2. *Cofmology*. 3. *Anthrophology*. 4. *Pfychology*. 5. *Pneumatology*: and, 6. *Theodicy*, or *metaphyfical theology*.

1. The doctrine that is named *ontology*, is that part of metaphyfics which inveftigates, and explains, the nature and general effence of all beings, as well as the qualities and attributes that effentially appertain to them, and which we ought to affign them by abftraction, as confidering them *à priori*. Hence it appears, that this doctrine fhould proceed in its operations from the moft fimple ideas; fuch as do not admit of any other qualities of which they may be compounded. Thefe fimple ideas are, for example, thofe of being, of effence, of fubftance, of mode, of exiftence as well with regard to time as place, of a neceffary caufe, of unity, the idea of negation, the difference between a being that is fimple or compound, neceffary or accidental, finite or infinite; the idea of effential and abftract properties, as of the greatnefs, perfection, and goodnefs of beings; and fo of the reft. The bufinefs therefore of ontology, is to make us acquainted with every kind of being in its effence and abftract qualities, and fuch as are diftinct from all other beings. This knowledge being once eftablifhed on fimple principles, juft confequences may from thence be drawn, and thofe things proved after which metaphyfics inquires, and which is its bufinefs to prove.

It is eafy to conceive, that even a clear knowledge of beings, and their effential properties, would be ftill defective and ufelefs to man, if he did not know how to determine and fix his ideas by proper denominations, and confequently to communicate his perceptions to thofe whom he would inftruct, or againft whom he is obliged to difpute, as they would not have the fame perceptions that he has. It is, by the way, perhaps, one of the greateft advantages that we have over other animals, to be able fo to determine our ideas by figns or denominations, either of writing or fpeech, as to refer each particular perception to its general idea, and each general perception to its particular idea. To render therefore our ideas intelligible to others, we muft have determinate words or denominations for each being, and the qualities of each being; and ontology teaches us thofe terms which are fo neceffary to fix our ideas, and to give them the requifite perfpicuity and precifion, that we may not difpute about words when we endeavour to extend the fphere of our knowledge, or when we debate concerning the effence of an object, or endeavour to make it more evident. It is for this reafon that ontology was formerly regarded as a barren fcience, that confifted of technical terms only; as a mere terminology: whereas the beft modern philofophers make it a more fubftantial fcience, by annexing determinate ideas to thofe words, and the examination of thofe objects themfelves that thefe terms imply. But the misfortune is, to fpeak the truth, that in this ontologic determination there is ftill much uncertainty and fophiftry. For, in the firft place, we yet know of no metaphyfics where all the definitions are juft; and in the fecond place, the words that are employed in thefe definitions have always fomething equivocal in their meaning, and have confequently themfelves need of definitions; and in this manner we may recede to infinity, unlefs we recur to the firft impreffions that the fimple words have made in our minds, and the primitive ideas which they there excite. The words *man*, *love*, *coach*, &c. fay more, and make a ftronger impreffion, than all the definitions we can give of them; by ontologic explications they are almoft always covered with a dark cloud.

2. Metaphyfics, after having, in as folid a manner as poffible, explained and eftablifhed the principles above-mentioned, continues its inquiries to the fecond part, that is called *Cofmology*, and examines into the effence of the world, and all that it contains; its eternal laws; of the nature of matter; of motion; of the nature of tangible bodies, of their attributes and effential qualities, and of all that can be known by abftraction, and fometimes alfo by adding the lights that man acquires concerning them by the experience of his fenfes. It is alfo in cofmology that we examine the Leibnitzian fyftem; that is, whether God in creating the world muft neceffarily have created the beft world; and if this world be fo in effect. And in this manner they purfue the argument from confequence to confequence to its laft refort. All philofophers, however, do not go equally deep. Each mind has its dofe of penetration. Due care fhould be likewife taken, that fubtilty, in this chain of reafoning, carried beyond the general bounds of the human mind, do not prejudice either the perfpicuity or the truth of ideas: feeing that error here too nearly approaches the truth; and that every idea, which cannot be rendered intelligible, is in effect equal to a falfe idea.

3. *Anthrophology*, or the knowledge of man, forms the third branch of metaphyfics. It is fubdivided into two parts. The firft, which confifts in the knowledge of the exterior parts of the human frame, does not belong to this fcience: anatomy and phyfiology teach that. The bufinefs here is only a metaphyfical examination of man, his exiftence, his effence, his effential qualities and neceffary attributes, all confidered *à priori*: and this examen leads at the fame time to

4. *Pyfychology*, which confifts in the knowledge of the foul in general, and of the foul of man in particu-

General View.

lar; concerning which the moſt profound, the moſt ſubtle and abſtract reſearches have been made, that the human reaſon is capable of producing; and concerning the ſubſtance of which, in ſpite of all theſe efforts, it is yet extremely difficult to aſſert any thing that is rational, and ſtill leſs any thing that is poſitive and well ſupported.

5. The fifth part of metaphyſics is called *pneumatology*. It is not a very long time ſince this term has been invented, and that metaphyſicians have made of it a diſtinct doctrine. By this they mean the knowledge of all ſpirits, angels, &c. It is eaſy to conceive that infinite art is neceſſary to give an account of what we do not abſolutely know any thing, and of which, by the nature of the ſubject itſelf, we never can know any thing. But the metaphyſician preſently offers to ſhow us, "what is the idea of a ſpirit; the effective exiſtence of a ſpirit; what are its general qualities and properties; that there are rational ſpirits, and that theſe rational ſpirits have qualities that are founded in the moral qualities of God:" for this is, in ſo many words, what is taught us by pneumatology.

6. *Metaphyſical Theology*, which M. Leibnitz and ſome others call *Theodicy*, is the ſixth and laſt doctrine of metaphyſics. It teaches us the knowledge of the exiſtence of God; to make the moſt rational ſuppoſitions concerning his divine eſſence, and to form a juſt idea of his qualities and perfections, and to demonſtrate them by abſtract reaſoning *à priori*. Theodicy differs from natural theology, in as much as this laſt borrows, in fact, from theodicy proofs and demonſtrations to confirm the exiſtence of a Supreme Being; but after having ſolidly eſtabliſhed that great truth, by extending its conſequences, natural theology teaches us what are the relations and connexions that ſubſiſt between that Supreme Being and man, and what are the moral duties that reſult from that connexion. As pneumatology is a ſcience highly inſidious and chimerical, ſo is metaphyſical theology ſuſceptible of ſound argument and demonſtration; to the great comfort of mankind, the whole of whoſe happineſs is founded on the certainty of this ſcience. If the effects and operations of ſpirits in the univerſe were as evident as the effects and operations of the Deity, and their neceſſary exiſtence as capable of being proved *à priori*, pneumatology would be a doctrine of equal certainty with theodicy: but as neither one nor the other can be proved with regard to ſpirits in general, whilſt God manifeſts himſelf in every part of nature, we have only to deſcend from the moſt ſimple and abſtract ideas, to thoſe that are the moſt compound; and from thence to reaſcend, by a chain of reaſonings, from the creature up to the Author of the creature and of all nature: we ſhall find, that the reſult of all theſe operations of the mind will conſtantly be, The neceſſity of the exiſtence of a God; and we may at all times determine, tho' very imperfectly, from the weakneſs of our diſcernment, what that Supreme Being muſt be, by poſitively determining what he cannot be. Every thing that can concur to furniſh new proofs on this ſubject, or to elucidate and eſtabliſh thoſe which are already known, is therefore of ineſtimable value to mankind: and though this were the only object of metaphyſics, it would highly merit the attention of thoſe of the moſt refined and moſt exalted genius.

After giving this general view of the ſubject, we ſhall proceed to give the ſubſtance of what Mr Locke has delivered upon it.

Of Ideas.

Sect. I. *Of Ideas in general, and their Original.*

7. By the term *idea*, as defined by Mr Locke, is meant whatever is the object of the underſtanding when a man thinks, or whatever it is which the mind can be employed about in thinking.

8. In order to trace the manner by which we acquire theſe ideas, let us ſuppoſe the mind to be, as we ſay, *white paper*, void of all characters, without any *ideas*: how comes it to be furniſhed? whence has it all the materials of reaſon and knowledge? From *experience* and *obſervation*. This, when employed about external ſenſible objects, we may call *ſenſation*: by this we have the ideas of *bitter*, *ſweet*, *yellow*, *hard*, &c. which are commonly called *ſenſible qualities*, becauſe conveyed into the mind by the ſenſes. The ſame experience, when employed about the internal operations of the mind, perceived and reflected on by us, we may call *reflection*: hence we have the *ideas* of *perception*, *thinking*, *doubting*, *willing*, *reaſoning*, &c.

9. Theſe two, viz. *external material things* as the objects of ſenſation, and *the operations of our own minds* as the objects of reflection, are the only *originals* from whence all our *ideas* take their beginnings: the underſtanding ſeems not to have the leaſt glimmering of *ideas* which it doth not receive from one of theſe two *ſources*. Theſe, when we have taken a full ſurvey of them, and their ſeveral *modes* and compoſitions, we ſhall find to contain our whole ſtock of *ideas*: and that we have nothing in our minds which did not come in one of theſe two ways.

10. It is evident, that children come by degrees to be furniſhed with *ideas* from the objects they are converſant with: they are ſo ſurrounded with bodies that perpetually and diverſely affect them, that ſome ideas will (whether they will or no) be imprinted on their minds. *Light* and *colours*, *ſounds* and *tangible* qualities, do continually ſolicit their proper ſenſes, and force an entrance into the mind. It is late, commonly, before *children* come to have *ideas* of the operations of their minds; and ſome men have not any very clear or perfect *ideas* of the greateſt part of them all their lives: becauſe, tho' they paſs there continually, yet, like floating viſions, they make not deep impreſſions enough to leave in the mind clear and laſting *ideas*, till the underſtanding turns inward upon itſelf, and reflects on its own operation, and makes them the objects of its own contemplation.

11. When a man *firſt perceives*, then he may be ſaid *to have ideas*; having ideas, and perception, ſignifying the ſame thing.

Sect. II. *Of Simple Ideas.*

Of ideas, ſome are *ſimple*, others *complex*. A *ſimple idea* is one uniform appearance or conception in the mind, which is not diſtinguiſhable into different *ideas*. Such are the *ideas* of *ſenſible qualities*, which though they are in the things themſelves ſo united and blended, that there is no ſeparation, no diſtance between them, yet the *ideas* they produce in the mind enter by the ſenſes ſimple and unmixed. Thus, tho' the

Different sorts of Ideas.

the hand feels *softness* and *warmth* in the same piece of *wax*, yet the *simple ideas* thus united in the same subject are as perfectly *distinct* as those that come in by different senses.

12. These *simple ideas* are suggested no other way than from the two ways above-mentioned, viz. *sensation* and *reflection*.

13. The mind being once stored with the *simple ideas*, has the power to repeat, compare, and unite them to an infinite variety; and so can make, at pleasure, new *complex ideas*. But the most enlarged understanding cannot frame one new *simple idea;* nor by any force destroy them that are there.

14. Ideas, with reference to the different ways wherein they approach the mind, are of *four sorts*.

First, There are some which come into our minds by *one sense* only.

Secondly, There are others conveyed into the mind by *more senses than one*.

Thirdly, Others that are had from *reflection* only.

Fourthly, There are some suggested to the mind by all the ways of *sensation* and *reflection*.

Sect. III. *Of Ideas of one Sense.*

15. Some ideas enter into the mind only by one sense peculiarly adapted to receive them. Thus colours, sounds, smells, &c. come in only by the eyes, ears, and nose. And if these organs are any of them so disordered as not to perform their functions, they have no other way to bring themselves in view, and be perceived by the understanding.

16. We shall here mention one, which we receive by our touch, because it is one of the chief ingredients in many of our complex ideas; and that is, the idea of *solidity:* it arises from the resistance one body makes to the entrance of another body into the place it possesses, till it has left it. There is no idea which we more constantly receive from sensation than this. In whatever posture we are, we feel somewhat that supports us, and hinders us from sinking downwards: and the bodies we daily handle, make us perrceive, that while they remain between them, they do, by an unsurmountable force, hinder the approach of the parts of our hands that press them. This seems to be the most essential property of body, and that whereby we conceive it to fill space: the idea of which is, that where we imagine any space taken up by a solid substance, we conceive it so to possess it, that it excludes all other solid substances. This resistance is so great, that no force can surmount it. All the bodies in the world pressing a *drop of water* on all sides, will never be able to overcome the resistance it makes to their approaching one another, till it be removed out of their way.

17. The idea of *solidity* is distinguished from that of *pure space*, in as much as this *latter* is neither capable of resistance nor motion: it is distinguished from *hardness*, in as much as hardness is a firm cohesion of the solid parts of matter making up masses of a sensible bulk, so that the whole doth not easily change its figure. Indeed, *hard* and *soft*, as commonly apprehended by us, are but *relative* to the constitutions of our bodies: that being called *hard* which will put us to pain sooner than change its figure by the pressure of any part of our bodies; and that *soft*, which changes the situation of its parts upon an easy and unpainful touch.

Sensation and Reflection.

18. This difficulty of changing situation among the parts, gives no more solidity to the hardest body than to the softest; nor is an adamant one jot more solid than water. He that shall fill a yielding soft body well with air or water, will quickly find its resistance. By this we may distinguish the idea of the extension of body, from the idea of the extension of space: That of body, is the cohesion or continuity of solid, separable, and moveable parts; that of space, the continuity of unsolid, inseparable, and immoveable parts. Upon the solidity of bodies depend their mutual impulse, resistance, and protrusion.

Sect. IV. *Of Simple Ideas of different Senses.*

19. Some ideas we get into the mind by *more than one sense;* as *space*, *extension*, *figure*, *rest*, and *motion*. These are perceivable by the eyes and touch.

Sect. V. *Of Simple Ideas of Reflection.*

20. Some ideas are had from reflection only. Such are the ideas we have of the operations of our minds: of which the two principal are, *perception*, or *thinking;* and *volition*, or *willing*. The powers of producing these operations are called *faculties;* which are, the *understanding*, and *will*. The several *modes* of thinking, &c. belong to this head.

Sect. VI. *Of Simple Ideas of Sensation and Reflection.*

21. There are some simple ideas conveyed into the mind by all the ways of *sensation* and *reflection;* such are *pleasure*, *pain*, *power*, *existence*, *unity*, *succession*. Pleasure or delight, pain or uneasiness, accompany almost every impression on our senses, and every action or thought of the *mind*.

22. The Author of our beings having given a power to our minds, in several instances, to choose amongst its ideas which it will think on; to excite us to these actions of *thinking* and *motion*, he has joined to several thoughts and sensations a perception of delight; without this we should have no reason to prefer one thought or action to another.

23. *Pain* has the same efficacy to set us on work that pleasure has; since we are as ready to avoid that, as to pursue this. This is worth our consideration, that *pain is often produced by the same objects and ideas that produce pleasure* in us. This their near conjunction gives us new occasion of admiring the wisdom and goodness of our *Maker;* who, designing the preservation of our being, has annexed pain to the application of many things to our bodies, to warn us of the harm they will do us, and as advices to withdraw us from them. But he not designing our preservation barely, but the preservation of every part and organ in its perfection, hath in many cases annexed pain to those very ideas which delight us. Thus heat, that is very agreeable to us in one degree, by a little greater increase of it proves no ordinary torment: Which is wisely ordered by *nature*, that when any object does by the vehemence of its operation disorder the instruments of sensation, whose structures cannot but be very delicate, we might by the pain be warned to withdraw before the organ be quite put out of order. That this is the *end of pain*, appears from this consideration;

Simple Ideas.

deration; that though great light is insufferable to the eyes, yet the highest degree of *darkness* does not at all disease them, because *that* causes no disorderly motion in that curious organ the eye. But excess of *cold*, as well as *heat*, pains us; because it is equally destructive to the temper which is necessary to the preservation of life.

24. *Existence* and *unity* are two other ideas suggested by every object without, and every idea within. When ideas are in our minds, we consider them as being actually there, as well as we consider things to be actually without us; which is, that they *exist*, or have existence: And whatever we consider as *one thing*, whether a *real being*, or *idea*, suggests the idea of *unity*.

25. *Power* is another idea derived from these sources: For finding in ourselves that we can *think*, and *move* several parts of our bodies at pleasure, and observing the *effects* that natural bodies produce in one another; by both these ways we get the idea of *power*.

26. *Succession* is another idea suggested by our senses, and by reflection on what passes in our minds: For if we look into ourselves, we shall find our *ideas* always, whilst we are awake, or have any thought, passing in train, one going and another coming, without intermission.

Sect. VII. *Some farther Considerations concerning Simple Ideas.*

27. Whatsoever is able, by affecting our senses, to cause any perception in the mind, doth hereby produce in the understanding a *simple idea;* which, whatsoever be the cause of it, is looked upon as a *real positive idea* in the understanding. Thus the ideas of *heat* and *cold*, *light* and *darkness*, *motion* and *rest*, &c. are equally positive in the mind, though some of their causes may be mere *privations*.

28. That a *privative* cause may produce a *positive* idea, appears from shadows; which, though nothing but the absence of light, are discernible, and cause clear and positive ideas. We have indeed some *negative* names which stand not directly for positive ideas, but of their absence; such as *insipid*, *silence*, which denote positive ideas, viz. *taste* and *sound*, with a signification of their absence.

29. It will be useful to distinguish *ideas* as they are *perceptions* in our minds, from what *they are in the bodies* that cause such perceptions in us; for we are not to think the former exact images and resemblances of something inherent in the subject, most of those of *sensation* being, in the mind, no more the likeness of something existing without us, than the names that stand for them are the likeness of our ideas, which yet, upon hearing, they excite in us.

30. Whatsoever the *mind perceives in itself*, or is the immediate object of perception, thought, or understanding, is an idea: And the power to produce any idea in our mind, is the *quality of the subject* wherein that power exists. Thus a *snow-ball* having the power to produce in us the ideas of *white*, *cold*, and *round;* those *powers*, as they are in the snow-ball, are called *qualities;* and as they are *sensations* or *perceptions* in our understandings, they are called *ideas*. These *qualities* are of *two sorts:*

31. First, *Original*, or primary; such are *solidity*, *extension*, *motion*, or *rest*, *number*, and *figure*. These are inseparable from body, and such as it constantly keeps in all its changes and alterations.

Perception.

32. Secondly, *Secondary qualities;* such as *colours*, *smells*, *tastes*, *sounds*, &c. which, whatever reality we by mistake may attribute to them, are in truth nothing in the objects themselves, but *powers* to produce various sensations in us; and depend on the qualities beforementioned.

33. The *ideas* of *primary* qualities of bodies, are resemblances of them; and their patterns really exist in bodies themselves: But the ideas produced in us by secondary qualities have no resemblance of them at all; and what is *sweet*, *blue*, or *warm*, in the idea, is but the certain bulk, figure, and motion of the sensible parts in the bodies themselves, which we call so.

34. Thus we see, that fire at one distance produces in us the sensation of *warmth*, which at a nearer approach causes the sensation of *pain*. Now what reason have we to say, that the idea of *warmth* is actually in the fire, but that of *pain* not in the fire, which the same fire produces in us the same way? The bulk, number, figure, and motion of the parts of fire, are really in it, whether we perceive them or not; and therefore may be called *real* qualities, because they really exist in that body: But *light* and *heat* are no no more really in it, than sickness or pain: Take away the sensation of them; let not the eyes see light or colours, nor the ear hear sounds; let the palate not taste, or the nose smell; and all *colours*, *tastes*, *odours*, and *sounds*, as they are such particular ideas, vanish and cease, and are reduced to their causes, that is, bulk, motion, figure, &c. of parts.

35. These *secondary* qualities are of two sorts. First, *Immediately perceivable:* which by immediately operating on our bodies, produce several different ideas in us. Secondly, *Mediately perceivable;* which, by operating on other bodies, change their primary qualities, so as to render them capable of producing ideas in us different from what they did before. These last are powers in bodies, which proceed from the particular constitution of those primary and original qualities, to make such a change in the *bulk*, *figure*, *texture*, &c. of another body, as to make it operate on our senses different from what it did before; as in fire, to make lead fluid. These two last being nothing but powers relating to other bodies, and resulting from the different modifications of the original qualities, are yet otherwise thought of; the former being esteemed *real qualities*, but the latter barely *powers*.

Sect. VIII. *Of Perception.*

36. Perception is the first idea we receive from reflection. It is by some called *thinking* in general: Though *thinking*, in the propriety of the *English* tongue, signifies that sort of operation of the mind about its ideas, wherein the mind is active; where it considers any thing with some degree of voluntary attention: For in bare *perception* the mind is, for the most part, only *passive;* and what it perceives, it cannot avoid perceiving. What this is, we cannot otherwise know, than by reflecting on what passes in our minds when we see, feel, hear, &c.

37. Im-

Retention. 37. Impreffions made on the outward parts, if they are not taken notice of within, caufe no *perception;* as we fee in thofe whofe minds are intently bufied in the contemplation of certain objects.

38. We may obferve, that the ideas we receive from fenfation, are often in grown people altered by the judgment, without our taking notice of it. Thus a globe of any uniform colour, as of gold or jet, being fet before our eyes, the *idea* thereby imprinted is of a flat circle varioufly fhadowed: But being accuftomed to perceive what kind of appearance convex bodies are wont to make in us, the judgment alters the appearance into their caufes; and, from that variety of fhadow or colour, frames to itfelf the perception of a convex figure of one uniform colour. This in many cafes, by a fetled habit, is performed fo readily, that we take that for the perception of our fenfation, which is but an idea formed by the judgment; fo that one ferves only to excite the other, and is fcarce taken notice of itfelf: As a man who reads or hears with attention, takes little notice of the characters or founds, but of the ideas that are excited in him by them.

39. Perception is alfo the firft ftep and degree towards knowledge, and the inlet of all the materials of it; fo that the fewer fenfes any man has, and the duller the impreffions that are made by them are, the more remote he is from that knowledge which is to be found in other men.

Sect. IX. *Of Retention.*

40. The next faculty of the mind whereby it makes a further progrefs towards knowledge, is called *retention;* which is the keeping of thofe ideas it has received. Which is done two ways:

41. *Firft*, By keeping the idea which is brought into the mind for fome time actually in view; which is called *contemplation.*

24. *Secondly*, By reviving thofe ideas in our minds which have difappeared, and have been, as it were, laid out of fight: And this is *memory;* which is, as it were, the ftore-houfe of our ideas; for the narrow mind of man not being capable of having many ideas under view at once, it was neceffary to have a repofitory to lay up thofe ideas, which at another time it may have ufe of. But our ideas being nothing but actual perceptions in the mind, which ceafe to be any thing when there is no perception of them, this laying up of our *ideas* in the repofitory of the memory fignifies no more but this, that the mind has a power, in many cafes, to revive perceptions it has once had, with this additional perception annexed to them, that it has had them before. And it is by the affiftance of this faculty, that we are faid to have all thofe ideas in our underftandings which we can bring in fight, and make the objects of our thoughts, without the help of thofe fenfible qualities which firft imprinted them there.

43. Thofe ideas that are often refrefhed by a frequent return of the objects or actions that produce them, fix themfelves beft in the memory, and remain longeft there: Such are the *original qualities of bodies.* viz. Solidity, extenfion, figure, motion, *&c.* Thefe and the like are feldom quite loft while the mind retains any *ideas* at all.

Sect. X. *Of Difcerning, and other Operations of the Mind.*

Complex Ideas.

44. Another faculty of the mind, is that of *difcerning between its ideas.* On this depends the evidence and certainty of feveral general propofitions. In being able nicely to diftinguifh one thing from another, where there is the leaft difference, confifts, in a great meafure, that *exactnefs of judgment* and *clearnefs of reafon* which is to be obferved in one man above another.

45. To the well diftinguifhing our *ideas*, it chiefly contributes that they be clear and determinate; and when they are fo, it will not breed any confufion or miftake about them, though the fenfes fhould convey them from the fame object differently on different occafions.

46. The comparing of our *ideas* one with another in refpect of *extent*, *degree*, *time*, *place*, or any other circumftances, is another operation of the mind about its *ideas*, which is the ground of *relations.* Brutes feem not to have this faculty in any great degree. They have probably feveral *ideas* diftinct enough; but cannot compare them farther than fome fenfible circumftances annexed to the objects themfelves.

47. *Compofition* is another operation of the mind, whereby it combines feveral of its fimple *ideas* into *complex* ones: Under which operation we may reckon that of *enlarging;* wherein we put feveral *ideas* together of the fame kind, as feveral units to make a *dozen.*

48. *Abftraction* is another operation of the mind, whereby the mind forms general *ideas* from fuch as it received from particular objects; which it does by confidering them, as they are in the mind fuch appearances feparate from the circumftances of real exiftence, as *time*, *place*, &c. Thefe become general *reprefentatives* of all the fame kind, and their names applicable to whatever exifts comformable to fuch abftract *ideas.* Thus the colour received from *chalk*, *fnow*, and *milk*, is made a reprefentative of all of that kind; and has a name given it (*whitenefs*), which fignifies the fame quality, wherever to be found or imagined. And thus *univerfals*, both *ideas* and *terms*, are made.

Sect. XI. *Of Complex Ideas.*

49. In the reception of fimple ideas the mind is only *paffive*, having no power to frame any one to itfelf, nor having any idea which does not wholly confift of them. But about thefe fimple ideas it exerts feveral acts of its own, whereby out of them, as the materials and foundations of the reft, the others are framed. The acts of the mind, wherein it exerts its power over its fimple ideas, are chiefly thefe three. *Firft*, It combines feveral fimple ideas into one compound one; and thus all *complex ideas* are made. *Secondly*, It brings two ideas, whether *fimple* or *complex*, together, and fets them by one another, fo as to take a view of them at once, without uniting them into one; by which way it gets all its ideas of relations. *Thirdly*, It feparates them from all other ideas that accompany them in their real exiftence: And thus all its *general ideas* are made. As *fimple ideas* are obferved to exift in feveral combinations united together, fo the mind may confider them as united, not only as they are really

Of Space. really united in external objects, but as itself has joined them. *Ideas* thus made up of several ones put together, are called *complex;* as *man*, *army*, *beauty*, *gratitude*, &c. By this faculty of repeating and joining together its *ideas*, the mind has great power in varying and multiplying the objects of its thoughts. But it is still confined to those simple *ideas* which it received from the two sources of *sensation* and *reflection*. It can have no other *ideas* of sensible qualities than what come from without by the senses, nor any other *ideas* of the operations of a thinking substance than what it finds in itself; but having once got these simple *ideas*, it can by its own power put them together, and make new *complex ones*, which it never received so united.

50. *Complex ideas*, however compounded and decompounded, though their number be infinite, and their variety endless, may all be reduced under these three heads: 1st, *Modes;* 2dly, *Substances;* 3dly, *Relations*.

51. First, *Modes* are such complex *ideas* as contain not the supposition of subsisting by themselves; but are considered as dependences on, and affections of, substances; as *triangle*, *gratitude*, *murder*, &c. These modes are of two sorts: First, *Simple;* which are combinations of the same simple *idea;* as a *dozen*, *score*, &c. which are but the *ideas* of so many distinct units put together. Secondly, *Mixed;* which are compounded of simple *ideas* of several kinds; as *beauty*, which consists in a certain composition of colour and figure, causing delight in the beholder; *theft*, which is the concealed change of the possession of any thing, without the consent of the proprietor. *These* visibly contain a combination of *ideas* of several kinds.

52. Secondly, *Substances*. The *ideas* of substances are only such combinations of simple *ideas*, as are taken to represent distinct particular things subsisting by themselves, in which the confused *idea* of substance is always the chief. Thus a combination of the *ideas* of a certain figure, with the powers of motion, thought, and reasoning, joined to substance, make the ordinary *idea* of man.

53. These again are either of *single substances*, as *man*, *stone;* or of *collective*, or several put together, as *army*, *heap*. *Ideas* of several substances thus put together, are as much each of them one single *idea*, as that of a *man* or an *unit*.

54. Thirdly, *Relations;* which consist in the consideration and comparing of one *idea* with another. Of these several kinds we shall treat in their order.

Sect. XII. *Of Simple Modes: And, first, of the simple modes of Space.*

55. Concerning *simple modes* we may observe, that the modifications of any *simple ideas* are as perfectly different and distinct ideas in the mind, as those of the greatest distance or contrariety: Thus *two* is as distinct from *three*, as *blueness* from *heat*.

56. *Space* is a simple idea which we get both by our sight and touch. When we consider it barely in length between two bodies, it is called *distance:* when in length, breadth, and thickness, it may be called *capacity*. When considered between the extremities of matter, which fills the capacity of space with something solid, tangible, and moveable, it is called *extension*. And thus *extension* will be an *idea* belonging to body; *space* may be conceived without it.

57. Each different *distance* is a different modification of space; and each *idea* of any different space is a *simple mode* of this *idea*. Such are an *inch*, *foot*, *yard*, &c. When these *ideas* are made familiar to mens thoughts, they can in their minds repeat them as often as they will, without joining to them the *idea* of body, and frame to themselves the *ideas* of feet, yards, or fathoms, beyond the utmost bounds of all bodies; and by adding these still one to another, enlarge their *idea* of space as much as they please. From this power of repeating any *idea* of distance, without being ever able to come to an end, we come by the *idea* of immensity.

58. Another modification of *space* is taken from the *relation* of the parts of the termination of extension or circumscribed space amongst themselves; and this is what we call *figure*. This the *touch* discovers in sensible bodies, whose extremities come within our reach; and the *eye* takes both from bodies and colours, whose boundaries are within its view; where observing how the extremities terminate either in straight lines, which meet at discernible angles, or in crooked lines, wherein no angles can be perceived; by considering these as they relate to one another in all parts of the extremities of any body or space, it has that idea we call *figure:* which affords to the mind infinite variety.

59. Another *mode* belonging to this head, is that of *place*. Our idea of *place* is nothing but the relative position of any thing with reference to its distance from some fixed and certain points. Whence we say, that a thing has or has not changed *place*, when its distance either is or is not altered with respect to those bodies with which we have occasion to compare it. That this is so, we may easily gather from hence, that we can have no idea of the place of the *universe*, though we can of all its parts. To say that the world is *somewhere*, means no more than that it does *exist*. The word *place* is sometimes taken to signify that *space* which any body takes up; and so the universe may be conceived in a place.

Sect. XIII. *Of Duration, and its Simple Modes.*

Duration.

60. There is another sort of *distance*, the *idea* of which we get from the fleeting and perpetually perishing parts of succession, which we call *duration*. The simple modes of it are any different lengths of it whereof we have distinct *ideas;* as *hours*, *days*, *years*, &c. *time* and *eternity*.

61. The *idea* of *succession* is got by reflecting on that train of *ideas* which constantly follow one another in our minds as long as we are awake. The distance between any parts of this *succession*, is what we call *duration;* and the continuation of the existence of ourselves, or any thing else, *commensurate* to the succession of any *ideas* in our minds, is what we call our *own duration*, or *that* of another thing co-existing with our thinking. That this is so, appears from hence, that we have no perception of succession or duration, when that succession of our *ideas* ceases, as in *sleep:* the moment that we sleep, and awake, how distant soever, seems to be joined and connected. And possibly it would be so to a waking man, could he fix upon one *idea* without variation and the succession of others. And we see that

they

Of Number.

they whose thoughts are very intent upon one thing, let slip out of their account a good part of that *duration*, and think that time shorter than it is. But if a man, during his sleep, *dream*, and a variety of *ideas* make themselves perceptible in his mind one after another, he hath then, during such dreaming, a sense of *duration*, and of the length of it.

A man having once got this *idea* of duration, can apply it to things which exist while he does not think: and thus we measure the time of our sleep, as well as that wherein we are awake.

Duration, as marked by certain periods and measures, is what we most properly call *time;* which we measure by the diurnal and annual *revolutions* of the sun, as being constant, regular, and universally observable by all mankind, and supposed equal to one another.

The mind having once got such a measure of *time*, as the annual revolution of the sun, can easily apply it to duration wherein that measure itself did not exist; and the *idea* of *duration* equal to an *annual revolution of the sun*, is as easily applicable in our thoughts to duration where no sun nor motion was, as the *idea* of a *foot* or *yard* to distances beyond the confines of the world.

By the same means, and from the same original that we come to have the *idea* of time, we have also that *idea* which we call *eternity:* for having got the ideas of certain lengths of duration, we can in our thoughts add them to one another as oft as we please, without ever coming to an end.

And thus it is plain, that from the two fountains of all knowledge before mentioned, *viz. sensation* and *reflection*, we get the ideas of duration, and the several measures of it.

Sect. XIV. *Of Number.*

62. The complex *ideas* of *number* are formed by adding several *units* together. The *simple modes* of it are each several combinations, as *two, three*, &c. These are of all others most distinct, the nearest being as clearly different from each other as the most remote: *two* being as distinct from *one*, as two hundred. But it is hard to form distinct *ideas* of every the least excess in extension. Hence demonstrations in numbers are more general in their use, and more determinate in their application, than those of extension.

63. *Simple modes* of numbers being in our minds but so many combinations of units, which have no variety but *more* or *less; names* for each distinct combination seem more necessary than in any other sort of *ideas:* For without a *name*, or *mark*, to distinguish that precise collection, it will hardly be kept from being a heap of confusion. Hence some *Americans* have no distinct *idea* of any number beyond twenty; so that when they are discoursed with of greater numbers, they shew the hairs of their head. So that to reckon right, two things are required.

64. *First*, That the mind distinguish carefully two *ideas* which are different one from another only by the addition or subtraction of one unit.

65. *Secondly*, That it retain in memory the names or marks of the several combinations, from an unit to that number; and that in exact order, as they follow one another. In either of which if it fails, the whole business of *numbering* will be disturbed; and there will remain only the confused *idea* of *multitude;* but the *ideas* necessary to distinct numeration will not be attained to.

Of Infinity.

Sect. XV. *Of Infinity.*

66. The *idea* signified by the name *infinity*, is best examined, by considering to *what* infinity is by the mind attributed, and then *how* it frames it. *Finite* and *infinite*, then, are looked upon as the modes of quantity; and attributed primarily to things that have parts, and are capable of increase or diminution by the *addition* or *subtraction* of any the least part. Such are the *ideas* of *space, duration*, and *number*.

67. When we apply this *idea* to the *Supreme Being*, we do it primarily, in respect of his duration and ubiquity; more figuratively, when to his *wisdom, power, goodness*, and other attributes, which are properly *inexhaustible* and *incomprehensible:* for when we call them infinite, we have no other *idea* of this infinity, but what carries with it some reflection on the *number* or the *extent* of the *acts* or *objects* of God's power and wisdom, which can never be supposed so great, or so many, that these attributes will not always surmount and exceed, though we multiply them in our thoughts with the infinity of *endless number*.

68. The next thing to be considered, is, *How we come* by the *idea* of infinity. Every one that has any *idea* of any stated lengths of space, as a *foot, yard*, &c. finds that he can repeat that *idea*, and join it to *another*, to a *third*, and so on without ever coming to an end of his additions. From this power of enlarging his *idea* of space, he takes the *idea* of infinite space, or *immensity*. By the same power of repeating the *idea* of any length of duration we have in our minds, with all the endless addition of number, we come by the *idea* of *eternity*.

69. If our *idea* of *infinity* be got by repeating without end our own *ideas;* why do we not attribute it to other *ideas*, as well as those of *space* and *duration;* since they may be as easily and as often repeated in our minds as the other? yet nobody ever thinks of infinite *sweetness* or *whiteness*, though he can repeat the *idea* of sweet or white as frequently as those of *yard* or *day*. But those *ideas* that have parts, and are capable of increase by the addition of any parts, afford us, by their repetition, an *idea* of infinity; because with the endless repetition there is continued an enlargement, of which there is no end. But it is not so in other *ideas:* for if to the perfect *idea* I have of white, I add another of equal whiteness, it enlarges not my *idea* at all. Those *ideas* that consist not of parts, cannot be augmented to what proportion men please, or be stretched beyond what they have received by their senses: but *space, duration*, and *number*, being capable of increase by repetition, leave in the mind an *idea* of an endless room for more; and so those *ideas* alone lead the mind towards the thought of infinity.

Sect. XVI. *Of the Modes of Thinking.*

70. When the mind turns its view inwards upon itself, *thinking* is the first *idea* that occurs: wherein it observes a great variety of modifications; and thereof frames to itself distinct *ideas*. Thus the perception annexed to any impression on the body made by an external

Pleasure and Pain.

ternal object, is called *sensation*. When an *idea* recurs without the presence of the object, it is called *remembrance:* when sought after by the mind, and brought again in view, it is *recollection:* when held there long under attentive consideration, it is *contemplation*. When *ideas* float in the mind without regard or reflection, it is called in French *reverie:* our language has scarce a name for it: When the ideas are taken notice of, and as it were registered in the memory, it is *attention*: When the mind fixes its view on any one *idea*, and considers it on all sides, it is *intention* and *study*. *Sleep*, without dreaming, is rest from all these: And *dreaming* is the perception of *ideas* in the mind, not suggested by any external objects, or known occasions; nor under any choice or conduct of the understanding.

Sect. XVII. *Of the Modes of Pleasure and Pain.*

71. Pleasure and *pain* are simple *ideas*, which we receive both from sensation and reflection. There are thoughts of the mind, as well as sensations, accompanied with pleasure or pain. Their causes are termed *good* or *evil*. *Pleasure* and *pain*, and their causes *good* and *evil*, are the hinges upon which our passions turn; by reflecting on the various modifications or tempers of mind, and the internal sensations which pleasure and pain, good and evil, produce in us, we may thence form to ourselves the *ideas* of our passions. Thus by reflecting upon the thought we have of the delight which any thing is apt to produce in us, we have an *idea* we call *love:* and on the contrary, the thought of the pain which any thing present or absent produces in us, is what we call *hatred*. *Desire* is that uneasiness which a man finds in himself upon the absence of any thing the present enjoyment of which carries the *idea* of delight with it. *Joy* is a delight of the mind arising from the present or assured approaching possession of a good. *Sorrow* is an uneasiness of the mind, upon the thought of a good lost, or the sense of a present evil. *Hope* is a pleasure in the mind, upon the thought of a probable future enjoyment of a thing which is apt to delight. *Fear* is an uneasiness of the mind, upon the thought of a future evil likely to befal us. *Anger* is a discomposure of the mind, upon the receipt of injury, with a present purpose of revenge. *Despair* is the thought of unattainableness of any good. *Envy* is an uneasiness of the mind, caused by the consideration of a good we desire, obtained by one we think should not have had it before us.

72. It is to be considered, that, in reference to the passions, the removal or lessening of a pain is considered and operates as a pleasure; and the loss or diminishing of a pleasure, as a pain: And farther, that the passions in most persons operate on the body, and cause various changes in it; but these being not always sensible, do not make a necessary part of the *idea* of each passion.

Sect. XVIII. *Of Power.*

73. The mind being every day informed by the senses of the alteration of those simple *ideas* it observes in things without, reflecting also on what passes within itself, and observing a constant change of its *ideas*, sometimes by the impressions of outward objects upon the senses, and sometimes by the determination of its own choice; and concluding, from what it has so constantly observed to have been, that the like changes will for the future be made in the same things, by the same agents, and by the like ways, considers in one thing the possibility of having any of its simple *ideas* changed, and in another the possibility of making that change, and so comes by that *idea* which we call *power*. Thus we say *fire* has a power to *melt gold*, and make it fluid; and *gold* has a power to be *melted*.

Of Power.

74. Power thus considered, is twofold, viz. as able to make, or able to receive any change: the one may be called *active*, the other *passive power*. Of *passive power* all sensible things abundantly furnish us with *ideas*, whose sensible qualities and beings we find to be in a continual flux. Nor have we of *active power* fewer instances; since whatever change is observed, the mind must collect a power somewhere able to make that change. But yet, if we will consider it attentively, bodies by our senses do not afford us so clear and distinct an *idea* of *active* power as we have from reflection on the operation of our minds. For all power relating to action, and there being but two sorts of *action*, viz. *thinking* and *motion*, let us consider whence we have the clearest *ideas* of the powers which produce these actions.

75. Of *thinking* body affords us no *idea* at all: it is only from reflection that we have that; neither have we from body any *idea* of the beginning of motion. A body at rest, affords us no *idea* of any *active* power to move; and when it is set in motion itself, that motion is rather a passion than action in it. The *idea* of the beginning of motion, we have only by reflection on what passes in ourselves; where we find by experience, that barely by willing it, we can move the parts of our bodies which were before at rest.

We find in ourselves a power to begin or forbear, continue or end, several actions of our minds, and motions of our bodies, barely by a thought, or preference of the mind. This power which the mind has thus to order the consideration of any *idea*, or the forbearing to consider it; or to prefer the motion of any part of the body to its rest, and *vice versa*, in any particular instance, is that we call the *will;* the actual exercise of that power is that which we call *volition* or *willing*. The forbearance or performance of that action, consequent to such order or command of the mind, is called *voluntary;* and whatsoever action is performed without such a thought of the mind, is called *involuntary*.

77. The power of perception is that we call the *understanding*. *Perception*, which we make the act of the understanding, is of three sorts: *1st*, The perception of *ideas* in our minds. *2dly*, The perception of the signification of signs. *3dly*, The perception of the agreement or disagreement of any distinct *ideas*. These powers of the mind, viz. of perceiving and preferring, are usually called by another name; and the ordinary way of speaking is, that the understanding and will are two *faculties* of the mind.

78. From the consideration of the extent of the power of the mind over the actions of the man, which every one finds in himself, arise the *ideas* of *liberty* and *necessity:* so far as a man has a power to think or not to think, to move or not to move, according to the preference or direction of his own mind, so far is a man free.

Of Power.

free. Wherever any performance or forbearance are not equally in a man's power; wherever doing, or not doing, will not equally follow upon the preference of his mind; there he is not *free*, though perhaps the action may be *voluntary*. So that the *idea* of *liberty* is the *idea* of a power in any agent to do or forbear any action, according to the determination or thought of the mind whereby either of them is preferred to the other. Where either of them is not in the power of the agent to be produced by him according to his volition, there he is not at liberty; that agent is under *neceſſity*. So that *liberty* cannot be where there is no *thought*, no *volition*, no *will;* but there may be thought, there may be will, there may be volition, where there is no *liberty*. Thus a *tennis-ball*, whether in motion by the ſtroke of a racket, or lying ſtill at reſt, is not by any one taken to be a free agent. So a man ſtriking himſelf or his friend by a convulſive motion of his arm, which it is not in his power by volition or the direction of his mind to ſtop or forbear; nobody thinks he has in this *liberty;* every one pities him, as acting by *neceſſity* and *conſtraint*. Again, ſuppoſe a man be carried while faſt aſleep into a room where is a perſon he longs to ſee, and be there locked faſt in beyond his power to get out; he awakes, and is glad to ſee himſelf in ſo deſirable company: which he ſtays willingly in, that is, prefers his ſtaying to going away. Is not this ſtay voluntary? no body will doubt it; and yet being locked faſt in, he is not at liberty to ſtay, he has not freedom to be gone. So that *liberty* is not an *idea* belonging to volition or preferring, but to the perſon having the power of doing, or forbearing to do, according as the mind ſhall chooſe or direct.

79. As it is in the motions of the body, ſo it is in the thoughts of our minds: where any one is ſuch, that we have power to take it up, or lay it by, according to the preference of the mind, there we are at liberty. A waking man is not at liberty to think, or not to think, no more than he is at liberty whether his body ſhall touch any other or no: but whether he will remove his contemplation from one *idea* to another, is many times in his choice. And then he is, in reſpect of his *ideas*, as much at liberty, as he is in reſpect of bodies he reſts on. He can at pleaſure remove himſelf from one to another: but yet ſome *ideas* to the mind, like ſome motions to the body, are ſuch, as in certain circumſtances it cannot avoid, nor obtain their abſence by the utmoſt effort it can uſe. Thus a man on the rack is not at liberty to lay by the *idea* of *pain*, and entertain other contemplations.

80. Wherever thought is wholly wanting, or the power to act or forbear according to the direction of thought, there neceſſity takes place. This, in an agent capable of volition, when the beginning or continuation of any action is contrary to the preference of his mind, is called *compulſion*; when the hindering or ſtopping any action is contrary to his volition, it is called *reſtraint:* agents that have no thought, no volition at all, are in every thing neceſſary agents.

Sect. XIX. *Of Mixed Modes.*

81. Mixed *modes* are combinations of *ſimple ideas* of different kinds. The mind being once furniſhed with ſimple *ideas*, can put them together in ſeveral compoſitions, without examining whether they exiſt ſo together in nature. And hence it is that theſe ideas are called *notions*, as if they had their original and conſtant exiſtence more in the thoughts of men than in the reality of things: and to form ſuch ideas, it ſufficed that the mind put the parts of them together, and that they were conſiſtent in the underſtanding, without conſidering whether they had any real being. There are three ways whereby we get theſe complex ideas of *mixed modes*.

Mixed Modes.

1ſt, By *experience*, and obſervation of things themſelves: Thus by ſeeing two men wreſtle, we get the *idea* of wreſtling.

2dly, By *invention*, or voluntary putting together of ſeveral ſimple *ideas* in our own minds: So he that firſt invented *printing*, had an *idea* of it firſt in his mind before it ever exiſted.

3dly, By *explaining* the names of actions we never ſaw, or nations we cannot ſee; and by enumerating all thoſe *ideas* which go to the making them up. Thus the mixed mode, which the word *lie* ſtands for, is made up of theſe ſimple *ideas:* 1ſt, *Articulate ſounds*. 2dly, *Certain* ideas *in the mind of the ſpeaker*. 3dly, *Thoſe words, the ſigns of theſe ideas*. 4thly, *Thoſe ſigns put together*, by affirmation or negation, otherwiſe than the *ideas* they ſtand for are in the mind of the ſpeaker. Since languages are made, *complex ideas* are uſually got by the explication of thoſe terms that ſtand for them: for ſince they conſiſt of ſimple *ideas* combined, they may, by words ſtanding for thoſe ſimple *ideas*, be repreſented to the mind of one who underſtands thoſe words, though that combination of ſimple *ideas* was never offered to his mind by the real exiſtence of things.

82. Mixed modes have their *unity* from an act of the mind, combining thoſe ſeveral ſimple *ideas* together, and conſidering them as one complex one: the mark of this union is one *name* given to that combination. Men ſeldom reckon any number of *ideas* to make one complex one: but ſuch collections as there be names for. Thus the *killing of an old man*, is as fit to be united into one *complex idea* as that of *a father:* yet there being no name for it, it is not taken for a particular complex *idea*, nor a diſtinct ſpecies of action from that of killing any other man.

83. Thoſe collections of *ideas* have names generally affixed which are of frequent uſe in converſation: in which caſes, men endeavour to communicate their thoughts to one another with all poſſible diſpatch. Thoſe others, which they have ſeldom occaſion to mention, they tie not together nor give them names.

84. This gives the reaſon why there are words in every language which cannot be rendered by any one ſingle word of another. For the faſhions and cuſtoms of one nation make ſeveral combinations of *ideas* familiar in one which another had never any occaſion to make. Such were *οστρακισμος* among the the Greeks, *proſcriptio* among the Romans. This alſo occaſions the *conſtant change* of languages; becauſe the change of cuſtom and opinions brings with it new combinations of *ideas*, which, to avoid long deſcriptions, have new names annexed to them, and ſo they become *new ſpecies* of *mixed* modes.

85. Of all our ſimple *ideas*, thoſe that have had moſt *mixed modes* made out of them, are, *thinking* and *motion*, which comprehend in them all action; and

power, from whence theſe actions are conceived to flow. For actions being the great buſineſs of mankind, it is no wonder if the ſeveral modes of thinking and motion ſhould be taken notice of, the *ideas* of them obſerved and laid up in memory, and have names aſſigned them. For without ſuch *complex ideas* with names to them, men could not eaſily hold any communication about them. Of this kind are the modes of actions diſtinguiſhed by their *cauſes*, *means*, *objects*, *ends*, *inſtruments*, *time*, *place*, and other circumſtances: as alſo of the powers fitted for thoſe actions. Thus *boldneſs* is the power to do or ſpeak what we intend, without fear or diſorder: which power of doing any thing, when it has been acquired by the frequent doing the ſame thing, is that *idea* we call *habit*; when forward, and ready upon every occaſion, to break into action, we call it *diſpoſition:* thus *teſtineſs* is a diſpoſition or aptneſs to be angry.

86. *Power* being the ſource of all action, the ſubſtances wherein theſe powers are, when they exert this power, are called *cauſes*; and the ſubſtances thereupon produced, or the ſimple *ideas* introduced into any ſubject, *effects*. The efficacy whereby the new ſubſtance or *idea* is produced, is called, in the ſubject exerting that power, *action*; in the ſubject, wherein any ſimple *idea* is changed or produced, *paſſion:* Which efficacy, in *intellectual agents*, we can conceive to be nothing elſe but modes of thinking and willing; in *corporeal agents*, nothing elſe but modifications of motion.

Sect. XX. *Of our Complex Ideas of Subſtances.*

87. The mind obſerving ſeveral ſimple *ideas* to go conſtantly together, which being preſumed to belong to one thing, are called, ſo united in one ſubject, by one name, which we are apt afterward to talk of and conſider as one ſimple *idea*, which indeed is a complication of many *ideas* together. We imagine not theſe ſimple *ideas* to ſubſiſt by themſelves: but ſuppoſe ſome *ſubſtratum* wherein they ſubſiſt, which we call *ſubſtance*. The *idea* of pure ſubſtance is nothing but the ſuppoſed (but unknown) ſupport of thoſe qualities which are capable of producing ſimple *ideas* in us.

88. The *ideas* of *particular circumſtances* are compoſed out of this obſcure and general *idea* of ſubſtance, together with ſuch combinations of ſimple *ideas* as are obſerved to exiſt together, and ſuppoſed to flow from the internal conſtitution and unknown eſſence of that ſubſtance. Thus we come by the *ideas* of *man*, *horſe*, *gold*, &c. Thus the ſenſible qualities of *iron*, or a *diamond*, make the complex *ideas* of thoſe ſubſtances which a ſmith or a jeweller commonly knows better than a philoſopher.

89. The ſame happens concerning the operations of the mind, viz. *thinking*, *reaſoning*, &c. which we concluding not to ſubſiſt by themſelves, nor apprehending how they can belong to body, or be produced by it, we think them the action of ſome other ſubſtance, which we call *ſpirit:* of whoſe ſubſtance or nature we have as clear a notion as of that of body; the one being but the ſuppoſed *ſubſtratum* of the ſimple *ideas* we have from without, as the other of thoſe operations which we experiment in ourſelves within: So that the *idea* of *corporeal ſubſtance* in matter, is as remote from our conceptions as that of *ſpiritual ſubſtance*.

90. Hence we may conclude, that he has the perfecteſt *idea* of any particular ſubſtance who has collected moſt of thoſe ſimple *ideas* which do exiſt in it; among which we are to reckon its *active powers* and *paſſive capacities*, though not ſtrictly *ſimple ideas*.

91. *Secondary qualities*, for the moſt part, ſerve to diſtinguiſh ſubſtance. For our ſenſes fail us in the diſcovery of the *bulk*, *figure*, *texture*, &c. of the minute parts of the bodies, on which their real conſtitutions and differences depend; and ſecondary are nothing but powers, with relation to our ſenſe. The *ideas* that make our complex ones of corporeal ſubſtances are of three ſorts: Firſt, The *ideas* of primary qualities of things, which are diſcovered by our ſenſes; ſuch are *bulk*, *figure*, *motion*, &c. Secondly, The ſenſible ſecondary qualities; which are nothing but powers to produce ſeveral *ideas* in us by our ſenſes. Thirdly, The aptneſs we conſider in any ſubſtance to cauſe or receive ſuch alterations of primary qualities, as that the ſubſtance ſo altered ſhould produce in us different *ideas* from what it did before; and they are called *active* and *paſſive powers*. All which, as we have any notice or notion of them, terminate in *ſimple ideas*.

92. Had we ſenſes acute enough to diſcern the minute particles of bodies, it is not to be doubted but they would produce quite different *ideas* in us; as we find in viewing things with *microſcopes*. Such bodies as to our naked eyes are coloured and opaque, will through *microſcopes* appear pellucid. *Blood* to the naked eye appears all red; but by a good *microſcope* we ſee only ſome red globules ſwimming in a tranſparent liquor.

93. Beſides theſe complex *ideas* we have of material ſubſtances; by the ſimple *ideas* taken from the operations of our own minds, which we experiment in ourſelves, as *thinking*, *underſtanding*, *willing*, *knowing*, &c. co-exiſting in the ſame ſubſtance, we are able to frame the complex *idea* of a *ſpirit*. And this *idea* of an *immaterial ſubſtance*, is as clear as that we have of a *material*. By joining theſe with ſubſtance, of which we have no diſtinct *idea*, we have the *idea* of a *ſpirit:* And by putting together the ideas of coherent ſolid parts, and power of being moved, joined with ſubſtance, of which likewiſe we have no poſitive *idea*, we have the *idea* of *matter*. The one is as clear and diſtinct as the other. The ſubſtance of *ſpirit* is unknown to us; and ſo is the ſubſtance of *body* equally unknown to us. Two primary qualities or properties of body, viz. *ſolid coherent parts*, and *impulſe*, we have diſtinct clear *ideas* of: So likewiſe have we of two primary qualities or properties of ſpirit, viz. *thinking*, and a *power of action*. We have alſo clear and diſtinct *ideas* of ſeveral qualities inherent in bodies, which are but the various modifications of the extenſion of cohering ſolid parts and their motion. We have likewiſe the *ideas* of the ſeveral modes of thinking, viz. Believing, doubting, hoping, fearing, &c. as alſo of willing and moving the body conſequent to it.

Sect. XXI. *Of Relation.*

94. There is another ſet of *ideas* which the mind gets

Of Cause and Effect. gets from the *comparing of one thing with another*. When the mind so considers one thing, that it does as it were bring it to and set it by another, and carry its view from one to the other, this is *relation* or *respect*; and the denominations given to things intimating that respect, are what we call *relatives*, and the things so brought together *related*. Thus when I call CAJUS, *husband*, or *whiter*, I intimate some other person, or thing, in both cases, with which I compare him. Any of our *ideas* may be the foundation of relation.

95. Where languages have failed to give correlative names, there the relation is not so easily taken notice of: As in *concubine*, which is a relative name as well as *wife*.

96. The *ideas* of relation may be the same in those men who have far different *ideas* of the things that are related. Thus those who have different *ideas* of *man*, may agree in that of *father*.

97. There is no *idea* of any kind which is not capable of an almost infinite number of considerations, in reference to other things; and therefore this makes no small part of mens words and thoughts. Thus one single man may at once sustain the relations of *father*, *brother*, *son*, *husband*, *friend*, *subject*, *general*, *European*, *Englishman*, *islander*, *master*, *servant*, *bigger*, *less*, &c. to an almost infinite number; he being capable of as many relations as there may be occasions of comparing him to other things in any manner of agreement, disagreement, or respect whatsoever.

SECT. XXII. *Of Cause and Effect, and other Relations.*

98. THE *ideas* of *cause* and *effect* we get from our observation of the *vicissitude of things*, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other things: That which *produces*, is the *cause*; that which is *produced*, the *effect*. Thus *fluidity* in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

99. We distinguish the originals of things into two sorts.

100. First, When the thing is wholly made new, so that no part thereof did ever exist before, as when a new particle of matter doth begin to exist which had before no being, it is called *creation*.

101. Secondly, When a thing is made up of particles which did all of them before exist, but the thing so constituted of pre-existing particles, which all together make up such a collection of simple *ideas*, had not any existence before; as this *man*, this *egg*, this *rose*, &c.: this, when referred to a substance produced in the ordinary course of nature by an internal principle, but set on work by some external agent, and working by insensible ways which we perceive not, is called *generation*: When the cause is extrinsical, and the effect produced by a sensible separation, or juxtaposition of discernible parts, we call it *making*: and such are all artificial things. When any simple *idea* is produced, which was not in that subject before, we call it *alteration*.

102. The denomination of things taken from *time* are for the most part only relations. Thus when it is said that queen *Elizabeth* lived sixty-nine, and reigned forty-five years, no more is meant, than that the duration of her existence was equal to sixty-nine, and of her government to forty-five annual revolutions of the sun.

Identity and Diversity.

103. *Young* and *old*, and other words of time, that are thought to stand for positive ideas, are indeed relative; and intimate a relation to a certain length of duration, whereof we have the idea in our minds. Thus we call a man *young* or *old*, that has lived little or much of that time that men usually attain to. This is evident from our application of these names to other things; for a man is called *young* at twenty, but a horse *old*, &c. The sun and stars we call not *old* at all, because we know not what period God has set to that sort of beings.

104. There are other ideas that are truly *relative*, which we signify by names that are thought *positive* and *absolute*; such as *great* and *little*, *strong* and *weak*. The things thus denominated, are referred to some standards, with which we compare them. Thus we call an apple *great*, that is bigger than the ordinary sort of those we have been used to; and a man *weak*, that has not so much strength or power to move as men usually have.

SECT. XXIII. *Of Identity and Diversity.*

105. ANOTHER occasion the mind takes of comparing is, the very *being of things*. When considering a thing as existing at any certain time or place, and comparing it with itself as existing at any other time, &c. it forms the ideas of *identity* and *diversity*. When we see any thing in any certain time and place, we are sure it is that very thing, and can be no other, how like soever it may be in all other respects.

106. We conceiving it to be impossible that two things of the same kind should exist together in the same place, we conclude, that whatever exists any where at the same time, excludes all of the same kind, and is there itself alone. When therefore we demand whether any thing be the *same*, or no, it refers always to something that existed such a time, in such a place, which it was certain at that instant was the same with itself, and no other.

107. We have ideas of three sorts of substances: 1. Of *God*. 2. *Finite intelligences*. 3. *Bodies*.

First, God being eternal, unalterable, and everywhere, concerning his *identity* there can be no doubt.

Secondly, Finite spirits having had their determinate time and place of beginning to exist, the relation to that time and place will always determine to each its *identity* as long as it exists.

Thirdly, The same will hold of every particle of matter to which no addition or subtraction is made. These three exclude not one another out of the same place, yet each exclude those of the same kind out of the same place.

108. The identity and diversity of *modes* and *relations* are determined after the same manner that substances are; only the actions of finite beings, as *motion* and *thought*, consisting in succession, they cannot exist in different times and places as permanent beings: for no motion or thought, considered as at different times,

Identity and Diversity.

times, can be the ſame, each part thereof having a different beginning of exiſtence.

109. From whence it is plain, that exiſtence itſelf is the *principium individuationis*, which determinates a being to a particular time and place incommunicable to two beings of the ſame kind. Thus, ſuppoſe an *atom* exiſting in a determined time and place; it is evident that, conſidered in any inſtant, it is the ſame with itſelf, and will be ſo as long as its exiſtence continues. The ſame may be ſaid of two, or more, or any number of particles, whilſt they continue together. The maſs will be the ſame, however jumbled: but if one atom be taken away, it is not the ſame maſs.

110. In *vegetables*, the identity depends not on the ſame maſs, and is not applied to the ſame thing. The reaſon of this is, the difference between an animate body and maſs of matter; *this* being only the coheſion of particles any-how united: *the other*, ſuch a diſpoſition, an organization of parts, as is fit to receive and diſtribute nouriſhment, ſo as to continue and frame the wood, bark, leaves, &c. (of an *oak*, for inſtance) in which conſiſts the vegetable life. That therefore which has ſuch an organization of parts partaking of one common life, continues to be the ſame *plant*, though that life be communicated to new particles of matter, vitally united to the living plant. The caſe is not ſo much different in *brutes*, but that any one may hence ſee what makes an *animal*, and continues it the *ſame*.

111. The identity of the *ſame man* likewiſe conſiſts in a participation of the ſame continued life in ſucceeding particles of matter vitally united to the ſame organized body.

112. To underſtand *identity* aright, we muſt conſider what *idea* the word it is applied to ſtands for; it being one thing to be the *ſame ſubſtance*, another the *ſame man*, and a third the *ſame perſon*.

113. An *animal* is a living organized body; and the ſame animal is the ſame continued life communicated to different particles of matter, as they happen ſucceſſively to be united to that organized living body; and our notion of *man* is but of a particular ſort of animal.

114. *Perſon* ſtands for an intelligent being, that reaſons and reflects, and can conſider itſelf the ſame thing in different times and places; which it doth by that *conſciouſneſs* that is inſeparable from thinking. By this every one is to himſelf what he calls *ſelf*, without conſidering whether that *ſelf* be continued in the ſame or divers ſubſtances. In this conſiſts *perſonal identity*, or the ſameneſs of a rational being; and ſo far as this conſciouſneſs extends backward to any paſt action or thought, ſo far reaches the identity of that perſon. It is the ſame *ſelf* now it was then: and it is by the ſame *ſelf*, with this preſent one that now reflects on it, that that action was done.

115. *Self* is that conſcious thinking thing, whatever ſubſtance it matters not, which is conſcious of pleaſure or pain, capable of happineſs or miſery; and ſo is concerned for itſelf as far as that conſciouſneſs extends. That with which the conſciouſneſs of this preſent thinking thing can join itſelf, makes the ſame perſon, and is one ſelf with it; and ſo attributes to itſelf and owns all the actions of that thing as its own, as far as that conſciouſneſs reaches.

Various Relations.

116. This *perſonal identity* is the object of reward and puniſhment, being that by which every one is concerned for himſelf. If the *conſciouſneſs* went along with the little finger, when that was cut off, it would be the ſame ſelf that was juſt before concerned for the whole body.

117. If the ſame *Socrates*, waking and ſleeping, did not partake of the ſame conſciouſneſs, they would not be the ſame *perſon*. *Socrates* waking, could not be in juſtice accountable for what *Socrates* ſleeping did, no more than one *twin* for what his brother *twin* did becauſe their outſides were ſo like that they could not be diſtinguiſhed.

118. But ſuppoſe I wholly loſe the memory of ſome parts of life, beyond a poſſibility of retrieving them, ſo that I ſhall never be conſcious of them again: am I not the *ſame perſon* that did thoſe actions, though I have now forgot them? I anſwer, that we muſt here take notice what the word *I* is applied to, which in this caſe is the man only: and the ſame man being preſumed to be the ſame perſon, *I* is eaſily here ſuppoſed to ſtand alſo for the ſame perſon. But if it be poſſible for the ſame man to have diſtinct incommunicable conſciouſneſs at different times, it is paſt doubt the ſame man would, at different times, make different perſons. Which we ſee is the ſenſe of mankind in the ſolemneſt declaration of their opinions, human laws not puniſhing the mad man for the ſober man's actions, nor the ſober man for what the mad man did; thereby making them two perſons. Thus we ſay in *Engliſh*, ſuch a one *is not himſelf*, or is *beſides himſelf*; in which phraſe, it is inſinuated, that *ſelf* is changed, and the *ſelf-ſame perſon* is no longer in that man.

119. But is not a man drunk or ſober the ſame perſon? Why elſe is he puniſhed for the ſame fact he commits when drunk, tho' he be never afterwards conſcious of it? Juſt as much the ſame perſon as a man that walks and does other things in his ſleep is the ſame perſon, and is anſwerable for any miſchief he ſhall do in it. Human laws puniſh both with a juſtice ſuitable to their way of knowledge: becauſe in theſe caſes they cannot diſtinguiſh certainly what is real and what is counterfeit. And ſo the ignorance in drunkenneſs or ſleep, is not admitted as a plea: for tho' puniſhment be annexed to perſonality, and perſonality to conſciouſneſs; and the drunkard, perhaps, is not conſcious of what he did; yet human judicatures juſtly puniſh him, becauſe the fact is proved againſt him, but want of conſciouſneſs cannot be proved for him.

120. To conclude: whatever ſubſtance begins to exiſt, it muſt during its exiſtence be the ſame. Whatever compoſitions of ſubſtances begin to exiſt, during the union of thoſe ſubſtances, the concrete muſt be the ſame. Whatſoever mode begins to exiſt, during its exiſtence it is the ſame. And ſo if the compoſition be of diſtinct ſubſtances, and different modes, the ſame rule holds.

SECT. XXIV. *Of other Relations.*

121. ALL ſimple *ideas*, wherein are parts or degrees, afford an occaſion of comparing the ſubjects wherein they are to one another, in reſpect of thoſe ſimple *ideas*: As *whiter*, *ſweeter*, *more*, *leſs*, &c.

Various Relations.

These depending on the equality and excess of the same simple *ideas*, in several subjects, may be called *proportional relations*.

122. Another occasion of comparing things is taken from the circumstances of their origin; as *father*, *son*, *brother*, &c. These may be called *natural relations*.

123. Sometimes the foundation of considering things, is some act whereby any one comes by a moral right, power, or obligation to do something: Such are *general*, *captain*, *burgher*. These are *instituted* and *voluntary relations*; and may be distinguished from the *natural*, in that they are alterable and separable from the persons to whom they sometimes belonged, tho' neither of the substances so related be destroyed. But natural relations are not alterable, but are as lasting as their subjects.

124. Another relation is the conformity or disagreement of mens voluntary actions to a rule to which they are referred, and by which they are judged of: these may be called *moral relations*. It is this conformity or disagreement of our actions to some law (whereby good or evil is drawn on us from the will and power of the law-maker, and is what we call *reward* or *punishment*) that renders our actions morally good or evil.

125. Of these moral *rules* or *laws* there seem to be three sorts, with their different enforcements: first, The *divine law*; secondly, *Civil law*; thirdly, *The law of opinion* or *reputation*. By their relation to the first, our actions are either *sins* or *duties*; to the second, *criminal* or *innocent*; to the third, *virtues* or *vices*.

126. *First*, The *divine law* is that law which God has set to the actions of men, whether promulgated to them by the light of nature or the voice of revelation.

127. That God has given a law to mankind, seems undeniable, since he has, first, A right to do it; we are his creatures. Secondly, Goodness and wisdom, to direct our actions to what is best. Thirdly, Power to enforce it by reward and punishment, of infinite weight and duration. This is the only true touchstone of moral rectitude, and by which men judge of the most considerable moral good or evil of their actions; that is, whether, as duties or sins, they are like to procure to them happiness or misery from the hands of the Almighty.

128. *Secondly*, The *civil law* is the rule set by the commonwealth to the actions of those that belong to it. This law nobody overlooks; the rewards and punishments being ready at hand to enforce it, extending to the protecting or taking away of the life, liberty, and estate, of those who observe or disobey it.

129. *Thirdly*, The law of *opinion* or *reputation*. *Virtue* and *vice* are names supposed every where to stand for actions in their own nature right and wrong. As far as they are really so applied, they so far are coincident with the divine law. But it is visible that these names, in the particular instances of their application, through the several nations and societies of men, are constantly attributed only to such actions as in each country and society are in reputation or discredit. So that the measure of what is every where called and esteemed virtue and vice, is the approbation or dislike, praise or blame, which by a tacit consent establishes itself in the societies and tribes of men in the world; whereby several actions come to find credit or disgrace amongst them, according to the judgment, maxims, or fashions of the place.

130. That this is so, appears hence: That tho' that passes for virtue in one place which is elsewhere accounted vice, yet every where *virtue* and *praise*, *vice* and *blame*, go together. *Virtue* is every where that which is thought praise-worthy; and nothing else but that which has the allowance of public esteem, is called *virtue*. These have so close an alliance, that they are often called by the same name.

131. It is true, virtue and vice do, in a great measure, every where correspond with the unchangeable rule of right and wrong, which the laws of God have established; because the observation of these laws visibly secures and advances the general good of mankind, and the neglect of them breeds mischief and confusion: and therefore men, without renouncing all sense and reason, and their own interest, could not generally mistake in placing their commendation and blame on that side that deserved it not.

132. They who think commendation and disgrace not sufficient motives to engage men to accommodate themselves to the opinions and rules of those with whom they converse, seem little skilled in the history of mankind; the greatest part whereof govern themselves by this *law of fashion*.

133. The penalties that attend the breach of God's laws are seldom seriously reflected on; and those that do reflect on them entertain thoughts of future reconciliation; and for the punishment due from the laws of the commonwealth, men flatter themselves with the hopes of impunity: but no man escapes censure and dislike, who offends against fashion; nor is there one of ten thousand stiff and insensible enough to bear up under the constant dislike and condemnation of his own club.

134. *Morality* then is nothing but a relation to these laws or rules: and these rules being nothing else but a collection of several simple *ideas*, the conformity thereto is but so ordering the action that the simple *ideas* belonging to it may correspond to those which the law requires. By which we see, how moral beings and notions are founded on and terminated in the simple *ideas* of sensation and reflection. For example; let us consider the complex *idea* signified by the word *murder*. First, from reflection, we have the *ideas* of *willing*, *considering*, *purposing*, *malice*, &c. also of *life*, *perception*, and *self-motion*. Secondly, from sensation, we have the *ideas* of *man*, and of some action whereby we put an end to that perception and motion in the man: all which simple *ideas* are comprehended in the word *murder*.

135. This collection of simple *ideas* being found to agree or disagree with the esteem of the country I have been bred in, and to be held worthy of praise or blame, I call the action *virtuous* or *vicious*. If I have the will of a supreme invisible Law-maker for my rule; then as I suppose the action commanded or forbidden by *God*, I call it *good* or *evil*, *sin* or *duty*: if I compare it with the civil law of my country, I call it *lawful* or *unlawful*, a crime or no crime.

136. Moral actions may be considered two ways;

First,

Real and Fantastical Ideas.

First, As they are in themselves a collection of simple *ideas*; in which sense they are positive absolute *ideas*.

Secondly, As *good*, or *bad*, or *indifferent*: in this respect they are *relative*, it being their conformity or disagreement with some rule that makes them so. We ought carefully to distinguish between the positive *idea* of the action, and the reference it has to a rule; both which are commonly comprehended under one name, which often occasions confusion, and misleads the judgment.

137. Thus the taking from another what is his, without his consent, is properly called *stealing*: but that name being commonly understood to signify also the moral pravity of the action, men are apt to condemn whatever they hear called *stealing* as an ill action disagreeing with the rule of right. And yet the private taking away his sword from a madman, to prevent his doing mischief, though it be properly denominated *stealing*, as the name of such a mixed mode; yet, when compared to the law of God, it is no sin or transgression, tho' the name *stealing* ordinarily carries such an intimation with it.

Sect. XXV. *Of Real and Fantastical Ideas.*

138. Our *ideas*, in reference to things from whence they are taken, or which they may be supposed to represent, come under a *threefold* distinction; and are, first, either *real* or *fantastical*; secondly, *adequate* or *inadequate*; thirdly, *true* or *false*.

139. *Real ideas*, are such as have a foundation in nature, such as have a conformity with the real being and existence of things, or with their archetypes.

140. *Fantastical* are such as have no foundation in nature, nor any conformity with that reality of being to which they are referred as to their *archetypes*. By examining the several sorts of *ideas* we shall find, that, first, our *simple ideas* are all real; not that they are images or representations of what does exist, but as they are the certain effects of powers in things without us, ordained by our Maker to produce in us such sensations: they are real *ideas* in us, whereby we distinguish the qualities that are really in things themselves.

141. Their reality lies in the steady correspondence they have with the distinct constitutions of real beings. But whether they answer to those constitutions as to *causes* or *patterns*, it matters not; it suffices that they are constantly produced by them.

142. *Complex ideas*, being arbitrary combinations of *simple ideas* put together, and united under one general name, in forming of which the mind uses its liberty, we must inquire which of these are real, and which imaginary combinations.

143. First, Mixed modes and relations having no other reality than what they have in the minds of men, nothing else is required to make them real, but a possibility of existing conformable to them. These *ideas* being themselves *archetypes*, cannot differ from their *archetypes*, and so cannot be chimerical; unless any one will jumble together in them inconsistent *ideas*. Those indeed that have names assigned them in any language, must have a conformity to the ordinary signification of the name that is given them, that they may not be thought fantastical.

144. Secondly, Our complex *ideas* of substances being made, in reference to things existing without us, whose representations they are thought, are no farther real than as they are such combinations of *simple ideas* as are really united, and co-exist in things without us: those are fantastical which are made up of several *ideas* that never were found united, as *Centaur*, &c.

Of Ideas adequate or inadequate.

Sect. XXVI. *Of Ideas Adequate or Inadequate.*

145. Real *ideas* are either *adequate* or *inadequate*. First, *adequate*; which perfectly represents those archetypes which the mind supposes them taken from, and which it makes them to stand for. Secondly, *Inadequate*; which are such as do but partially or incompletely represent those archetypes to which they are referred. Whence it appears,

146. First, That all our *simple ideas* are *adequate*; for they being but the effects of certain powers in things fitted and ordained by God to produce such sensations in us, they cannot but be correspondent and adequate to such powers, and we are sure they agree to the reality of things.

147. Secondly, Our *complex ideas of modes* being voluntary collections of *simple ideas*, which the mind puts together without reference to any real archetypes, cannot but be *adequate ideas*. They are referred to no other pattern, nor made by any original, but the good-liking and will of him that makes the combination. If indeed one would conform his *ideas* to those which are formed by another person, they may be wrong or *inadequate*, because they agree not to that which the mind designs to be their archetype and pattern; in which respect only any *ideas* of modes can be wrong, imperfect, or inadequate.

148. Thirdly, Our *ideas of substances* have in the mind a double reference: First, They are sometimes referred to a supposed real essence, of each species of things; secondly, They are designed for representations in the mind, of things that do exist, by *ideas* discoverable in them: in both which respects they are *inadequate*.

149. First, If the names of substances stand for things, as supposed to have certain real essences, whereby they are of this or that species, of which real essences men are wholly ignorant; it follows, that the *ideas* they have in their minds, being referred to real essences as *archetypes* which are unknown, they must be so far from being adequate, that they cannot be supposed to be any representation of them at all. Our complex *ideas* of substances are nothing but certain collections of simple *ideas* that have been observed or supposed constantly to exist together. But such a complex *idea* cannot be the real essence of any substance: for then the properties we discover in it would be deducible from it, and their necessary connection with it be known; as all the properties of a *triangle* depend on and are deducible from the complex *idea* of *three lines including a space*: but it is certain, that in our complex *ideas* of substances are not contained such *ideas* on which all other qualities that are to be found in them depend.

150. Secondly, Those that take their *ideas* of substances from their sensible qualities, cannot form adequate *ideas* of them: because their qualities and powers

True and False Ideas.

powers are so various, that no man's complex *idea* can contain them all. Most of our simple *ideas*, whereof our complex ones of substances do consist, are powers, which being relations to other substances, we cannot be sure we know all the powers, till we have tried what changes they are fitted to give and receive from other substances in their several ways of application; which being not possible to be tried upon one body, much less upon all, it is impossible we should have adequate *ideas* of any substance made of a collection of all its properties.

Sect. XXVII. *Of True and False Ideas.*

151. Truth and *falsehood*, in propriety of speech, belong only to propositions; and when *ideas* are termed *true* or *false*, there is some secret or tacit proposition which is the foundation of that denomination. Our *ideas* being nothing but *appearances* or *perceptions* in the mind, can, in strictness of speech, no more be said to be true or false than single names of things can be said to be true or false. The *idea* of *Centaur* has no more falsehood in it when it appears in our minds, than the name *Centaur* when it is pronounced or writ on paper. For truth or falsehood lying always in some affirmation or negation, our *ideas* are not capable, any of them, of being false, till the mind passes some judgement on them, that is, affirms or denies something of them. In a *metaphysical* sense they may be said to be true, that is, to be really such as they exist; tho' in things called *true*, even in that sense, there is perhaps a secret reference to our *ideas*, looked upon as the standards of that truth; which amounts to a *mental proposition.*

152. When the mind refers any of its *ideas* to any thing extraneous to it, they are then capable of being true or false: because in such a reference, the mind makes a tacit supposition of their conformity to that thing; which supposition, as it is true or false, so the *ideas* themselves come to be denominated. This happens in these cases:

1st, When the mind supposes its *idea* conformable to that in other mens minds called by the same name, such as that of *justice*, *virtue*, &c.

2dly, When the mind supposes any *idea* conformable to some real existence. Thus, that of *Man* is true, that of *Centaur* false; the one having a conformity to what has really existed, the other not.

3dly, When the mind refers any of its *ideas* to that real constitution and essence of any thing whereon all its properties depend: and thus the greatest part, if not all our *ideas of substances* are false.

153. As to the first, when we judge of our *ideas* by their conformity to those of other men, they may be any of them false: but simple *ideas* are least liable to be so mistaken. We seldom mistake green for blue, or bitter for sweet; much less do we confound the names belonging to different senses, and call a *colour* by the name of a *taste*. Complex *ideas* are much more liable to falsehood in this particular; and those of mixed modes more than substances: because, in substances, their sensible qualities serve, for the most part, to distinguish them clearly; but in mixed modes we are more uncertain, and we may call that *justice* which ought to be called by another name. The reason of this is, that the abstract *ideas* of mixed modes being mens voluntary combination of such a precise collection of simple *ideas*, we have nothing else to refer our *ideas* of mixed modes or standards to, but the *ideas* of those who are thought to use names in their proper significations; and so as our *ideas* conform or differ from them, they pass for true or false.

154. As to the *second*, When we refer our *ideas* to the real existence of things, none can be termed *false* but our complex *ideas* of substances: for our simple *ideas* being nothing but perceptions in us answerable to certain powers in external objects, their truth consists in nothing but such appearances as are produced in us suitable to those powers: neither do they become liable to the imputation of falsehood, whether we judge these *ideas* to be in the things themselves, or no: for God having set them as marks of distinguishing things, that we may be able to discern one thing from another, and thereby choose them as we have occasion, it alters not the nature of our simple *ideas*, whether we think the *idea* of *blue* (for instance) to be in the violet itself, or in the mind only: and it is equally from that appearance to be denominated *blue*, whether it be that real colour, or only a peculiar texture in it, that causes in us that *idea*; since the name *blue* notes properly nothing but that mark of distinction that is in a violet, discernible only by our eyes, whatever it consists in.

155. Neither would our simple *ideas* be *false*, if by the different structure of our organs it were so ordered that the same object should produce in several mens minds different *ideas*: for this could never be known, since objects would operate constantly after the same manner. It is most probable, nevertheless, that the *ideas* produced by the same objects in different mens minds are very near and undiscernibly like. Names of simple *ideas* may be misapplied; as a man, ignorant in the *English* tongue, may call *purple*, *scarlet*: but this makes no falsehood in the *idea*.

156. Complex *ideas* of modes cannot be false, in reference to the essence of any thing really existing; because they have no reference to any pattern existing, or made by nature.

157. Our complex *ideas* of substances, being all referred to patterns in things themselves, may be false. They are so, *1st*, When looked upon as representations of the unknown essences of things: *2dly*, When they put together simple *ideas* which in the real existence of things have no union; as in *Centaur*. *3dly*, When from any collection of simple *ideas*, that do not always exist together, there is separated, by a direct negation, any one simple *idea* which is constantly joined with them. Thus, if from extension, solidity, fixedness, malleableness, fusibility, &c. we remove the colour observed in *gold*: if this *idea* be only left out of the complex one of *gold*, it is to be looked on as an inadequate and imperfect, rather than a false one; since though it contains not all the simple *ideas* that are united in nature, yet it puts none together but what do really exist together.

158. Upon the whole, our *ideas*, as they are considered by the mind, either in reference to the proper signification of their names, or in reference to the reality of things, may more properly be called *right* or *wrong ideas*, according as they agree or disagree to those patterns to which they are referred. The *ideas* that are in mens minds, simply considered, cannot be wrong

Association of Ideas.

wrong, unless *complex ideas*, wherein inconsistent parts are jumbled together. All other *ideas* are in themselves right, and the knowledge about them right and true knowledge. But when we come to refer them to any patterns, or archetypes, then they are capable of being wrong, as far as they disagree with such archetypes.

Sect. XXVIII. *Of the Association of Ideas.*

159. Some of our *ideas* have a natural correspondence and connection one with another: it is the office and excellency of our reason to trace these, and hold them together in that union and correspondence which is founded in their peculiar beings. Besides this, there is another connection of *ideas* wholly owing to chance or custom: *ideas* that in themselves are not at all of kin, come to be so united in some mens minds, that it is very hard to separate them; they always keep company, and the one no sooner comes into the understanding, but its associate appears with it; and if they are more than two, the whole gang always inseparably shew themselves together. This strong combination of *ideas*, not allied by nature, the mind makes in itself either voluntarily or by chance: and hence it comes in different men to be very different, according to their different *inclinations*, *educations*, *interests*, &c. Custom settles habits of thinking in the understanding, as well as of determining in the will, and of motions in the body; all which seem to be but trains of motion in the animal-spirits, which, once set a-going, continue on in the same steps they have been used to; which by often treading are worn into a smooth path, and the motion in it becomes easy, and, as it were, natural. As far as we can comprehend thinking, thus *ideas* seem to be produced in our minds; or if they are not, this may serve to explain their following one another in an habitual train, when once they are put into that tract, as well as it does to explain such motions of the body.

160. This connection in our minds of *ideas*, in themselves loose and independent one of another, is of so great force to set us awry in our actions, as well moral as natural, passions, reasonings, and notions themselves, that perhaps there is not any one thing that deserves more to be looked after. Thus the *ideas* of *goblins* and *sprights* have really no more to do with darkness than light; yet let but a foolish maid inculcate these often on the mind of a child, and raise them there together, possibly he shall never be able to separate them again so long as he lives, but darkness shall ever afterwards bring with it those frightful *ideas*. A man has suffered pain or sickness in any place; he saw his friend die in such a room; though these have in nature nothing to do one with another, yet when the *idea* of the *place* occurs to his mind, it brings that of the pain and displeasure with it; he confounds him in his mind, and can as little bear the one as the other.

161. *Intellectual habits* and defects this way contracted, are not less frequent and powerful, though less observed. Let the *ideas* of *being* and *matter* be strongly joined either by education or much thought, whilst these are still combined in the mind, what notions, what reasonings will there be about separate spirits? Let custom from the very childhood have joined figure and shape to the *idea* of God, and what absurdities will that mind be liable to about the Deity? Let the *idea* of *infalliblity* be joined to any person, and these two constantly together possess the mind; and then one body in two places at once shall be swallowed for a certain truth, whenever that imagined infallible person dictates, and demands assent without inquiry.

162. Some such wrong combinations of *ideas* will be found to establish the irreconcileable opposition between different sects of philosophy and religion: for we cannot imagine every one of their followers to impose wilfully on himself, and knowingly refuse truth offered by plain reason. Interest, though it does a great deal in the case, yet cannot be thought to work whole societies of men to so universal a perverseness, as that every one of them should knowingly maintain falsehood; some at least must be allowed to do what all pretend to, i. e. to pursue truth sincerely. That therefore which captivates their reasons, and leads men of sincerity blindfold from common sense, will, when examined, be found to be what we are speaking of: some independent *ideas* are by education, custom, and the constant din of their party, so coupled in their minds, that they always appear there together; and they can no more separate them in their thoughts, than if they were but one *idea*; and they operate as if they were so. This gives sense to jargon, demonstration to absurdities, and consistency to nonsense, and is the foundation of the greatest errors in the world. The confusion of two different *ideas*, which a customary connection of them in their minds hath to them in effect made but one, cannot but fill mens heads with false views, and their reasonings with false consequences.

Knowledge in general.

Sect. XXIX. *Of Knowledge in general.*

163. Since the mind, in all its thoughts and reasonings, has no other immediate object but its own *ideas*, which alone it does or can contemplate, it is evident that our knowledge is only conversant about them. *Knowledge* then seems to be nothing but the perception of the connection and agreement, or disagreement and repugnancy of any of our *ideas:* where this perception is, there is *knowledge;* and where it is not, there, though we fancy, guess, or believe, yet we always come short of *knowledge*. When we know that *white* is not *black*, what do we but perceive that these two *ideas* do not agree? Or that the three angles of a *triangle*, are equal to two right ones; what do we more but perceive that equality to two right ones does necessarily agree to and is inseparable from the three angles of a triangle? But to understand a little more distinctly wherein this agreement or disagreement consists, we may reduce it all to these *four sorts:* 1st, *Identity* or *diversity;* 2dly, *Relation;* 3dly, *Co-existence;* 4thly, *Real existence.*

164. I. *Identity* or *diversity*. It is the first act of the mind *to perceive its* ideas; and, so far as it perceives them, to know each what it is, and thereby to perceive their difference, that is, the one not to be the other: by this the mind clearly perceives each *idea* to agree with itself, and to be what it is; and all distinct *ideas* to disagree. This it does without any pains or deduction, by its natural power of perception and distinction. This is what men of art have reduced to those general rules, viz. *What is, is;* and, *It is impossible for the same thing to be and not to be.* But no

maxim

Knowledge. *maxim* can make a man know it clearer, that *round* is not *square*, than the bare perception of those two *ideas*, which the mind at first sight perceives to disagree.

165. II. The next sort of agreement or disagreement the mind perceives in any of its *ideas* may be called *relative*, and is nothing but the perception of the relation between any two *ideas* of what kind soever; that is, their agreement or disagreement one with another in several ways the mind takes of comparing them.

166. III. The third sort of agreement or disagreement to be found in our ideas, is, *coexistence* or *non-existence* in the same subject; and this belongs particularly to substances. Thus when we pronounce concerning *gold*, that it is fixed; it amounts to no more but this, that fixedness, or a power to remain in the fire unconsumed, is an *idea* that always accompanies that particular sort of *yellowness*, *weight*, *fusibility*, &c. which make our complex *idea* signified by the word *gold*.

167. IV. The fourth sort is that of actual and *real existence* agreeing to any *idea*. Within these four sorts of agreement or disagreement, is contained all the knowledge we have, or are capable of. For all that we know or can affirm concerning any *idea*, is, That it is, or is not, the same with some other; as, that *blue is not yellow:* That it does, or does not, coexist with another in the same subject; as, that *iron is susceptible of magnetical impressions:* That it has that or this relation to some other *ideas;* as, that *two triangles, upon equal bases upon two parallels, are equal:* or, That it has a real existence without the mind; as, *that God is*.

168. There are several ways wherein the mind is possessed of truth, each of which is called *knowledge*. *First*, There is *actual knowledge*, when the mind has a present view of the agreement or disagreement of any of its *ideas*, or of the relation they have one with another. *Secondly*, A man is said to know any proposition, when having once evidently perceived the agreement or disagreement of the *ideas* whereof it consists, and so lodged it in his memory, that whenever it comes to be reflected on again, the mind assents to it without doubt or hesitation, and is certain of the truth of it. And this may be called *habitual knowledge*. And thus a man may be said to know all those truths which are lodged in his memory by a foregoing, clear, and full perception.

169. Of *habitual knowledge* there are two sorts: the one is of such truths laid up in the memory, as whenever they occur to the mind, it actually perceives the relation that is between those *ideas*. And this is in all those truths, where the *ideas* themselves, by an immediate view, discover their agreement or disagreement one with another. The other is of such truths, whereof the mind having been convinced, it retains the memory of the conviction, without the proofs. Thus a man that remembers certainly, that he once perceived the demonstration, that the three angles of a triangle are equal to two right ones, knows it to be true, when that demonstration is gone out of his mind, and possibly cannot be recollected: but he knows it in a different way from what he did before, namely, not by the intervention of those intermediate *ideas*, whereby the agreement or disagreement of those in the proposition was at first perceived, but by remembering, i. e. knowing that he was once certain of the truth of this proposition, that the three angles of a triangle are equal to two right ones. The immutability of the same relations between the same immutable things, is now the *idea* that shews him, that if the three angles of a triangle were once equal to two right ones, they will always be so. And hence he comes to be certain, that what was once true, is always true; what *ideas* once agreed, will always agree; and consequently, what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it. Degrees of Knowledge.

Sect. XXX. *Of the Degrees of our Knowledge.*

170. All our knowledge consisting in the view the mind has of its own *ideas*, which is the utmost light and greatest certainty we are capable of, *the different clearness of our knowledge* seems to lie in the different way of perception the mind has of the agreement or disagreement of any of its *ideas*.

171. When the mind perceives this agreement or disagreement of two *ideas immediately* by themselves, without the intervention of any other, we may call it *intuitive knowledge*; in which cases the mind perceives truth, as the eye does light, only by being directed towards it. Thus the mind perceives, that *white is not black;* that *three are more than two*, and *equal to one and two*. This part of knowledge is irresistible, and, like the bright sunshine, forces itself immediately to be perceived as soon as ever the mind turns its view that way. It is on this *intuition* that depends all the certainty and evidence of our other knowledge; which certainty every one finds to be so great, that he cannot imagine, and therefore not require a greater.

172. The next degree of knowledge is, where the mind perceives not this agreement or disagreement immediately, or by the *juxta-position*, as it were, of the *ideas*, because those *ideas* concerning whose agreement or disagreement the inquiry is made, cannot by the mind be so put together as to shew it. In this case the mind is fond to discover the agreement or disagreement which it searches, by the intervention of other *ideas:* And this is that which we call *reasoning*. And thus, if we would know the agreement or disagreement in bigness between the three angles of a triangle and two right angles, we cannot by an immediate view and comparing them do it; because the three angles of a triangle cannot be brought at once, and be compared with any other one or two angles. And so of this the mind has no immediate or intuitive knowledge. But we must find out some other angles to which the three angles of a triangle have equality; and finding those equal to two right ones, we come to know the equality of these three angles to two right ones. These intervening *ideas* which serve to shew the agreement of any two others, are called *proofs*; and where the agreement or disagreement is by this means plainly and clearly perceived, it is called *demonstration*. A quickness in the mind to find those proofs, and to apply them right, is that which is called *sagacity*.

173. This knowledge, though it be certain, is not so clear and evident as *intuitive* knowledge. It requires pains and attention, and steady application of mind, to discover the agreement or disagreement of the *ideas* it considers; and there must be a progression by steps and degrees before the mind can in this way

Degrees of Knowledge.

arrive at certainty. Before demonſtration there was a doubt, which, in *intuitive knowledge*, cannot happen to the mind that has its faculty of perception left to a degree capable of diſtinct *ideas*, no more than it can be a doubt to the eye (that can diſtinctly ſee *white* and *black*) whether this ink and paper be all of a colour.

174. Now, in every ſtep that reaſon makes in *demonſtrative knowledge*, there is an *intuitive knowledge* of that agreement or diſagreement it ſeeks with the next immediate *idea*; which it uſes as a proof: for if it were not ſo, that yet would need a proof; ſince without the perception of ſuch agreement or diſagreement, there is no knowledge produced. By which it is evident, that every ſtep in reaſoning that produces knowledge has *intuitive certainty*; but when the mind perceives, there is no more required but to remember it, to make the agreement or diſagreement of the *ideas* concerning which we inquire viſible and certain. This *intuitive perception* of the agreement or diſagreement of the intermediate *ideas* in each ſtep and progreſſion of the demonſtration, muſt alſo be exactly carried in the mind; and a man muſt be ſure that no part is left out; which becauſe in long deductions the memory cannot eaſily retain, this knowledge becomes more imperfect than *intuitive*, and men often embrace falſehoods for demonſtrations.

175. It has been generally taken for granted, that mathematics alone are capable of demonſtrative certainty. But to have ſuch an agreement or diſagreement as may be *intuitively* perceived, being not the privilege of the ideas of *number*, *extenſion*, and *figure* alone, it may poſſibly be the want of due method and application in us, and not of ſufficient evidence in things, that demonſtration has been thought to have ſo little to do in other parts of knowledge: For in whatever ideas the mind can perceive the agreement or diſagreement immediately, there it is capable of *intuitive knowledge*: And where it can perceive the agreement or diſagreement of any two *ideas* by an *intuitive perception* of the agreement or diſagreement they have with any intermediate *ideas*, there the mind is capable of demonſtration which is not limited to the ideas of figure, number, extenſion, or their modes. The reaſon why it has been generally ſuppoſed to belong to them only, is becauſe in comparing their equality or exceſs the *modes of numbers* have every the leaſt difference very clear and perceivable: And in *extenſion*, though every the leaſt exceſs is not ſo perceptible, yet the mind has found out ways to diſcover the juſt equality of two angles, extenſions, or figures; and both, that is, numbers and figures, can be ſet down by viſible and laſting marks.

176. But in other ſimple *ideas*, whoſe modes and differences are made and counted by degrees, and not quantity, we have not ſo nice and accurate a diſtinction of their differences as to perceive or find ways to meaſure their juſt equality or the leaſt differences: for thoſe other ſimple ideas being appearances or ſenſations produced in us by the *ſize*, *figure*, *motion*, &c. of minute corpuſcles ſingly inſenſible, their different degrees alſo depend on the variation of ſome or all of thoſe cauſes; which ſince it cannot be obſerved by us in particles of matter, whereof each is too ſubtile to be perceived, it is impoſſible for us to have any exact meaſures of the different degrees of theſe ſimple *ideas*. Thus, for inſtance, not knowing what number of particles, nor what motion of them, is fit to produce any preciſe degree of *whiteneſs*, we cannot demonſtrate the certain equality of any two degrees of *whiteneſs*, becauſe we have no certain ſtandard to meaſure them by, nor means to diſtinguiſh every the leaſt difference; the only help we have being from our ſenſes, which in this point fail us.

Extent of Knowledge.

177. But where the difference is ſo great as to produce in the mind *ideas* clearly diſtinct, there *ideas* of *colours*, as we ſee in different kinds, (*blue* and *red*, for inſtance), are as capable of demonſtration as ideas of number and extenſion. What is here ſaid of colours holds true in all ſecondary qualities. Theſe two then, *intuition* and *demonſtration*, are the degrees of our *knowledge*; whatever comes ſhort of one of theſe is but *faith* or *opinion*, not *knowledge*, at leaſt in all *general truths*. There is indeed another perception of the mind employed about the *particular exiſtence of finite beings* without us; which going beyond probability, but not reaching to either of the foregoing degrees of certainty, paſſes under the name of *knowledge*.

178. Nothing can be more certain than that the *idea* we receive from an external object is in our minds: This is *intuitive knowledge*; but whether we can thence certainly infer the exiſtence of any thing without us correſponding to that idea, is that whereof ſome men think there may be a queſtion made, becauſe men may have ſuch an idea in their minds when no ſuch things exiſt, no ſuch object affects their ſenſes. But it is evident that we are invincibly conſcious to ourſelves of a different perception, when we look upon the ſun in the day, and think on it by night; when we actually taſte wormwood or ſmell a roſe, or only think on that ſavour or odour. So that we may add to the two former ſorts of knowledge this alſo of the exiſtence of particular external objects, by that perception and conſciouſneſs we have of the actual entrance of ideas from them, and allow theſe three degrees of knowledge, viz. *intuitive*, *demonſtrative*, and *ſenſitive*.

179. But ſince our knowledge is founded on and employed about our ideas only, will it follow thence that it muſt be conformable to our ideas; and that where our ideas are clear and diſtinct, obſcure and confuſed, there our knowledge will be ſo too? *No*. For our knowledge conſiſting in the perception of the agreement or diſagreement of any two ideas, its clearneſs or obſcurity conſiſts in the clearneſs or obſcurity of that perception, and not in the clearneſs or obſcurity of the ideas themſelves. A man (for inſtance) that has a clear idea of the angles of a triangle, and of equality to two right ones, may yet have but an obſcure perception of their agreement; and ſo have but a very obſcure knowledge of it. But obſcure and confuſed ideas can never produce any clear or diſtinct knowledge; becauſe, as far as any ideas are obſcure or confuſed, ſo far the mind can never perceive clearly whether they agree or diſagree.

Sect. XXXI. *Of the Extent of Human Knowledge.*

180. From what has been ſaid concerning knowledge, it follows, Firſt, That we can have no knowledge

Extent of Knowledge

ledge farther than we have *ideas*.

Secondly, That we have no knowledge farther than we can have perception of that agreement or disagreement of our *ideas*, either by *intuition*, *demonstration*, or *sensation*.

Thirdly, We cannot have an *intuitive* knowledge that shall extend itself to all our *ideas*, and all that we would know about them, because we cannot examine and perceive all the relations they have one to another by juxta-position, or an immediate comparison one with another. Thus we cannot *intuitively* perceive the equality of two extensions, the difference of whose figures makes their parts incapable of an exact immediate application.

Fourthly, Our *rational* knowledge cannot reach to the whole extent of our *ideas*; because between two different *ideas* we would examine, we cannot always find such *proofs* as we can connect one to another, with an *intuitive knowledge* in all the parts of the deduction.

Fifthly, *Sensitive* knowledge reaching no farther than the existence of things actually present to our senses, is yet much narrower than either of the former.

Sixthly, From all which it is evident, that the *extent of our knowledge* comes not only short of the reality of *things*, but even of the extent of our own *ideas*. We have the *ideas* of a *square*, a *circle*, and *equality*; and yet perhaps shall never be able to find a *circle equal to a square*.

181. The affirmations or negations we make concerning the ideas we have, being reduced to the four sorts above-mentioned, viz. *identity*, *coexistence*, *relation*, and *real existence*, we shall examine how far our knowledge extends in each of these.

182. First, As to *identity* and *diversity*, our *intuitive knowledge* is as far extended as our *ideas* themselves; and there can be no *idea* in the mind which it does not presently, by an *intuitive knowledge*, perceive to be what it is, and to be different from any other.

183. Secondly, As to the agreement or disagreement of our *ideas* in *coexistence*: in this our knowledge is very short; tho' in this consists the greatest and most material part of our knowledge, concerning *substances*. For our *ideas* of *substances* being nothing but certain *collections of simple* ideas, *coexisting in one subject*, (our *idea* of *flame*, for instance, is a body *hot*, *luminous*, and *moving upward*; when we would know any thing farther concerning this, or any other sort of substance, what do we do but inquire what other qualities or powers these substances have, or have not? Which is nothing else but to know what other simple *ideas* do or do not *coexist* with those that make up that complex *idea*. The reason of this is, because the simple *ideas* which make up our complex *ideas* of substances, have no visible necessary connection or inconsistence with other simple *ideas* whose coexistence with them we would inform ourselves about. These *ideas* being likewise, for the most part, *secondary qualities*, which depend upon the *primary* qualities of their minute or insensible parts, or on something yet more remote from our comprehension, it is impossible we should know which have a necessary union or inconsistency one with another, since we know not the root from whence they spring, or the size, figure, and texture of parts on which they depend, and from which they result.

184. Besides this, there is no *discoverable connection* between any *secondary* quality, and those *primary* qualities that it depends on. We are so far from knowing what figure, size, or motion produces (for instance), a *yellow colour*, or *sweet taste*, or a *sharp sound*, that we can by no means conceive how any *size*, *figure*, or *motion*, can possibly produce in us the *idea* of any *colour*, *taste*, or *sound*, whatsoever; and there is no conceivable connection between the one and the other.

185. Our knowledge therefore of coexistence reaches little farther than *experience*. Some few, indeed, of the *primary* qualities have a necessary dependence and visible connection one with another; as *figure* necessarily supposes *extension*, *receiving or communicating motion by impulse* supposes *solidity*. But qualities coexistent in any subject, without this dependence and connection, cannot certainly be known to coexist any farther than experience by our senses informs us. Thus, though upon trial we find *gold* yellow, weighty, malleable, fusible, and fixed, yet because none of these have any evident dependence or necessary connection with the other, we cannot certainly know that where any *four* of these are, the *fifth* will be there also, how highly probable soever it may be: but the highest degree of *probability* amounts not to *certainty*; without which there can be no true knowledge: for this coexistence can be no further known, than it is perceived; and it cannot be perceived, but either, in *particular* subjects, by the observation of our senses, or, in *general*, by the necessary connection of the *ideas* themselves.

186. As to *incompatibility*, or *repugnancy to coexistence*, we may know, that any subject can have of each sort of *primary* qualities but one particular at once, one extension, one figure; and so of sensible *ideas*, peculiar to each sense: for whatever of each kind is present in any subject, excludes all others of that sort; for instance, one subject cannot have *two smells* or *two colours* at the same time.

187. As to *powers of substances*, which make a great part of our inquiries about them, and are no inconsiderable branch of our knowledge; our knowledge as to these reaches little farther than *experience*, because they consist in a texture and motion of parts which we cannot by any means come to discover. *Experience* is that which in this part we must depend on; and it were to be wished that it were more improved.

188. As to the third sort, the *agreement or disagreement of our ideas in any other relation*, this is the largest field of knowledge, and it is hard to determine how far it may extend. This part depending on our sagacity in finding intermediate *ideas* that may shew the habitudes and relations of *ideas*, it is an hard matter to tell when we are at the end of such discoveries. They that are ignorant of *algebra*, cannot imagine the wonders in this kind that are to be done by it; and what further improvements and helps advantageous to other parts of knowledge the sagacious mind of man may yet find out, it is not easy to determine. The *ideas* of *quantity* are not those alone that are capable of demonstration and knowledge; other, and perhaps more useful parts of contemplation, would un-

Extent of Knowledge. doubtedly afford us certainty, if vices, passions, and domineering interest, did not oppose or menace endeavours of this kind.

189. The *idea* of a *Supreme Being*, infinite in power, goodness, and wisdom, whose workmanship we are, and on whom we depend; and *ideas* of *ourselves*, as understanding rational creatures; would, if duly considered, afford such foundation of our *duty*, and *rules of action*, as might place *morality* among the sciences capable of demonstration. The relations of other modes may certainly be perceived, as well as those of number and extension. *Where there is no property, there is no injustice*, is a proposition as certain as any demonstration in Euclid: for the *idea* of *property* being a right to any thing; and the *idea* of *injustice* being the invasion or violation of that right; it is evident, that these *ideas* being thus established, and these names annexed to them, we can as certainly know this proposition to be true, as that a *triangle has three angles equal to two right ones*. Again, *No government allows absolute liberty*. The *idea* of *government* being the establishment of society upon certain rules or laws which require conformity to them, and the *idea* of *absolute liberty* being for any one to do whatever he pleases, we are as capable of being certain of the truth of this proposition as of any in *mathematics*.

190. What has given the advantage to the *ideas* of *quality*, and made them thought more capable of certainty and demonstration, is,

191. First, That they can be represented by sensible marks, which have a nearer correspondence with them than any words or sounds. *Diagrams* drawn on paper are copies of the *ideas*, and not liable to the uncertainty that words carry in their signification: but we have no sensible marks that resemble our *moral ideas*, and nothing but words to express them by; which though when written they remain the same, yet the *ideas* they stand for may change in the same man; and it is very seldom that they are not different in different persons.

192. Secondly, *Moral ideas* are commonly more complex than figures. Whence these two inconveniences follow: 1. That their names are of more uncertain signification; the precise collection of simple *ideas* they stand for not being so easily agreed on, and so the sign that is used for them, in communication always, and in thinking often, does not steadily carry with it the same *idea*. 2. The mind cannot easily retain those precise combinations so exactly and perfectly as is necessary, in the examination of the habitudes and correspondencies, agreements or disagreements, of several of them one with another, especially where it is to be judged of by long deductions, and the intervention of several other complex *ideas* to shew the agreement or disagreement of two remote ones.

193. Now one part of these disadvantages in *moral ideas*, which has made them to be thought not capable of demonstration, may in a good measure be remedied by *definitions*, setting down that collection of simple *ideas* which every term shall stand for, and then using the terms steadily and constantly for that precise collection.

194. As to the fourth sort of knowledge, viz. of *the real actual existence of things*, we have an *intuitive* knowledge of our *own existence*; a *demonstrative* knowledge of *the existence of God*; and a *sensitive* knowledge of the *objects that present themselves to our sense*.

Causes of Ignorance.

195. From what has been said, we may discover the *causes of our ignorance*, which are chiefly these three: First, Want of *ideas*: Secondly, Want of a discoverable connection between the *ideas* we have: Thirdly, Want of tracing and examining our *ideas*.

196. First, There are some things we are ignorant of for *want of ideas*. All the simple *ideas* we have are confined to the observations of our senses, and the operations of our own minds that we are conscious of in ourselves. What other *ideas* it is possible other creatures may have by the assistance of other senses and faculties more or perfecter than we have, or different from ours, it is not for us to determine; but to say or think there are no such, because we conceive nothing of them, is no better an argument, than if a blind man should be positive in it, that there was no such thing as sight and colours, because he had no manner of *idea* of any such thing. What faculties therefore other species of creatures have to penetrate into the nature and inmost constitutions of things, we know not. This we know, and certainly find, that we want other views of them, besides those we have, to make discoveries of them more perfect. The *intellectual* and *sensible* world are in this perfectly alike, that the parts which we see of either of them hold no proportion with that we see not, and whatsoever we can reach with our eyes or our thoughts of either of them is but a point almost nothing in comparison of the rest.

197. Another great cause of ignorance, is the *want of ideas that we are capable of*. This keeps us in ignorance of things we conceive capable of being known. Bulk, figure, and motion, we have *ideas* of; yet not knowing what is the particular bulk, motion, and figure, of the greatest part of the bodies of the universe, we are ignorant of the several powers, efficacies, and ways of operation, whereby the effects we daily see are produced. These are hid from us, in some things, by being *too remote*; in others, by being *too minute*.

198. When we consider the vast distance of the known and visible parts of the world, and the reasons we have to think that what lies within our ken is but a small part of the immense universe, we shall then discover an huge abyss of ignorance. What are the particular fabrics of the great masses of matter which make up the whole stupendous frame of corporeal beings; how far they are extended; what is their motion, and how continued; and what influence they have upon one another; are contemplations, that at first glimpse our thoughts lose themselves in. If we confine our thoughts to this little system of our sun, and the grosser masses of matter that visibly move about it; what several sorts of vegetables, animals, and intellectual corporeal beings, infinitely different from those of our little spot of earth, may probably be in other *planets*, to the knowledge of which, even of their outward figures and parts, we can no way attain whilst we are confined to this earth, there being no natural means, either by sensation or reflection, to convey their certain *ideas* into our minds?

199. There are other bodies in the universe, no less con-

Causes of Ignorance.

concealed from us by their *minuteneſs*. Theſe inſenſible corpuſcles being the active parts of matter, and the great inſtruments of nature on which depend all their *ſecondary* qualities and operations, our want of precise diſtinct *ideas* of their *primary* qualities keeps us in incurable ignorance of what we deſire to know about them. Did we know the mechanical affections of *rhubarb* and *opium*, we might as eaſily account for their operations of *purging* or *cauſing ſleep*, as a watchmaker can for the motions of his watch. The diſſolving of ſilver in *aqua fortis*, or gold in *aqua regia*, and not *vice verſa*, would be then, perhaps, no more difficult to know, than it is to a ſmith to underſtand why the turning of one key will open a lock, and not the turning of another. But whilſt we are deſtitute of ſenſes acute enough to diſcover the minute particles of bodies, and to give us *ideas* of their mechanical affections, we muſt be content to be ignorant of their properties and operations : nor can we be aſſured about them any farther than ſome few trials we make are able to reach ; but whether they will ſucceed again another time, we cannot be certain. This hinders our certain knowledge of univerſal truths concerning natural bodies; and our reaſon carries us herein very little beyond particular matters of fact. And therefore, how far ſoever human induſtry may advance uſeful and *experimental philoſophy* in phyſical things, yet *ſcientifical* will ſtill be out of our reach ; becauſe we want perfect and adequate *ideas* of thoſe very bodies which are neareſt to us, and moſt under our command.

200. This, at firſt ſight, ſhews us how diſproportionate our knowledge is to the whole extent, even of *material* beings ; to which if we add the conſideration of that infinite number of *ſpirits* that may be, and probably are, which are yet more remote from our knowledge, whereof we have no cognizance ; we ſhall find this cauſe of ignorance conceal from us, in an impenetrable obſcurity, almoſt the whole *intellectual* world, a greater, certainly, and a more beautiful world than the *material :* for bating ſome very few *ideas* of ſpirit we get from our own mind by reflection, and from thence the beſt we can collect of the *Father of all ſpirits*, the Author of them and us and all things, we have no certain information ſo much as of the exiſtence of other ſpirits but by revelation ; much leſs have we diſtinct *ideas* of their different natures, ſtates, powers, and ſeveral conſtitutions, wherein they agree or differ one from another, and from us ; and therefore in what concerns their different ſpecies and properties, we are under an abſolute ignorance.

201. The *ſecond* cauſe of ignorance, is the *want of diſcoverable connection* between thoſe *ideas* we have : where we want that, we are utterly incapable of *univerſal* and *certain* knowledge : and are, in the former caſe, left only to *obſervation* and *experiment*. Thus the mechanical affections of bodies having no affinity at all with the *ideas* they produce in us, we can have no diſtinct knowledge of ſuch operations beyond our experience ; and can reaſon no otherwiſe about them, than as the effects or appointment of an infinitely *wiſe agent*, which perfectly ſurpaſs our comprehenſions.

202. The operation of our minds upon our bodies is as inconceivable. How any *thought* ſhould produce a motion in *body*, is as remote from the nature of our *ideas*, as how any *body* ſhould produce any *thought* in the *mind*. That it is ſo, if experience did not convince us, the conſideration of the things themſelves would never be able in the leaſt to diſcover to us.

Reality of Knowledge.

203. In ſome of our *ideas* there are certain relations, habitudes, and connections, ſo viſibly included in the nature of the *ideas* of themſelves, that we cannot conceive them ſeparable from them by any power whatſoever : in theſe only we are capable of certain and univerſal knowledge. Thus the *idea* of a *right-lined triangle*, neceſſarily carries with it an *equality of its angles to two right ones*. But the coherence and continuity of the parts of matter, the production of ſenſation in us of *colours* and *ſounds*, &c. by impulſe and motion, being ſuch wherein we can diſcover no natural connection with any *ideas* we have, we cannot but aſcribe them to the arbitrary will and good pleaſure of the wiſe Architect.

204. The things that we obſerve conſtantly to proceed regularly, we may conclude to act by a law ſet them ; but yet by a law that we know not ; whereby, tho' cauſes work ſteadily, and effects conſtantly flow from them, yet their connections and dependencies being not diſcoverable in our *ideas*, we can have but an experimental knowledge of them.

205. The *third* cauſe of ignorance, is our *want of tracing thoſe ideas we have* or may have, and finding out thoſe intermediate *ideas* which may ſhew us what habitude of agreement or diſagreement they may have one with another : and thus many are ignorant of *mathematical* truths, for want of application in inquiring, examining, and by due ways comparing thoſe *ideas*.

206. Hitherto we have examined the *extent* of our knowledge in reſpect of the ſeveral ſorts of beings that are : there is another *extent* of it, in reſpect of *univerſality*, which will alſo deſerve to be conſidered ; and in this regard our knowledge follows the nature of our *ideas*. If the *ideas* are *abſtract*, whoſe agreement or diſagreement we perceive, our knowledge is *univerſal*. For what is known of ſuch general *ideas*, will be true of every particular thing in which that *eſſence*, that is, *abſtract idea*, is to be found : and what is once known of ſuch *ideas*, will be perpetually and for ever true. So that, as to all general knowledge, we muſt ſearch and find it only in our own minds : and it is only the examining of our own *ideas* that furniſhes us with that. Truths belonging to eſſences of things, (that is, to *abſtract ideas*), are *eternal*, and are to be found out by the contemplation only of thoſe eſſences, as the exiſtence of things is to be known only from experience.

Sect. XXXII. *Of the Reality of our Knowledge.*

207. The reader by this time may be ready to object, If it be true, that all knowledge lies only in the perception of the agreement or diſagreement of our own *ideas*, the viſions of an *enthuſiaſt*, and the reaſonings of a *ſober* man, will be equally certain : it is no matter how things are, ſo a man obſerve but the agreement of his own imaginations, and talk conformably ; it is all truth, all certainty.

208. To this it is anſwered, That if our knowledge of our *ideas* ſhould terminate in them, and reach no farther,

Reality of Knowledge. farther, when there is ſomething farther intended, our moſt ſerious thoughts would be of little more uſe than the *reveries* of a crazy brain. But it is evident, that this way of *certainty*, by the knowledge of our own *ideas*, goes a little farther than bare imagination; and that all the certainty of general truths a man has, lies in nothing elſe but this knowledge of our *ideas*.

209. It is evident, that the mind knows not things immediately, but by the intervention of the *ideas* it has of them. Our knowledge therefore is *real*, only ſo far as there is a conformity between our *ideas* and the reality of things. But how ſhall we know when our *ideas* agree with things themſelves? There are *two ſorts* of *ideas*, that we may be aſſured agree with things: theſe are,

210. Firſt, *Simple* ideas; which ſince the mind can by no means make to itſelf, muſt be the effect of things operating upon the mind in a natural way, and producing therein thoſe perceptions, which, by the will of our Maker, they are ordained and adapted to. Hence it follows, that *ſimple ideas* are not fictions of our fancies, but the natural and regular productions of things without us, really operating upon us; which carry with them all the conformity our ſtate requires, which is to repreſent things under thoſe appearances they are fitted to produce in us. Thus the *idea* of *whiteneſs*, as it is in the mind, exactly anſwers that power which is in any body to produce it there. And this conformity between our *ſimple ideas*, and the exiſtence of things, is ſufficient for real knowledge.

211. Secondly, All our *complex ideas*, except thoſe of ſubſtances, being *archetypes* of the mind's own making, and not referred to the exiſtence of things as to their originals, cannot want any conformity neceſſary to real knowledge: for that which is not deſigned to repreſent any thing but itſelf, can never be capable of a wrong repreſentation. Here the *ideas* themſelves are conſidered as *archetypes*, and things no otherwiſe regarded than as they are conformable to them. Thus the mathematician conſiders the truth and properties belonging to a *rectangle* or *circle* only as they are *ideas* in his own mind, which poſſibly he never found exiſting mathematically, that is, preciſely true: yet his knowledge is not only certain, but *real*; becauſe real things are no farther concerned, nor intended to be meant by any ſuch propoſitions, than as things really agree to thoſe *archetypes* in his mind. It is true of the *idea* of a *triangle*, *that its three angles are equal to two right ones*: it is true alſo of a *triangle*, wherever it *exiſts*: what is true of thoſe *figures* that have barely an *ideal* exiſtence in his mind, will hold true of them alſo when they come to have a *real* exiſtence in matter.

212. Hence it follows, that *moral* knowledge is as capable of *real certainty* as *mathematics*: For *certainty* being nothing but the perception of the agreement or diſagreement of our *ideas*, and demonſtration nothing but the perception of ſuch agreement by the intervention of other *ideas*; our *moral ideas*, as well as *mathematical*, being *archetypes* themſelves, and ſo adequate or complete *ideas*, all the agreement or diſagreement we ſhall find in them will produce *real* knowledge, as well as in *mathematical figures*. That which is requiſite to make our knowledge *certain*, is the clearneſs of our *ideas*; and that which is required to make it *real*, is, that they anſwer their *archetypes*.

213. Thirdly, But the complex *ideas*, which we refer to *archetypes* without us, may differ from them, and ſo our knowledge about them may come ſhort of being real; and ſuch are our *ideas* of *ſubſtances*. Theſe muſt be taken from ſomething that does or has exiſted, and not be made up *ideas* arbitrarily put together without any real pattern. Herein, therefore, is founded the reality of our knowledge concerning *ſubſtances*, that all our complex *ideas* of them muſt be ſuch, and ſuch only, as are made up of ſuch ſimple ones as have been diſcovered to coexiſt in nature. And our *ideas* being thus true, though not perhaps very exact copies, are the ſubjects of the *real* knowledge of them. Whatever *ideas* we have, the agreement we find they have with others will be knowledge. If thoſe *ideas* be abſtract, it will be *general* knowledge. But to make it *real* concerning *ſubſtances*, the *ideas* muſt be taken from the real exiſtence of things. Wherever, therefore, we perceive the agreement or diſagreement of our *ideas*, there is *certain knowledge*: and wherever we are ſure thoſe *ideas* agree with the reality of things, there is *certain real knowledge*.

Sect. XXXIII. *Of Truth in general.*

Of truth.

214. Truth, in the proper import of the word, ſignifies the joining or ſeparating of ſigns, as the things ſignified by them do agree or diſagree one with another. The joining or ſeparating of ſigns, is what we call *propoſitions*; ſo that *truth* properly belongs only to *propoſitions*: whereof there are two ſorts, *mental* and *verbal*; as there are *two* ſorts of ſigns commonly made uſe of, *ideas* and *words*.

215. It is difficult to treat of *mental* propoſitions without *verbal*; becauſe, in ſpeaking of *mental*, we muſt make uſe of *words*, and then they become *verbal*. Again, men commonly in their thoughts and reaſonings uſe *words* inſtead of *ideas*; eſpecially if the ſubject of their meditation contains in it *complex ideas*. If we have occaſion to form *mental* propoſitions about *white*, *black*, *circle*, &c. we can, and often do, frame in our minds the *ideas* themſelves, without reflecting on the *names*: but when we would conſider, or make propoſitions about the more *complex ideas*, as of a *man*, *vitriol*, *fortitude*, *glory*, &c. we uſually put the *name* for the *idea*; becauſe the *idea* theſe *names* ſtand for being for the moſt part confuſed, imperfect, and undetermined, we reflect on the *names* themſelves, as being more clear, certain, and diſtinct, and readier to occur to our thoughts, than pure *ideas*; and ſo we make uſe of theſe *words* inſtead of the *ideas* themſelves, even when we would meditate and reaſon within ourſelves, and make tacit *mental propoſitions*.

216. We muſt then obſerve two ſorts of *propoſitions* that we are capable of making: Firſt, *Mental propoſitions*, wherein the *ideas* in our underſtandings are put together or ſeparated by the mind perceiving or judging of their agreement or diſagreement. Secondly, *Verbal propoſitions*; which are words put together or ſeparated in affirmative or negative ſentences: ſo that *propoſition* conſiſts in joining or ſeparating ſigns; and *truth* conſiſts in putting together or ſeparating theſe ſigns, according as the things they ſtand for agree or diſagree.

217.

Knowledge of Existence.

217. Truth, as well as knowledge, may well come under the distinction of *verbal* and *real;* that being only *verbal truth*, wherein terms are joined according to the agreement or disagreement of the *ideas* they stand for, without regarding whether our *ideas* are such as really have or are capable of having an existence in nature. But then it is they contain *real truth*, when these signs are joined as our *ideas* agree: and when our ideas are such as, we know, are capable of having an existence in nature; which in substances we cannot know, but by knowing that such have existed. *Truth* is the marking down in words the agreement or disagreement of *ideas* as it is; *falsehood* is the marking down in words the agreement or disagreement of *ideas* otherwise than it is: and so far as these *ideas*, thus marked by sounds, agree to their *archetypes*, so far only is the *truth real*. The knowledge of this *truth* consists in knowing what *ideas* the words stand for, and the perception of the agreement or disagreement of those *ideas* according as it is marked by those words.

218. Besides *truth* taken in the strict sense before mentioned, there are other sorts of *truths:* As, first, *Moral truth;* which is speaking of things according to the persuasion of our own minds. Secondly, *Metaphysical truth;* which is nothing but the real existence of things conformable to the *ideas* to which we have annexed their names.

219. These considerations of *truth* either having been before taken notice of, or not being much to our present purpose, it may suffice here only to have mentioned them.

SECT. XXXIV. *Of our Knowledge of Existence.*

220. HITHERTO we have only considered the *essences* of things; which being only *abstract ideas*, and thereby removed in our thoughts from particular existence, give us no knowledge of *existence* at all. We proceed now to inquire concerning our *knowledge of the existence* of things, and how we come by it.

221. We have the knowledge of our *own existence* by *intuition;* of *the existence of God*, by *demonstration;* and of *other things*, by *sensation*. As for our *own existence*, we perceive it so plainly, that it neither needs, nor is capable of any proof. *I think, I reason, I feel pleasure and pain:* can any of these be more evident to me than my *own existence?* If I doubt of all other things, that very *doubt* makes me perceive my *own existence*, and will not suffer me to doubt of that. If I know I doubt, I have as certain a perception of the *thing* doubting, as of that *thought* which I call *doubt*. Experience then convinces us, that we have an *intuitive knowledge of our own existence*, and an internal infallible perception that we *are*. In every act of sensation, reasoning, or thinking, we are conscious to ourselves of our own being; and in this matter come not short of the highest degree of certainty.

SECT. XXXV. *Of our Knowledge of the Existence of a God.*

222. THOUGH *God* has given us no *innate ideas* of himself, yet having furnished us with those faculties our minds are endowed with, he hath not *left himself without a witness*, since we have sense, perception, and reason, and cannot want a clear proof of him as long as we carry ourselves about us. Nor can we justly complain of our ignorance in this great point, since he has so plentifully provided us with means to discover and know him, so far as is necessary to the end of our being, and the great concernment of our happiness. But though this be the most obvious truth that reason discovers, yet it requires thought and attention; and the mind must apply itself to a regular deduction of it, from some part of our *intuitive* knowledge; or else we shall be as ignorant of this, as of other propositions which are in themselves capable of clear demonstration. To shew, therefore, that we are capable of knowing, that is, *being certain*, that *there is a God*, and how we may come by this certainty, we need go no farther than ourselves, and that undoubted knowledge we have of our own *existence*. It is beyond question, that *man has a clear perception of his own being*: He knows certainly that he exists, and that he is something. In the next place, man knows by an *intuitive* certainty, that *bare nothing can no more produce any real being, than it can be equal to two right angles*. If therefore we know there is some real being, it is an evident demonstration, that *from eternity there has been something;* since what was not from eternity had a beginning, and what had a beginning must be produced by something else. Next, it is evident, that *what has its being from another, must also have all that which is in and belongs to its being from another too:* All the powers it has, must be owing to, and received from, the same source. This eternal source then of all being must be also the source and original of all power; and so this *eternal being* must be also the *most powerful*.

Existence of a God.

223. Again, man finds in himself *perception* and *knowledge:* We are certain, then, that there is not only some being, but some knowing intelligent being in the world. There was a time, then, when there was no knowing being, or else there has been a knowing being from eternity. If it be said, there was a time when that eternal being had no knowledge; the reply is, that then it is impossible there should have ever been any knowledge; it being as impossible that things wholly void of knowledge, and operating blindly and without any perception, should produce a knowing being, as it is that a triangle should make itself three angles bigger than two right ones.

224 This from the consideration of ourselves, and what we infallibly find in our own constitutions, our reason leads us to the knowledge of this certain and evident truth, that *there is an eternal, most powerful and knowing being;* and from this *idea* duly considered, will easily be deduced all those other *attributes* we ought to ascribe to this *eternal being*.

225. From what has been said, it is plain, we have a more certain knowledge of the existence of a *God* than of any thing our senses have not immediately discovered to us; nay, that we more certainly know that there is a *God*, than that there is any thing else without us.

226. It being then unavoidable for all rational creatures to conclude, that *something has existed from eternity;* let us next see what *kind of thing* that must be. There are but two sorts of beings in the world, that man knows or conceives. First, Such as are purely material, without sense or preception, as the clippings of our beards, and parings of our nails.

Secondly,

Exiſtence of a God.

Secondly, Senſible perceiving beings; ſuch as we find ourſelves to be. Theſe two ſorts we ſhall hereafter call *cogitative* and *incogitative* beings; which to our preſent purpoſe are better than *material* and *immaterial*.

228. If then there muſt be ſomething *eternal*, it is very obvious to reaſon, that it muſt neceſſarily be a *cogitative* being; becauſe it is as impoſſible to conceive that ever bare *incogitative* matter ſhould produce a *thinking* intelligent being, as that nothing ſhould of itſelf produce matter. Let us ſuppoſe any parcel of matter *eternal*, we ſhall find it in itſelf unable to produce any thing. Let us ſuppoſe its parts firmly at reſt together: If there were no other being in the world, muſt it not eternally remain ſo, a dead unactive lump? Is it poſſible to conceive it can add motion to itſelf, or produce any? *Matter* then by its own ſtrength cannot produce in itſelf ſo much as *motion*. The motion it has muſt alſo be from eternity, or elſe added to matter by ſome other being more powerful than matter. But let us ſuppoſe motion eternal too; yet matter, *incogitative* matter and motion, could never produce *thought*. *Knowledge* will ſtill be as far beyond the *power* of *motion* and *matter* to produce, as matter is beyond the power of nothing to produce. Divide *matter* into as minute parts as you will, vary the figure and motion of it as much as you pleaſe, it will operate no otherwiſe upon other bodies of proportionable bulk than it did before this diviſion. The minuteſt particles of matter knock, impel, and reſiſt one another, juſt as the greater do; and that is all they can do. So that if we will ſuppoſe *nothing eternal*, *matter can never begin to be:* If we ſuppoſe *bare matter* without motion *eternal*, *motion can never begin to be:* If we ſuppoſe only matter and motion *eternal*, *thought can never begin to be:* For it is impoſſible to conceive that matter, either with or without motion, could have originally, in and from itſelf, ſenſe, perception, and knowledge; as is evident from hence, that then ſenſe, perception, and knowledge, muſt be a property eternally inſeparable from matter and every particle of it. Since, therefore, whatſoever is the firſt eternal being, muſt neceſſarily be *cogitative;* and whatſoever is firſt of all things, muſt neceſſarily contain in it, and actually have, at leaſt all the perfections that can ever after exiſt; it neceſſarily follows, that the *firſt eternal being cannot be matter*.

229. If therefore it be evident that ſomething neceſſarily muſt exiſt from eternity, it is alſo evident that that *ſomething muſt neceſſarily be a cogitative being:* For it is as impoſſible that *incogitative matter* ſhould produce a *cogitative being*, as that nothing, or the negation of all being, ſhould produce a poſitive being or matter.

230. This diſcovery of the neceſſary exiſtence of an Eternal Mind, does ſufficiently lead us into the knowledge of God. For it will hence follow, that all other knowing beings that have a beginning muſt depend on him, and have no other ways of knowledge or extent of power than what he gives them; and therefore if he made thoſe, he made alſo the leſs excellent pieces of this univerſe, all *inanimate bodies*, whereby his *omniſcience*, *power*, and *providence*, will be eſtabliſhed; and from thence all his other attributes neceſſarily follow.

Sect. XXXVI. *Of our Knowledge of the Exiſtence of other Things.*

Knowledge of other Exiſtences.

231. The knowledge of our own being we have by *intuition:* The exiſtence of a God, *reaſon* clearly makes known to us. The *knowledge of the exiſtence* of any other thing, we can have only by *ſenſation:* For there being no neceſſary connection *of real exiſtence* with any idea a man hath in his memory; nor of any other exiſtence, but that of God, with the exiſtence of any particular man; no particular man can know the exiſtence of any other being, but only when, by actually operating upon him, it makes itſelf be perceived by by him. The having the idea of any thing in our mind, no more proves the exiſtence of that thing, than the picture of a man evidences his being in the world, or the viſions of a dream make thereby a true hiſtory. It is therefore the actual receiving of ideas from without, that gives us notice of the exiſtence of other things, and makes us know that ſomething doth exiſt at that time without us, which cauſes that idea in us, though perhaps we neither know nor conſider how it does it; for it takes not from the *certainty* of our ſenſes, and the ideas we receive by them, that we know not the manner wherein they are produced. This notice we have by our ſenſes of the exiſting of things without us, though it be not altogether ſo certain as *intuition* and *demonſtration*, deſerves the name of *knowledge*, if we perſuade ourſelves that our faculties act and inform us right concerning the exiſtence of thoſe objects that affect them. But beſides the aſſurance we have from our ſenſes themſelves, that they do not err in the information they give us of the exiſtence of things without us, we have other concurrent reaſons: As, 1. It is plain thoſe perceptions are produced in us by exterior cauſes affecting our ſenſes, becauſe thoſe that want the *organs* of any *ſenſe* never can have the *ideas* belonging to that ſenſe prodouced in their minds. This is too evident to be doubted; and therefore we cannot but be aſſured, that they come in by the organs of that ſenſe, and no other way.

Secondly, Becauſe we find ſometimes that we cannot avoid the having thoſe *ideas* produced in our minds. When my eyes are ſhut, I can with pleaſure recall to my mind the *ideas* of *light* or the *ſun*, which former ſenſations had lodged in my memory: But if I turn my eyes towards the *ſun*, I cannot avoid the *ideas* which the *light* or the *ſun* then produces in me. Which ſhews a manifeſt difference between thoſe *ideas* laid up in the memory, and ſuch as force themſelves upon us and we cannot avoid having. And therefore it muſt needs be ſome *exterior* cauſe, whoſe efficacy I cannot reſiſt, that produces thoſe *ideas* in my mind whether I will or no.

233. Beſides, there is nobody who doth not perceive the difference in himſelf, between actually looking upon the *ſun*, and contemplating the *idea* he has of it in his memory; and therefore he hath certain knowledge, that they are not both memory or fancy, but that actual ſeeing has a cauſe without.

234. Thirdly, add to this, that many *ideas* are produced in us with pain, which we afterwards remember without the leaſt offence. Thus the pain of *heat* or *cold*, when the *idea* of it is received in our minds, gives

Existence. us no disturbance, which, when felt, was very troublesome; and we remember the pain of *hunger*, *thirst*, *head-ach*, &c. without any pain at all, which would either never disturb us, or else constantly do it as often as we thought of it, were there nothing more but *ideas* floating in our minds, and appearances entertaining our fancies, without the real existence of things affecting us from abroad.

235. *Fourthly*, Our *senses* in many cases bear witness to the truth of each other's report concerning the existence of sensible things without us: he that doubts when he sees a *fire*, whether it be *real*, may, if he please, feel it too; and by the exquisite pain he will be convinced, that it is not a bare *idea* or *phantom*.

236. If, after all this, any one will be so *sceptical* as to distrust his senses, and to question the existence of all things, or our knowledge of any thing, let him consider that the certainty of things existing *in rerum natura*, when we have the testimony of our senses for it, is not only as great as our frame can attain to, but as our condition needs. For our *faculties* being not suited to the full extent of being, nor a clear comprehensive knowledge of all things, but to the preservation of us in whom they are, and accommodated to the use of life; they serve our purpose well enough, if they will but give us certain notice of those things that are convenient or inconvenient to us. For he that sees a *candle* burning, and has experimented the force of the flame by putting his finger in it, will little doubt that this is something existing without him which does him harm and puts him to pain: which is assurance enough; when no man requires greater certainty to govern his actions by, than what is as certain as his actions themselves. So that this evidence is as great as we can desire, being as certain to us as our pleasure or pain, that is, *happiness* or *misery*; beyond which we have no concernment either of knowing or being.

237. In fine, when our *senses* do actually convey into our understandings any *idea*, we are assured that there is something at that time *really existing* without us. But this knowledge extends only as far as the present testimony of our senses, employed about particular objects that do then affect them, and no farther. My seeing a *man* a minute since, is no certain argument of his present existence.

238. As when our *senses* are actually employed about any object, we know that it does exist; so by our memory we may be assured, that heretofore things that affected our *senses have existed:* And thus we have the knowledge of the past existence of several things, whereof our senses having informed us, our memories still retain the *ideas;* and of this we are past all doubt, so long as we remember well.

239. As to the *existence* of *spirits*, our having *ideas* of them does not make us know that any such things do exist without us, or that there are any *finite spirits*, or any other *spiritual beings* but the *eternal God*. We have ground from *revelation*, and several other reasons, to believe with assurance, that there are such creatures: But our senses not being able to discover them, we want the means of knowing their particular existence; for we can no more know that there are *finite spirits* really existing, by the *ideas* we have of such beings, than by the *ideas* any one has of *fairies*, or *centaurs*, he can come to know, that things answering those *ideas* do really exist.

240. Hence we may gather, that there are *two sorts* of propositions: *One* concerning the existence of any thing answerable to such an *idea*, as that of an *elephant*, *phœnix*, *motion*, or *angel*, *viz.* whether such a thing does any where exist: And this knowledge is only of *particulars*, and not to be had of any thing without us, but only of *God*, any other way than by our *senses*.

241. *Another sort* of proposition is, wherein is expressed the agreement or disagreement of our *abstract ideas*, and their dependence one on another. And these may be *universal* and certain: so having the *idea* of *God* and my *self*, of *fear* and *obedience*, I cannot but be sure that *God is to be feared and obeyed by me:* and this proposition will be certain concerning *man* in general, if I have made an *abstract idea* of such a *species*, whereof I am one particular. But such a proposition, how certain soever, proves not to me the existence of men in the world; but will be true of all such creatures, whenever they do exist: which *certainty* of such general propositions depends on the agreement or disagreement discoverable in those *abstract ideas*. In the former case, our knowledge is the consequence of the *existence of things* producing *ideas* in our minds by our senses: in the latter, the consequences of the *ideas* that *are in our minds*, and producing these general propositions, many whereof are called *eternæ veritates:* and all of them indeed are so; not from being written all or any of them in the minds of all men, or that they were any of them propositions in any one's mind, till he, having got the *abstract ideas*, joined or separated them by affirmation or negation; but wheresoever we can suppose such a creature as *man* is, endowed with such faculties, and thereby furnished with such *ideas* as we have, we must conclude he must needs, when he applies his thoughts to the consideration of his *ideas*, know the truth of certain propositions that will arise from the agreement or disagreement he will perceive in his own *ideas*. Such propositions being once made about *abstract ideas*, so as to be true, they will, whenever they can be supposed to be made again, at any time past, or to come, by a mind having those *ideas*, always be true: for names being supposed to stand perpetually for the same *ideas*, and the same *ideas* having immutably the same habitudes one to another, propositions concerning any *abstract ideas* that are once true must needs be *eternal verities*.

Sect. XXXVII. *Of Judgment.*

242. The *understanding faculties* being given to man, not barely for speculation, but also for the conduct of his life, a man would be at a great loss, if he had nothing to direct him but what has the certainty of true knowledge. He that will not *eat* till he has demonstration that it will nourish him, nor *stir* till he is infallibly assured of success in his business, will have little else to do but *sit still, and perish*. Judgment.

243. Therefore as *God* hath set some things in broad *day-light;* as he has given us some certain knowledge, though limited to a few things in comparison, (probably

Probability.

(probably as a taſte of what *intellectual* creatures are capable of, to excite in us a deſire and endeavour after a better ſtate;) ſo, in the greateſt part of our concernment, he has afforded us only the *twilight* of *probability*, ſuitable to that ſtate of *mediocrity* and *probationerſhip* he has been pleaſed to place us in here.

244. The faculty which *God* has given *man* to enlighten him, next to certain knowledge, is *judgment*; whereby the mind takes its *ideas* to agree or diſagree, without perceiving a demonſtrative evidence in the proofs. The mind exerciſes this judgment ſometimes out of *neceſſity*, where demonſtrative proofs and certain knowledge are not to be had; and ſometimes out of *lazineſs*, unſkilfulneſs, or haſte, even where they are to be had.

245. This faculty of the mind, when it is exerciſed immediately about things, is called *judgment:* when about truths delivered in words, is moſt commonly called *aſſent* or *diſſent*. Thus the mind has *two faculties* converſant about truth and falſehood: Firſt, *Knowledge;* whereby it certainly perceives, and is undoubtedly ſatisfied of the agreement or diſagreement of any ideas. Secondly, *Judgment;* which is the putting *ideas* together, or ſeparating them from one another in the mind, when their certain agreement or diſagreement is not *perceived*, but preſumed to be ſo. And if it ſo unites or ſeparates them as in reality things are, it is *right judgment.*

Sect. XXXVIII. *Of Probability.*

246. Probability is nothing but the appearance of the agreement or diſagreement of two *ideas*, by the intervention of proofs, whoſe connection is not conſtant and immutable, or is not perceived to be ſo; but is or appears for the moſt part to be ſo; and is enough to induce the mind to judge the propoſition to be *true* or *falſe*, rather than the contrary.

247. Of *probability* there are degrees, from the neighbourhood of *certainty* and *demonſtration*, quite down to *improbability* and *unlikelineſs*, even to the confines of *impoſſibility:* And alſo degrees of *aſſent*, from *certain knowledge*, and what is next it, *full aſſurance* and *confidence*, quite down to *conjecture*, *doubt*, *diſtruſt*, and *diſbelief.*

248. That propoſition then is *probable*, for which there are arguments or proofs to make it paſs or be received for *true:* The entertainment the mind gives to this ſort of propoſitions, is called *belief*, *aſſent*, or *opinion*. *Probability* then being to ſupply the defect of our knowledge, is always converſant about propoſitions whereof we have no *certainty*, but only ſome *inducements* to receive them for true. The *grounds* of it are, in ſhort, *theſe two* following.

Firſt, The *conformity* of any thing with our own knowledge, experience, or obſervation.

Secondly, The *teſtimony* of others, vouching their obſervation and experience. In the *teſtimony* of others is to be conſidered, *Firſt*, The number; *Secondly*, The integrity; *Thirdly*, The ſkill of the witneſſes; *Fourthly*, The deſign of the author, if it be a teſtimony cited out of a book; *Fifthly*, The conſiſtency of the parts and circumſtances of the relation; *Sixthly*, Contrary teſtimonies.

249. The mind, before it rationally *aſſents* or *diſſents* to any probable propoſition, ought to examine all the grounds of *probability*, and ſee how they make, more or leſs, for or againſt it; and upon a due balancing of the whole, reject or receive it, with a more or leſs firm *aſſent*, according to the preponderancy of the greater *grounds* of *probability* on one ſide or the other.

Degrees of Aſſent.

Sect. XXXIX. *Of the Degrees of Aſſent.*

250. The *grounds of probability*, laid down in the foregoing ſection, as they are the foundations on which our *aſſent* is built, ſo are they alſo the meaſure whereby its ſeveral *degrees* are (or ought to be) regulated. Only we are to take notice, that no grounds of probability operate any farther on the mind, which ſearches after truth, and endeavours to judge right, than they appear, at leaſt, in the firſt judgment or ſearch that the mind makes. It is indeed in many caſes impoſſible, and in moſt very hard, even for thoſe who have admirable memories, to retain all the proofs which, upon a due examination, made them embrace that ſide of the queſtion. It ſuffices that they have once, with care and fairneſs, ſifted the matter as far as they could; and having once found on which ſide the *probability* appeared to them, they lay up the concluſion in their memories, as a *truth* they have diſcovered; and for the future remain ſatisfied with the teſtimony of their memories, that this is the opinion, that, by the proofs they have once ſeen of it, deſerves ſuch a *degree* of their *aſſent* as they afford it.

251. It is unavoidable then that the memory be relied on in this caſe, and that men be perſuaded of ſeveral *opinions*, whereof the proofs are not actually in their thoughts, nay, which perhaps they are not able actually to recall: without this the greateſt part of men muſt be either *ſceptics*, or change every moment, when any one offers them arguments which, for want of memory, they are not preſently able to anſwer.

252. It muſt be owned, that mens ſticking to paſt judgments, is often the cauſe of great *obſtinacy* in error and miſtake. But the fault is not that they rely on their memories for what they have before well judged, but becauſe they judged before they had well examined. Who almoſt is there that hath the leiſure, patience, and means, to collect together all the proofs concerning moſt of the opinions he has, ſo as ſafely to conclude, that he has a clear and full view, and that there is no more to be alleged for his better information? And yet we are forced to determine ourſelves on one ſide or other: the conduct of our lives, and the management of our great concerns, will not bear delay: For thoſe depend, for the moſt part, on the determination of our judgment in points wherein we are not capable of certain knowledge, and in where it is neceſſary for us to embrace one ſide or the other.

253. The propoſitions we receive upon inducements of *probability are of two ſorts: Firſt*, Concerning ſome particular exiſtence, or matter of *fact*, which falling under our obſervation, is capable of *human teſtimony: Secondly*, Concerning things which, being beyond the diſcovery of our *ſenſes*, are not capable of human teſtimony.

Concerning the firſt of theſe, *viz. Particular matter of fact.*

254. *Firſt*, Where any particular thing conſonant to the conſtant obſervation of ourſelves, and others, in the like caſe, comes atteſted with the concurrent reports

Degrees of Assent.

ports of all that mention it, we receive it as easily, and build as firmly upon it, as if it were certain knowledge. Thus, if all *Englishmen*, who have occasion to mention it, should report, that it *froze* in England last winter, or the like, a man would as little doubt of it, as that *seven and four are eleven*.

255. The *first* and *highest* degree of *probability* then is, when the general consent of all men, in all ages, as far as can be known, concurs with a man's own constant experience in the like cases, to confirm the truth of any particular matter of fact, attested by fair witnesses. Such are the stated *constitutions* and *properties* of bodies, and the regular proceedings of *causes* and *effects* in the ordinary course of *nature*. This we call an *argument* from the nature of things themselves: For what we and others always observe to be after the same manner, we conclude with reason to be the effects of steady and regular *causes*, though they come not within the reach of our knowledge; as that fire warmed a man, or made *lead fluid*; that *iron* sunk in water, or swam in quicksilver. A relation affirming any such thing to have been, or a predication that it will happen again in the same manner, is received without doubt or hesitation; and our *belief* thus grounded, rises to *assurance*.

256. *Secondly*, The next degree of *probability*, is when by my own experience, and the agreement of all others that mention it, a *thing* is found to be for the most part so; and that the particular instance of it is attested by many and undoubted *witnesses*. Thus *history* giving us such an account of men in all ages, and my own experience confirming it, that most men prefer their own private advantage to the public; if all historians that write of *Tiberius*, say that he did so, it is extremely probable: And in this case, our *assent* rises to a degree which we may call *confidence*.

257. *Thirdly*, In matters happening indifferently, as that a *bird* should fly this or that way; when any particular matter of fact comes attested by the concurrent testimony of unsuspected *witnesses*, there our *assent* is also unavoidable. Thus, that there is in *Italy* such a city as *Rome*; that about one thousand and eight hundred years ago there lived such a man in it as *Julius Cæsar*, &c. a man can as little doubt of this, and the like, as he does of the being and actions of his own acquaintance, whereof he himself is a witness.

258. *Probability*, on these grounds, carries so much evidence with it, that it leaves us as little liberty to believe or disbelieve, as demonstration does, whether we will know or be ignorant. But the difficulty is, when testimonies contradict common experience, and the reports of witnesses clash with the ordinary course of nature, or with one another; here diligence, attention, and exactness, is required to form a *right judgment*, and to proportion the *assent* to the evidence and *probability* of the thing, which rises and falls according as the two foundations of credibility favour or contradict it. These are liable to such variety of contrary observations, circumstances, reports, tempers, designs, oversight, &c. of reporters, that it is impossible to reduce to precise rules the various degrees wherein men give their *assent*. This in general may be said, that as the *proofs*, upon due examination, shall to any one appear in a greater or less degree to preponderate on either side, so they are fitted to produce in the mind such different entertainments, as are called *belief*, *conjecture*, *guess*, *doubt*, *wavering*, *distrust*, *disbelief*, &c.

Degrees of Assent.

259. It is a *rule* generally approved, that any testimony, the farther off it is removed from the original truth, the less force it has: and in *traditional* truths, each remove weakens the force of the *proof*. There is a *rule* quite contrary to this, advanced by some men, who look on *opinions* to gain force by growing *older*. Upon this ground, propositions evidently false or doubtful in their first beginning, come by an inverted *rule* of *probability* to pass for *authentic* truths; and those which deserved little credit from the mouths of their first relators, are thought to grow *venerable* by age, and are urged as undeniable.

260. But certain it is, that no *probability can rise above its first original*. What has no other evidence than the single testimony of *one witness*, must stand or fall by his *only* testimony, though afterwards cited by hundreds of others; and is so far from receiving any strength thereby, that it becomes the weaker; because passion, interest, inadvertency, mistake of his meaning, and a thousand odd reasons, which capricious mens minds are acted by, may make one man quote another's words or meaning wrong. This is certain, that what in one age was affirmed upon slight grounds, can never after come to be more valid in future ages by being often repeated.

261. *The second sort of probability*, is concerning things not falling under the reach of our senses, and therefore not capable of testimony: and such are,

262. (1.) The existence, nature, and operations of *finite immaterial* beings without us, as *spirits*, *angels*, &c. or the existence of *material* beings, such as, for their smallness or remoteness, our *senses* cannot take notice of; as whether there be any *plants*, *animals*, &c. in the *planets*, and other mansions of the vast universe.

263. (2.) Concerning the manner of operation in most parts of the works of *nature*; wherein though we see the sensible *effects*, yet their causes are unknown, and we perceive not the ways and manner how they are produced. We see *animals* are generated, nourished, and move; the *loadstone* draws *iron*, &c. But the causes that operate, and the manner they are produced, we can only guess, and probably conjecture. In these matters *analogy* is the only help we have; and it is from that alone we draw all our grounds of *probability*. Thus observing, that the bare rubbing of two bodies violently upon one another, produces *heat*, and very often *fire*, we have reason to think, that what we call *heat* and *fire* consists in a certain violent agitation of the imperceptible minute parts of the burning matter.

This sort of *probability*, which is the best conduct of rational experiments, and the rise of *hypotheses*, has also its use and influence. And a wary reasoning from *analogy* leads us often into the discovery of *truths* and useful *deductions*, which would otherwise lie concealed.

264. Though the common experience, and the ordinary course of things, have a mighty influence on the minds of men, to make them give or refuse credit to any thing proposed to their belief; yet there is one case wherein the strangeness of the fact lessens not the *assent* to a fair testimony given of it. For where such supernatural *events* are suitable to ends aimed at by

Reason. Him who has the power to change the courſe of nature, there, under ſuch circumſtances, they may be the fitter to procure belief, by how much the more they are beyond or contrary to ordinary obſervation. This is the proper caſe of *miracles;* which, well atteſted, do not only find credit themſelves, but give it alſo to other *truths.*

265. There are propoſitions that challenge the higheſt degree of our *aſſent* upon bare teſtimony, whether the thing propoſed agree or diſagree with common experience and the ordinary courſe of things or no: the reaſon whereof is, becauſe the teſtimony is of ſuch *an one* as cannot deceive nor be deceived; and that is *God* himſelf. This carries with it certainty beyond doubt, evidence beyond exception. This is called by a peculiar name, *revelation,* and our *aſſent* to it, *faith,* which has as much certainty in it as our knowledge itſelf; and we may as well doubt of our own *being,* as we can whether any *revelation* from *God* be *true.* So that *faith* is a ſettled and ſure principle of *aſſent* and *aſſurance,* and leaves no manner of room for doubt or heſitation; only we muſt be ſure, that it be a divine *revelation,* and that we underſtand it right, elſe we ſhall expoſe ourſelves to all the extravagancy of *enthuſiaſm,* and all the error of wrong principles, if we have *faith* and *aſſurance* in what is not *divine revelation.*

Sect. XL. *Of Reaſon.*

266. The word *reaſon,* in *Engliſh,* has different ſignifications. Sometimes it is taken for *true* and *clear principles;* ſometimes for *clear* and *fair deductions* from thoſe principles; ſometimes for the *cauſe,* and particularly for the *final cauſe:* but the conſideration we ſhall have of it here, is as it ſtands for a *faculty* whereby *man* is ſuppoſed to be diſtinguiſhed from *beaſts,* and wherein it is evident he much ſurpaſſes them.

267. Reaſon is neceſſary, both for the enlargement of our knowledge and regulating our aſſent; for it hath to do both in knowledge and opinion, and is neceſſary and aſſiſting to all our other intellectual faculties; and indeed contains *two* of them, *viz.* firſt, *Sagacity,* whereby it finds intermediate *ideas;* ſecondly, *Illation,* whereby it ſo orders and diſpoſes of them, as to diſcover what connection there is in each link of the chain, whereby the extremes are held together, and thereby, as it were, to draw into view the truth ſought for; which is that we call *illation,* or *inference,* and conſiſts in nothing but the perception of the connection there is between the *ideas* in each ſtep of the deduction; whereby the mind comes to ſee either the certain agreement or diſagreement of any two *ideas,* as in *demonſtration,* in which it arrives at knowledge; or their probable connection, on which it gives or withholds its *aſſent,* as in *opinion.*

268. *Senſe* and *intuition* reach but a little way: the greateſt part of our knowledge depends upon deductions and intermediate *ideas.* In thoſe caſes where we muſt take propoſitions for true, without being certain of their being ſo, we have need to find out, examine, and compare the grounds of their probability: in both caſes, the faculty which finds out the means, and rightly applies them to diſcover certainty in the one, and probability in the other, is that which we call *reaſon:* ſo that in reaſon we may conſider theſe *four* degrees; *Firſt,* The diſcovering and finding out of proofs. *Secondly,* The regular and methodical diſpoſition of them, and laying them in ſuch order as their connection may be plainly perceived. *Thirdly,* The perceiving their connection. *Fourthly,* The making a right concluſion.

Reaſon. 269. There is one thing more which deſerves to be conſidered concerning *reaſon;* and that is, whether *ſyllogiſm,* as is generally thought, be the proper inſtrument of it, and the uſefulleſt way of exerciſing this faculty. The cauſes to doubt of it, are theſe:

270. *Firſt,* Becauſe *ſyllogiſm* ſerves our *reaſon* but in one only of the forementioned parts of it; and that is, to ſhew the connection of the proofs of any one inſtance, and no more: but in this it is of no great uſe, ſince the mind can perceive ſuch connection, where it really is, as eaſily, nay perhaps better, without it. We may obſerve, that there are many men that reaſon exceeding clear and rightly, who know not how to make a *ſyllogiſm;* and ſcarce any one make *ſyllogiſms* in reaſoning within himſelf. Indeed, ſometimes they may ſerve to diſcover a fallacy, hid in a *rhetorical* flouriſh; or, by ſtripping an abſurdity of the cover of wit and good language, ſhew it in its naked deformity: but the weakneſs or fallacy of ſuch a looſe diſcourſe it ſhews, by the artificial form it is put into, only to thoſe who have thoroughly ſtudied *mode* and *figure,* and have ſo examined the many ways that three propoſitions may be put together, as to know which of them does certainly conclude right, and which not, and upon what grounds it is that they do ſo: but they who have not ſo far looked into thoſe forms, are not ſure, by virtue of *ſyllogiſm,* that the concluſion certainly follows from the premiſſes; the mind is not taught to reaſon by theſe *rules;* it has a native faculty to perceive the coherence or incoherence of its *ideas,* and can range them right without any ſuch perplexing *repetitions.*

271. And to ſhew the weakneſs of an argument, there needs no more but to ſtrip it of the ſuperfluous *ideas,* which, blended and confounded with thoſe on which the inference depends, ſeem to ſhew a connection where there is none, or at leaſt do hinder the diſcovery of the want of it; and then to lay the naked *ideas,* on which the force of the argumentation depends, in their due order; in which poſition the mind, taking a view of them, ſees what connection they have, and ſo is able to judge of the inference without any need of ſyllogiſm at all.

272. *Secondly,* Becauſe ſyllogiſms are not leſs liable to fallacies than the plainer ways of argumentation. And for this we appeal to common obſervation, which has always found theſe artificial methods of reaſoning more adapted to catch and entangle the mind, than to inſtruct and inform the underſtanding. And if it be certain that fallacy can be couched in ſyllogiſms, as it cannot be denied, it muſt be ſomething elſe, and not ſyllogiſm, that muſt diſcover them: but if men ſkilled in and uſed to ſyllogiſms, find them aſſiſting to their reaſon in the diſcovery of truth, we think they ought to make uſe of them. All that we aim at is, that they ſhould not aſcribe more to theſe forms than belongs to them; and think that men have no uſe, or not ſo full a uſe, of their reaſoning faculty without them.

273. But however it be in knowledge, it is of far leſs, or no uſe at all in *probabilities:* for the *aſſent* there being to be determined by the preponderancy, after a due weighing of all the proofs on both ſides, nothing is

Reason. is so unfit to assist the mind in that as *syllogism;* which running away with one assumed *probability*, pursues that till it has led the mind quite out of sight of the thing under consideration.

274. But let it help us (as perhaps may be said) *in convincing men of their errors or mistakes:* yet still it fails our reason in that part, which if not its highest perfection, is yet certainly its hardest task, and that which we most need its help in; and that is, the *finding out of proofs and making new discoveries*. This way of reasoning discovers no new proofs, but is the art of marshalling and ranging the old ones we have already. A man knows first, and then he is able to prove *syllogistically;* so that *syllogism* comes after knowledge; and then a man has little or no need of it. But it is chiefly by the finding out those *ideas* that shew the connection of distant ones, that our stock of knowledge is increased, and that useful arts and sciences are advanced.

275. *Reason*, though of a very large extent, fails us in several instances; as, *first*, Where our ideas fail. *Secondly*, It is often at a loss, because of the obscurity, confusion, or imperfection of the *ideas* it is employed about. Thus having no perfect *idea* of the least extension of *matter*, or of *infinity*, we are at a loss about the divisibility of *matter*. *Thirdly*, Our *reason* is often at a stand, because it perceives not those *ideas* which would serve to shew the certain or probable agreement or disagreement of any two other *ideas*. *Fourthly*, Our *reason* is often engaged in absurdities and difficulties, by proceeding upon false principles, which being followed lead men into contradictions to themselves, and inconsistency in their own thoughts. *Fifthly*, Dubious words, and uncertain signs, often puzzle mens *reason*, and bring them to a nonplus.

276. Though the deducing one proposition from another be a great part of reason, and that which it is usually employed about; yet the principal act of ratiocination, is the finding the agreement or disagreement of two *ideas* one with another, by the intervention of a third; as a man, by a yard, finds two houses to be of the same length, which could not be brought together to measure their equality by *juxta-position:* words have their consequences as the signs of such *ideas:* and things agree or disagree, as really they are; but we observe it only by our *ideas*.

In reasoning, men ordinarily use *four* sorts of *arguments*.

277. The *first* is to allege the opinions of men, whose parts, learning, eminency, power, or some other cause, has gained a name, and settled their reputation in the common esteem with some kind of authority: this may be called *argumentum ad verecundiam*.

278. *Secondly*, Another way is, to require the adversary to admit what they allege as a proof, or to assign a better: this is called *argumentum ad ignorantiam*. Reason.

279. A *third* way, is to press a man with consequences drawn from his own principles or concessions: this is known under the name of *argumentum ad hominem*.

280. *Fourthly*, The using of proofs drawn from any of the foundations of knowledge or probability: this is called *argumentum ad judicium*. This alone, of all the four, brings true instruction with it, and advances us in our way to knowledge: for, first, It argues not another man's opinion to be right, because I, out of respect, or any other consideration but that of conviction, will not contradict him. Secondly, It proves not another man to be in the right way, nor that I ought to take the same with him, because I know not a better. Thirdly, Nor does it follow, that another man is in the right way, because he has shewn me that I am in the wrong: this may dispose me, perhaps, for the reception of truth, but helps me not to it; that must come from *proofs and arguments*, and light arising from the nature of things themselves; not from my shamefacedness, ignorance, or error.

281. By what has been said of *reason*, we may be able to make some guess at the distinction of things into those that are according to, above, and contrary to, *reason*. *According to reason*, are such propositions whose truth we can discover by examining and tracing those *ideas* we have from *sensation* and *reflection*, and by natural deduction find to be true or probable. *Above reason*, are such propositions, whose *truth* or *probability* we cannot by *reason* derive from those principles. *Contrary to reason*, are such propositions as are inconsistent with, or irreconcileable to, our clear and distinct *ideas*. Thus the *existence of one God*, is according to *reason;* the *existence of more than one God*, contrary to *reason;* the *resurrection of the body* after death, above *reason*. *Above reason*, may be also taken in a double sense, viz. *above probability*, or, *above certainty:* in that large sense also, *contrary to reason* is sometimes taken.

282. There is another use of the word *reason*, wherein it is opposed to *faith;* which, though authorised by common use, yet is in itself a very improper way of speaking: for *faith* is nothing but a firm *assent* of the mind; which, if it be regulated as is our duty, cannot be afforded to any thing but upon good *reason*, and so cannot be opposite to it: he that believes without having any reason for believing, may be in love with his own fancies; but neither seeks *truth* as he ought, nor pays the obedience due to his Maker, who would have him use those discerning faculties he has given him, to keep him out of mistake and error.

METAPLASMUS, in grammar, a transmutation or change made in a word, by adding, retrenching, or altering a syllable or letter thereof.

METAPONTUM, or METAPONTIUM, (anc. geog.), a town of Lucania, on the Sinus Tarentinus, to the west of Tarentum; built by the Pylians, who returned from Troy, (Mela). Where Pythagoras is said to have taught in the time of Servius Tullius, (Livy). *Metapontini*, the people; who pretended to shew, in a temple of Minerva, the tools with which Epeus built the wooden horse, (Justin). Now a tower, called *Torre di Mare*, in the Basilicata of Naples, (Baudrand).

METASTASIS, in medicine, a transposition, or settlement of some humour or disease on some other part; and sometimes it signifies such an alteration of a disease

difeafe as is fucceeded by a folution.

METATARSUS, in anatomy. See there, nº 69.

METATHESIS, in grammar, a fpecies of the metaplafmus; being a figure whereby the letters or fyllables of a word are tranfpofed, or fhifted out of their ufual fituations, as *piftris* for *priftis*, *Lybia* for *Libya*, &c.

This word is, by phyficians, ufed with refpect to morbific caufes; which, when they cannot be evacuated, are removed to places where they are lefs injurious.

METEMPSYCHOSIS, the doctrine of tranfmigration, which fuppofes, that human fouls, upon their leaving the body, become the fouls of fuch kind of brutes as they moft refemble in their manners.

This was the doctrine of Pythagoras and his followers, who held, that the fouls of vicious men were imprifoned in the bodies of miferable beafts, there to do penance for feveral ages, at the expiration whereof they returned again to animate men; but if they had lived virtuoufly, fome happier brute, or even a human creature, was to be their lot. What led Pythagoras into this opinion was the perfuafion he had that the foul was not of a perifhable nature; whence he concluded, that it muft move into fome other body upon its abandoning this. Lucan thinks this doctrine was contrived to mitigate the apprehenfion of death, by perfuading men that they only changed their lodgings, and ceafed to live only to begin a new life. Reuchlin denies this doctrine, and maintains, that the metempfychofis of Pythagoras implied nothing more than a fimilitude of manners and defires formerly exifting in fome perfon deceafed, and now reviving in another alive. Pythagoras is faid to have borrowed the notion of a metempfychofis from the Egyptians; others fay from the ancient brachmans. It is ftill retained among the ancient Banians, and other idolaters of India and China, and makes the principal foundation of their religion. Many of the modern Jews are faid to efpoufe this doctrine; and, to fupport their opinion, quote thefe words of Job, "Lo all thefe things worketh God oftentimes with man (in Hebrew, *and thrice*) to bring back his foul from the pit to be enlightened with the light of the living." It is certain, that at the time of Jefus Chrift this opinion was very common among the Jews: this appears in the gofpel, when they fay, that fome thought Jefus Chrift to be John the Baptift, others Elias, others Jeremiah, &c.

METEMPTOSIS, a term in chronology, expreffing the folar equation, neceffary to prevent the new moon from happening a day too late; by which it is oppofed to proemptofis, which fignifies the lunar equation neceffary to prevent the new moon from happening a day too foon. The new moon's running a little backward, that is, coming a day too foon, at the end of three hundred twelve years and a half; by the proemptofis a day is added every three hundred years, and another every two thoufand four hundred years. On the other hand, by the metemptofis, a biffextile is fuppreffed every one hundred and thirty-four years; that is, three times in four hundred years. Thefe alterations are never made but at the end of each century; that period being very remarkable, and rendering the practice of the kalendar eafy.

There are three rules for making this addition or fuppreffion of the biffextile day, and by confequence for changing the index of the epacts. 1. When there is a metemptofis, the next following, or lower index, muft be taken. 2. When there is a proemptofis without a metemptofis, the next preceding or fuperior index is to be taken. 3. When there are both a metemptofis and proemptofis, or when there is neither the one nor the other, the fame index is preferved.

METEOR, (by the Greeks called μετεωρα, q. d. *fublima*, or "high raifed;" by the Latins *impreffiones*, as making figns or impreffions in the air), commonly denotes any bodies in the air that are of a flux or tranfitory nature. Hence it is extended to the phenomena of hail, rain, fnow, thunder, &c.; but is moft commonly confined to thofe unufual and fiery appearances named *falling-ftars*, *ignes fatui*, *auroræ boreales*, &c. whether they appear at a great diftance from the earth or not. —Till the difcovery of electricity thefe meteors could not be accounted for: but they are now refolved, by the almoft univerfal confent of philofophers, into the action of that fluid; which, tho' unheeded, hath fhewed itfelf in all ages.

A luminous appearance, which muft have been of an electric nature, is mentioned by Plutarch in his life of Lyfander; who confiders it as a meteor. Pliny, in his fecond book of Natural Hiftory, calls thofe appearances *ftars;* and tells us, that they fettled not only upon the mafts, and other parts of fhips, but alfo upon mens heads. "Stars, fays he, make their appearance, both on land and fea. I have feen a light in that form on the fpears of foldiers keeping watch by night upon the ramparts. They are feen alfo on the fail-yards, and other parts of the fhips, making an audible found, and frequently changing their places. Two of thefe lights forebode good weather and a profperous voyage; and drive away the fingle one, which wears a threatening afpect. This the failors call *Helen;* but the two they call *Caftor* and *Pollux*, and invoke them as gods. Thefe lights do fometimes, about the evening, reft on mens heads, and are a great and good omen." Seneca, in his natural queftions, chap. 1. takes notice of the fame phenomenon. "A ftar (fays he) fettled on the lance of Gylippus, as he was failing to Syracufe: and fpears feemed to be on fire in the Roman camp." In Cæfar we find the fame appearances attending a violent ftorm. "About that time, (fays the author,) there was a very extraordinary appearance in the army of Cæfar. In the month of February, about the fecond watch of the night, there fuddenly arofe a thick cloud, followed by a fhower of ftones; and the fame night, the points of the fpears belonging to the fifth legion feemed to be on fire." Livy alfo mentions two fimilar facts. "The fpears of fome foldiers in Sicily, and a walking ftick which a horfeman in Sardinia was holding in his hand, feemed to be on fire. The fhores were alfo luminous with frequent fires."

Thefe appearances are called, both by the French and Spaniards inhabiting the coafts of the Mediterranean, *St Helme's* or *St Telme's fires;* by the Italians, the *fires of St Peter and St Nicholas;* and are frequently taken notice of by the writers of voyages. If fome late accounts from France are to be depended upon, this phenomenon has been obferved at Plauzet for time immemorial; and Mr Binon, the curate of the place,

fays,

fays, that for 27 years, during which he refided there, in great ftorms accompanied with black clouds, and frequent lightning, the three-pointed extremities of the crofs of the fteeple of that place appeared furrounded with a body of flame; and that when this phenomenon has been feen, the ftorm was no longer to be dreaded, and calm weather returned foon after.

Modern hiftory furnifhes a great many examples of a fimilar kind; but the moft remarkable of thefe terreftrial meteors, if they may be fo called, is the *ignis fatuus*, or, in common Englifh, *Will with a wifp*, to which the credulous vulgar afcribe very extraordinary and efpecially mifchievous powers. This phenomenon is chiefly vifible in damp places, and is alfo faid to be very often feen in burying grounds, and near dunghills. Travellers fay, that it is very frequent near Bologna in Italy, and in feveral parts of Spain and Ethiopia. The form and fize of it are very various, and often variable.

It was the opinion of many philofophers, and efpecially Willoughby and Ray, that the ignis fatuus is made by fhining infects; but this opinion was never well fupported. Sir Ifaac Newton calls it *a vapour fhining without heat*, and fuppofes that there is the fame difference between this vapour and flame, that there is between wood fhining without heat, and burning coals of fire. That this opinion is juft, and, moreover, that the light of this vapour fhining without heat is of the fame nature with light from putrefcent fubftances, may, according to Dr Prieftley, be concluded from the following circumftances relating to them, as defcribed by Dr Derham, and G. B. Beccari.

The former of thefe gentlemen, having obferved an ignis fatuus in fome boggy ground, between two rocky hills, in a dark and calm night, got by degrees within two or three yards of it, and thereby had an opportunity of viewing it to the greateft advantage. It kept fkipping about a dead thiftle, till a flight motion of the air, occafioned, as he fuppofed, by his near approach to it, made it jump to another place; and as he advanced, it kept flying before him. He was fo near to it, that, had it been the fhining of glow-worms, he was fatisfied that he could not but have diftinguifhed the feparate lights of which it muft have confifted; whereas it was one uniform body of light. He therefore thought that it muft be an ignited vapour. Similar in fome refpects to this light, was one that furrounded the body and the bed of a woman at Milan, which fled from the hand that approached it, but was at length difperfed by the agitation of the air.

Mr Beccari made it his bufinefs to inquire concerning this phenomenon of all his acquaintance, who had had opportunities of obferving it, either on the mountains, or on the plain. He found that two which appeared on the plains, one to the north, and the other to the eaft of Bologna, were to be feen almoft every dark night, efpecially the latter; and the light they gave was equal to that of an ordinary faggot. That to the eaft of Bologna once appeared to a gentleman of his acquaintance, as he was travelling, and kept him company above a mile, conftantly moving before him, and cafting a ftronger light upon the road than the torch which was carried along with him. All thefe luminous appearances, he fays, gave light enough to make all the neighbouring objects vifible, and they were always obferved to be in motion, but this motion was various and uncertain. Sometimes they would rife up, and at other times fink; but they commonly kept hovering about fix feet from the ground. They would alfo difappear of a fudden, and inftantly appear again in fome other place. They differed both in fize and figure, fometimes fpreading pretty wide, and then again contracting themfelves; fometimes breaking into two, and then joining again; fometimes floating like waves, and dropping, as it were, fparks of fire. He was affured that there was not a dark night all the year round in which they did not appear, and that they were obferved more frequently when the ground was covered with fnow, than in the hotteft fummer; nor did rain or fnow in the leaft hinder their appearance; but, on the contrary, they were obferved more frequently, and caft a ftronger light in rainy and wet weather; nor were they much affected by the wind.

The grounds to the eaft of Bologna, where the largeft of thefe appearances was feen, is, he fays, a hard chalky and clayey foil, which will retain the water a long time, and afterwards, in hot weather, would break into large cracks; but on the mountains, where the *ignes fatui* were fmaller, the foil was of a loofe fandy texture, which would not keep the water very long. According to the beft information he could procure, thefe lights very much frequent brooks and rivers, being often obferved on the banks of them; perhaps, he fays, becaufe the current of air carries them thither more readily than to any other place.

This gentleman concludes his account of thefe appearances with the following curious narrative. An intelligent gentleman travelling in March, between eight and nine in the evening, in a mountainous road, about ten miles fouth of Bologna, perceived a light, which fhone very ftrongly upon fome ftones which lay on the banks of the river Rioverde. It feemed to be about two feet above the ftones, and not far from the water. In fize and figure it had the appearance of a parallelopiped, fomewhat more than a foot in length, and half a foot high, the longeft fide being parallel to the horizon. Its light was fo ftrong, that he could plainly diftinguifh by it part of a neighbouring hedge, and the water of the river; only in the eaft corner of it the light was rather faint, and the fquare figure lefs perfect, as if it was cut off or darkened by the fegment of a circle.

His curiofity tempting him to examine this appearance a little nearer, he advanced gently towards the place; but was furprifed to find that it changed gradually from a bright red, firft to a yellowifh, and then to a pale colour, in proportion as he drew nearer; and when he came to the place itfelf it quite vanifhed. Upon this he ftepped back, and not only faw it again, but found that the farther he went from it, the ftronger and brighter it grew. When he examined the place of this luminous appearance, he could not perceive the leaft fmell, or any other mark of fire.

This extraordinary account was confirmed to M. Beccari by another gentleman, who frequently travelled the fame road, and who affured him that he had feen the very fame light five or fix different times, in fpring and autumn, and that he had always obferved it

it to be of the very fame fhape, and in the fame place; and he once took particular notice of its coming out of a neighbouring place, and fettling itfelf in the figure above defcribed.

M. Beccari owns himfelf to be greatly at a lofs to account not only for this very remarkable appearance, but alfo for the *ignes fatui* in general. He only fays, that all perfons who ever faw any of thefe appearances, agree, that they caft a light quite different from that of fhining flies.

Dr Shaw defcribes an ignis fatuus, which he faw in the Holy Land, the circumftances of which are very remarkable. As he and his company were travelling by night, through the valleys of mount Ephraim, they were attended, more than an hour, by an ignis fatuus, which was fometimes globular, or in the form of the flame of a candle; and which would, immediately afterwards, fpread itfelf fo much as to involve the whole company in a pale inoffenfive light, and then contract itfelf again, and fuddenly difappear. But in lefs than a minute it would become vifible as before; or, running along from one place to another, with a fwift progreffive motion, would expand itfelf, at certain intervals, over more than two or three acres of the adjacent mountains. The atmofphere, from the beginning of the evening, had been remarkably thick and hazy, and the dew, as they felt it upon their bridles, was unufually clammy and unctuous. In the fame kind of weather, he fays, he has obferved thofe luminous appearances, which, at fea, fkip about the mafts and yards of fhips, and which the failors call *corpufanfe*, which is a corruption of the Spanifh *cuerpo fanto*.

Of the *celeftial* meteors, the moft common are thofe called *falling-ftars*, which are fo well known, that it is needlefs to defcribe them. They do not very often appear of a larger fize than the brighteft fixed ftars, tho' fometimes they equal Jupiter, or even Venus in apparent bulk, and are then exceedingly bright. They fometimes rife high in the air; for Mr Brydone takes notice of his having feen them as high to appearance above the top of Mount Ætna, as they ufually appear when viewed from the ordinary ground. Sometimes, however, they are much lower. Signior Beccari mentions one which feemed to direct its courfe towards the place where he fat, growing continually larger and larger as it advanced, till at laft it difappeared at no great diftance, and left the faces, hands, and clothes, of thofe who faw it, and all the neighbouring objects, fuddenly illuminated with a diffufed and lambent light attended with no noife at all. While they were ftarting up, ftanding and looking at one another, furprifed at the appearance, a fervant came running to them out of a neighbouring garden, and afked them if they had feen nothing; for that he had feen a light fhine fuddenly in the garden, and efpecially upon the ftreams which he was throwing to water it.

The other kinds of celeftial meteors are, aurora borealis, lightning of various forms, and large fire-balls. All thefe too fometimes appear very high, and fometimes very low; the fire-balls efpecially, will fometimes ftrike the ground, and explode with great violence, producing many mifchievous effects. See Atmosphere, Aurora Borealis, Cloud, Lightning, &c.

The general principles on which the phenomena of meteors depend, have already been fo fully explained under the article Electricity, &c. that very little remains to be added in this place. The inoffenfive lights, fuch as appear on the points of metallic bodies, the ignis fatuus, &c. are occafioned by a current of electric matter fetting into or out of any particular body; for wherever that fluid is much agitated, there a light will be vifible. If at the fame time there is a confiderable difference between the electricity of the atmofphere and the furface of the ground, the electric ftream will be quietly imbibed, and no dangerous confequences will enfue to thofe who approach it; but if the electricity of the atmofphere and the ground happens to be much the fame, the fluid will then be much compreffed, will burn, explode, and produce all the mifchief of the forked or crooked lightning, or of that kind which appears in the form of balls, and which is fully explained under the article Lightning.

METHOD, the arrangement of our ideas in fuch a regular order, that their mutual connection and dependence may be readily comprehended. See Logic, n° 114.—118.

METHODISTS, a name at firft given to a fociety of religious young men at Oxford, and now applied to all thofe who adhere to the doctrine of the church of England as taught by Whitefield, Wefley, &c. They are faid to be, in general, plain well-meaning people, who do not diffent from the eftablifhed church, but profefs to live with great purity according to her articles. At their firft appearance their teachers were charged, in the heat of their zeal, with feveral irregularities, and many expreffions in their preaching which were not altogether unexceptionable: but as the civil government, with a moderation and wifdom peculiar to the prefent time, thought fit to overlook their behaviour, they have fince honeftly acknowledged wherein they were miftaken; and, in confequence of the perfect liberty of confcience they enjoy, have fubfided into a more regular and peaceable conduct, agreeable to the genuine fpirit of Chriftianity.

Methodists, *Methodici*, is alfo an appellation given to a fect of ancient phyficians, who reduced the whole healing art to a few common principles or appearances.

METHODIUS, a father of the church, bifhop of Olympus or Patara in Lycia, and afterward of Tyre in Paleftine, fuffered martyrdom at Chalcis in Greece toward the end of Dioclefian's perfecution in the year 302. He compofed many works in a clear and elaborate ftile, which were extant in Jerome's time. Father Combefis collected feveral confiderable fragments of this writer, cited by Epiphanius, Photius, and others; and printed them with notes of his own, together with the works of Amphilochius, and Andreas Cretenfis, in folio, Paris 1644.

METIUS (James), of Alcmaer, in Holland, the inventor of telefcopes with glaffes, one of which he prefented to the States General in 1609. Tubes extended, by uniting them, to a great length, were known to the ancients; but Metius was the firft who added glaffes, and he was indebted to chance for the difcovery: he had frequently obferved fome fchool-boys playing upon the ice, who made ufe of their co-

py-

py books rolled up in the ſhape of tubes, to look at each other, to which they ſometimes added pieces of ice at each end, to view diſtant objects: this led him to the invention of optic glaſſes.

METO, a famous mathematician of Athens, 432 B. C. publiſhed his *Anneadecatoride*, that is, his Cycle of Nineteen years, by which he endeavoured to adjuſt the courſe of the ſun to that of the moon, and to make the ſolar and lunar years begin at the ſame point of time. See Cycle *of the Moon*.

METONYMY, in rhetoric, is a trope in which one name is put for another, on account of the near relation there is between them. See Oratory, n° 51.

METOPE, in architecture, is the interval, or ſquare ſpace between the triglyphs of the Doric freeze, which among the ancients uſed to be painted or adorned with carved work, repreſenting the heads of oxen, or utenſils uſed in ſacrifices.

METOPOSCOPY, the pretended art of knowing a perſon's diſpoſitions and manners, by viewing the traces and lines in the face. Ciro Spontoni, who has wrote expreſsly on metopoſcopy, ſays, that ſeven lines are examined in the forehead, and that each line is conſidered as having its particular planet: the firſt is the line of Saturn, the ſecond of Jupiter, the third of Mars, &c. Metopoſcopy is only a branch of phyſiognomy, which founds its conjectures on all the parts of the body.

METRE, μετρικ, in poetry, a ſyſtem of feet of a juſt length.

The different metres in poetry, are the different manners of ordering and combining the quantities, or the long and ſhort ſyllables: thus hexameter, pentameter, iambic, ſapphic verſes, &c. conſiſt of different metres, or meaſures. See Hexameter.

In Engliſh verſes, the metres are extremely various and arbitrary, every poet being at liberty to introduce any new form that he pleaſes. The moſt uſual are the heroic, generally conſiſting of five long and five ſhort ſyllables, and verſes of four feet, and of three feet, and a cæſura, or ſingle ſyllable.

The ancients, by variouſly combining and tranſpoſing their quantities, made a vaſt variety of different meaſures, by forming ſpondees, &c. of different feet. See Poetry, n° 124, &c.

METRODORUS, a Greek phyſician, born at Chios, was the diſciple of Democritus the philoſopher, and the maſter of Hippocrates the phyſician and Anaxarchus the philoſopher. He maintained, that the univerſe is infinite and eternal: but his works are loſt. He lived about 444 B. C.

METROPOLIS, the capital or principal city of a country or province.

The term *metropolis* is alſo applied to archiepiſcopal churches, and ſometimes to the principal or mother-church of a city. The Roman empire having been divided into 13 dioceſes and 120 provinces, each dioceſe and each province had its metropolis, or capital city, where the proconſul had his reſidence. To this civil diviſion, the eccleſiaſtical was afterwards adapted, and the biſhop of the capital city had the direction of affairs, and the preheminence over all the biſhops of the province. His reſidence in the metropolis gave him the title of *metropolitan*. This erection of metropolitans is referred to the end of the third century, and was confirmed by the council of Nice. A metropolitan has the privilege of ordaining his ſuffragans; and appeals from ſentences paſſed by the ſuffragans are preferred to the metropolitan.

METZ, an ancient, large, and ſtrong town of France, and capital of the territory of Meſſin, with a citadel, a parliament, and a biſhop's ſee, whoſe biſhop aſſumes the title of a *prince of the empire*. The cathedral church is one of the fineſt in Europe, and the ſquare called *Coſlin*, and the houſe of the governor, are worth ſeeing. The Jews live in a part of the town by themſelves, where they have a ſynagogue. The ſweetmeats they make here are in high eſteem. It is ſeated at the confluence of the rivers Moſelle and Seille. E. Long. 6. 16. N. Lat. 49. 7.

MEURSIUS (John), a learned and laborious writer, born at Loſdun, near the Hague, in 1579. He early diſcovered a fondneſs for polite literature and the ſciences; and went to ſtudy the law at Orleans with the ſon of Barneveldt, whom he accompanied in his travels. In 1610 he was made profeſſor of hiſtory at Leyden, and afterwards Greek profeſſor. His reputation daily increaſing, Chriſtian IV. king of Denmark made him profeſſor of hiſtory and politics, in the univerſity of Sora. Meurſius filled that chair with univerſal applauſe; and died in 1641, aged 62. He wrote many learned works, ſeveral of which relate to the ancient ſtate of Greece; as, 1. *De populis Atticæ*. 2. *Atticarum lectionum libri* vi. 3. *Archontes Athenienſes*. 4. *Fortuna Attica*. 5. *De Athenarum origine*. 6. *De feſtis Græcorum*, &c. John Meurſius, his ſon, was alſo the author of ſeveral works. It ſeems almoſt needleſs to obſerve, that the ſcandalous obſcene Latin work, intitled *Meurſius*, is not either of our author or his ſon; but, as is ſaid, the notable production of one John Weſtranus, a lawyer at the Hague.

MEW, Sea-mew, or *Sea-mall*. See Anas.

Winter-Mew, or *Coddy-moddy*, in ornithology. See Larus.

MEWING, the falling off or change of hair, feathers, ſkin, horns, or other parts of animals, which happens in ſome annually, in others only at certain ſtages of their lives: but the generality of beaſts mew in the ſpring. An old hart caſts his horns ſooner than a young one, which is commonly in the months of February and March, after which they begin to button in March or April: and as the ſun grows ſtrong, and the ſeaſon of the year puts forth the fruits of the earth, ſo their heads grow, and are ſummed full by the middle of June. It is to be obſerved, that if a hart be gelt before he has a head, he will never have any; and if he be gelt after he has a head, he will never caſt his horns; again, if he be gelt when he has a velvet-head, it will always be ſo, without fraying, or burniſhing.

MEXICO, otherwiſe called *New-Spain*; a large country of America, bounded on the north by New-Mexico, on the eaſt by the gulf of Mexico and the North Sea, and on the ſouth and weſt by South America and the South Sea; extending upwards of 2000 miles in length, and from 60 to 600 in breadth.

1 Conqueſt of Mexico undertaken by Cortes.

This country was firſt diſcovered, though imperfectly, by a Spaniard named *Nunez de Balboa*; but, in 1518, the conqueſt of it was undertaken by a celebrated adventurer named *Ferdinando Cortes*. It was not, how-

however, without great difficulty that he got his expedition ſet on foot; being perſecuted by the Spaniſh governors in the Weſt Indies, ſo that he was at laſt obliged to throw off his allegiance to them, and proceed without any commiſſion. However, on the 10th of February 1519, he ſet ſail from the Havannah in Cuba; and ſoon landed on the iſland of Cozumel, on the coaſt of Yucatan, diſcovered the preceding year. Here he joined one of his officers named *Pedro d' Alvaredo*, who had arrived ſome days before, and collected ſome booty and taken a few priſoners. But the general ſeverely cenſured his conduct; and the priſoners were diſmiſſed, after they had been informed by an Indian interpreter named *Melchior*, that ſuch injuries were entirely diſagreeable to the intentions and wiſhes of Cortes. Here he muſtered his army, and found that it amounted to 508 ſoldiers, 16 horſemen, and 109 mechanics, pilots, and mariners. Having encouraged his men by a proper ſpeech, and releaſed, by means of ſome Indian ambaſſadors, a Spaniard named *Jerom de Aguilar*, who had been detained a priſoner for eight years, he proceeded to the river Tabaſco, where he hoped to be received in a friendly manner, as one Grijalva had been a ſhort time before; but, from ſome unknown cauſe, he was violently attacked by them: however, the ſuperiority of the Spaniſh arms ſoon decided the victory, and the inhabitants were obliged to own the king of Caſtile as their ſovereign.

2
Receives an embaſſy from the emperor of Mexico.

The Spaniards then continued their courſe weſtward, to the harbour of St Juan de Ullua; where they were met by two Mexican canoes, who carried two ambaſſadors from the emperor of that country, and ſhewed the greateſt ſigns of peace and amity. Their language was unknown to Aguilar; but one of the female ſlaves above-mentioned underſtood it, and tranſlated it into the Yucatan tongue; after which Aguilar interpreted the meaning in Spaniſh. This ſlave was afterwards named *Donna Marina*, and proved very uſeful in their conferences with the natives.

3
State of the empire at that time.

At this time the Mexican empire, according to Dr Robertſon, was arrived at a pitch of grandeur to which no ſociety had ever attained in ſo ſhort a period. Though it had ſubſiſted only for 130 years, its dominion extended from the north to ſouth ſea; over territories ſtretching about 500 leagues from eaſt to weſt, and more than 200 from north to ſouth; comprehending provinces not inferior in fertility, population, and opulence, to any in the torrid zone. The reigning emperor was called Montezuma, or *Motezuma*, whoſe authority was very deſpotic, and his temper haughty and cruel. Though by nature he poſſeſſed a good deal of courage and reſolution; yet from the firſt moment that the Spaniards appeared on his coaſt, he diſcovered ſymptoms of timidity and embarraſſment, and all his ſubjects were embarraſſed as well as himſelf. The general diſmay which took place on this occaſion was partly owing to the ſtrange figure the Spaniards made, and the prodigious power of their arms; but partly alſo to the following circumſtance. An opinion prevailed almoſt univerſally among the Americans, if we may believe the earlieſt and moſt authentic hiſtorians, that ſome dreadful calamity impended over their heads, from a race of formidable invaders who ſhould come from regions towards the riſing ſun, to over-run and deſolate their country. Whether this diſquieting apprehenſion flowed from the memory of ſome natural calamity which had afflicted that part of the globe, and impreſſed the minds of the inhabitants with ſuperſtitious fears and forebodings; or whether it was an imagination accidentally ſuggeſted by the aſtoniſhment which the firſt ſight of a race of new men occaſioned, it is impoſſible to determine. But as the Mexicans were more prone to ſuperſtition than any people in the new world, they were more deeply affected with the appearance of the Spaniards, whom they inſtantly ſuppoſed to be the inſtruments deſtined to bring about that fatal revolution which they dreaded: and this produced the embaſſy above-mentioned.

By means of his two interpreters, Donna Marina, and Aguilar, Cortes learned that the chiefs of the Mexican embaſſy were deputies from Pilpatoe and Teutile; the one governor of a province under the emperor, and the other the commander of all his forces in that province: the purport of their embaſſy was, to inquire what his intentions were in viſiting their coaſts, and to offer him what aſſiſtance he might need in order to continue his voyage. Cortes, in his turn, alſo profeſſed the greateſt friendſhip; and informed the ambaſſadors, that he came to propoſe matters of the utmoſt conſequence to the welfare of the prince and his kingdom; which he would more fully unfold in perſon to the governor and the general. Next morning, without waiting for any anſwer, he landed his troops, his horſes, and his artillery; began to erect huts for his men, and to fortify his camp. The natives, inſtead of oppoſing the entrance of theſe fatal gueſts into their country, aſſiſted them in all their operations, with an alacrity which they had ere long reaſon to repent.

4
Cortes lands and fortifies his camp.

The next day the ambaſſadors had a formal audience; at which Cortes acquainted them, that he came from Don Carlos of Auſtria, king of Caſtile, the greateſt monarch of the eaſt, and was intruſted with propoſitions of ſuch moment, that he would impart them to none but the emperor himſelf, and therefore required to be conducted immediately to the capital. This demand immediately produced the greateſt uneaſineſs; and the ambaſſadors did all in their power to diſſuade Cortes from his deſign, endeavouring to conciliate his good-will by the preſents ſent him by Montezuma. Theſe they introduced with great parade, and conſiſted of fine cotton-cloth, of plumes of various colours, and of ornaments of gold and ſilver to a conſiderable value, the workmanſhip of which appeared to be as curious as the materials were rich. But theſe preſents ſerved only to excite the avidity of the Spaniards, and to increaſe their deſire for becoming maſters of a country which abounded with ſo many precious commodities. Cortes indeed could ſcarcely reſtrain himſelf ſo far as to hear the arguments made uſe of by the ambaſſadors to diſſuade him from going to the capital; and, in a haughty, determined tone, inſiſted on his former demand of being admitted to a perſonal interview with their ſovereign.

5
The Indians endeavour to diſſuade him from going to the capital, but in vain.

During this converſation, ſome painters in the retinue of the Mexican chiefs had been diligently employed in delineating, upon white cotton cloths, figures of the ſhips, horſes, artillery, ſoldiers, and whatever elſe attracted their eyes as ſingular. When Cortes obſerved this, and was informed that theſe pictures were to be ſent to Montezuma, he reſolved to render the repreſentation ſtill more ſtriking and intereſting. The trumpets, by his orders, ſounded an alarm; the

Mexico. troops formed in order of battle, and ſhewed their agility and ſtrength in the beſt manner they could; while the artillery was pointed againſt the neighbouring trees, among which it made dreadful havock. The Indians for ſome time looked on with ſilent aſtoniſhment; but at the exploſion of the cannon, ſome fled, others fell to the ground, and all were ſo confounded, that Cortes found it difficult to quiet and compoſe their minds.

6 Montezuma made acquainted with his deſign.

When the painters had exerted their utmoſt efforts in repreſenting all theſe wonderful things, meſſengers were immediately diſpatched to Montezuma with the pictures, and a full account of every thing that had paſſed ſince the arrival of the Spaniards, together with ſome European curioſities to Montezuma; which, though of no great value, Cortes believed would be acceptable on account of their novelty. The Mexican monarchs, in order to obtain the earlieſt information of every occurrence in all parts of their empire, had couriers poſted at proper ſtations along the principal roads; and as theſe were trained to agility by a regular education, they conveyed intelligence with ſurpriſing rapidity. Though the city in which Montezuma reſided was above 180 miles from St Juan de Ullua, Cortes's preſents were carried thither, and an anſwer returned to his demands, in a few days.

7 Sends an unfavourable anſwer, but accompanied with rich preſents.

As the anſwer was unfavourable, Montezuma had endeavoured to mollify the Spaniſh general by the richneſs of his preſents. Theſe conſiſted of the manufactures of the country; cotton-ſtuffs ſo fine, and of ſuch delicate texture, as to reſemble ſilk; pictures of animals, trees, and other natural objects, formed with feathers of different colours, diſpoſed and mingled with ſuch ſkill and elegance as to rival the works of the pencil in truth and beauty of imitation. But what chiefly attracted their attention, were two large plates of a circular form; one of maſſive gold repreſenting the ſun, the other of ſilver repreſenting the moon. Theſe were accompanied with bracelets, collars, rings, and other trinkets of gold; and that nothing might be wanting which could give the Spaniards a complete idea of what the country afforded, ſome boxes filled with pearls, precious ſtones, and grains of gold unwrought, as they had been found in the mines or rivers, were ſent along with the reſt. Cortes received all with an appearance of the moſt profound reſpect for Montezuma; but when the Mexicans, preſuming upon this, informed him, that their maſter, though he deſired him to accept of what he had ſent as a token of his regard for the prince whom he repreſented, would not give his conſent that foreign troops ſhould approach nearer to his capital, or even allow them to continue longer in his dominions.

8 Cortes ſtill inſiſts on his demand.

Cortes declared, in a manner more reſolute and peremptory than formerly, that he muſt inſiſt on his firſt demand; as he could not, without diſhonour, return to his own ſovereign until he was admitted into the preſence of the prince whom he was appointed to viſit in his name. The Mexicans were aſtoniſhed at the ſight of a man who dared to oppoſe the will of their emperor; but not being willing to come to an open rupture with ſuch formidable enemies, with much ado they prevailed upon Cortes to promiſe that he would not move from his preſent camp until the return of a meſſenger whom they ſent to Montezuma for further inſtructions.

The puſillanimity of the Indian monarch afforded time to the Spaniards to take meaſures which would have been out of their power had they been vigorouſly attacked on their firſt refuſal to obey his orders. Cortes uſed every method of ſecuring the affections of the ſoldiers; which indeed was very neceſſary, as many of them began to exclaim againſt the raſhneſs of his attempt in leading them againſt the whole force of the Mexican empire.

9 Montezuma peremptorily commands him to leave his dominions.

In a ſhort time Teutile arrived with another preſent from Montezuma, and together with it delivered the ultimate orders of that monarch to depart inſtantly out of his dominions; and when Cortes, inſtead of complying with his demands, renewed his requeſt of audience, the Mexican immediately left the camp with ſtrong marks of ſurpriſe and reſentment. Next morning, none of the natives appeared; all friendly correſpondence ſeemed to be at an end, and hoſtilities were expected to commence every moment. A ſudden conſternation enſued among the Spaniards, and a party was formed againſt him by the adherents of Velaſques; who took advantage of the occaſion, and deputed one of their number, a principal officer, to remonſtrate, as if in name of the whole army, againſt his raſhneſs, and to urge the neceſſity of his returning to Cuba. Cortes received the meſſage without any appearance of emotion; and as he well knew the temper and wiſhes of his ſoldiery, and foreſaw how they would receive a propoſition ſo fatal to all the ſplendid hopes and ſchemes which they had been forming with ſuch complacency, he pretended to comply with the requeſt now made him, and iſſued orders that the army ſhould be in readineſs next day to embark for Cuba. Upon hearing this, the troops, as Cortes had expected, were quite outrageous: they poſitively refuſed to comply with theſe orders, and threatened immediately to chooſe another general if Cortes continued to inſiſt on their departure.

Our adventurer was highly pleaſed with the diſpoſition which now appeared among his troops: nevertheleſs, diſſembling his ſentiments, he declared, that his orders for embarking had proceeded from a perſuaſion that it was agreeable to his fellow-ſoldiers, to whoſe opinion he had ſacrificed his own; but now he acknowledged his error, and was ready to reſume his original plan of operation. This ſpeech was highly applauded; and Cortes, without allowing his men time to cool, ſet about carrying his deſigns into execution.

10 Villa Rica founded.

In order to give a beginning to a colony, he aſſembled the principal perſons in his army, and by their ſuffrages elected a council and magiſtrates, in whom the government was to be veſted. The perſons choſen were moſt firmly attached to Cortes; and the new ſettlement had the name of *Villa Rica de la vera Cruz*; that is, the rich town of the true croſs.

11 The government of the new colony veſted in Cortes.

Before this court of his own making, Cortes did not heſitate at reſigning all his authority, and was immediately re-elected chief-juſtice of the colony, and captain-general of its army, with an ample commiſſion, in the king's name, to continue in force till the royal pleaſure ſhould be farther known. The ſoldiers eagerly ratified their choice by loud acclamations; and Cortes, now conſidering himſelf as no longer accountable to any ſubject, began to aſſume a much greater degree of dignity, and to exerciſe more extenſive powers, than he had done before. Some of the ſoldiers began to exclaim againſt the proceedings of the council as illegal; but the ringleaders were in-

 ſtantly

Mexico. ſtantly ſent on board the fleet loaded with irons. By this timely ſeverity the reſt were overawed; and Cortes, knowing of how great importance unanimity was to his future ſucceſs, ſoon found means to reconcile thoſe who were moſt diſaffected; to which purpoſe a liberal diſtribution of the Mexican gold, both among friends and foes, contributed not a little.

11
Makes an alliance with the Cacique of Zempoalla.

Cortes, having thus ſtrengthened himſelf as well as he could, reſolved to advance into the country; and to this he was encouraged by the behaviour of the cacique or petty prince of Zempoalla, a conſiderable town at no great diſtance. This prince, though ſubject to Montezuma, was exceedingly impatient of the yoke; and ſo filled with dread and hatred of the emperor, that nothing could be more acceptable to him than an appearance of being delivered from that ſubjection; and a deliverance of this kind he now hoped from the Spaniards. For this reaſon he ſent ambaſſadors to Cortes, with offers of friendſhip, which were gladly accepted by him; and in conſequence of the alliance, he very ſoon viſited Zempoalla. Here he was received in the moſt friendly manner imaginable, and had a reſpect paid towards him almoſt equivalent to adoration. The cacique informed him of many particulars relating to the character of Montezuma.—He told him, that he was a tyrant, haughty, cruel, and ſuſpicious; who treated his own ſubjects with arrogance, ruined the conquered provinces by his extortions, and often tore their ſons and daughters from them by violence; the former to be offered as victims to his gods, the latter to be reſerved as concubines for himſelf and favourites. Cortes, in reply, artfully inſinuated, that one great object of the Spaniards in viſiting a country ſo remote from their own was, to redreſs grievances, and to relieve the oppreſſed; and having encouraged him to hope for this interpoſition in due time, continued his march to Quiabiſlan, the territory of another cacique, and where, by the friendly aid of the Indians, a Spaniſh colony was ſoon formed.

12
Character of Montezuma given by the cacique.

During the reſidence of Cortes in theſe parts, he ſo far wrought on the minds of the caciques of Zempoalla and Quiabiſlan, that they ventured to inſult the Mexican power, at the very name of which they had been formerly accuſtomed to tremble. Some of Montezuma's officers having appeared to levy the uſual tribute, and to demand a certain number of human victims, as an expiation of their guilt in preſuming to hold intercourſe with thoſe ſtrangers whom the emperor had commanded to leave his dominions; inſtead of obeying his orders, they made them priſoners, treated them with great indignity, and, as their ſuperſtition was no leſs barbarous than Montezuma's, they threatened to ſacrifice them to their gods. From this laſt danger, however, they were delivered by the interpoſition of Cortes, who manifeſted the utmoſt horror at the mention of ſuch a deed. This act of rebellion firmly attached the two caciques to the intereſt of Cortes; and without heſitation they acknowledged themſelves vaſſals of the king of Spain. Their example was followed by the Totonaques, a fierce people who inhabited the mountainous parts of the country. They willingly ſubjected themſelves to the crown of Caſtile; and offered to accompany Cortes with all their forces in his march towards Mexico.

13
The caciques of Zempoalla, Quiabiſlan, and ſome others, ſubmit.

Though Cortes had now taken ſuch meaſures as in a manner enſured his ſucceſs; yet, as he had thrown off all dependence on the governor of Cuba, who was his lawful ſuperior, and apprehended his intereſt at court, he thought proper, before he ſet out on his intended expedition, to take the moſt effectual meaſures againſt the impending danger. With this view, he perſuaded the magiſtrates of his colony to addreſs a letter to the king, containing a pompous account of their own ſervices, of the country they had diſcovered, &c. and of the motives which had induced them to throw off their allegiance to the governor of Cuba, and to ſettle a colony dependent on the crown alone, in which the ſupreme power civil as well as military had been veſted in Cortes; humbly requeſting their ſovereign to ratify what had been done by his royal authority. Cortes himſelf wrote in a ſimilar ſtrain; but as he knew that the Spaniſh court, accuſtomed to the repeated exaggerations of American adventurers, would give little credit to the ſplendid accounts of New-Spain, if they were not accompanied with ſuch a ſpecimen of what it contained as would excite an high idea of its opulence, he ſolicited his ſoldiers to relinquiſh what they might claim as their part of the treaſures which had hitherto been collected, in order that the whole might be ſent to the king. Portocarrero and Montejo, the chief magiſtrates of the colony, were appointed to carry this preſent to Caſtile, with expreſs orders not to touch at Cuba in their paſſage thither. But while a veſſel was preparing for their departure, an unexpected event produced a general alarm. Some ſoldiers and ſailors, ſecretly diſaffected to Cortes, formed a deſign of ſeizing one of the brigantines, and making their eſcape to Cuba, in order to give ſuch intelligence to the governor, as might enable him to intercept the veſſel which was to carry the treaſure and diſpatches to Spain. This conſpiracy was conducted with profound ſecreſy; but at the moment when every thing was ready for execution, the ſecret was diſcovered by one of the aſſociates. The latent ſpirit of diſaffection which Cortes was now too well convinced had not been extinguiſhed amongſt his troops, gave him very great uneaſineſs. The only method which he could think of to prevent ſuch conſpiracies for the future was, to deſtroy his fleet; and thus deprive his ſoldiers of every reſource except that of conqueſt: and with this propoſal he perſuaded his men to comply. With univerſal conſent therefore the ſhips were drawn aſhore, and, after being ſtripped of their ſails, rigging, iron-work, and whatever elſe might be of uſe, they were broke in pieces.

14
The magiſtrates of Villa Rica ſend a letter to the king of Spain in favour of Cortes.

15
Cortes burns his fleet.

Cortes having thus rendered it neceſſary for his troops to follow wherever he choſe to lead, began his march from Zempoalla with 500 infantry, 15 horſe, and ſix field-pieces. The reſt of his troops, conſiſting chiefly of ſuch as from age or infirmity were leſs fit for active ſervice, he left as a garriſon in Villa Rica, under the command of Eſcalante, an officer of merit, and warmly attached to his intereſt. The cacique of Zempoalla ſupplied him with proviſions; and with 200 of thoſe Indians called *Tamames*, whoſe office, in a country where tame animals were unknown, was to carry

Mexico. carry burdens, and perform all manner of servile labour. He offered likewise a considerable body of troops; but Cortes was satisfied with 400; taking care, however, to choose persons of such note, that they might serve as hostages for the fidelity of their master.

Nothing memorable happened till the Spaniards arrived on the confines of the republic of Tlascala. The inhabitants of that province were warlike, fierce, and revengeful, and had made considerable progress in agriculture and some other arts. They were implacable enemies to Montezuma; and therefore Cortes hoped that it would be an easy matter for him to procure their friendship. With this view, four Zempoallans of high rank were sent ambassadors to Tlascala, dressed with all the badges of that office usual among the Indians. The senate were divided in their opinions with regard to the proposals of Cortes: but at last, Magiscatzin, one of the oldest senators, and a person of great authority, mentioned the tradition of their ancestors, and the revelations of their priests; that a race of invincible men, of divine origin, who had power over the elements, should come from the east to subdue their country. He compared the resemblance which the strangers bore to the persons figured in the tradition of Mexico, their dominion over the elements of fire, air, and water; he reminded the senate of their prodigies, omens, and signals, which had lately terrified the Mexicans, and indicated some very important event; and then declared his opinion, that it would be rashness to oppose a force apparently assisted by heaven, and men who had already proved, to the sad experience of those who opposed them, that they were invincible. This orator was opposed by Xicotencal, who endeavoured to prove that the Spaniards were at best but powerful magicians; that they had rendered themselves obnoxious to the gods by pulling down their images and altars, (which indeed Cortes had very imprudently done at Zempoalla); and of consequence, that they might easily be overcome, as the gods would not fail to resent such an outrage. He therefore voted for war, and advised the crushing of these invaders at one blow.

16 Sends ambassadors to the republic of Tlascala.

17 The Tlascalans resolve on war.

The advice of Xicotencal prevailed; and in consequence of it, the ambassadors were detained; which giving Cortes the alarm, he drew nearer the city of Tlascala. In this transaction we may easily see how little the Tlascalans, notwithstanding all their ferocity, were skilled in military affairs. They suffered Cortes, with his army drawn up in good order, to pass a strong wall between two mountains, which might have been very advantageously defended against him. He had not advanced far beyond this pass, however, before a party of Tlascalans with plumes were discovered, which denoted that an army was in the field. These he drove before him by a detachment of six horse, obliged them to join another party, and then reinforcing the advanced detachment, charged the enemy with such vigour that they began to retire. Five thousand Tlascalans, whom Xicotencal had placed in ambush, then rushed out of their hiding places, just as the infantry came up to assist their slender body of cavalry. The enemy attacked with the utmost fury; but were so much disconcerted by the first discharge of the fire-arms, that they retreated in confusion, furnishing the Spaniards with an opportunity of pursuing them with great slaughter. Cortes, however, supposing that this could not be their whole force, advanced with the utmost caution, in order of battle, to an eminence, from whence he had a view of the main body of the Tlascalan army commanded by Xicotencal, consisting of no fewer than 40,000 men. By these the small army of Cortes was entirely surrounded; which Xicotencal no sooner perceived, than he contracted the circle with incredible diligence, while the Spaniards were almost overwhelmed with showers of arrows, darts, and stones. It is impossible but in this case many of the Spaniards must have perished, had it not been for the insufficiency of the Indian weapons. Their arrows and spears were headed only with flint, or the bones of fishes; their stakes hardened in the fire, and wooden swords, though destructive weapons among naked Indians, were easily turned aside by the Spanish bucklers, and could hardly penetrate the quilted jackets which the soldiers wore. These circumstances gave the Spaniards a prodigious advantage over them; and therefore, the Tlascalans notwithstanding their valour and superiority in number, could accomplish no more in the present instance, than to kill one horse, and slightly wound nine soldiers.

The Tlascalans being taught by this, and some subsequent encounters, how much they were inferior to the Spaniards, began to conceive them to be really what Magiscatzin had said; a superior order of beings, against whom human power could not prevail. In this extremity they had recourse to their priests, requiring them to reveal the causes of such extraordinary events, and to declare what means they should take to repel such formidable invaders. The priests, after many sacrifices and incantations, delivered their response, That these strangers were the offspring of the sun, procreated by his animating energy in the regions of the east: that, by day, while cherished with the influence of his parental beams, they were invincible; but by night, when his reviving heat was withdrawn, their vigour declined and faded like herbs in the field, and they dwindled down into mortal men. In consequence of this, the Tlascalans acted in contradiction to one of their most established maxims in war, and ventured to attack the enemy in the night-time, hoping to destroy them when enfeebled and surprised. But the Spanish centinels having observed some extraordinary movements among the Tlascalans, gave the alarm. Immediately the troops were under arms, and sallying out, 18
defeated their antagonists with great slaughter, without allowing them to approach the camp. By this disaster the Tlascalans were heartily disposed to peace; but they were at a loss to form an adequate idea of the enemies they had to deal with. They could not ascertain the nature of these surprising beings, or whether they were really of a benevolent or malignant disposition. There were circumstances in their behaviour which seemed to favour each opinion. On the one hand, as the Spaniards constantly dismissed the prisoners whom they took, not only without injury, but often with presents of European toys, and renewed their offers of peace after every victory; this lenity amazed people accustomed to the exterminating system of war known in America, and who sacrificed and devoured without mercy all the captives taken in battle; and

But are defeated and sue for peace.

and disposed them to entertain sentiments favourable to their humanity. But, on the other hand, as Cortes had seized 50 of their countrymen who brought provisions to their camp, and cut off their heads; this bloody spectacle, added to the terror occasioned by the fire-arms and horses, filled them with dreadful ideas of their ferocity. Accordingly they addressed them in the following manner: "If, (said they), you are divinities of a cruel and savage nature, we present to you five slaves, that you may drink their blood and eat their flesh. If you are mild deities, accept an offering of incense and variegated plumes. If you are men, here is meat, bread, and fruit, to nourish you."

19
Which is granted.

After this address, the peace was soon concluded, to the great satisfaction of both parties. The Tlascalans yielded themselves as vassals to the crown of Castile, and engaged to assist Cortes in all his operations; while he took the republic under his protection, and promised to defend their persons and possessions from injury and violence.

20
Great distresses of the Spaniards.

This reconciliation took place at a very seasonable juncture for the Spaniards. They were not only worn out with incessant toil, but so destitute of necessaries, that they had no other salve to dress their wounds but what was composed of the fat of Indians whom they had slain. Their distresses, in short, were arisen to such an height that they had begun to murmur, and even to despair, insomuch that Cortes had much difficulty in restraining them within any kind of bounds: but the submission of the Tlascalans, and their own triumphant entry into the city, where they were received with the reverence due to a superior order of beings, banished at once all memory of past sufferings, dispelled every anxious thought, and fully convinced them that they could not be resisted by any power in America.

Cortes left no method untried to gain the favour and confidence of the Tlascalans; which, however, he had almost entirely lost, by his untimely zeal in destroying their idols as he had done those of Zempoalla. But he was deterred from this rash action by his chaplain, father Bartholomew de Olmedo; and left the Tlascalans in the undisturbed exercise of their superstition, requiring only that they should desist from their horrid practice of offering human victims.

21
Cortes continues his march for Mexico.

As soon as his troops were fit for service, he resolved to continue his march towards Mexico, notwithstanding the remonstrances of the Tlascalans, who looked upon his destruction as unavoidable if he put himself into the power of such a faithless prince as Montezuma. But the emperor, probably intimidated with the fame of his exploits, had resolved to admit his visit; and informed Cortes that he had given orders for his friendly reception at Cholula, the next place of any consequence on the road to Mexico.

22
Treachery of Montezuma and the Cholulans.

In this, however, he was by no means sincere. Cholula was looked upon by all the inhabitants of the empire as a very holy place; the sanctuary and chief seat of their gods, to which pilgrims resorted from every province, and a greater number of human victims were offered in its principal temple than even in that of Mexico. Montezuma therefore invited the Spaniards thither, either from some superstitious hope that the gods would not suffer this sacred mansion to be defiled; or from a belief, that he himself might there find an opportunity of cutting them off with more certainty of success, when under the immediate protection of his gods. Cortes, however, was received with much seeming cordiality; but 6000 Tlascalan troops who accompanied him were obliged to remain without the town, as the Cholulans refused to admit their ancient enemies within their precincts. Yet two of these, by disguising themselves, got into the city, and acquainted Cortes that they observed the women and children belonging to the principal citizens retiring every night in a great hurry, and that six children had been sacrificed in the great temple; a sign that some warlike enterprise was at hand. At the same time Donna Marina, the interpreter, received information from an Indian woman of distinction, whose confidence she had gained, that the destruction of the Spaniards was concerted; that a body of Mexican troops lay concealed near the town; that some of the streets were barricaded, in others deep pits or trenches were dug, and slightly covered over, as traps into which the horse might fall; that stones and missive weapons were collected on the tops of the temples, with which to overwhelm the infantry; that the fatal hour was already at hand, and their ruin unavoidable.

23
Severe punishment of the Cholulans.

Cortes, alarmed at this news, secretly arrested three of the chief priests, from whom he extorted a confession that confirmed the intelligence he had already received. As not a moment was to be lost, he instantly resolved to prevent his enemies, and to inflict on them such dreadful vengeance as might strike Montezuma and his subjects with terror. For this purpose the Spaniards and Zempoallans were drawn up in a large court, which had been allotted for their quarters, near the centre of the town; the Tlascalans had orders to advance; the magistrates and chief citizens were sent for under various pretexts, and seized. On a signal given, the troops rushed out, and fell upon the multitude, destitute of leaders, and so much astonished, that the weapons dropped from their hands, and they stood motionless, and incapable of defence. While the Spaniards attacked them in front, the Tlascalans did the same in the rear; the streets were filled with slaughter; the temples, which afforded a retreat to the priests and some leading men, were set on fire, and they perished in the flames. This scene of horror continued two days; during which the wretched inhabitants suffered all that the destructive rage of the Spaniards, or the implacable revenge of their Indian allies, could inflict. At length the carnage ceased, after the slaughter of 6000 Cholulans, without the loss of a single Spaniard. Cortes then released the magistrates; and reproaching them bitterly for their intended treachery, declared, that as justice was now appeased, he forgave the offence; but required them to recall the inhabitants who had fled, and re-establish order in the town. Such was the ascendant that the Spaniards had now obtained over this superstitious race, that this order was instantly complied with; and the city was in a few days again filled with people, who paid the most respectful service to those men whose hands were stained with the blood of their relations and fellow-citizens.

24
Disaffection of Montezuma's subjects.

From Cholula, Cortes advanced directly towards Mexico; and throughout the whole of his journey was entertained with accounts of the oppressions and cruelty of Montezuma. This gave him the greatest hope of accomplishing his design; as he now perceived that the

Mexico. the empire was entirely divided, and no ſort of unanimity prevailed among them. No enemy appeared to check his progreſs. Montezuma was quite irreſolute; and Cortes was almoſt at the gates of the capital, before the emperor had determined whether to receive him as a friend, or oppoſe him as an enemy. But as no ſign of open hoſtility appeared, the Spaniards, without regarding the fluctuations of Montezuma's ſentiments, continued their march to Mexico, with great circumſpection and the ſtricteſt diſcipline, though without ſeeming to ſuſpect the prince whom they were about to viſit.

25 Meeting of Cortes and Montezuma.

When they drew near the city, about 1000 perſons, who appeared to be of diſtinction, came forth to meet them, adorned with plumes, and clad in mantles of fine cotton. Each of theſe, in his order, paſſed by Cortes, and ſaluted him according to the mode deemed moſt reſpectful and ſubmiſſive in their country. They announced the approach of Montezuma himſelf, and ſoon after his harbingers came in ſight. There appeared firſt 200 perſons in an uniform dreſs, with large plumes of feathers, alike in faſhion, marching two and two, in deep ſilence, barefooted, with their eyes fixed on the ground. Theſe were followed by a company of higher rank, in their moſt ſhowy apparel; in the midſt of whom was Montezuma, in a chair or litter richly ornamented with gold, and feathers of various colours. Four of his principal favourites carried him on their ſhoulders, others ſupported a canopy of curious workmanſhip over his head. Before him marched three officers with rods of gold in their hands, which they lifted up on high at certain intervals; and at that ſignal all the people bowed their heads, and hid their faces, as unworthy to look on ſo great a monarch. When he drew near, Cortes diſmounted, advancing towards him with officious haſte, and in a reſpectful poſture. At the ſame time Montezuma alighted from his chair, and leaning on the arms of two of his near relations, approached with a ſlow and ſtately pace, his attendants covering the ſtreet with cotton cloths, that he might not touch the ground. Cortes accoſted him with profound reverence, after the European faſhion. He returned the ſalutation, according to the mode of his country, by touching the earth with his hand, and then kiſſing it. This ceremony, the cuſtomary expreſſion of reverence from inferiors towards thoſe who are above them in rank, appeared ſuch amazing condeſcenſion in a proud monarch, who ſcarcely deigned to conſider the reſt of mankind as of the ſame ſpecies with himſelf, that all his ſubjects firmly believed thoſe perſons, before whom he humbled himſelf in this manner, to be ſomething more than human. Accordingly, as they marched through the crowd, the Spaniards frequently, and with much ſatisfaction, heard themſelves denominated *teules*, or *divinities*. Nothing material paſſed in this firſt interview. Montezuma conducted Cortes to the quarters which he had prepared for his reception; and immediately took leave of him, with a politeneſs not unworthy of a court more refined. "You are now, (ſays he), with your brothers, in your own houſe; refreſh yourſelves after your fatigue, and be happy until I return." The place allotted to the Spaniards for their lodging was a houſe built by the father of Montezuma. It was ſurrounded by a ſtone-wall, with towers at proper diſtances, which ſerved for defence as well as for ornament; and its apartments and courts were ſo large as to accommodate both the Spaniards and their Indian allies. The firſt care of Cortes was to take precautions for his ſecurity, by planting the artillery ſo as to command the different avenues which led to it, by appointing a large diviſion of his troops to be always on guard, and by poſting centinels at proper ſtations, with injunctions to obſerve the ſame vigilant diſcipline as if they were within ſight of an enemy's camp.

In the evening Montezuma returned to viſit his gueſts with the ſame pomp as in their firſt interview; and brought preſents of ſuch value, not only to Cortes and to his officers, but even to the private men, as proved the liberality of the monarch to be ſuitable to the opulence of his kingdom. A long conference enſued, in which Cortes learned what was the opinion of Montezuma with reſpect to the Spaniards. It was an eſtabliſhed tradition, he told him, among the Mexicans, that their anceſtors came originally from a remote region, and conquered the provinces now ſubject to his dominion; that after they were ſettled there, the great captain who conducted this colony returned to his own country, promiſing, that at ſome future period his deſcendants ſhould viſit them, aſſume the government, and reform their conſtitutions and laws; that, from what he had heard and ſeen of Cortes and his followers, he was convinced that they were the very perſons whoſe appearance and prophecies taught them to expect; that accordingly he had received them, not as ſtrangers, but as relations of the ſame blood and parentage, and deſired that they might conſider themſelves as maſters in his dominions; for both himſelf and his ſubjects ſhould be ready to comply with their will, and even to prevent their wiſhes. Cortes made a reply in his uſual ſtyle with reſpect to the dignity and power of his ſovereign, and his intention in ſending him into that country; artfully endeavouring ſo to frame his diſcourſe, that it might coincide as much as poſſible with the idea which Montezuma had formed concerning the origin of the Spaniards. Next morning, Cortes and ſome of his principal attendants were admitted to a public audience of the emperor. The three ſubſequent days were employed in viewing the city; the appearance of which, ſo far ſuperior in the order of its buildings and the number of its inhabitants to any place the Spaniards had beheld in America, and yet ſo little reſembling the ſtructure of an European city, filled them with ſurpriſe and admiration.

26 Deſcription of the city of Mexico.

Mexico, *Tenuchtitlan*, as it was anciently called by the natives, is ſituated in a large plain, environed by mountains of ſuch height, that though within the torrid zone, the temperature of its climate is mild and healthful. All the moiſture which deſcends from the high grounds is collected in ſeveral lakes, the two largeſt of which, of about 90 miles in circuit, communicate with each other. The waters of the one are freſh, thoſe of the others brackiſh. On the banks of the latter, and on ſome ſmall iſlands adjoining to them, the capital of Montezuma's empire was built. The acceſs to the city was by artificial cauſeways or ſtreets, formed of ſtones and earth, about 30 feet in breadth. As the waters of the lake, during the rainy ſeaſon, overflowed the flat country, theſe cauſeways were of con-

Mexico. considerable length. That of Tacuba on the weft a mile and a half; that of Tezeuco on the north-weft three miles; that of Cuoyacan towards the fouth fix miles. On the eaft there was no caufeway, and the city could be approached only by canoes. In each of thefe caufeways were openings, at proper intervals, through which the waters flowed; and over thefe beams of timber were laid, which being covered with earth, the caufeway or ftreet had every where an uniform appearance. As the approaches to the city were fingular, its conftruction was remarkable. Not only the temple of their gods, but the houfes belonging to the monarch and to perfons of diftinction, were of fuch dimenfions, that, in comparifon with any other buildings which had been difcovered in America, they might be termed *magnificent*. The habitations of the common people were mean, refembling the huts of other Indians. But they were all placed in a regular manner, on the banks of the canals which paffed thro' the city, in fome of its diftricts, or on the fides of the ftreets which interfected it in other quarters. In feveral places were large openings or fquares, one of which, allotted for the great market, is faid to have been fo fpacious, that 40,000 or 50,000 perfons carried on traffic there. In this city, the pride of the New World, and the nobleft monument of the induftry and art of man, while unacquainted with the ufe of iron, and deftitute of aid from any domeftic animal, the Spaniards, who are moft moderate in their computations, reckon that there were at leaft 60,000 inhabitants.

27 Uneafinefs of the Spaniards.

But how much foever the novelty of thofe objects might amufe or aftonifh the Spaniards, they felt the utmoft folicitude with refpect to their own fituation. From a concurrence of circumftances, no lefs unexpected than favourable to their progrefs, they had been allowed to penetrate into the heart of a powerful kingdom, and were now lodged in its capital, without having once met with open oppofition from its monarch. The Tlafcalans, however, had earneftly diffuaded them from placing fuch confidence in Montezuma as to enter a city of fuch a peculiar fituation as Mexico, where that prince would have them at mercy, fhut up as it were in a fnare, from which it was impoffible to efcape. They affured him that the Mexican priefts had, in the name of the gods, counfelled their fovereign to admit the ftrangers into the capital, that he might cut them off there at one blow with perfect fecurity. The Spaniards now perceived, too plainly, that the apprehenfions of their allies were not deftitute of foundation; that, by breaking the bridges placed at certain intervals on the caufeways, or by deftroying part of the caufeways themfelves, their retreat would be rendered impracticable; and they muft remain cooped up in the centre of a hoftile city, furrounded by multitudes fufficient to overwhelm them, and without a poffibility of receiving aid from their allies. Montezuma had, indeed, received them with diftinguifhed refpect. But ought they to reckon upon this as real, or to confider it as feigned? Even if it were fincere, could they promife on its continuance? Their fafety depended upon the will of a monarch in whofe attachment they had no reafon to confide; and an order flowing from his caprice, or a word uttered by him in paffion, might decide irrevocably concerning their fate.

Mexico. 28 Some hoftilities between the Spaniards and Mexicans.

Thefe reflections, fo obvious as to occur to the meaneft foldier, did not efcape the vigilant fagacity of their general. Before he fet out from Cholula, Cortes had received advice from Villa Rica, that Qualpopoca, one of the Mexican generals on the frontiers, having affembled an army in order to attack fome of the people whom the Spaniards had encouraged to throw off the Mexican yoke, Efcalante had marched out with part of the garrifon to fupport his allies; that an engagement had enfued, in which, though the Spaniards were victorious, Efcalante, with feven of his men, had been mortally wounded, his horfe killed, and one Spaniard had been furrounded by the enemy and taken alive; that the head of this unfortunate captive, after being carried in triumph to different cities, in order to convince the people that their invaders were not immortal, had been fent to Mexico. Cortes, though alarmed with this intelligence, as an indication of Montezuma's hoftile intentions, had continued his march. But as foon as he entered Mexico, he became fenfible, that, from an excefs of confidence in the fuperior valour and difcipline of his troops, as well as from the difadvantage of having nothing to guide him in an unknown country but the defective intelligence which he received from people with whom his mode of communication was very imperfect, he had pufhed forward into a fituation, where it was difficult to continue, and from which it was dangerous to retire. Difgrace, and perhaps ruin, was the certain confequence of attempting the latter. The fuccefs of his enterprife depended upon fupporting the high opinion which the people of New Spain had formed with refpect to the irrefiftible power of his arms. Upon the firft fymptom of timidity on his part, their veneration would ceafe, and Montezuma, whom fear alone reftrained at prefent, would let loofe upon him the whole force of his empire. At the fame time, he knew that the countenance of his own fovereign was to be obtained only by a feries of victories; and that nothing but the merit of extraordinary fuccefs could fcreen his conduct from the cenfure of irregularity. From all thefe confiderations, it was neceffary to maintain his ftation, and to extricate himfelf out of the difficulties in which one bold ftep had involved him, by venturing upon another ftill bolder. The fituation was trying, but his mind was equal to it; and after revolving the matter with deep attention, he fixed upon a plan no lefs extraordinary than daring. He determined to feize Montezuma in his palace, and carry him a prifoner to the Spanifh quarters. From the fuperftitious veneration of the Mexicans for the perfon of their monarch, as well as their implicit fubmiffion to his will, he hoped, by having Montezuma in his power, to acquire the fupreme direction of their affairs; or at leaft, with fuch a facred pledge in his hands, he made no doubt of being fecure from any effort of their violence.

29 Cortes refolves to feize Montezuma in his palace.

This he immediately propofed to his officers. The timid ftartled at a meafure fo audacious, and raifed objections. The more intelligent and refolute, confcious that it was the only refource in which there appeared any profpect of fafety, warmly approved of it, and brought over their companions fo cordially to the fame opinion, that it was agreed inftantly to make the attempt. At his ufual hour of vifiting Montezuma, Cortes went to the palace, accompanied by Alvarado, Saudoval,

Sandoval, Lugo, Velaſquez de Leon, and Davila, five of his principal officers, and as many truſty ſoldiers. Thirty choſen men followed, not in regular order, but ſauntering at ſome diſtance, as if they had no object but curioſity; ſmall parties were poſted at proper intervals, in all the ſtreets leading from the Spaniſh quarters to the court; and the remainder of his troops, with the Tlaſcalan allies, were under arms, ready to ſally out on the firſt alarm. Cortes and his attendants were admitted without ſuſpicion; the Mexicans retiring, as uſual, out of reſpect. He addreſſed the monarch in a tone very different from that which he had employed in former conferences; reproaching him bitterly as the author of the violent aſſault made upon the Spaniards by one of his officers, and demanded public reparation for the loſs which he had ſuſtained by the death of ſome of his companions, as well as for the inſult offered to the great prince whoſe ſervants they were. Montezuma, confounded at this unexpected accuſation, and changing colour either from the conſciouſneſs of guilt, or from feeling the indignity with which he was treated, aſſerted his own innocence with great earneſtneſs; and, as a proof of it, gave orders inſtantly to bring Qualpopoca and his accomplices priſoners to Mexico. Cortes replied, with ſeeming complaiſance, that a declaration ſo reſpectable left no doubt remaining in his own mind; but that ſomething more was requiſite to ſatisfy his followers, who would never be convinced that Montezuma did not harbour hoſtile intentions againſt them, unleſs, as an evidence of his confidence and attachment, he removed from his own palace and took up his reſidence in the Spaniſh quarters, where he ſhould be ſerved and honoured as became a great monarch. The firſt mention of ſo ſtrange a propoſal bereaved Montezuma of ſpeech, and almoſt of motion. At length he haughtily anſwered, "That perſons of his rank were not accuſtomed voluntarily to give up themſelves as priſoners; and were he mean enough to do ſo, his ſubjects would not permit ſuch an affront to be offered to their ſovereign." Cortes, unwilling to employ force, endeavoured alternately to ſoothe and intimidate him. The altercation became warm; and having continued above three hours, Velaſquez de Leon, an impetuous and gallant young man, exclaimed with impatience, "Why waſte more time in vain? Let us either ſeize him inſtantly, or ſtab him to the heart." The threatening voice and fierce geſtures with which theſe words were uttered, ſtruck Montezuma. The Spaniards, he was ſenſible, had now proceeded ſo far, as left him no hope that they would recede. His own danger was imminent, the neceſſity unavoidable. He ſaw both; and abandoning himſelf to his fate, complied with their requeſt.

30
The emperor carried to the Spaniſh quarters.

His officers were called. He communicated to them his reſolution. Though aſtoniſhed and afflicted, they preſumed not to queſtion the will of their maſter, but carried him in ſilent pomp, all bathed in tears, to the Spaniſh quarters. When it was known that the ſtrangers were conveying away the emperor, the people broke out into the wildeſt tranſports of grief and rage, threatening the Spaniards with immediate deſtruction, as the puniſhment juſtly due to their impious audacity. But as ſoon as Montezuma appeared with a ſeeming gaiety of countenance, and waved his hand, the tumult was huſhed; and upon his declaring it to be of his own choice that he went to reſide for ſome time among his new friends, the multitude, taught to revere every intimation of their ſovereign's pleaſure, quietly diſperſed.

The Spaniards at firſt pretended to treat Montezuma with great reſpect; but ſoon took care to let him know that he was entirely in their power. Cortes wiſhed that the ſhedding the blood of a Spaniard ſhould appear the moſt heinous crime that could be committed; and therefore not only took a moſt exemplary vengeance on thoſe who had been concerned in the affair of Villa Rica, but even put the emperor himſelf in chains till the execution of the Mexican general was over. By theſe, and other inſults, he at laſt gained entirely the aſcendant over this unhappy monarch; and he took care to improve his opportunity to the utmoſt. He ſent his emiſſaries into different parts of the kingdom, accompanied with Mexicans of diſtinction, who might ſerve both to guide and to protect them. They viſited moſt of the provinces, viewed their ſoil and productions, ſurveyed with particular care the diſtricts which yielded gold or ſilver, pitched upon ſeveral places as proper for future colonies, and endeavoured to prepare the minds of the people for ſubmitting to the Spaniſh yoke: and while they were thus employed, Cortes, in the name and by the authority of Montezuma, degraded ſome of the principal officers in the empire, whoſe abilities or independent ſpirit excited his jealouſy; and ſubſtituted in their place perſons who he imagined would be more obſequious. One thing, however, was ſtill wanting to complete his ſecurity. He wiſhed to have ſuch a command of the lake as might enſure a retreat, if, either from levity or diſguſt, the Mexicans ſhould take arms againſt him, and break down the bridges or cauſeways, in order to incloſe him in the city. In order to obtain this without giving diſguſt to the emperor or his court, Cortes artfully inflamed the curioſity of the Indians with accounts of the Spaniſh ſhipping, and thoſe floating palaces that moved with ſuch velocity on the water, without the aſſiſtance of oars; and when he found that the monarch himſelf was extremely deſirous of ſeeing ſuch a novelty, he gave him to underſtand, that nothing was wanting to his gratification beſides a few neceſſaries from Vera Cruz, for that he had workmen in his army capable of building ſuch veſſels. The bait took with Montezuma; and he gave immediate orders that all his people ſhould aſſiſt Cortes in whatever he ſhould direct concerning the ſhipping. By this means, in a few days, two brigantines were got ready, full-rigged and equipped; and Montezuma was invited on board, to make the firſt trial of their ſailing, of which he could form no idea. Accordingly he embarked for this purpoſe, and gave orders for a great hunting upon the water, in order that all his people might be diverted with the novelty preſented by the Spaniards. On the day appointed, the royal equipage was ready early in the morning; and the lake was covered with a multitude of boats and canoes loaded with people. The Mexicans had augmented the number of their rowers on board the royal barges, with an intention to diſgrace the Spaniſh veſſels, which they regarded as clumſy, unweildy, and heavy. But they were ſoon undeceived; a freſh gale ſtarted up, the brigantines hoiſted ſail, to the utter aſtoniſhment of all the ſpectators, and ſoon left all the canoes behind; while the monarch

31
Cortes rules the empire.

32
By a pretence, he obtains leave to build two brigantines on the lake.

monarch exulted in the victory of the Spaniards, without once conſidering that now he had effectually rivetted his own chains.

33 Montezuma owns himſelf a vaſſal to the king of Spain.

Cortes having obtained this important point, reſolved to put the condeſcenſion of the emperor to a trial ſtill more ſevere. He urged Montezuma to acknowledge himſelf a vaſſal to the crown of Caſtile; to hold his crown of him as ſuperior, and to ſubject his dominions to the payment of an annual tribute. With this requiſition, humiliating as it was, Montezuma complied. He called together the chief men of his empire, and, in a ſolemn harangue, reminded them of the traditions and prophecies which led them to expect the arrival of a people ſprung from the ſame ſtock with themſelves, in order to take poſſeſſion of the ſupreme power; he declared his belief that the Spaniards were this promiſed race; and that therefore he recognized the right of their monarch to govern the Mexican empire, would lay his crown at his feet, and obey him as a tributary. While uttering theſe words, Montezuma diſcovered how deeply he was affected in making ſuch a ſacrifice. Tears and groans frequently interrupted his diſcourſe. The firſt mention of ſuch a reſolution ſtruck the aſſembly dumb with aſtoniſhment. This was followed by a ſullen murmur of ſorrow mingled with indignation; which indicated ſome violent eruption of rage to be near at hand. This Cortes foreſaw, and ſeaſonably interpoſed to prevent it, by declaring that his maſter had no intention to deprive Montezuma of the royal dignity, or to make any innovation upon the conſtitution and laws of the Mexican empire. This aſſurance, added to their dread of the Spaniſh arms, and the authority of their monarch's example, extorted the conſent of the aſſembly; and the act of ſubmiſſion and homage was executed with all the formalities which the Spaniards pleaſed to preſcribe.

34 The Spaniards divide their treaſure.

Montezuma, at the requeſt of Cortes, accompanied this profeſſion of fealty and homage with a magnificent preſent to his new ſovereign; and, after his example, his ſubjects brought in very liberal contributions. The Spaniards then collected all the treaſure which had been either voluntarily beſtowed upon them at different times by Montezuma, or had been extorted from his people under various pretences; and having melted the gold and ſilver, the value of theſe, without including jewels and ornaments of various kinds, which were preſerved on account of their curious workmanſhip, amounted to 600,000 peſos. The ſoldiers were impatient to have it divided; and Cortes complied with their deſire. A fifth of the whole was ſet apart as the tax due to the king. Another fifth was allowed to Cortes, as commander. The ſums advanced by the governor of Cuba, who had originally fitted out the expedition, were then deducted. The remainder was then divided among the army, including the garriſon of Vera Cruz, in proportion to their different ranks; and after ſo many deductions, the ſhare of a private man did not exceed 100 peſos. This ſum fell ſo far below their ſanguine expectations, that it required all the addreſs, and no ſmall exertions of the liberality of Cortes to prevent an open mutiny. However, he at laſt reſtored tranquillity; but had no ſooner eſcaped this danger, than he involved himſelf, by his imprudent zeal for religion, in one much worſe. Montezuma, though often importuned, had obſtinately refuſed to change his religion, or aboliſh the ſuperſtitious rites which had been for ſuch a long time practiſed throughout his dominions. This at laſt tranſported the Spaniard with ſuch rage, that, in a ſally of zeal, he led out his ſoldiers in order to throw down the idols in the great temple by force. But the prieſts taking arms in defence of their altars, and the people crowding with great ardour to ſupport them, Cortes's prudence over-ruled his zeal; and induced him to deſiſt from his raſh attempt, after diſlodging the idols from one of the ſhrines, and placing in their ſtead an image of the Virgin Mary.

35 Cortes attempts to deſtroy the Mexican idols.

36 Which produces a general diſaffection.

From this moment the Mexicans began to meditate the expulſion or the deſtruction of the Spaniards. The prieſts and leading men held frequent meetings with Montezuma for this purpoſe. But as any violent attempt might have proved fatal to the captive monarch, it was thought proper firſt to try more gentle means. Having called Cortes into his preſence, he obſerved, that now, as all the purpoſes of his embaſſy were fully accompliſhed, the gods had declared their will, and the people ſignified their deſire, that he and his followers ſhould inſtantly depart out of the empire. With this he required them to comply, or unavoidable deſtruction would fall ſuddenly on their heads. This unexpected requiſition, as well as the manner in which it was delivered, alarmed Cortes. However, he ſuppoſed that more might be gained by a feigned compliance than by open reſiſtance; and therefore replied with great compoſure, that he had already begun to prepare for his return; but as he had deſtroyed the veſſels in which he arrived, ſome time was requiſite for building other ſhips. This appeared reaſonable; and a number of Mexicans were ſent to Vera Cruz to cut down timber, and ſome Spaniſh carpenters were appointed to ſuperintend the work.

37 The Spaniards are commanded to depart.

38 An armament ſent from Cuba againſt Cortes.

Cortes flattered himſelf that, during this interval, he might either find means to avert the threatened danger, or receive ſuch reinforcements as would enable him to defend himſelf. Nine months had now elapſed ſince Portocarrero and Montejo had ſailed with his diſpatches to Spain; and he daily expected a return with a confirmation of his authority from the king, without which all that he had done ſerved only to mark him out as an object of puniſhment. While he remained in great anxiety on this account, news were brought that ſome ſhips had appeared on the coaſt. Theſe were imagined by Cortes to be a reinforcement ſent him from Spain: but his joy was of ſhort continuance, for a courier very ſoon arrived from Vera Cruz, with certain information that the armament was fitted out by Velaſquez, the governor of Cuba; and inſtead of bringing ſuccours, threatened them with immediate deſtruction.

Velaſquez had been excited to this hoſtile meaſure chiefly through the indiſcretion, or rather treachery, of the meſſengers of Cortes; who, contrary to his expreſs injunctions, had landed on the iſland of Cuba, and given intelligence of all that had paſſed; and Velaſquez, tranſported with rage at hearing of the proceedings of Cortes, had now ſent againſt him this armament; conſiſting of 18 ſhips, which carried 80 horſemen, 800 infantry, of which 80 were muſketeers, and 120 croſs-bowmen, commanded by a brave officer named *Pamphilo de Narvaez;* whoſe inſtructions were, to ſeize Cortes and his principal officers, to ſend them

priſoners

Mexico.

priſoners to him, and then to complete the diſcovery and conqueſt of the country in his name. This proved a moſt afflicting piece of news to Cortes. However, thinking it imprudent to attempt any thing againſt his countrymen at firſt by force, he ſent his chaplain, Olmedo, with propoſals of accommodation. Narvaez rejected his propoſals with ſcorn; but his followers were leſs violent in their reſentments. Olmedo delivered many letters to them, either from Cortes himſelf, or from his officers, their ancient friends and companions. Theſe Cortes had artfully accompanied with preſents of rings, chains of gold, and other trinkets of value; which inſpired thoſe needy adventurers with high ideas of the wealth he had acquired, and with envy of the good fortune of thoſe who were engaged in his ſervice. Some, from hopes of becoming ſharers in theſe rich ſpoils, declared for an immediate accommodation; while others were for the ſame pacific meaſure, through fear of ſubverting the Spaniſh power entirely in a country where it was ſo imperfectly eſtabliſhed. Narvaez diſregarded both; and, by a proclamation, denounced Cortes and his adherents rebels, and enemies to their country.

39 Which is defeated by that general.

Cortes having now no reſource but in war, left 150 men under the command of Pedro de Alvarado, an officer of great bravery, and much reſpected by the Mexicans, to guard the capital, and the captive emperor; while he himſelf marched with the remainder to meet his formidable opponent, who had taken poſſeſſion of Zempoalla. Even after being reinforced by Sandoval his governor of Vera Cruz, the force of Cortes did not exceed 250 men. He hoped for ſucceſs chiefly from the rapidity of his motions and the poſſibility of ſurpriſing his enemies; and as he chiefly dreaded their cavalry, he armed his ſoldiers with long ſpears; accuſtoming them to that deep and compact arrangement which the uſe of this formidable weapon enabled them to aſſume. As he advanced, however, he repeated his propoſals of accommodation; but theſe being conſtantly rejected, and a price ſet upon his head, he at laſt attacked Narvaez in the night-time, entirely defeated and took him priſoner, obliging all his troops to own allegiance to himſelf.

Nothing could be more ſeaſonable than this victory, by which Cortes found his army very conſiderably increaſed; for moſt of the ſoldiers of Narvaez choſe rather to follow Cortes than to return to Cuba, whither the conqueror had offered to ſend them if they choſe. His affairs at Mexico, in the mean time, were in the utmoſt danger of being totally ruined; and had this deciſive victory been delayed but a few days longer, he muſt have come too late to ſave his companions. A ſhort time after the defeat of Narvaez, a courier arrived from Mexico with the diſagreeable intelligence that the Mexicans had taken arms; and having ſeized and deſtroyed the two brigantines which he had built in order to ſecure the command of the lake, had attacked the Spaniards in their quarters, killed ſome, and wounded many more, burnt their magazine of proviſions, and, in ſhort, carried on hoſtilities with ſuch fury, that though Alvarado and his men defended themſelves with undaunted reſolution, they muſt either be cut off by famine, or ſink under the multitude of their enemies. This revolt was excited by motives which rendered it ſtill more alarming. On the departure of Cortes for Zempoalla, the Mexicans flattered themſelves, that the long-expected opportunity of reſtoring their ſovereign to liberty, and driving out the Spaniards, was arrived; and conſultations were accordingly held for bringing about both theſe events. The Spaniards in Mexico, conſcious of their own weakneſs, ſuſpected and dreaded theſe machinations; but Alvarado, who had neither the prudence nor the addreſs of Cortes, took the worſt method imaginable to overcome them. Inſtead of attempting to ſooth or cajole the Mexicans, he waited the return of one of their ſolemn feſtivals, when the principal perſons in the empire were dancing, according to cuſtom, in the court of the great temple; he ſeized all the avenues which led to it; and, allured partly by the rich ornaments which they wore in honour of their gods, and partly by the facility of cutting off at once the authors of that conſpiracy which he dreaded, he fell upon them, unarmed and unſuſpicious of danger, and maſſacred a great number; none eſcaping, but ſuch as made their way over the battlements of the temple. An action ſo cruel and treacherous filled not only the city, but the whole empire, with indignation and rage; and the Mexicans immediately proceeded in the manner above-mentioned.

40 Dangerous situation of the Spaniards left at Mexico.

41 Cortes allowed to return to Mexico.

Cortes advanced with the utmoſt celerity to the relief of his diſtreſſed companions; but as he paſſed along, had the mortification to find that the Spaniards were generally held in abhorrence. The principal inhabitants had deſerted the towns through which he paſſed; no perſon of note appeared to meet him with the uſual reſpect, nor were proviſions brought to his camp as uſual. Notwithſtanding theſe ſigns of averſion and horror, however, the Mexicans were ſo ignorant of the militray art, that they again permitted him to enter the capital without oppoſition; though it was in their power to have eaſily prevented him, by breaking down the bridges and cauſeways which led to it.

Cortes was received by his companions with the utmoſt joy; and this extraordinary ſucceſs ſo far intoxicated the general himſelf, that he not only neglected to viſit Montezuma, but expreſſed himſelf very contemptuouſly concerning him. Theſe expreſſions being reported among the Mexicans, they all at once flew to arms, and made ſuch a violent and ſudden attack, that all the valour and ſkill of Cortes were ſcarce ſufficient to repell them. This produced great uneaſineſs among the ſoldiers of Narvaez, who had imagined there was nothing to do but to gather the ſpoils of a conquered country. Diſcontent and murmurings, however, were now of no avail; they were incloſed in an hoſtile city, and, without ſome extraordinary exertions, were inevitably undone. Cortes therefore made a deſperate ſally; but, after exerting his utmoſt efforts for a whole day, was obliged to retire with the loſs of 12 killed, and upwards of 60 wounded. Another ſally was attempted with the like bad ſucceſs, and in it Cortes himſelf was wounded in the hand.

42 But is furiouſly attacked by the natives.

The Spaniſh general was now thoroughly convinced of his error; and therefore betook himſelf to the only reſource which was left; namely, to try what effect the interpoſition of Montezuma would have to ſooth or overawe his ſubjects. When the Mexicans approached the next morning to renew the aſſault, that

Mexico. that unfortunate prince, at the mercy of the Spaniards, and reduced to the sad necessity of becoming the instrument of his own disgrace, and of the slavery of his people, advanced to the battlements in his royal robes, and with all the pomp in which he used to appear on solemn occasions. At the sight of their sovereign, whom they had been long accustomed to reverence almost as a god, the Mexicans instantly forebore their hostilities, and many prostrated themselves on the ground: but when he addressed them in favour of the Spaniards, and made use of all the arguments he could think of to mitigate their rage, they testified their resentment with loud murmurings; and at length broke forth with

43 Montezuma killed.

such fury, that before the soldiers, appointed to guard Montezuma, had time to cover him with their shields, he was wounded with two arrows, and a blow on his temple with a stone struck him to the ground. On seeing him fall, the Mexicans instantly fled with the utmost precipitation: but the unhappy monarch, now convinced that he was become an object of contempt even to his own subjects, obstinately refused all nourishment; and thus in a short time ended his days.

44 A terrible engagement between the Spaniards and Mexicans.

On the death of Montezuma, Cortes having lost all hope of bringing the Mexicans to any terms of peace, prepared for retreat. But his antagonists, having taken possession of a high tower in the great temple, which overlooked the Spanish quarters, and placing there a garrison of their principal warriors, the Spaniards were so much exposed to their missile weapons, that none could stir without danger of being killed or wounded. From this post, therefore, it was necessary to dislodge them at any rate; and Juan de Escobar, with a large detachment of chosen soldiers, was ordered to make the attack. But Escobar, though a valiant officer, and though he exerted his utmost efforts, was thrice repulsed. Cortes, however, sensible, that not only his reputation, but the safety of his army, depended on the success of this assault, caused a buckler to be tied to his arm, as he could not manage it with his wounded hand, and rushed with his drawn sword among the thickest of the combatants. Encouraged by the presence of their general, the Spaniards returned to the charge with such vigour, that they gradually forced their way up the steps, and drove the Mexicans to the platform at the top of the tower. There a dreadful carnage began; when two young Mexicans of high rank, observing Cortes, as he animated his soldiers, resolved to sacrifice their own lives in order to cut off the author of so many calamities which desolated their country. They approached him in a suppliant posture, as if they intended to lay down their arms, and seizing him in a moment, hurried him towards the battlements, over which they threw themselves headlong, in hopes of dragging him along with them. But Cortes, by his strength and agility, disengaged himself from their grasp; so that the two Mexicans perished alone.

As soon as the Spaniards became masters of the tower, they set fire to it, and without further molestation continued the preparations for their retreat. This became the more necessary, as their emenies, astonished at this last effort of their valour, had now entirely changed their system of hostility; and, instead of incessant attacks, endeavoured, by barricading the streets, and breaking down the causeways, to cut off the communication of the Spaniards with the continent, and thus to starve an enemy whom they could not subdue. The first point to be determined was whether they should march out openly in the face of day, when they could discern every danger, or whether they should endeavour to retire secretly in the night. The latter was preferred, partly from hopes that the superstition of the Mexicans would prevent them from attacking them in the night, and partly from their own superstition in giving credit to the predictions of a private soldier, who pretended to astrology, and assured them of success if they retreated in this manner. Towards midnight, therefore, they began their march, in three divisions. Sandoval led the van; Pedro Alvarado and Veles Guez de Lean had the conduct of the rear; and Cortes commanded in the centre, where he placed the prisoners, among whom were a son and two daughters of Montezuma, together with several Mexicans of distinction; the artillery, baggage, and a portable bridge of timber intended to be laid over the breaches in the causeway. They marched in profound silence along the causeway which led to Tacuba, because it was shorter than any of the rest, and, lying most remote from the road towards Tlascala and the sea-coast, had been left most entire by the Mexicans.

They reached the first breach in the causeway without molestation, hoping that their retreat was undiscovered. But the Mexicans had not only watched all their motions, but made preparations for a most formidable attack. While the Spaniards were intent upon placing their bridges in the breach, and occupied in conducting their horses and artillery along it, they were suddenly alarmed with the sound of warlike instruments, and found themselves assaulted on all sides by an innumerable multitude of enemies. Unfortunately the wooden bridge was wedged so fast in the mud by the weight of the artillery, that it was impossible to remove it. Dismayed at this accident, the Spaniards advanced with precipitation to the second breach. The Mexicans hemmed them in on every side; and though they defended themselves with their usual courage, yet, crowded as they were in a narrow causeway, their discipline and military skill were of little avail; nor did the obscurity of the night allow them to derive much advantage from their fire-arms or the superiority of their other weapons. At last the Spaniards, overborne with the numbers of their enemies, began to give way, and in a moment the confusion was universal. Cortes, with about 100 foot-soldiers, and a few horse, forced his way over the two remaining breaches in the causeway, the bodies of the dead serving to fill up the chasms, and reached the main land. Having formed them as soon as they arrived, he returned with such as were yet capable of service, to assist his friends in their retreat. He met with part of his soldiers who had forced their way through the enemy, but found many more overwhelmed by the multitude of their aggressors, or perishing in the lake; and heard the grievous lamentations of others whom the Mexicans were carrying off in triumph, to be sacrificed to the god of war.

45 Cortes retreats with great loss.

In this fatal retreat more than one half of Cortes's army perished, together with many officers of distinction. All the artillery, ammunition, and baggage were

Mexico were loſt; the greater part of the horſes and above 2000 Tlaſcalans were killed, and only a very ſmall part of their treaſure ſaved. The firſt care of the Spaniſh general was to find ſome ſhelter for his wearied troops; for, as the Mexicans infeſted them on every ſide, and the people of Tacuba began to take arms, he could not continue in his preſent ſtation. At laſt he diſcovered a temple ſeated on an eminence, in which he found not only the ſhelter he wanted, but ſome proviſions; and though the enemy did not intermit their attacks throughout the day, they were without much difficulty prevented from making any impreſſion. For ſix days after, they continued their march through a barren, ill-cultivated, and thinly-peopled country, where they were often obliged to feed on berries, roots, and the ſtalks of green maize; at the ſame time they were haraſſed without intermiſſion by large parties of Mexicans, who attacked them on all ſides. On the ſixth day they reached Otumba, not far from the road between Mexico and Tlaſcala. Early next morning they began to advance towards it, flying parties of the enemy ſtill hanging on their rear; and amidſt the inſults with which they accompanied their hoſtilities, Donna Marina remarked, that they often exclaimed with exultation, "Go on, robbers; go to the place where you ſhall quickly meet the vengeance due to your crimes." The meaning of this threat the Spaniards did not comprehend, until they reached the ſummit of an eminence before them. There a ſpacious valley opened to their view, covered with a vaſt army as far as the eye could reach. The Mexicans, while with one body of their troops they haraſſed the Spaniards in their retreat, had aſſembled their principal force on the other ſide of the lake; and marching

46 The battle of Otumba. along the road which led directly to Tlaſcala, poſted it in the plain of Otumba, through which they knew Cortes muſt paſs. At the ſight of this incredible multitude, which they could ſurvey at once from the riſing ground, the Spaniards were aſtoniſhed, and even the boldeſt began to deſpair. But Cortes, without allowing their fears time to operate, after warning them briefly that no alternative remained but to conquer or die, led them inſtantly to the charge. The Mexicans waited their approach with unuſual fortitude: yet, ſuch was the ſuperiority of the Spaniſh diſcipline and arms, that the impreſſion of this ſmall body was irreſiſtible; and which ever way its force was directed, it penetrated and diſperſed the moſt numerous battalions. But while theſe gave way in one quarter, new combatants advanced from another; and the Spaniards, though ſucceſsful in every attack, were ready to ſink under theſe repeated efforts, without ſeeing any end to their toil, or any hope of victory. At that time Cortes obſerved the great ſtandard of the empire, which was carried before the Mexican general, advancing; and fortunately recollecting to have heard, that on the fate of it depended the event of every battle, he aſſembled a few of his braveſt officers, whoſe horſes were ſtill capable of ſervice, and, placing himſelf at their head, puſhed towards the ſtandard with ſuch impetuoſity that he bore down every thing before him. A choſen body of nobles, who guarded the ſtandard, made ſome reſiſtance, but were ſoon broken. Cortes, with a ſtroke of his lance, wounded the Mexican general, and threw him to the ground. One of his followers alighting, put an end to his life, and laid hold of the imperial ſtandard. The moment that their leader fell, and the ſtandard, towards which all directed their eyes, diſappeared, an univerſal panic ſtruck the Mexicans; and, as if the bond which held them together had been diſſolved, every enſign was lowered, each ſoldier threw away his weapons, and fled with precipitation to the mountains. The Spaniards, unable to purſue them far, returned to collect the ſpoils of the field; and theſe were ſo valuable as to be ſome compenſation for the wealth which they had loſt in Mexico; for in the enemy's army were moſt of their principal warriors dreſſed out in their richeſt ornaments, as if they had been marching to aſſured victory. Mexico. 47 Mexicans defeated.

The day after this important action, (being July 8th 1520), the Spaniards entered the Tlaſcalan territories, where they were received with the moſt cordial friendſhip. Cortes endeavoured to avail himſelf of this diſpoſition as much as poſſible; for which purpoſe he diſtributed among them the rich ſpoils taken at Otumba with ſuch a liberal hand, that he made himſelf ſure of obtaining from the republic whatever he ſhould deſire. He drew a ſmall ſupply of ammunition, and two or three field-pieces from his ſtores at Vera Cruz. He diſpatched an officer of confidence with four ſhips of Narvaez's fleet to Hiſpaniola and Jamaica, to engage adventurers, and to purchaſe horſes, gunpowder, and other military ſtores. And, as he knew that it would be in vain to attempt the reduction of Mexico, unleſs he could ſecure the command of the lake, he gave orders to prepare, in the mountains of Tlaſcala, materials for building 12 brigantines, ſo that they might be carried thither in pieces, ready to be put together, and launched when he ſtood in need of their ſervice. But, in the mean time, his ſoldiers, alarmed at the thoughts of being expoſed to ſuch calamities a ſecond time, preſented a remonſtrance to their general, in which they repreſented the imprudence of attacking a powerful empire with his ſhattered forces, and formally required him to return back to Cuba. All the eloquence of Cortes could now only prevail with them to delay their departure for ſome time, when he promiſed to diſmiſs ſuch as ſhould deſire it. However, this was only a pretence; for Cortes, in fact, had the conqueſt of Mexico as much at heart as ever. Without giving his ſoldiers an opportunity of caballing, therefore, he daily employed them againſt the people of the neighbouring provinces, who had cut off ſome detachments of Spaniards during his misfortunes at Mexico; and by which, as he was conſtantly attended with ſucceſs, his men ſoon reſumed their wonted ſenſe of ſuperiority. 48

But all the efforts of Cortes could have been of little avail, had he not unexpectedly obtained a reinforcement of Spaniſh ſoldiers. The governor of Cuba, to whom the ſucceſs of Narvaez appeared an event of infallible certainty, having ſent two ſmall ſhips after him with new inſtructions, and a ſupply of men and military ſtores, the officer whom Cortes had appointed to command on the coaſt, artfully decoyed them into the harbour of Vera Cruz, ſeized the veſſels, and eaſily perſuaded the ſoldiers to follow the ſtandard of a more able leader than him whom they were deſtined to join. Soon after, three ſhips of more conſiderable force came into the harbour ſeparately. Theſe belonged to an Cortes receives an unexpected reinforcement.

Mexico. an armament fitted out by Francifco de Garay, governor of Jamaica, who had long aimed at dividing with Cortes the glory and gain of annexing the empire of Mexico to the crown of Caftile. They had, however, unadvifedly made their attempt on the northern provinces, where the country was poor, and the inhabitants fierce and warlike; fo that, after a fucceffion of difafters, they were now obliged to venture into Vera Cruz, and caft themfelves upon the mercy of their countrymen; and here they alfo were foon perfuaded to throw off their allegiance to their mafter, and to enlift with Cortes. About the fame time a fhip arrived from Spain, freighted by fome private adventurers, with military ftores; and the cargo was eagerly purchafed by Cortes, while the crew, following the example of the reft, joined him at Tlafcala.

From thefe various quarters, the army of Cortes was augmented with 180 men, and 20 horfes; by which means he was enabled to difmifs fuch of the foldiers of Narvaez as were moft troublefome and difcontented; after the departure of whom, he ftill mustered 550 infantry, of whom 80 were armed with mufkets or crofs-bows, 40 horfemen, and nine pieces of

49
He fets out again for Mexico.

artillery. At the head of thefe, with 10,000 Tlafcalans and other friendly Indians, he began his march towards Mexico, on the 28th of December, fix months after his fatal retreat from that city.

The Mexicans, in the mean time, had made the beft preparations they could for oppofing fuch a formidable enemy. On the death of Montezuma, his brother Quetlavaca was raifed to the throne; and he had an immediate opportunity of fhewing that he was worthy of their choice, by conducting in perfon thofe fierce attacks which obliged the Spaniards to retire from his

50
Preparations of the Mexicans for their defence.

capital. His prudence in guarding againft the return of the invaders was equal to the fpirit he had fhewn in driving them out. He repaired what the Spaniards had ruined in the city, ftrengthened it with fuch fortifications as his people could erect; and befides filling his magazines with the ufual weapons of war, gave directions to make long fpears, headed with the fwords and daggers which they had taken from the Spaniards, in order to annoy the cavalry. But in the midft of thefe preparations he was taken off by the fmall-pox; and Guatimozin, his nephew and fon-in-law, raifed to the throne.

As foon as Cortes entered the enemy's territories, he difcovered various preparations to obftruct his progrefs. But his troops forced their way with little difficulty; and took poffeffion of Tezeuco, the fecond city of the empire, fituated on the banks of the lake, about 20 miles from Mexico. Here he determined to eftablifh his head-quarters, as the moft proper ftation for lanching his brigantines, as well as for making his approaches to the capital. In order to render his refidence there more fecure, he depofed the cazique or chief, who was at the head of that community, under pretence of fome defect in his title, and fubftituted in his place a perfon whom a faction of the nobles pointed out as the right heir of that dignity. Attached to him by this benefit, the new cazique and his adherents ferved the Spaniards with inviolable fidelity.

As the conftruction of the brigantines advanced flowly under the unfkilful hands of foldiers and Indians, whom Cortes was obliged to employ in affifting three or four carpenters who happened fortunately to be in his fervice, and as he had not yet received the reinforcement which he expected from Hifpaniola, he was not in a condition to turn his arms directly againft the capital. To have attacked a city fo populous, fo well prepared for defence, and in a fituation of fuch peculiar ftrength, muft have expofed his troops to inevitable deftruction. Three months elapfed before the materials for conftructing the brigantines were finifhed, and before he heard any thing with refpect to the fuccefs of his negotiation in Hifpaniola. This, however, was not a feafon of inaction to Cortes. He at- 51

Cortes makes great progrefs.

tacked fucceffively feveral of the towns fituated around the lake; and though all the Mexican power was exerted to obftruct his operations, he either compelled them to fubmit to the Spanifh crown, or reduced them to ruins. Other towns he endeavoured to conciliate by more gentle means; and though he could not hold any intercourfe with the inhabitants but by the intervention of interpreters, yet, under all the difadvantage of that tedious and imperfect mode of communication, he had acquired fuch thorough knowledge of the ftate of the country, as well as of the difpofitions of the people, that he conducted his negotiations and intrigues with aftonifhing dexterity and fuccefs. Moft of the cities adjacent to Mexico were originally the capitals of fmall independent ftates; and fome of them having been but lately annexed to the Mexican empire, ftill retained the remembrance of their ancient liberty, and bore with impatience the rigorous yoke of their new mafters. Cortes having early obferved fymptoms of their difaffection, availed himfelf of this knowledge to gain their confidence and friendfhip. By offering with confidence to deliver them from the odious dominion of the Mexicans, and by liberal promifes of more indulgent treatment if they would unite with him againft their oppreffors, he prevailed on the people of feveral confiderable diftricts, not only to acknowledge the king of Caftile as their fovereign, but to fupply the Spanifh camp with provifions, and to ftrengthen his army with auxiliary troops. Guatimozin, on the firft appearance of defection among his fubjects, exerted himfelf with vigour to prevent or to punifh their revolt; but, in fpite of his efforts, the fpirit continued to fpread. The Spaniards gradually acquired new allies; and with deep concern he beheld Cortes arming againft his empire thofe very hands which ought to have been active in his defence, and ready to advance againft the capital at the head of a numerous body of his own fubjects.

While, by thofe various methods, Cortes was gradually circumfcribing the Mexican power within fuch narrow limits that his profpect of overturning it feemed neither to be uncertain nor remote, all his fchemes were well nigh defeated by a confpiracy againft his own perfon, and which was difcovered only a fhort time before it was to have been executed. Though many were concerned, Cortes did not think proper to punifh any more than the principal ringleader, whom he caufed immediately to be hanged; and then, without allowing them leifure to ruminate on what had happened, and as the moft effectual means of preventing the return of a mutinous fpirit, he determined to call forth his troops immediately to action. Fortunately, a proper occafion for this occurred, without his feeming to

Mexico.

to court it. He received intelligence, that the materials for building the brigantines were at length completely finished, and waited only for a body of Spaniards to conduct them to Tezeuco. The command of this convoy, consisting of 200 foot-soldiers, 15 horsemen, and 2 field-pieces, he gave to Sandoval, who, by the vigilance, activity, and courage, which he manifested on every occasion, was growing daily in his confidence, and in the estimation of his fellow-soldiers. The service was no less singular than important; the beams, the planks, the masts, the cordage, the sails, the iron-work, and all the infinite variety of articles requisite for the construction of 13 brigantines, were to be carried 60 miles over land, thro' a mountainous country, by people who were unacquainted with the ministry of domestic animals, or the aid of machines to facilitate any work of labour. The Tlascalans furnished 8000 *Tamenes*, an inferior order of men destined for servile tasks, to carry the materials on their shoulders, and appointed 15,000 warriors to accompany and defend them. Sandoval made the disposition for their progress with great propriety, placing the Tamenes in the centre, one body of warriors in the front, another in the rear, with considerable parties to cover the flanks. To each of these he joined some Spaniards, not only to assist them in danger, but to accustom them to regularity and subordination. Parties of Mexicans frequently appeared hovering around them on the high grounds: but perceiving no prospect of success in attacking an enemy continually on his guard, and prepared to receive them, they did not venture to molest him; and Sandoval had the glory of conducting safely to Tezeuco, a convoy on which all the future operations of his countrymen depended.

52
The Spaniards receive another reinforcement.

This was followed by another event of no less moment. Four ships arrived at Vera Cruz from Hispaniola, with 200 soldiers, 80 horses, two battering cannon, and a considerable supply of ammuniton and arms. Elevated with observing that all his preparatory schemes, either for recruiting his own army, or impairing the force of the enemy, had now produced their full effect, Cortes, impatient to begin the siege in form, hastened the launching of the brigantines. To facilitate this, he had employed a vast number of Indians, for two months, in deepening the small rivulet which runs by Tezeuco into the lake, and in forming it into a canal near two miles in length: and though the Mexicans, aware of his intentions, as well as of the danger which threatened them, endeavoured frequently to interrupt the labourers, or to burn the brigantines, the work was at last completed. On the 28th of April, all the Spanish troops, together with auxiliary Indians, were drawn up on the banks of the canal; and with extraordinary military pomp, heightened and rendered more solemn by the celebration of the most sacred rites of religion, the brigantines were launched. As they fell down the canal in order, Father Olmedo blessed them, and gave each its name. Every eye followed them with wonder and hope, until they entered the lake, when they hoisted their sails, and bore away before the wind. A general shout of joy was raised; all admiring that bold inventive genius, which, by means so extraordinary, that their success almost exceeded belief, had acquired the command of a fleet, without the aid of which Mexico would have continued to set the Spanish power and arms at defiance.

Mexico.

53
The city besieged.

Cortes determined to attack the city from three different quarters; from Tezeuco on the east side of the lake, from Tacuba on the west, and from Cuyocan towards the south. Those towns were situated on the principal causeways which led to the capital, and intended for their defence. He appointed Sandoval to command in the first, Pedro de Alvarado in the second, and Christoval de Olid in the third; allotting to each a numerous body of Indian auxiliaries, together with an equal division of Spaniards, who, by the junction of the troops from Hispaniola, amounted now to 86 horsemen, and 818 foot-soldiers; of whom 118 were armed with muskets or cross-bows. Their train of artillery consisted of three battering cannon, and 15 field-pieces. He reserved for himself, as the station of greatest importance and danger, the conduct of the brigantines, each armed with one of his small cannon, and manned with 25 Spaniards.

As Alvarado and Olid proceeded towards the posts assigned them, they broke down the aqueducts which the ingenuity of the Mexicans had erected for conveying water into the capital, and, by the distress to which this reduced the inhabitants, gave a beginning to the calamities which they were destined to suffer. Alvarado and Olid found the towns, of which they were ordered to take possession, deserted by their inhabitants, who had fled for safety to the capital, where Guatimozin had collected the chief force of his empire, as there alone he could hope to make a succesful stand against the formidable enemies who were approaching to assault him.

54
The Spaniards defeat the Mexicans, and become masters of the lake.

The first effort of the Mexicans was to destroy the fleet of brigantines, the fatal effects of whose operations they foresaw and dreaded. Though the brigantines, after all the labour and merit of Cortes in forming them, were of inconsiderable bulk, rudely constructed, and manned chiefly with landmen, hardly possessed of skill enough to conduct them, they must have been objects of terror to a people unacquainted with any navigation but that of their lake, and possessed of no vessel larger than a canoe. Necessity, however, urged Guatimozin to hazard the attack; and hoping to supply by numbers what he wanted in force, he assembled such a multitude of canoes as covered the face of the lake. They rowed on boldly to the charge, while the brigantines, retarded by a dead calm, could scarcely advance to meet them. But as the enemy drew near, a breeze suddenly sprung up; in a moment the sails were spread, and the brigantines with irresistible impetuosity broke their feeble opponents, overset many canoes, and dissipated the whole armament with such slaughter, as convinced the Mexicans, that the progress of the Europeans in knowledge and arts rendered their superiority greater on this new element than they had hitherto found it by land.

From that time Cortes remained master of the lake; and the brigantines not only preserved a communication between the Spaniards in their different stations, though at considerable distance from each other; but were employed to cover the causeways on each side, and keep off the canoes, when they attempted to annoy the troops as they advanced towards the city. He formed

Mexico.

formed the brigantines in three divisions, allotting one to each station, with orders to second the operations of the officer who commanded there. From all the three stations he pushed on the attack against the city with equal vigour; but in a manner so very different from that whereby sieges are conducted in regular war, as might appear no less improper than singular to persons unacquainted with his situation. Each morning his troops assaulted the barricades which the enemy had erected on the causeways, forced their way over the trenches which they had dug, and thro' the canals where the bridges were broken down, and endeavoured to penetrate into the heart of the city, in hopes of obtaining some decisive advantage, which might force the enemy to surrender, and terminate the war at once; but when the obstinate valour of the Mexicans rendered the efforts of the day ineffectual, the Spaniards retired in the evening to their former quarters. Thus their toil and danger were, in some measure, continually renewed; the Mexicans repairing in the night what the Spaniards had destroyed through the day, and recovering the posts from which they had driven them. But necessity prescribed this slow and untoward mode of operation. The number of his troops was so small, that Cortes durst not, with a handful of men, attempt to make a lodgment in a city where he might be surrounded and annoyed by such a multitude of enemies. The remembrance of what he had already suffered by the ill-judged confidence with which he had ventured into such a dangerous situation, was still fresh in his mind. The Spaniards, exhausted with fatigue, were unable to guard the various posts which they daily gained; and though their camp was filled with Indian auxiliaries, they durst not devolve this charge upon them, because they were so little accustomed to discipline, that no confidence could be placed in their vigilance. Besides this, Cortes was extremely solicitous to preserve the city as much as possible from being destroyed, both as he destined it to be the capital of his conquests, and wished that it might remain as a monument of his glory. From all these considerations, he adhered obstinately, for a month after the siege was opened, to the system which he had adopted. The Mexicans, in their own defence, displayed valour which was hardly inferior to that with which the Spaniards attacked them. On land, on water, by night and by day, one furious conflict succeeded to another. Several Spaniards were killed, more wounded, and all were ready to sink under the toils of unintermitting service, which were rendered more intolerable by the injuries of the season, the periodical rains being now set in with their usual violence.

Astonished and disconcerted with the length and difficulties of the siege, Cortes determined to make one great effort to get possession of the city before he relinquished the plan which he had hitherto followed, and had recourse to any other mode of attack. With this view, he sent instructions to Alvarado and Sandoval to advance with their divisions to a general assault, and took the command in person of that posted on the causeway of Cuyocan. Animated by his presence, and the expectation of some decisive event, the Spaniards pushed forward with irresistible impetuosity. They broke through one barricade after another, forced their way over the ditches and canals, and having entered the city, gained ground incessantly, in spite of the multitude and ferocity of their opponents. Cortes, though delighted with the rapidity of his progress, did not forget that he might still find it necessary to retreat; and in order to secure it, appointed Julian de Alderete, a captain of chief note in the troops which he had received from Hispaniola, to fill up the canals and gaps in the causeway as the main body advanced. That officer deeming it inglorious to be thus employed, while his companions were in the heat of action and the career of victory, neglected the important charge committed to him, and hurried on inconsiderately to mingle with the combatants. The Mexicans, whose military attention and skill were daily improving, no sooner observed this, than they carried an account of it to their monarch.

Guatimozin instantly discerned the consequences of the error which the Spaniards had committed, and, with admirable presence of mind, prepared to take advantage of it. He commanded the troops posted in the front to slacken their efforts, in order to allure the Spaniards to push forward, while he dispatched a large body of chosen warriors through different streets, some by land, and others by water, towards the great breach in the causeway, which had been left open. On a signal which he gave, the priests in the great temple struck the great drum consecrated to the god of war. No sooner did the Mexicans hear its doleful solemn sound, calculated to inspire them with contempt of death and with enthusiastic ardour, than they rushed upon the enemy with frantic rage. The Spaniards, unable to resist men urged on no less by religious fury than hope of success, began to retire, at first leisurely, and with a good countenance; but as the enemy pressed on, and their own impatience to escape increased, the terror and confusion became so general, that when they arrived at the gap in the causeway, Spaniards and Tlascalans, horsemen and infantry, plunged in promiscuously, while the Mexicans rushed upon them fiercely from every side, their light canoes carrying them through shoals which the brigantines could not approach. In vain did Cortes attempt to stop and rally his flying troops; fear rendered them regardless of his intreaties or commands. 55 Cortes repulsed in an attack.
Finding all his endeavours to renew the combat fruitless, his next care was to save some of those who had thrown themselves into the water; but while thus employed, with more attention to their situation than to his own, six Mexican captains suddenly laid hold of him, and were hurrying him off in triumph; and tho' two of his officers rescued him at the expence of their own lives, he received several dangerous wounds before he could break loose. Above 60 Spaniards perished in the rout; and what rendered the disaster more afflicting, 40 of these fell alive into the hands of an enemy never known to shew mercy to a captive.

The approach of night, though it delivered the dejected Spaniards from the attacks of the enemy, ushered in, what was hardly less grievous, the noise of their barbarous triumph, and of the horrid festival with which they celebrated their victory. Every quarter of the city was illuminated; the great temple shone with such peculiar splendour, that the Spaniards could plainly

plainly ſee the people in motion, and the prieſts buſy in haſtening the preparations for the death of the priſoners. Through the gloom they fancied that they diſcerned their companions by the whiteneſs of their ſkins, as they were ſtripped naked and compelled to dance before the image of the god to whom they were to be offered. They heard the ſhrieks of thoſe who were ſacrificed, and thought they could diſtinguiſh each unhappy victim by the well-known ſound of his voice. Imagination added to what they really ſaw or heard, and augmented its horror. The moſt unfeeling melted into tears of compaſſion, and the ſtouteſt heart trembled at the dreadful ſpectacle which they beheld.

Cortes, who, beſides all that he felt in common with his ſoldiers, was oppreſſed with the additional load of anxious reflections natural to a general on ſuch an unexpected calamity, could not like them relieve his mind by giving vent to its anguiſh. He was obliged to aſſume an air of tranquillity in order to revive the ſpirits

56
The Mexicans renew the attack with great fury.

and hopes of his followers. The juncture, indeed, required an extraordinary exertion of fortitude. The Mexicans, elated with their victory, ſallied out next morning to attack him in his quarters. But they did not rely on the efforts of their own arms alone. They ſent the heads of the Spaniards whom they had ſacrificed to the leading men in the adjacent provinces, and aſſured them that the god of war, appeaſed by the blood of their invaders, which had been ſhed ſo plentifully on his altars, had declared with an audible voice, that in eight days time thoſe hated enemies ſhould be finally deſtroyed, and peace and proſperity re-eſtabliſhed in the empire.

A prediction, uttered with ſuch confidence, and in terms ſo void of ambiguity, gained univerſal credit among a people prone to ſuperſtition. The zeal of the provinces which had already declared againſt the Spaniards augmented, and ſeveral which had hitherto remained inactive took arms with enthuſiaſtic ardour to execute the decrees of the gods. The Indian auxiliaries who had joined Cortes, accuſtomed to venerate the ſame deities with the Mexicans, and to receive the reſponſes of their prieſts with the ſame implicit faith, abandoned the Spaniards as a race of men devoted to certain deſtruction. Even the fidelity of the Tlaſcalans was ſhaken, and the Spaniſh troops were left almoſt alone in their ſtations. Cortes finding that he attempted in vain to diſpel the ſuperſtitious fears of his confederates by argument, took advantage from the imprudence of thoſe who had framed the prophecy in fixing its accompliſhment ſo near at hand, to give them a ſtriking demonſtration of his falſity. He ſuſpended all military operations during the period marked out by the oracle. Under cover of the brigantines, which kept the army at a diſtance, his troops lay in ſafety, and the fatal term expired without any diſaſter.

His allies, aſhamed of their own credulity, returned to their ſtation. Other tribes, judging that the gods, who had now deceived the Mexicans, had decreed finally to withdraw their protection from them, joined

57
Cortes adopts a more cautious method of proceeding.

his ſtandard; and ſuch was the levity of a ſimple people, moved by every ſlight impreſſion, that, in a ſhort time after ſuch a general defection of his confederates, Cortes ſaw himſelf, if we may believe his own account, at the head of 150,000 Indians. Even with ſuch a numerous army, he found it neceſſary to adopt a new and more wary ſyſtem of operation. Inſtead of renewing his attempts to become maſter of the city at once, by ſuch bold but dangerous efforts of valour as he had already tried, he made his advances gradually, and with every poſſible precaution againſt expoſing his men to any calamity ſimilar to that which they ſtill bewailed. As the Spaniards puſhed forward, the Indians regularly repaired the cauſeways behind them. As ſoon as they got poſſeſſion of any part of the town, the houſes were inſtantly levelled with the ground. Day by day, the Mexicans, forced to retire as their enemies gained ground, were hemmed in within more narrow limits. Guatimozin, though unable to ſtop the career of the enemy, continued to defend his capital with obſtinate reſolution, and diſputed every inch of ground. But the Spaniards, having not only varied their mode of attack, but, by orders of Cortes, having changed the weapons with which they fought, were again armed with the long Chinantlan ſpears, which they had employed with ſuch ſucceſs againſt Narvaez; and, by the firm array in which this enabled them to range themſelves, they repelled, with little danger, the looſe aſſault of the Mexicans: incredible numbers of them fell in the conflicts, which they renewed every day. While war waſted without, famine began to conſume them within the city. The Spaniſh brigantines, having the entire command of the lake, rendered it impoſſible to receive any ſupply of proviſions by water. The vaſt number of his Indian auxiliaries enabled Cortes to ſhut up the avenues to the city by land. The ſtores which Guatimozin had laid up were exhauſted by the multitudes which crowded into the capital, to defend their ſovereign and the temples of their gods. Not only the people, but perſons of the higheſt rank, felt the utmoſt diſtreſſes of want. What they ſuffered brought on infectious and mortal diſtempers, the laſt calamity that viſits beſieged cities, and which filled up the meaſure of their woes.

58
Guatimozin refuſes to ſubmit on any terms.

But, under the preſſure of ſo many and ſuch various evils, the ſpirit of Guatimozin remained firm and unſubdued. He rejected with ſcorn every overture of peace from Cortes; and, diſdaining the idea of ſubmitting to the oppreſſors of his country, determined not to ſurvive its ruin. The Spaniards continued their progreſs. At length all the three diviſions penetrated into the great ſquare in the centre of the city, and made a ſecure lodgment there. Three-fourths of the city were now reduced, and laid in ruins. The remaining quarter was ſo cloſely preſſed, that it could not long withſtand aſſailants who attacked it from their new ſtation with ſuperior advantage, and more aſſured expectation of ſucceſs. The Mexican nobles, ſolicitous to ſave the life of a monarch whom they revered, prevailed on Guatimozin to retire from a place where reſiſtance was now vain, that he might rouſe the more diſtant provinces of the empire to arms, and maintain there a more ſucceſsful ſtruggle with the public enemy. In order to facilitate the execution of this meaſure, they endeavoured to amuſe Cortes with overtures of ſubmiſſion, that, while his attention was employed in adjuſting the articles of pacification, Guatimozin might eſcape unperceived. But they made this attempt upon a leader of greater ſagacity and diſcernment than to be deceived by their arts. Cortes ſuſpec-

Mexico. ting their intention, and aware of what moment it was to defeat it, appointed Sandoval, the officer on whoſe vigilance he could moſt perfectly rely, to take the command of the brigantines, with ſtrict injunctions to watch every motion of the enemy. Sandoval, attentive to the charge, obſerving ſome large canoes crowded with people rowing along the lake with extraordinary rapidity, inſtantly gave the ſignal to chace. Gracia Holguin, who commanded the fleeteſt brigantine, ſoon overtook them, and was preparing to fire on the foremoſt canoe, which ſeemed to carry ſome perſon whom all the reſt followed and obeyed. At once the rowers dropt their oars, and all on board,

59 He is taken priſoner. throwing down their arms, conjured him with cries and tears to forbear, as the emperor was there. Holguin eagerly ſeized his prize; and Guatimozin, with a dignified compoſure, gave himſelf up into his hands, requeſting only that no inſult might be offered to the empreſs or his children. When conducted to Cortes, he appeared neither with the ſullen fierceneſs of a barbarian, nor with the dejection of a ſupplicant. "I have done," ſaid he, addreſſing himſelf to the Spaniſh general, "what became a monarch. I have defended my people to the laſt extremity. Nothing now remains but to die. Take this dagger," laying his hand on one which Cortes wore, "plant it in my breaſt, and put an end to a life which can no longer be of uſe."

60 Mexico ſubmits. As ſoon as the fate of their ſovereign was known, the reſiſtance of the Mexicans ceaſed; and Cortes took poſſeſſion of that ſmall part of the capital which yet remained undeſtroyed. Thus terminated the ſiege of Mexico, the moſt memorable event in the conqueſt of America. It continued 75 days, hardly one of which paſſed without ſome extraordinary effort of one party in the attack, or of the other in the defence of a city, on the fate of which both knew that the fortune of the empire depended. As the ſtruggle here was more obſtinate, it was likewiſe more equal, than any between the inhabitants of the Old and New Worlds. The great abilities of Guatimozin, the number of his troops, the peculiar ſituation of his capital, ſo far counterbalanced the ſuperiority of the Spaniards in arms and diſcipline, that they muſt have relinquiſhed the enterpriſe, if they had truſted for ſucceſs to themſelves alone. But Mexico was overturned by the jealouſy of neighbours who dreaded its power, and by the revolt of ſubjects impatient to ſhake off its yoke. By their effectual aid, Cortes was enabled to accompliſh what, without ſuch ſupport, he would hardly have ventured to attempt. How much ſoever this account of the reduction of Mexico may detract, on the one hand, from the marvellous relations of ſome Spaniſh writers, by aſcribing that to ſimple and obvious cauſes which they attribute to the romantic valour of their countrymen, it adds, on the other, to the merit and abilities of Cortes, who, under every diſadvantage, acquired ſuch an aſcendant over unknown nations, as to render them inſtruments towards carrying his ſcheme into execution.

The exultation of the Spaniards, on accompliſhing this arduous enterpriſe, was at firſt exceſſive. But this was quickly damped by the cruel diſappointment of thoſe ſanguine hopes which had animated them amidſt ſo many hardſhips and dangers. Inſtead of the inexhauſtible wealth which they expected from becoming maſters of Montezuma's treaſures, and the ornaments of ſo many temples, their rapaciousneſs could collect only an inconſiderable booty amidſt ruins and deſolation (A). Guatimozin, aware of his impending fate, had ordered what remained of the riches amaſſed by his anceſtors to be thrown into the lake. The Indian auxiliaries, while the Spaniards were engaged in conflict with the enemy, had carried off the moſt valuable part of the ſpoil. The ſum to be divided among the conquerors was ſo ſmall, that many of them diſdained to accept of the pittance which fell to their ſhare, and all murmured and exclaimed; ſome againſt Cortes and his confidents, whom they ſuſpected of having ſecretly appropriated to their own uſe a large portion of the riches which ſhould have been brought into the common ſtock; others againſt Guatimozin, whom they accuſed of obſtinacy, in refuſing to diſcover the place where he had hidden his treaſure.

Arguments, intreaties, and promiſes, were employed in order to ſoothe them; but with ſo little effect, that Cortes, from ſolicitude to check this growing ſpirit of diſcontent, gave way to a deed which ſtained the glory of all his great actions. Without regarding the former dignity of Guatimozin, or feeling any reverence for thoſe virtues which he had diſplayed, he ſubjected the unhappy monarch, together with his chief favourite, to torture, in order to force from them a diſcovery of the royal treaſures, which it was ſuppoſed they had concealed. Guatimozin bore whatever the refined cruelty of his tormentors could inflict, with the invincible fortitude of an American warrior. His fellow-ſufferer, overcome by the violence of the anguiſh, turned a dejected eye towards his maſter, which ſeemed to implore his permiſſion to reveal all that he knew. But the high-ſpirited prince, darting on him a look of authority mingled with ſcorn, checked his weakneſs, by aſking, "Am I now repoſing on a bed of flowers?" Overawed by the reproach, he perſevered in his dutiful ſilence, and expired. Cortes, aſhamed of a ſcene ſo horrid, reſcued the royal victim from the hands of his torturers, and prolonged a life reſerved for new indignities and ſufferings. 61 Guatimozin tortured.

The fate of the capital, as both parties had foreſeen, decided that of the empire. The provinces ſubmitted one after another to the conquerors. Small detachments of Spaniards marching through them without interruption, penetrated, in different quarters, to the great Southern Ocean, which, according to the ideas of Columbus, they imagined would open a ſhort as well as eaſy paſſage to the Eaſt Indies, and ſecure to the crown of Caſtile all the envied wealth of thoſe fertile regions; and the active mind of Cortes began already to form ſchemes for attempting this important diſcovery. In his after ſchemes, however, he was diſappointed; but Mexico hath ever ſince remained in the hands of the Spaniards. 62 The Spaniards become maſters of the whole Mexican empire.

Mexico is almoſt entirely ſituated within the torrid zone. The air is exceſſively warm, moiſt, and unwholeſome, on the coaſts of the North Sea. Theſe de- 63 Climate, ſoil, &c. of Mexico.

(A) The gold and ſilver, according to Cortes, amounted only to 120,000 peſos, Relat. 280, A. a ſum far inferior to that which the Spaniards had formerly divided in Mexico.

Mexico. defects of the climate are infinitely less felt on the coasts of the South Sea, and hardly at all in the inland country, which is intersected by a chain of mountains, that are supposed to be a continuation of the Cordeleras.

The quality of the soil has the same variations. The eastern part is low, marshy, overflowed in the rainy seasons, covered with impenetrable forests, and totally uncultivated. The soil on the western side is higher, of a better quality, on which there are many fields, and several houses are built upon it. In the low lands there are districts on which nature has been very liberal; but, like every country situated under the tropics, they abound more in fruits than in corn.

The population of this vast empire is not less various than its soil. Its most distinguished inhabitants are the Spaniards sent hither by the court, to fill the posts of government. They are obliged, like those in the mother-country who aspire to any ecclesiastical, civil, or military employments, to prove that there have been neither heretics, Jews, Mohammedans, nor any persons in their family who have been called before the inquisition for four generations. Merchants who are desirous of going to Mexico, as well as to other parts of America, without becoming colonists, are compelled to observe the same forms. They are also obliged to swear that they have 300 palms of merchandise, their own property, in the fleet in which they embark, and that they will not carry their wives with them. On these absurd conditions they become the principal agents of the European commerce with the Indies. Though their charter is only to continue three years, and a little longer for countries more remote, it is of great importance. To them alone belongs the right of selling, as commissioners, the major part of the cargo. If these laws were observed, the merchants stationed in the new world would be confined to dispose of what they have received on their own account.

The predilection which administration has for Spaniards born in Europe, has reduced the Spanish Creoles to acquiesce in subordinate stations. The descendents of the companions of Cortes, and of those who came after them, being constantly excluded from all places of honour or of trust that were any way considerable, have seen the gradual decay of the power that supported their fathers. The habit of being obliged to bear that unjust contempt with which they have been treated, has at last made them become really contemptible. They have totally lost, in the vices which originate from indolence, from the heat of the climate, and from a superfluous enjoyment of all things, that firmness and that sort of pride which have ever characterized their nation. A barbarous luxury, shameful pleasures, and romantic intrigues, have enervated all the vigour of their minds, and superstition hath completed the ruin of their virtues. Blindly devoted to priests too ignorant to enlighten them by their instructions, too depraved to edify them by their example, and too mercenary to attend to both these duties of their function, they have no attachment to any part of their religion but that which enfeebles the mind, and have neglected what might have contributed to rectify their morals.

The Mestees, who constitute the third order of citizens, are held in still greater contempt. It is well known that the court of Madrid, in order to replenish a part of that dreadful vacancy which the avarice and cruelty of the conquerors had occasioned, and to regain the confidence of those who had escaped their fury, encouraged as much as possible the marriage of Spaniards with Indian women. These alliances, which became pretty common throughout all America, were particularly frequent in Mexico, where the women had more understanding and were more agreeable than in other places. The Creoles transferred to this mixed progeny the contemptuous slight they received from the Europeans. Their condition, equivocal at first, in process of time at last was fixed between the whites and the blacks.

These blacks are not very numerous in Mexico. As the natives are more intelligent, more robust, and more industrious, than those of the other colonies, they have hardly introduced any Africans except such as were required either to indulge the caprice, or perform the domestic service, of rich people. These slaves, who are much beloved by their masters, on whom they absolutely depend, who purchased them at an extravagant price, and who make them the ministers of their pleasures, take advantage of the high favour they enjoy, to oppress the Mexicans. They assume over these men, who are called *free*, an ascendant which keeps up an implacable hatred between the two nations. The law has studied to encourage this aversion, by taking effectual measures to prevent all connection between them. Negroes are prohibited from having any amorous correspondence with the Indians; the men, on pain of being mutilated, the women of being severely punished. On all these accounts, the Africans, who in other settlements are enemies to Europeans, are in the Spanish Indies their warm friends.

Authority has no need of this support, at least in Mexico, where population is no longer what it was formerly. The first historians, and those who copied them, have recorded, that the Spaniards found there 10,000,000 of souls. This is supposed to have been the exaggerated account of conquerors, to exalt the magnificence of their triumph: and it was adopted, without examination, with so much the more readiness, as it rendered them the more odious. We need only trace with attention the progress of those ruffians who at first desolated these fine countries, in order to be convinced that they had not succeeded in multiplying men at Mexico and the adjacent parts, but by depopulating the centre of the empire; and that the provinces which are remote from the capital, differed in nothing from the other deserts of South and North-America. It is making a great concession, to allow that the population of Mexico has only been exaggerated one-half: for it does not now much exceed 2,000,000.

64 Mexicans cruelly treated by the Spaniards.

It is generally believed, that the first conquerors massacred the Indians out of wantonness, and that even the priests incited them to these acts of ferocity. Undoubtedly these inhuman soldiers frequently shed blood without even an apparent motive; and certainly their fanatic missionaries did not oppose these barbarities as they ought to have done. This was not, however,

Mexico. degree. The Spaniards are encouraged to profecute the labours which thefe cultures require, from the happy circumftance of their having difcovered iron mines, which were entirely unknown to the Mexicans, as well as fome mines of a kind of copper that is hard enough to ferve for implements of hufbandry. All thefe articles, however, for want of men and induftry, are merely confumed within the country.—There is only the vanilla, indigo, and cochineal, which make part of the trade of Mexico with other nations.

New-MEXICO, fo called becaufe of its being difcovered later than Old-Mexico, a country of America, is bounded on the north by high mountains, beyond which is a country altogether unknown; by Louifiana on the eaft; by New-Spain on the fouth; and on the weft by the gulph of California, and the Rio Colorado; extending, it is faid, above 100 miles from eaft to weft, and about 900 from fouth to north; but the twentieth part of the country within thefe limits is neither cultivated nor inhabited either by Spaniards or Indians. As it lies in the midft of the temperate zone, the climate, in general, is very pleafant; the fummers, though very warm, are neither fultry nor unwholefome; and the winters, though pretty fharp, are far from being infupportable, and, for the moft part, clear and healthy.

The greateft encomiums are lavifhed on the fertility of the foil, the richnefs of the mines, and the variety of valuable commodities produced in this country. It is faid to be beautifully diverfified with fields, meadows, rifing grounds, and rivers; abounding with fruit and timber-trees, turquoifes, emeralds, and other precious ftones, mines of gold and filver, a great variety of wild and tame cattle, fifh, and fowls. Upon the whole, we may fafely affirm, that New-Mexico is among the pleafanteft, richeft, and moft plentiful countries in America, or any other part of the world. There are few great or navigable rivers in it: the moft confiderable are, the Rio Solado and Rio del Norte, which, with feveral fmaller ftreams, fall into the gulph of Mexico. On the coaft of the gulph are divers bays, ports, and creeks, which might be eafily converted into excellent harbours if the Spaniards were poffeffed of any portion of that commercial fpirit which animates the other maritime nations of Europe.

The Spanifh writers tell us, that New-Mexico is inhabited by a great variety of Indian nations or tribes, totally unconnected with each other: but the principal are the Apaches, a brave, warlike, refolute people; fond of liberty, and the inveterate enemies of tyranny and oppreffion. About the clofe of the laft century, thinking themfelves aggrieved by the Spanifh government, they made a general infurrection, and did a great deal of mifchief; but were at laft obliged to fubmit, and have fince been curbed by ftronger garrifons. Moft of the natives are now Chriftians. When the Spaniards firft entered this country, they found the natives well clothed, their lands cultivated, their villages neat, and their houfes built with ftone. Their flocks alfo were numerous, and they lived more comfortably than moft of the other favages of America. As to religion, they were idolaters, and worfhipped the fun and moon; but whether they offered human facrifices, we are not fufficiently informed.

As to the number of the provinces of this country, we can advance nothing certain; fome writers making them only five, others 15, 18, 20, and 25; but adding no defcription, either of them or the towns contained in them, excepting the capital, Santa Fé, which we are told, ftands near the fource of the Rio del Norte, in 36° of north latitude, and about 130 leagues from the gulph: that it is a well-built handfome, rich town; and the feat of a bifhop, fuffragan of Mexico, as well as of the governor of the province, who is fubordinate to the viceroy of Mexico, or New-Spain.

Mezeray. MEZERAY (Francis Eudes de), an eminent French hiftorian, the fon of Ifaac Eudes a furgeon, was born at Rye, in Lower Normandy, in 1610; and took the furname of *Mezeray*, from a hamlet near Rye. Having performed his ftudies at Caen, he difcovered a ftrong inclination to poetry; but going to Paris, he, by the advice of one of his friends, applied himfelf to the ftudy of politics and hiftory, and procured the place of commiffary at war, which he held for two campaigns. He then fhut himfelf up in the college of St Barbe, in the midft of books and manufcripts; and, in 1643, publifhed the firft volume of the Hiftory of France, in folio; and fome years after, the other two volumes. Mezeray in that work furpaffed all who had written the hiftory of France before him, and was rewarded by the king with a penfion of 4000 livres. In 1668, he publifhed an Abridgment of his Hiftory of France, in three volumes 4to. which was well received by the public: but as he inferted in that work the origin of moft of the taxes, with very free reflections, Mr Colbert complained of it, when Mezeray promifed to correct what he had done in a fecond edition; but thofe corrections being only palliations, the minifter caufed half of his penfion to be fuppreffed. Mezeray complained of this in very fevere terms; when he obtained no other anfwer than the fuppreffion of the other half. Vexed at this treatment, he refolved to write on fubjects that could not expofe him to fuch difappointments; and compofed his treatife on the origin of the French, which did him much honour. He was elected perpetual fecretary to the French academy; and died in 1683. He is faid to have been a man extremely negligent in his perfon; and fo carelefs in his drefs, that he might have paffed for a beggar, rather than for what he was. He was actually feized one morning by the *archers des pauvres*, or parifh-officers; which miftake was fo far from provoking him, that he was highly diverted with it, and told them, that "he was not able to walk on foot, but that as foon as a new wheel was put to his chariot, he would attend them wherever they thought proper." He ufed to ftudy and write by candle-light, even at noon-day in fummer; and, as if there had been no fun in the world, always waited upon his company to the door with a candle in his hand. With regard to religion, he affected Pyrrhonifm; which however was not, it feems, fo much in his heart as in his mouth. This appeared from his laft ficknefs: for having fent for thofe friends who had been the moft ufual witneffes of his licentious talk about religion, he made a fort of recantation, which he concluded with defiring them "to forget what he might formerly have faid upon the fubject of religion, and to remember, that Mezeray dying was a

a better believer than Mezeray in health." Befides his hiftory, he alfo wrote, 1. A continuation of the hiftory of the Turks. 2. A French tranflation of John de Sarifbury's Latin treatife on the vanities of the court. 3. There are attributed to him feveral fatires againft the government; and in particular, thofe that bear the name of *Sandricourt*.

MEZIERS, a ftrong town of France, in Champagne, with a citadel. It was befieged with a powerful army by Charles V. who was obliged to raife the fiege in 1521. It is feated on the river Meafe, partly upon a hill, and partly in a valley, in E. Long. 3. 48. N. Lat. 49. 46.

MEZIRIAC (Claude Gafpar Backet Sieur de), one of the moft ingenious men of the 17th century, was born at Breffe, of an ancient and noble family. He was a good poet in French, Italian, and Latin; an excellent grammarian, a great Greek fcholar, and an admirable critic. He was well verfed in the controverfies, both in philofophy and religion; and was deeply fkilled in algebra and geometry, of which laft he gave proof by publifhing the fix books of Diophantes, enriched with a very able Commentary and Notes. In his youth he fpent a confiderable time at Paris and at Rome: at which laft place he wrote a fmall collection of Italian poems, in competition with Vaugelas, who was there at the fame time; among which there are imitations of the moft beautiful fimilies contained in the eight firft books of the Æneid. He alfo tranflated Ovid's Epiftles; a great part of which he illuftrated with very curious Commentaries of his own. While he was at Paris, they talked of making him preceptor of Lewis XIII.: upon which he left the court in great hafte, and afterwards declared that he had never felt fo much pain upon any occafion of his life; for he feemed to have already upon his fhoulders the important weight of the whole kingdom. He undertook the tranflation of all Plutarch's works, with notes; which he had brought nearly to a conclufion, when he died at Bourg, in Breffe, anno 1638, at 45 years of age. He left behind him feveral finifhed works, that were not printed.

MEZZOTINTO, a particular manner of reprefenting figures on copper, fo as to form prints in imitation of painting in Indian ink.

The manner of making mezzotintos is very different from all other kinds of engraving and etching; fince, inftead of forming the figures with lines and fcratches made with the point of a graver, or by means of aquafortis, they are wholly formed by fcraping and burnifhing. Mezzotintos are made in the following manner: Take a well-polifhed copperplate, and beginning at the corner, rake or furrow the furface all over with a knife or inftrument made for the purpofe, firft one way, and then the other, till the whole is of a regular roughnefs, without the leaft fmooth part to be feen; in which ftate, if a paper was to be worked off from it at the copper-plate prefs, it would be all over black. When this is done, the plate is rubbed over with charcoal, black chalk, or black lead, and then the defign is drawn with white chalk; after which the out-lines are traced out, and the plate finifhed by fcraping off the roughnefs, fo as to leave the figure on the plate. The outlines and deepeft fhades are not fcraped at all; the next fhades are fcraped but little, the next more; and fo on, till the fhades gradually falling off, leave the paper white, in which places the plate is neatly burnifhed.

By an artful difpofition of the fhades and different parts of a figure on different plates, mezzotintos have been printed in colours, fo as nearly to refemble very beautiful paintings.

MIASMA, among phyficians, a particular kind of effluvia, by which certain fevers, particularly intermittents, are produced. See MEDICINE, n° 139.

MICA, GLIMMER, in natural hiftory, a genus of talcs. See TALC.

MICAH, or *The Book of* MICAH, a canonical book of the Old Teftament, written by the prophet Micah, who is the feventh of the twelve leffer prophets. He is cited by Jeremiah, and prophefied in the days of Jotham, Ahaz, and Hezekiah. He cenfures the reigning vices of Jerufalem and Samaria, and denounces the judgments of God againft both kingdoms. He likewife foretells the confufion of the enemies of the Jews, the coming of the Meffiah, and the glorious fuccefs of his church.

MICHAEL (Angelo Buonaruoti). See ANGELO.

MICHAEL (Angelo da Caravaggia). See ANGELO, and CARAVAGGIO.

Mount MICHAEL, one of the moft celebrated ftate-prifons of France, lies about 20 miles from Granville. It is a rock fituated in the middle of the bay of Avranches; and is only acceffible at low water. Nature has completely fortified one fide, by its craggy and almoft perpendicular defcent, which renders it impracticable to mount it by any addrefs or courage, however confummate. The other parts are furrounded by walls fenced with femilunar towers after the Gothic manner; but fufficiently ftrong, together with the advantages of its fituation, to render it impregnable to any attack. At the foot of the mountain begins a ftreet or town, which winds round its bafe to a confiderable height. Above are chambers where ftate-prifoners are kept, and where there are other buildings intended for refidence. On the fummit is erected the abbey itfelf, occupying a prodigious fpace of ground, and of a ftrength and folidity equal to its enormous fize; fince it has for many centuries withftood all the injuries of the weather, to which it is fo much expofed. In an apartment, called the *Sale de Chavalerie*, the knights of St Michael ufed to meet in folemn convocation on important occafions. They were the defenders and guardians of this mountain and abbey, as thofe of the temple, and of St John of Jerufalem, were of the holy fepulchre. The hall in which they met is very fpacious, but rude and barbarous. At one end is a painting of the archangel, the patron of their order; and in this hall Lewis XI. firft inftituted and invefted with the infignia of knighthood the chevaliers of the crofs of St Michael. There is a miferable dark apartment, or rather dungeon, in which many eminent perfons were formerly confined. In the middle of it is a cage, compofed of prodigious bars of wood; and the wicket which gives entrance into it is 10 or 12 inches in thicknefs. The infide of it comprifes about 12 or 14 feet fquare, and it is nearly 20 in height. Towards the latter end of the laft century, a certain newfwriter in Holland, who had prefumed to print fome very fevere and farcaftic reflections on Madame de Main-

Michael. Maintenon, was confined in this place. Some months after his publication, he was induced, by a perfon fent exprefsly for that purpofe, to make a tour into French Flanders. The moment he had quitted the Dutch territories, he was put under arreft; and immediately, by his majefty's exprefs command, conducted to Mount Michael, where he was fhut up in this cage. Here he lived upwards of 23 years; and here he at length expired. During the long nights of winter, no candle or fire was allowed him. He was not permitted to have any book. He faw no human face, except the goaler; who came once every day to prefent him, through a hole in the wicket, with his little portion of bread and wine. No inftrument was given him with which he could deftroy himfelf: but he found means at length to draw out a nail from the wood, with which he engraved, or cut on the bars of his cage, certain fleurs de lis and armorial bearings, which formed his only employment and recreation. They are very curioufly performed, confidering the rudenefs of his tool.

The fubterraneous chambers in this mountain are faid to be fo numerous, that the jailors themfelves do not know them. There are certain dungeons called *oubliettes*, into which they were accuftomed anciently to let down malefactors guilty of very heinous crimes: they provided them with a loaf of bread and a bottle of wine, and then they were totally forgotten, and left to perifh by hunger in the dark vaults of the rock. This punifhment, however, has not been inflicted by any king in the laft or prefent century.

Here alfo is a remarkable chamber, in one corner of which is a kind of window; between this and the wall of the building is a very deep fpace, of near 100 feet perpendicular, at the bottom of which is another window opening to the fea. It is called the *Hole of Montgomeri;* and the hiftory of it is as follows: In the year 1559, Henry II. king of France was unfortunately killed at a tournament by the count de Montgomeri ‡. He was a Huguenot; and having efcaped the maffacre of Paris, made head againft the royal forces in Normandy, fupported by queen Elizabeth with arms and money. Being driven from his fortreffes in thefe parts, he retired to a rock called the *Tombelaine*. This is another fimilar to Mount Michael; only three quarters of a league from it, and of nearly equal dimenfions. At that time there was a caftle upon it, which hath fince been demolifhed, and of which fcarce any veftiges now remain. From this fortrefs, acceffible only at low-water, he continually made excurfions, and annoyed the enemy, who never dared to attack him. He coined money, laid all the adjacent country under contribution, and rendered himfelf univerfally dreaded. Defirous, however, to furprife Mount Michael, he found means to engage one of the monks refident in the abbey; who promifed to give him the fignal for his enterprife by difplaying a handkerchief. The monk having made the fignal, betrayed him, and armed all his affociates, who waited Montgomeri's arrival. The chieftain came, attended by 50 chofen foldiers, all defperate, and capable of any attempt. They croffed the fand; and having placed their fcaling-ladders, mounted one by one. As they came to the top, they were difpatched, each in turn, without noife. Montgomeri, who followed laft, difcovered the perfidy, and efcaped with only two of his men, with whom he regained the Tombelaine. They preferve with great care the ladders and grappling irons ufed on this occafion. The count was at laft befieged and taken prifoner, by the marefhal de Matignon, in 1574, at Domfront in Normandy; and Catharine de Medicis, who hated him for having been, though innocently, the caufe of her hufband's death, caufed him to be immediately executed.

‡ See *France*, nº 80.

The church of Mount Michael is a great curiofity. It ftands on nine pillars of moft enormous dimenfions, built on the folid rock. Each of them appear to be about 25 feet in circumference: befides thefe, there are two others much inferior in fize, on which the centre of the church refts, and over which is the tower. The following is the legendary account of the origin of this church: In the reign of Childebert II. there was a bifhop of Avranches named *St Aubert*. To this holy man the archangel Michael was pleafed to appear one night, and ordered him to go to this rock to build a church. St Aubert treated this as a dream; upon which the angel appeared a fecond time; and being ftill difobeyed, he returned a third time; when, by way of imprinting his command upon the faint's memory, he made a hole in his fkull, by touching it with his thumb. The fkull is ftill preferved in the treafury of the church. It is inclofed in a little fhrine of gold, and a cryftal, which opens over the orifice, admits the gratification of curiofity by the minuteft examination of it. The hole is of a fize and fhape proportionable to the thumb faid to have produced it; but it is impoffible to determine whether it has been really made by a knife, or any other way. It is not to be fuppofed that the faint would forget fuch a fenfible mark of the angel's difpleafure; he therefore immediately repaired to the rock, and constructed a fmall church, as he had been commanded. Here, however, true hiftory fupplies the place of fable; and informs us, that it was in 966 when Richard the fecond duke of Normandy began to build the abbey. It was completed about the year 1070, under William the Conqueror, though many other additions were made by fucceeding abbots.

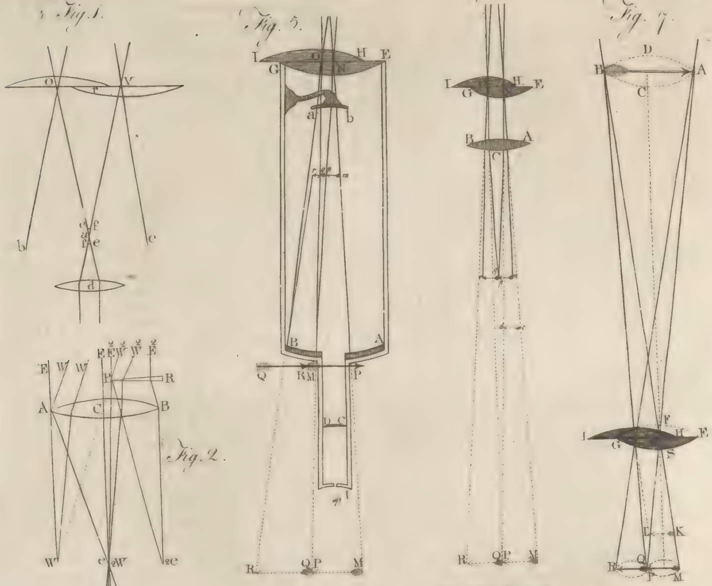
In the treafury of the church are innumerable other relics; among which fome few have a real and intrinfic value. There is a fine head of Charles VI. of France, cut in a cryftal, and the reprefentation of a cockle-fhell in gold, weighing many pounds, given by Richard II. duke of Normandy when he founded the abbey. There is an arm faid to belong to *St Richard* king of England; but who this faint was, muft be very difficult to determine.

MICHAELMAS, or *Feaft of St* MICHAEL *and all Angels*, a feftival of the Chriftian church, obferved on the 29th of September.

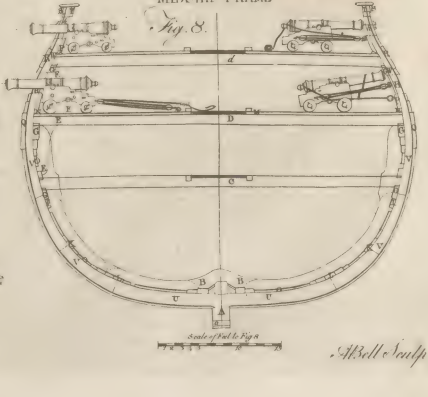
The Scripture account of Michael is, That he was an archangel, who prefided over the Jewifh nation, as other angels did over the Gentile world, as is evident of the kingdoms of Perfia and Greece; that he had an army of angels under his command; that he fought with the Dragon, or Satan and his angels; and that, contending with the devil, he difputed about the body of Mofes.

As to the combat between Michael and the Dragon, fome authors underftand it literally, and think it means the expulfion of certain rebellious angels, with their

MICROMETERS.



MIDSHIP FRAME



A.Bell Sculp!

their head or leader, from the presence of God. Others take it in a figurative sense; and refer it, either to the contest that happened at Rome between St Peter and Simon Magus, in which the apostle prevailed over the magician; or to those violent persecutions, under which the church laboured for 300 years, and which happily ceased when the powers of the world became Christian.

The contest about the body of Moses is likewise taken both literally and figuratively. Those who understand it literally, are of opinion, that Michael, by the order of God, hid the body of Moses after his death, and that the devil endeavoured to discover it, as a fit means to entice the people to idolatry by a superstitious worship of his relics. But this dispute is figuratively understood to be a controversy about rebuilding the temple, and restoring the service of God among the Jews at Jerusalem, the Jewish church being fitly enough styled the *body of Moses*. It is thought by some, that this story of the contest between Michael and the devil was taken by St Jude out of an apocryphal book, called the *Assumption of Moses*.

MICROCOSM, a Greek term signifying the *little world*; used by some for man, as being supposed an epitome of the universe or great world.

MICROGRAPHY, the description of objects too minute to be viewed without the assistance of a microscope. See Microscopic *Objects*.

MICROMETER, an instrument, by the help of which the apparent magnitudes of objects viewed thro' telescopes or microscopes are measured with great exactness.

The first micrometers were only mechanical contrivances for measuring the image of an object in the focus of the object-glass. Before these contrivances were thought of, astronomers were accustomed to measure the field of view in each of their telescopes, by observing how much of the moon they could see through it, the semidiameter being reckoned at 15 or 16 minutes; and other distances were estimated by the eye, comparing them with the field of view. Mr Gascoigne, an English gentleman, however, fell upon a much more exact method, and had a treatise on Optics prepared for the press; but he was killed during the civil wars, in the service of Charles I. and his manuscript was never found. His instrument, however, fell into the hands of Mr R. Townly, who says, that by the help of it he could mark above 40,000 divisions in a foot.

Mr Gascoigne's instrument being shewn to Dr Hooke, he gave a drawing and description of it, and proposed several improvements in it, which may be seen in *Phil. Trans.* abr. Vol. I. p. 217. Mr Gascoigne divided the image of an object, in the focus of the object-glass, by the approach of two pieces of metal, ground to a very fine edge, in the place of which Dr Hooke would substitute two fine hairs stretched parallel to one another. Two other methods of Dr Hooke's, different from this, are are described in his Posthumous Works, p. 497, 498. An account of several curious observations that Mr Gascoigne made by the help of his micrometer, particularly in the mensuration of the diameters of the moon and other planets, may be seen in the Phil. Trans. Vol. XLVIII. p. 190.

Mr Huygens, as appears by his System of Saturn, published in 1659, used to measure the apparent diameters of the planets, or any small angles, by first measuring the quantity of the field of view in his telescope; which, he says, is best done by observing the time which a star takes up in passing over it, and then preparing two or three long and slender brass plates, of various breadths, the sides of which were very straight, and converging to a small angle. In making use of these pieces of brass, he made them slide in two slits, that were made in the sides of the tube, opposite to the place of the image, and observed in what place it just covered the diameter of any planet, or any small distance that he wanted to measure. It was observed, however, by Sir Isaac Newton, that the diameters of planets, measured in this manner, will be larger than they should be, as all lucid objects appear to be, when they are viewed upon dark ones.

In the Ephemerides of the Marquis of Malvasia, published in 1662, it appears that he had a method of measuring small distances between fixed stars, and the diameters of the planets, and also of taking accurate draughts of the spots of the moon; and this was by a net of silver wire, fixed in the common focus of the object and eye-glass. He also contrived to make one of two stars to pass along the threads of this net, by turning it, or the telescope, as much as was necessary for that purpose; and he counted, by a pendulum-clock, beating seconds, the time that elapsed in its passage from one wire to another, which gave him the number of the minutes and seconds of a degree contained between the intervals of the wires of his net, with respect to the focal length of his telescope.

In 1666, Messrs Auzout and Picard published a description of a micrometer, which was nearly the same with that of the Marquis of Malvasia, excepting the method of dividing it, which they performed with more exactness by a screw. In some cases they used threads of silk, as being finer than silver wires. Dechales also recommends a micrometer consisting of fine wires, or silken threads, the distances of which were exactly known, disposed in the form of a net, as peculiarly convenient for taking a map of the moon.

M. de la Hire says, that there is no method more simple or commodious for observing the digits of an eclipse than a net in the focus of the telescope. These, he says, were generally made of silken threads; and that for this particular purpose six concentric circles had also been made use of, drawn upon oiled paper; but he advises to draw the circles on very thin pieces of glass with the point of a diamond. He also gives several particular directions to assist persons in the use of them. In another memoir he shews a method of making use of the same net for all eclipses, by using a telescope with two object-glasses, and placing them at different distances from one another.

M. Cassini invented a very ingenious method of ascertaining the right ascensions and declinations of stars, by fixing four cross hairs in the focus of the telescope, and turning it about its axis, so as to make them move in a line parallel to one of them. The difficulty there was in accomplishing this was entirely removed by a mechanical contrivance of Dr Bradley.

M. Lewenhoek's method of estimating the size of small objects was by comparing them with grains of sand, of which 100 placed in a line took up an inch. These grains he laid on the same plate with his ob-

Micrometer

jects, and viewed them at the fame time. Dr Jurin's method was fimilar to this of M. Lewenhoek; for he found the diameter of a piece of fine filver-wire, by wrapping it as clofe as he could about a pin, and obferving how many rings made an inch. For he ufed this wire in the fame manner as Lewenhoek ufed his fand.

Mr Martin, in his Optics, recommends fuch a micrometer to a microfcope as had been applied to telefcopes; for he advifes to draw a number of parallel lines on a piece of glafs, with the fine point of a diamond, at the diftance of $\frac{1}{40}$ of an inch from one another, and to place it in the focus of the eye-glafs. By this method Dr Smith contrived to take the exact draught of objects viewed by a double microfcope. For he advifes to get a lattice, made with fmall filver wires or fmall fquares, drawn upon a plain glafs by the ftrokes of a diamond, and to put it into the place of the image formed by the object-glafs. Then by transferring the parts of the object, feen in the fquares of the glafs or lattice, upon fimilar correfponding fquares, drawn on paper, the picture may be exactly taken. Mr Martin alfo introduced into compound mifcrofcopes another micrometer, confifting of a fcrew.

Dr Hooke ufed to look upon the magnified object with one eye, while, at the fame time, he viewed other objects placed at the fame diftance with the other eye. In this manner he was able, by the help of a ruler, divided into inches and fmall parts, and laid on the pedeftal of the microfcope, to caft, as it were, the magnified appearance of the object upon the ruler, and thereby exactly to meafure the diameter which it appeared to have through the glafs; which being compared with the diameter as it appeared to the naked eye, eafily fhewed the degree in which it was magnified. This, fays Mr Baker, is a ready and good method for many objects; and he declares, from his own experience, that a little practice will render it exceedingly eafy and pleafant.

We are obliged to Dr Hooke for an excellent method of viewing the fun without injuring our eyes. For this purpofe he contrived that the rays fhould be reflected from one plane to another, till it was fo much weakened that the eye might receive it with great fafety and pleafure. This method is much preferable to that of looking at the fun through a fmoky or coloured glafs, which gives it a red and difagreeable hue. His difcourfe on this fubject was read before the Royal Society June 28 1675.

Thefe micrometers, however, have feveral confiderable defects. In particular, it is not eafy to meafure with them objects that are in motion, or thofe which are too large to come within the field of view; fo that the diameters of the fun and moon cannot well be meafured with them to any great degree of exactnefs. Another method was found of meafuring the apparent magnitude of the object, free from the inconveniencies above mentioned, by means of a telefcope furnifhed with two object-glaffes. This ingenious method was hit upon about the fame time both by Mr Servington Sauvery and the celebrated M. Bouguer.

In this inftrument, both object-glaffes are of equal focal diftance, and placed one of them by the fide of the other; fo that the fame eye-glafs may ferve for them both. By this means two diftinct images of an object are formed in the focus of the eye-glafs; and fince the diftance of thefe images depends upon the diftance at which the two object-glaffes are placed from one another, it may be meafured with great accuracy. Nor is it neceffary that the whole difc of the fun or moon come within the field of view; fince, if the images of a fmall part of the difc be formed by each object-glafs, the whole diameter may eafily be computed, by their pofition with refpect to one another. For if the object be large, the images will approach towards, or perhaps even ly over one another. And the object-glaffes being moveable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known diftance of the centres of the two glaffes.

Another advantage attending this inftrument is, that by having a common micrometer in the focus of the eye-glafs, when the two images of the fun or moon are made in part to cover one another, that part which is common to both the images may be meafured with great exactnefs, as being viewed upon a ground that is only one half lefs luminous than itfelf; whereas, in general, the heavenly bodies are viewed upon a dark ground, and on that account are imagined to be larger than they really are. By a fmall addition to this inftrument, provided it be of a moderate length, M. Bouguer thought it very poffible to meafure angles of three or four degrees; which is of particular confequence in taking the diftance of ftars from the moon.

Mr Sauvery's paper containing a very particular defcription of his conftruction of this inftrument was read at the Royal Society October 27. 1743, and M. Bouguer's account of his inftrument which he called an *heliometer* is contained in the Memoirs of the Royal Academy of Sciences for the year 1748, p. 15.

A very great improvement was made in this kind of micrometer by Mr Dollond; for, inftead of two complete object-glaffes, he ufed only one, cut into two equal parts, one of them fliding by the other. Each half of this object-glafs will give a feparate and diftinct image; and as the diftance at which their centres are placed from one another may be exactly afcertained, the fame ufes may be made of them as of two entire object-glaffes, and the application of them is much more commodious.

But the ground or reafon of this new micrometer, as applied to the refractory or reflecting telefcope, may be illuftrated by figures, as follows:

Let ABCD reprefent any very diftant object, as the fun, &c. and AB its diameter; alfo let EFGS reprefent the object-glafs confifting of two fegments EFG and ESG divided through the centre N in the right line EG. The angle under which it appears at the end of the telefcope will be ANB equal to the angle KNL, under which the image KL is contained. Now, fuppofe the moveable fegment EFG were by a mechanical contrivance drawn off to the pofition HI, the diftance of their centres would be NO; and the two lines AN and BO paffing through the centres N, O, of the fegments, if produced, meet at the focus in L; and fince BL and BK do alfo pafs through the centres N and O, and the object being at an indefinitely great diftance, the line OL will be parallel

Plate CLXXV. fig. 7.

to

Micrometer to NK, and consequently the angle NLO is equal to the angle KNL or ANB; that is to say, *the angle under which the object appears from the end of the telescope (or to the naked eye), is equal to the angle under which the distance between the two centres of the segments appear from the solar focus of the telescope.*

And this will be the case in every distance of an object: for supposing the object AB were at some near distance from the telescope, and subtended the same angle ANB, the only consequence would be, that its image would be formed at a greater distance from the glass, suppose at MP: it would still be contained under the same angle MNP, equal to NLO, as before, upon the supposition that the segment HI and BO produced meets AP in the point P; that is to say, suppose that the segment HI is in such position that the moveable image QR formed by it, exactly coincides with the fixed image MP, formed by the segment ESG.

Concerning this vitreous micrometer we may farther observe, that its great excellency consists in this, that it depends solely in measuring the distance of the centres of the two segments, not only when applied alone at the end of a telescope, but even in conjunction with the object-glass of any common telescope; Fig. 6. for, let EG and HI represent the two segments, as before, of a glass whose focal distance is very long, suppose, for instance, 50 feet; then, at a small distance from it, let AB represent the object-glass of a common long telescope, whose focal distance of parallel rays is C *d*, or its focus of very distant objects *d c*. Then this glass, combined with the foregoing segments, will have its focus shortened, and the common focus of both will be in point *q*. Then because the triangles RCQ and PNM are similar to the triangles *r* O *q* and *p* N *m* respectively; therefore the images RQ and PM will be similar, and alike posited to the two small images *r q* and *p m*; and therefore when these two images are in contact in the focus of the semi-lenses, they will likewise be in contact in the shortened compound focus. And as the centres N and O of the two semi-lenses GE and IH are separated farther from, or brought nearer to, each other, the images in either focus will be moved in similar manner; and when the centres N and O coincide, the images in each focus respectively will also coincide, or become one entire image; the difference in every case being only as to large and small, greater or lesser distance. Consequently, in the micrometer by which those two semi-lenses are moved by each other, the same turns of the screw which measures the angle OPN, and which brings the images into an exact contact in the single focus at Q, will be necessary for the same purpose in the compound focus also; so that by this means we have an opportunity of measuring the said angle OPQ, without being obliged to have so great and so unmanageable a length of the telescope.

However, the larger the focal distance of the lens AB is, the more distinct the contact of the images will appear; and because this is the point on which the whole perfection of this micrometer depends, it will be likewise necessary to have it so contrived, when applied to a telescope, that the centres NO may be equally distant from the axis of the telescope or centre of the aperture on either side; because, in this case, Micrometer the point of contact in the two images will be just in the centre of the focus, and therefore the most distinct that it possibly can be.

But the application of this micrometer to refracting telescopes will be less convenient than when it is applied to a reflecting telescope; for if it be placed on the open end of the reflecting telescope, then will the rays that tend to form the larger images RQ and PM be incident upon the larger speculum Fig. 5. AB, and from thence reflected to a compound focus, where the similar images *r q* and *p m* will be formed as before; the rays proceeding from these two images to the smaller speculum *a b*, will be reflected back through the hole of the larger, to form the images QR and PM, which likewise will still be in contact in the focus of the eye-glass DC, where it will be distinctly perceived by the eye at I. This contact will likewise be shewn in the focus of the eye-glass, if the centres O and N are properly disposed, as before-mentioned.

From what has been said, the general rationale of this micrometer will evidently appear; but one thing must not pass unregarded in an affair of such moment and consequence as the measuring these small angles in the science of astronomy. It has been customary to suppose, that the focus of a lens, or the local distance of rays parallel to its axis, is equal to the radius in a double and equally convex lens. But this is too great an error not to be noticed here; for in different sorts of glass there is found a different refractive power, and the focus of parallel rays is at a different distance in each; but this distance in no sort of glass is equal to the radius, but falls short of it more or less. Now the foregoing demonstration regards the radius, and not the focal distance of parallel rays.

With regard to the planets, as Jupiter is the largest of all, and subtends an angle to the eye of 3′ 12″, the diameter of his image in the focus of a 50 foot glass will be about half an inch; and that will be the utmost distance to which the centres of the segments will be required to be separated for measuring the apparent diameters of the planets.

But for a heliometer, the diameter of the sun, being near 10 times as great as that of Jupiter, will require the centres of the segments in a glass of 40 or 50 feet focus to be removed from each other at least to the distance of four or five inches; and to take in the whole system of Jupiter's moons, the distance of the centres will be required much larger; and therefore, for such purposes, the segments of glasses of a less focal length must be used.

But, valuable as the object-glass micrometer undoubtedly is, some difficulties have been found in the use of it, owing to the alterations in the focus of the eye, which are apt to cause it to give different measures of the same angle at different times. For instance, in measuring the sun's diameter, the axes of the pencils of rays, which come through the two segments of the object-glass from contrary limbs of the sun, crossing one another at the focus of the telescope under an angle equal to that of the sun's diameter, the union of the limbs of the two images of the sun cannot appear perfect unless the eye be disposed to see

fee objects diftinctly which are placed at the point of interfection. But if the eye be difpofed to fee objects diftinctly, which are placed nearer the object-glafs than the interfection is, the two limbs will appear feparated by the interval of the axes of the pencils in that place; and if the eye be difpofed to fee objects diftinctly, which are placed farther from the object-glafs than the interfection is, the two limbs will appear to encroach upon each other by the diftance of the axes of the pencils, after their croffing, taken at that place.

Fig. 1. To explain this, let OV reprefent the centres of the two femicircular glaffes of the object-glafs micromemeter, feparated to the diftance OV from each other, fubtending the angle O*a*V, equal to the fun's diameter, at the point *a*, which is the common focus of the two pencils of rays having O*a* and V*a* for their axes, namely, thofe proceeding from contrary fides of the fun, and paffing through the contrary femi-circles; and let *d* be the eye-glafs. It is evident, that if *d* be properly placed to give diftinct vifion of objects placed at the point *a*, the rays O*a*, V*a*, as well as all the other rays belonging to thofe pencils, will be collected into one point upon the retina of the eye; and confequently, the two oppofite limbs of the two images of the fun will feem to coincide, and the two images of the fun to touch one another externally. But if the ftate of the eye fhould alter, the place of the eye-glafs remaining the fame, the eye will be no longer difpofed to fee the image formed at the point *a* diftinctly, but to fee an object placed at e*f*, nearer to or farther from the object-glafs diftinctly; and therefore an image will be formed on the retina exactly fimilar to the fomewhat confufed image formed by the rays on a plane perpendicular to their courfe at e*f*. Confequently, as the two cones of folar rays, *b*O *a*, *c*V*a*, formed by the two femi-circles, are feparated or encroach upon one another at this point of the axis by the diftance e*f*, the two images of the fun will not feem to touch one another externally, but to feparate or to encroach upon one another by the interval e*f*. The error hereby introduced into the meafure of the fun's diameter will be the angle e*rf*, fubtended by e*f* at *r* the middle point between O and V, which is to c*af* or O*a*V, the fun's apparent diameter, as ee to e*r*, or even to *ar*, on account of the fmallnefs of *a*e with refpect to *ar*.

Thefe confiderations concerning the caufe of a principal error that has been found in the object-glafs micrometer led to an inquiry, whether fome method might not be found of producing two diftinct reprefentations of the fun, or any other object, which fhould have the axes of the pencils of rays, by which they are formed, diverging from one and the fame point, or nearly fo: and it occurred to Mr Mafkelyne, that this might be done by the refraction of a prifm placed to receive part of the rays proceeding from the object, either before or after their refraction through the object-glafs of a telefcope. If the prifm be placed without the object-glafs, the rays that are refracted thro' it will make an angle with the rays that pafs befide it equal to the refraction of the prifm; and this angle will not be altered by the refraction of the object-glafs afterwards. Confequently, two images of an object will be reprefented, and the prifm fo applied will enable us to meafure the apparent diameter of any object, or any other angular diftance which is equal to the refraction of the prifm. But if the prifm be placed within the object-glafs, that is to fay, between the object-glafs and eye-glafs, the angle meafured by the inftrument will vary according to the diftance of the prifm from the focus of the object-glafs, bearing the fame ratio to the refraction of the prifm, as the diftance of the prifm from the focus bears to the focal length of the object-glafs.

Let ACB (fig. 2.) reprefent the object-glafs and *d* the eye-glafs of a telefcope, and PR a prifm placed to intercept part of the rays coming from an object, fuppofe the fun, before they fall on the object-glafs. The rays EE proceeding from the eaftern limb of the fun, and refracted through the object-glafs ACB without paffing through the prifm, will form the correfponding point of the fun's image at e; and the rays WW proceeding in like manner from the weftern limb of the fun will be refracted to form the correfponding point of the fun's image at W. But the rays 2E, 2E, 2W, 2W, proceeding in like manner from the eaftern and weftern limbs of the fun, and falling on the prifm PR, and thence refracted to the object-glafs ACB, will, after refraction through it, form the correfpondent points of the fun's image at 2e, 2W. Let the refraction of the prifm be equal to the fun's apparent diameter: in this cafe, at whatever diftance the prifm be placed beyond the object-glafs, the two images of the fun We, 2W 2e, will touch one another externally at the point e2W; for the rays 2W, 2W, proceeding from the weftern of the fun being inclined to the rays EE proceeding from the eaftern limb in the angle of the fun's apparent diameter, will, after fuffering a refraction in paffing through the prifm equal to the fun's apparent diameter, emerge from the prifm and fall upon the object-glafs parallel to the rays EE, and confequently will have their focus 2W coincident with the focus e of the rays EE; and therefore the two images of the fun We, 2W 2e, will touch one another externally at the point e 2W, and the inftrument will meafure the angle EC2W, and that only.

But if the prifm be placed within the telefcope, the angle meafured by the inftrument will be to the refraction of the prifm as the diftance of the prifm from the focus of the object-glafs is to the focal diftance of the object-glafs: or if two prifms be ufed to form the two images, with their refracting angles placed contrary ways, as reprefented in fig. 3. and 4. the angle meafured will be to the fum of the refractions of the prifm, as the diftance of the prifms from the focus of the object-glafs is to the focal diftance of the object-glafs. For let ACB (fig. 3.) reprefent the object-glafs, and *d* the eye-glafs of a telefcope, and PR, RS, two prifms interpofed between them, with their refracting angles turned contrary ways, and the common fections of their refracting planes touching one another at R. The rays proceeding from an object, fuppofe the fun, will be difpofed, by the refraction of the object-glafs, to form an image of the fun at the focus; but part of them falling on one prifm, and part on the other, will be thereby refracted contrary ways, fo as to form two equal images We, 2W 2e, which, if the refractions of the prifms be of proper quantities, will touch one another externally at the point e 2W.

Let

Let ECN be the axis of the pencil of rays EE proceeding from the ſun's eaſtern limb; and WCO the axis of the pencil of rays WW proceeding from the ſun's weſtern limb; and the point N the place where the image of the ſun's eaſtern limb would be formed, and the point O where that of the weſtern limb would be formed, were not the rays diverted from their courſe by the refractions of the priſms. But by this means part of the rays EE, which were proceeding to N, falling on the priſm PR, will be refracted to form an image of the ſun's eaſtern limb at *e*, while others of the rays EE, which fall on the priſm RS, will be refracted to form an image of the ſun's eaſtern limb at 2*e*. In like manner, part of the rays WW, which were proceeding to form an image of the ſun's weſtern limb at O, falling on the priſm RS, will be refracted to form an image of the ſun's weſtern limb at 2W coincident with e, the point of the image correſpondent to the ſun's eaſtern limb; while others of the rays WW, which fall on the priſm PR, will be refracted to form the image of the ſun's weſtern limb at W. The two images We, 2W 2e, are ſuppoſed to touch one another externally at the point e2W. The ray EFR, which belongs to the axis ECN, and is refracted by the priſm PR to e, undergoes the refraction NRe, which (becauſe ſmall angles are proportional to their ſines, and the ſine of NR*e* is equal to the ſine of its ſupplement NRC), is to NCR as NC or C*e* is to NR or R*e*. In like manner, the ray WGR, which belongs to the axis WCO, and is refracted by the priſm RS to 2W or e, undergoes the refraction ORe, which is to OCe as OC or Ce is to RO or Re; therefore, by compoſition, ORN the ſum of the refractions OR*e*, NR*e*, is to OCN the ſum of the angles OC*e*, NC*e*, or the ſun's apparent diameter, as C*e* to R*e*; that is, as the focal diſtance of the object-glaſs to the diſtance of the priſms from the focus of the object-glaſs.

Or let the priſms PR, RS, be placed with their refracting angles P, S, turned from one another as in fig. 4.: the refraction of the priſm PR will transfer the image of the ſun from ON to We, and the refraction of the priſm RS will transfer the image ON to 2W 2e, the two images 2W 2e, We, touching one another externally at the point 2We. Let ECN, WCO, be the axes of the pencils of rays proceeding from the two extreme limbs of the ſun, and N, O, the points where the images of the ſun's eaſtern and weſtern limbs would be formed by the object-glaſs, were it not for the refraction of the priſms; the ray EFR, which belongs to the axis ECN, and is refracted by the priſm RS, to 2e, undergoes the refraction NR2e; and the ray WGR, which belongs to the axis WCO, and is refracted by the priſm PR to W, undergoes the refraction ORW. Now NC2e, part of the angle meaſured, is to NR2e, the refraction of the priſm RS, as RW to CW; and OCW, the other part of the angle meaſured, is to ORW, the refraction of the priſm PR, in the ſame ratio of RW to CW: therefore OCN, the whole angle meaſured, is to ORN, the ſum of the refractions of the two priſms, as RW to CW; that is, as the diſtance of the priſms from the focus of the object-glaſs to the focal diſtance of the object-glaſs.

When the priſms are placed in the manner repreſented in fig. 3. the point e of the image We is illuminated only by the rays which fall on the object-glaſs between A and F, and the point 2W only by the rays which fall on the object-glaſs between B and G. Now the angles CRF, CRG, equal to the refractions of the priſms, being conſtant, the ſpaces FC, CG, will increaſe in proportion as the diſtances RF, RG, increaſe, and the ſpaces AF, GB, diminiſh as much; and therefore the images at the point of mutual contact e2W will be each illuminated by half the rays which fall on the object-glaſs when the priſms are placed cloſe to the object-glaſs, but will be enlightened leſs and leſs the nearer the priſms are brought to the focus of the object-glaſs.

But when the priſms are placed in the manner ſhewn in fig. 4. the images at the point of contact, as the priſms are removed from the object-glaſs towards the eye-glaſs, will be enlightened with more than half the rays that fall on the object-glaſs, and will be moſt enlightened when the priſms are brought to the focus itſelf; for the point 2e of the image 2W 2e will be enlightened by all the rays EE that fall on the object-glaſs between B and B, and the point W of the image W e will be enlightened by all the rays WW which fall on the object-glaſs between A and G. But the difference of the illuminations is not very conſiderable in achromatic teleſcopes, on account of the great aperture of the object-glaſs; as the greateſt ſpace FG is to the focal diſtance of the object-glaſs as the ſum of the ſines of the refractions of the priſms is to the radius.

There is a third way, and perhaps the beſt, of placing the priſm, ſo as to touch one another along their ſides which are at right angles to the common ſections of their refracting planes. In this diſpoſition of the priſms the images will be equally enlightened, namely, each with half the rays which fall on the object-glaſs, wherever the priſms be placed between the object-glaſs and eye-glaſs.

From what has been ſhewn it appears, that this inſtrument, which may be properly called the *priſmatic micrometer*, will meaſure any angle that does not exceed the ſum of the refractions of the priſms, excepting only very ſmall angles, which cannot be taken with it on account of the vaniſhing of the pencils of rays at the juncture of the two priſms near the focus of the object-glaſs; that it will afford a very large ſcale, namely, the whole focal length of the object-glaſs, for the greateſt angle meaſured by it; and that it will never be out of adjuſtment; as the point of the ſcale where the meaſurement begins (or the point of O) anſwers to the focus of the object-glaſs, which is a point for celeſtial objects, and a point very eaſily found for terreſtial objects. All that will be neceſſary to be done, in order to find the value of the ſcale of this micrometer, will be to meaſure accurately the diſtance of the priſms from the focus when the inſtrument is ſet to meaſure the apparent diameter of any object ſubtending a known angle at the centre of the object-glaſs, which may be eaſily found by experiment, as by meaſuring a baſe and the diameter of the object obſerved placed at the end of it, in the manner practiſed with other micrometers: for the angle ſubtended by this object will be to the angle ſubtended by a celeſtial object, or very remote land-object, when the diſtance of the priſms from the principal

cipal focus is the fame as it was found from the actual focus in the terreftrial experiment, as the principal focal diftance of the object-glafs is to the actual focal diftance in the faid experiment.

It will probably be the beft way in practice, inftead of one prifm to ufe two prifms, refracting contrary ways, and fo divide the refraction between them (as reprefented in fig. 3. and 4.). Achromatic prifms, each compofed of two prifms of flint and crown-glafs, placed with their refracting angles contrary ways, will unoubtedly be neceffary for meafuring angles with great precifion by this inftrument: and we can only add with pleafure, that it is found by experiment made with this inftrument, as it was executed by Mr Dollond with achromatic prifms, ground with great care for this trial fometime ago, that the images, after refraction through the prifms, appear very diftinct; and that obfervations of the apparent diameters of objects may be taken in the manner here propofed with eafe and precifion.

Two or more fets of prifms may be adapted to the fame telefcope, to be ufed each in their turn, for the more commodious meafurement of different angles. Thus it may be very convenient to ufe one fet of prifms for meafuring angles not exceeding 36′, and confequently fit for meafuring the diameters of the fun and moon, and the lucid parts and diftances of the cufps in their eclipfes; and another fet of prifms to meafure angles not much exceeding one minute, and confequently fit for meafuring the diameters of all the other planets. This latter fet of prifms will be the more convenient for meafuring fmall angles, on account of a fmall imperfection attending the ufe of this micrometer, as before mentioned; namely, that angles cannot be meafured with it when the prifms approach very near the focus of the object-glafs, the pencils of rays being there loft at the point where the prifms touch one another.

Upon the principles that have been here explained, a prifm placed within the telefcope of an aftronomical inftrument, adjufted by a plumb-line or level, to receive all the rays that pafs through the object-glafs, may conveniently ferve the purpofe of a micrometer, and fuperfede the ufe both of the vernier fcale and the external micrometer; and the inftrument may then be always fet to fome even divifion before the obfervation. Thus the ufe of a telefcopic level may be extended to meafure with great accuracy the horizontal refractions, the depreffion of the horizon of the fea, and fmall altitudes and depreffions of land-objects. Time and experience will doubtlefs fuggeft many other ufeful applications of this inftrument.

But the greateft improvement which the micrometer hath yet received is from Dr Mafkelyne, who hath invented a catoptric one. This, befides the advantage it derives from the principle of reflection, of not being difturbed by the heterogeneity of light, avoids every defect of other micrometers, and can have no aberration, nor any defect which arifes from the imperfection of materials, or of execution, as the extreme fimplicity of its conftruction requires no additional mirrors or glaffes to thofe required for the telefcope: and the feparation of the image being effected by the inclination of the two fpecula, and not depending on the focus of any lens or mirror, any alteration, in the eye of an obferver, cannot affect the angle meafured.

It has, peculiar to itfelf, the advantages of an adjuftment to make the images coincide in a direction perpendicular to that of their motion; and alfo of meafuring the diameter of a planet on both fides the zero, which will appear no inconfiderable advantage to obfervers who know how much eafier it is to afcertain the contact of the external edges of two images than their perfect coincidence. A fhort explanation of the annexed drawings will make the conftruction and the properties of this micrometer obvious.

"I divided (fays Mr Mafkelyne) the fmall fpeculum of a reflecting telefcope, of Caffegrain's conftruction, into two equal parts, by a plane acrofs its centre; and by inclining the halves of the fpeculum to each other on an axis at right angles to the plane that feparated them, I obtained two diftinct images. The fatisfaction I received on the firft trial was checked by the apparent impoffibility of reducing this principle to practice. The angular feparation of the two images in this cafe being half the angular inclination of the two fpecula, it required an index of an unmanageable length to allow the quantity of one fecond of a degree to become vifible. Some time afterwards, on revifing the principle, I confidered, that if both the halves of the mirror turned on their centre of curvature, there could be no alteration in their relative inclination to each other from their motion on this centre; and that any extent of fcale might be obtained, by fixing the centre of motion at a proportional diftance from the common centre of curvature. This will be better underftood from the annexed figure.

"R (fig. 1.) reprefents the fmall fpeculum divided into two equal parts; one of which is fixed on the end of the arm B; the other end of the arm is fixed on a fteel axis X, which croffes the end of the telefcope C. The other half of the mirror R is fixed on the arm D, which arm at the other end terminates in a focket *y*, that turns on the axis, X; both arms are prevented bending by the braces *a a*. G reprefents a double fcrew, having one part *e* cut into double the number of threads in an inch to that of the part *g*: the part *e* having 100 threads in one inch, and the part *g* 50 only. The fcrew *e* works in a nut F in the fide of the telefcope, while the part *g* turns in a nut H, which is attached to the arm B; the ends of the arms B and D, to which the mirrors are fixed, are feparated from each other by the point of the double fcrew preffing againft the ftud *h*, fixed to the arm D, and turning in the nut H on the arm B. The two arms B and D are preffed againft the direction of the double fcrew *eg* by a fpiral fpring within the part *n*, by which means all fhake or play in the nut H, on which the meafure depends, is entirely prevented. Plate CLXXVII.

"From the difference of the threads on the fcrew at *e* and *g*, it is evident, that the progreffive motion of the fcrew through the nut will be half the diftance of the feparation of the two halves of the mirror; and confequently the half mirrors will be moved equally in contrary directions from the axis of the telefcope C.

"The wheel V fixed on the end of the double fcrew has its circumference divided into 100 equal parts, and numbered at every fifth divifion with 5, 10, &c. to 100, and the index I fhews the motion of the fcrew with

Fig. 1.

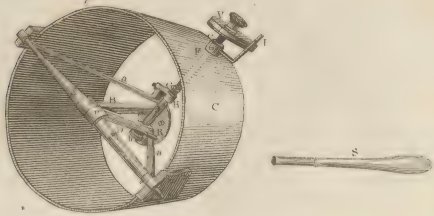

Fig. 2.

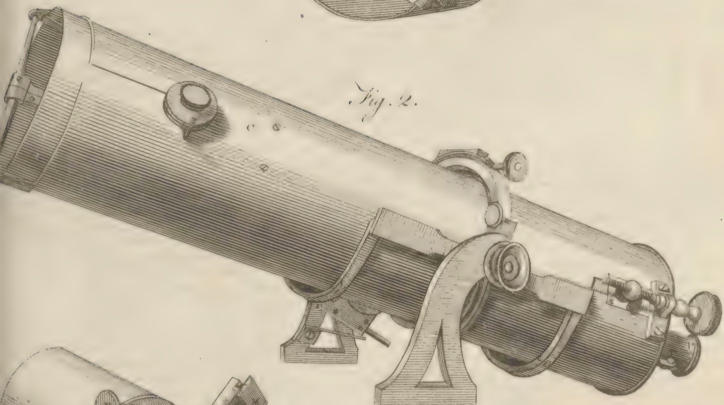

Fig. 3.

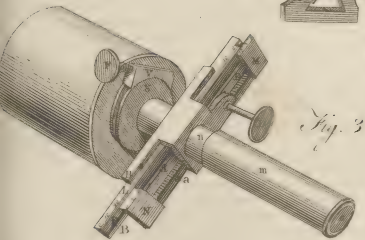

Fig. 4.

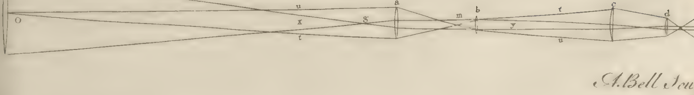

A. Bell Sculpt.

with the wheel round its axis, while the number of revolutions of the ſcrew is ſhewn by the diviſions on the ſame index. The ſteel ſcrew at R may be turned by the key S, and ſerves to incline the ſmall mirror at right angles to the direction of its motion. By turning the finger-head T (fig. 2.) the eye-tube P is brought nearer or farther from the ſmall mirror, to adjuſt the teleſcope to diſtinct viſion; and the teleſcope itſelf hath a motion round its axis for the conveniency of meaſuring the diameter of a planet in any direction. The inclination of the diameter meaſured with the horizon is ſhewn in degrees and minutes by a level and vernier on a graduated circle, at the breech of the teleſcope.

"The method of adjuſting and uſing the catoptric micrometer is too obvious to require any explanation: it is only neceſſary to obſerve, that, beſides the table for reducing the revolutions and parts of the ſcrew to minutes, ſeconds, &c. it may require a table for correcting a very ſmall error which ariſes from the excentric motion of the half-mirrors. By this motion their centres of curvature will (when the angle to be meaſured is large) approach a little towards the large mirror: the equation for this purpoſe in ſmall angles is inſenſible; but when angles to be meaſured exceed ten minutes, it ſhould not be neglected. Or, the angle meaſured may be corrected by diminiſhing it in the proportion the verſed ſine of the angle meaſured, ſuppoſing the excentricity radius, bears to the focal length of the ſmall mirror.

"The teleſcope to which the catoptric micrometer is applied is of the Caſſegrain conſtruction. The great ſpeculum is about 22 inches focus, and bears an aperture of $5\frac{1}{10}$ inches, which is conſiderably larger than thoſe of the ſame focal length are generally made: indeed, the apparent utility of this micrometer makes me wiſh to ſee the reflecting teleſcope meet with further improvements. I believe it would more tend to the advancement of the art of working mirrors, if writers on this ſubject, inſtead of giving us their methods of working imaginary parabolas, would demonſtrate the properties of curves for mirrors, which, placed in a teleſcope, will ſhew images of objects perfectly free from aberration; or, what will yet be more uſeful in practice, of what forms ſpecula might be made, that the aberration cauſed by one mirror may be corrected by that of the other. If mathematicians aſſume *data* which really exiſt, they muſt ſee, that when the two ſpecula of a reflecting teleſcope are parabolas, they cauſe a very conſiderable aberration, which is negative, that is to ſay, the focus of the extreme ray is longer than thoſe of the middle ones. If the large ſpeculum is a parabola, the ſmall one ought to be an ellipſe; but when the ſmall ſpeculum is ſpherical, which is generaly the caſe in practice, if concave, the figure of the large ſpeculum ought to be an hyperbola; if convex, the large ſpeculum ought to be an ellipſe, to free the teleſcope from aberration.

"This will be eaſier underſtood by attending to the poſitions of the firſt and ſecond images; when a curve is of ſuch form that lines drawn from each image, and meeting in any part of the curve, make equal angles with the tangent to the curve at that point, it is evident, that ſuch curve will be free from aberration.

"This is the property of a circle when the radiant and image are in the ſame place; but, when they recede from each other, of an ellipſe, of ſuch form that the radiant and image are in the two *foci*, till, one diſtance becoming infinite the ellipſe changes into a parabola, and to an hyperbola when the focus is negative; that is to ſay, when reflected rays diverge, and the focus is on the oppoſite ſide of the mirror.

"Theſe principles made me prefer Caſſegrain's conſtruction of the reflecting teleſcope to either the Gregorian or Newtonian. In the former, errors cauſed by one ſpeculum are diminiſhed by thoſe in the other.

"From a property of the reflecting teleſcope (which has not been attended to) that the apertures of the two ſpecula are to each other very nearly in the proportion of their focal lengths, it follows, that their aberrations will be to each other in the ſame proportion; and theſe aberrations are in the ſame direction, if the two ſpecula are both concave; or in contrary directions, if one ſpeculum is concave, and the other convex.

"In the Gregorian conſtruction, both ſpecula being concave, the aberration at the ſecond image will be the ſum of the aberrations of the two mirrors; but in the Caſſegrain conſtruction, one mirror being concave, and the other convex, the aberration at the ſecond image will be the difference between their aberrations. By aſſuming ſuch proportions for the *foci* of the ſpecula as are generally uſed in the reflecting teleſcope, which is about as 1 to 4, the aberration in the Caſſegrain conſtruction will be to that in the Gregorian as 3 to 5.

"I have mentioned theſe circumſtances in hopes of recommending the demonſtration of curves ſuited to the purpoſes of optics to the attention of mathematicians, which would be of great uſe to artiſts.

"I ſhall conclude with the deſcription of a new micrometer ſuited to the principle of refraction; being ſenſible that both principles have their peculiar advantages. Though the former part of this paper proves my partiality to the principle of reflection applied to micrometers, yet the favourable opinion I have of the refracting teleſcope made me attentively conſider ſome means of applying a micrometer to it, which might obviate the errors complained of in the former part of this paper.

"The application of any lens or medium between the object-glaſs and its focus muſt inevitably deſtroy the diſtinctneſs of the image; I therefore have employed for the micrometer-glaſs, one of the eye-glaſſes requiſite in the common conſtruction of the teleſcope; but if it ſhould be found neceſſary to apply an additional eye-glaſs for the conveniency of enlarging the ſcale, I am able thereby to correct both the colours and ſpherical aberration of the firſt eye-glaſs.

"This micrometer is applied to the erect eye-tube of a refracting teleſcope, and is placed in the conjugate focus of the firſt eye-glaſs: hence ariſes its great ſuperiority to the object-glaſs micrometer. It has been before obſerved, that if a micrometer is applied at the object-glaſs, the imperfections of its glaſs are magnified by the whole power of the teleſcope; but in this poſition, the image being conſiderably magnified before it comes to the micrometer, any imperfection in its glaſs will be magnified only by the remaining eye-glaſſes,

glasses, which in any telescope seldom exceeds five or six times.

"By this position the size of the micrometer glass will not be the $\frac{1}{100}$ part of the area which would be required if it was placed in the object-glass; and, notwithstanding this great disproportion of size, which is of great moment to the practical optician, the same extent of scale is preserved, and the images are uniformly bright in every part of the field of the telescope.

"Fig. 4. represents the glasses of a refracting telescope; $x y$ the principal pencil of rays from the object-glass O; $t t$ and $u u$, the axis of two oblique pencils; a, the first eye-glass; m, its conjugate focus, or the place of the micrometer; b the second eye-glass; c the third; and d the fourth, or that which is nearest the eye. Let p be the diameter of the object-glass, e the diameter of a pencil at m, and f the diameter of the pencil at the eye; it is evident, that the axis of the pencils from every part of the image will cross each other at the point m; and e, the width of the micrometer-glass, is to p the diameter of the object-glass as $m a$ is to $g o$, which is the proportion of the magnifying power at the point m; and the error caused by an imperfection in the micrometer-glass placed at m will be to the error, had the micrometer been at O, as m is to p.

"Fig. 3. represents the micrometer; A, a convex or concave lens divided into two equal parts by a plane across its centre; one of these semi-lenses is fixed in a frame B, and the other in the frame E; which two frames slide on a plate H, and are pressed against it by thin plates $a a$: the frames B and E are moved in contrary directions by turning the button D; L is a scale of equal parts on the frame B; it is numbered from each end towards the middle with 10, 20, &c. There are two verniers on the frame E, one at M and the other at N, for the conveniency of measuring the diameter of a planet, &c. on both sides the zero. The first division on both these verniers coincides at the same time with the two zeros on the scale L; and, if the frame is moved towards the right, the relative motion of the two frames is shewn on the scale L by the vernier M; but if the frame B be moved towards the left, the relative motion is shewn by the vernier N.

"This micrometer has a motion round the axis of vision, for the conveniency of measuring the diameter of a planet, &c. in any direction, by turning an endless screw F, and the inclination of the diameter measured with the horizon is shewn on the circle g by a vernier on the plate V. The telescope may be adjusted to distinct vision by means of an adjusting screw, which moves the whole eye-tube with the micrometer nearer or farther from the object-glass, as telescopes are generally made; or the same effect may be produced in a better manner, without moving the micrometer, by sliding the part of the eye-tube m on the part n, by help of a screw or pinion. The micrometer is made to take off occasionally from the eye-tube, that the telescope may be used without it."

MICROPUS, BASTARD CUDWEED; a genus of the polygamia segregata order, belonging to the syngenesia class of plants. There are two species, the supinus and erectus; but only the former is ever cultivated in gardens. It is an annual plant growing naturally in Portugal, in places near the sea. The root sends out several trailing stalks, about six or eight inches long, which are garnished with small, oval, silvery leaves, whose bases embrace the stalks. The flowers comes out in clusters from the wings of the stalks, and are very small, and of a white colour. It flowers in June and July; and is frequently preserved in gardens on account of the beauty of its silvery leaves. It is easily propagated by seed sown in autumn, and requires no other culture but to be kept free from weeds.

MICROSCOPE, an optical instrument, consisting of lenses, or mirrors, by means of which small objects appear larger than they do the naked eye. Single microscopes consist of lenses or mirrors; or if more lenses or mirrors be made use of, they only serve to throw light upon the object, and not contribute to enlarge the image of it. Double microscopes are those in which the image of an object is composed by means of more lenses or mirrors than one. For the principles on which the construction of microscopes depend, and the best methods of making them, see (the *Index* subjoined to) OPTICS.

MICROSCOPIC OBJECTS. All things too minute to be viewed distinctly by the naked eye, are proper objects for the microscope. Whatever object offers itself as the subject of our examination, the size, contexture, and nature of it are first to be considered, in order to apply to it such glasses and in such a manner as may shew it best. The first step should always be to view the whole of it together, with such a magnifier as can take it all in at once; and after this the several parts of it may the more fitly be examined, whether remaining on the object or separated from it. The smaller the parts are, the more powerful ought the magnifiers to be which are employed: the transparency or opacity of the object must also be considered, and the glasses employed accordingly suited thereto; for a transparent object will bear a much greater magnifier than one which is opake, since the nearness that a glass must be placed at, unavoidably darkens an object if in its own nature opake, and renders it very difficult to be seen, unless by the help of the apparatus contrived for that purpose, which has a silver speculum. Most objects, however, become transparent by being divided into extremely thin parts.

The nature of the object also, whether it be alive or dead, a solid or a fluid, an animal, a vegetable, or a mineral substance, must likewise be considered, and all the circumstances of it attended to, that we may apply it in the most advantageous manner. If it be a living object, care must be taken not to squeeze or injure it, that we may see it in its natural state and full perfection. If it be a fluid, and that too thick, it must be diluted with water; and if too thin, we should let some of its watery parts evaporate. Some substances are fittest for observation when dry, others when moistened; some when fresh, and others after they have been kept some time.

Light is the next thing to be taken care of, for on this the truth of all our observations depends; and a very little observation will shew how very different objects appear in one degree of it to what they do in another;

other; fo that every new object fhould be viewed in all degrees of light, from the greateft glare of brightnefs to perfect obfcurity; and that in all pofitions to each degree, till we hit upon the certain form and figure of it. In many objects it is very difficult to diftinguifh between a prominency and a depreffion, a black fhadow and a black ftain; and in colour, bebetween a bright reflection and whitenefs. The eye of a fly in one kind of light appears like a lattice drilled full of holes, in the fun-fhine like a folid fubftance covered with golden nails; in one pofition like a furface covered with pyramids, in another with cones, and in others with ftill different fhapes.

The degree of light muft always be fuited to the object. If that be dark, it muft be feen in a full and ftrong light; but if tranfparent, the light fhould be proportionably weak; for which reafon there is a contrivance both in the fingle and double microfcope to cut off abundance of the rays, when fuch tranfparent objects are to be examined by the largeft magnifiers. The light of a candle for many objects, and efpecially for fuch as are very bright and tranfparent, and very minute, is preferable to day-light: for others, a ferene day-light is beft: but fun-fhine is the worft light of all; for it is reflected from objects with fo much glare, and exhibits fuch gaudy colours, that nothing can be determined from it with any certainty. This, however, is not to be extended to the folar or *camera obfcura Microfcope;* for in that nothing but fun-fhine can do, and the brighter that is, the better; but in that way we do not fee the object itfelf on which the fun-fhine is caft, but only the image or fhadow of it exhibited on a fcreen; and therefore no confufion can arife from the glaring reflection of the fun's rays from the object to the eye, which is the cafe in other microfcopes. But then in that folar way we muft reft contented with viewing the true form and fhape of an object, without expecting to find its natural colour; fince no fhadow can poffibly wear the colour of the body it reprefents.

Moft objects require alfo fome management in order to bring them properly before the glaffes. If they are flat and tranfparent, and fuch as will not be injured by preffure, the beft way is to inclofe them in fliders between two Mufcovy talcs or ifinglaffes. This way the feathers of butterflies, the fcales of fifhes, and the farinæ of flowers, may be very conveniently preferved, as alfo the parts of infects, the whole bodies of minute ones, and a great number of other things. Thefe are to be kept in fliders, each containing three, four, or more holes: and thefe muft not be filled promifcuoufly; but all the things preferved in one flider fhould be fuch as require one and the fame magnifying power to view them, that there may not be a neceffity of changing the glaffes for every object; and the fliders fhould be marked with the number of the magnifier it is proper to be viewed with. In placing the objects in the fliders, it is always proper to have a fmall magnifier, of about an inch focus, in your hand, to examine and adjuft them by, before they are fixed down with the rings.

Small living objects, fuch as lice, fleas, bugs, mites, minute fpiders, &c. may be placed between thefe talcs without injuring them, if care be taken to lay on the brafs rings without preffing them down, and they will remain alive many weeks in this manner; but if they are too large to be treated thus, they fhould be either preferved between two concave glaffes, or elfe viewed immediately, by holding them in the pliers, or fticking them on the point at the other end of that inftrument.

If fluids come under examination, to difcover the animalcules in them, a fmall drop is to be taken with a hair-pencil, or on the nib of a clean pen, and placed on a plate of glafs; and if they are too numerous to be thus feen diftinctly, fome water, warmed by holding it in the mouth, muft be added to the drop, and they will then feparate and be feen diftinctly. This is particularly neceffary in viewing the animalcules in the *femen mafculinum* of all creatures; which, though extremely minute, are always fo numerous, that without this caution their true form can feldom be feen. But if we are to fee the falts in a fluid, the contrary method muft be obferved, and the plate of glafs muft be held gently over the fire, till part of the liquor is evaporated.

The diffection of minute animals, as lice, fleas, &c. requires patience and care: but it may be done very accurately by means of a needle and a fine lancet, placing the creature in a drop of water; for then the parts will readily unfold themfelves, and the ftomach, guts, &c. be very diftinctly feen.

Thefe feem the beft ways of preferving tranfparent objects; but the opake ones, fuch as feeds, woods, &c. require a very different treatment, and are beft preferved and viewed in the following manner.

Cut cards into fmall flips about half an inch long and a tenth of an inch broad; wet thefe half-way of their length in gum-water, and with that faften on feveral parcels of the object; and as the fpots of cards are of different colours, fuch fhould be chofen for every object as are the moft different from its own colours. Thefe are very convenient for viewing by the microfcope made for opake objects with the filvered fpeculum; but they are proper for any microfcope that can view opake bodies.

A fmall box fhould be contrived for thefe flips, with little fhallow holes for the reception of each: and this is conveniently done, by cutting pieces of pafte-board, fuch as the covers of books are made of, to the fize of the box, fo that they will juft go into it; and then cutting holes through them with a fmall chiffel, of the fhape of the flips of card: thefe pafte-boards having then a paper pafted over their bottom, are cells very proper for the reception of thefe flips, which may be taken out by means of a pair of plyers, and will be always ready for ufe.

Great caution is to be ufed in forming a judgment on what is feen by the microfcope, if the objects are extended, or contracted, by force or drinefs. Nothing can be determined about them, without making the proper allowances; and different lights and pofitions will often fhew the fame object as very different from itfelf. There is no advantage in any greater magnifier than fuch as is capable of fhewing the object in view diftinctly; and the lefs the glafs magnifies, the more pleafantly the object is always feen.

The colours of objects are very little to be depended on, as feen by the microfcope; for their feveral component particles being by this means removed to great diftances from one another, may give reflections very

very different from what they would, if seen by the naked eye.

The motions of living creatures also, or of the fluids contained in their bodies, are by no means to be hastily judged of, from what we see by the microscope, without due consideration; for as the moving body, and the space wherein it moves, are magnified, the motion must be so too; and therefore that rapidity with which the blood seems to pass through the vessels of small animals must be judged of accordingly: suppose, for instance, that a horse and a mouse move their limbs exactly at the same time, if the horse runs a mile while the mouse runs 50 yards; though the number of steps are the same in both, the motion of the horse must notwithstanding be allowed the swiftest; and the motion of a mite, as viewed by the naked eye, or through the microscope, is perhaps not less different.

MIDAS, in fabulous history, a famous king of Phrygia, who having received Bacchus with great magnificence, that god, out of gratitude, offered to grant him whatever he should ask. Midas desired that every thing he touched should be changed into gold. Bacchus consented; and Midas, with extreme pleasure, every where found the effects of his touch. But he had soon reason to repent of his folly: for wanting to eat and drink, the aliments no sooner entered his mouth, than they were changed into gold; which obliged him to have recourse to Bacchus again, to beseech him to restore him to his former state; on which the god ordered him to bathe in the river Pactolus, which from thence forward had golden sands. Some time after, being chosen judge between Pan and Apollo, he gave another instance of his folly and bad taste, in preferring Pan's music to Apollo's; on which the latter being enraged, gave him a pair of asses ears. See the article Apollo.

Midas, *Ear-shell*, the smooth ovato-oblong buccinum, with an oblong and very narrow mouth. It consists of six volutions, but the lower one alone makes up almost the whole shell.

MID-heaven, the point of the ecliptic that culminates, or in which it cuts the meridian.

MIDDLEBURG, one of the friendly islands in the south-sea. This island was first discovered by Tasman, a Dutch navigator, in January 1742-3; and is called by the natives *Ea-Oo-whe*: it is about sixteen miles from north to south, and in the widest part about eight miles from east to west. The skirts are chiefly laid out in plantations, the south-west and north-west sides especially. The interior parts are but little cultivated, though very capable of it: but this neglect adds greatly to the beauty of the island; for here are agreeably dispersed groves of cocoa-nuts and other trees, lawns covered with thick grass, here and there plantations and paths leading to every part of the island, in such beautiful disorder, as greatly to enliven the prospect. The hills are low; the air is delightful; but unfortunately water is denied to this charming spot. Yams, with other roots, bananas, and bread-fruit, are the principal articles of food; but the latter appeared to be scarce. Here is the pepper-tree, or *ava-ava*, with which they make an intoxicating liquor, in the same disgusting manner as is practised in the Society Islands. Here are several odoriferous trees and shrubs, particularly a species of the lemon tribe; and the botanical gentlemen met with various new species of plants. Here also are a few hogs and fowls.

There are no towns or villages; most of the houses are built in plantations, which are laid out in different parts, with no other order than what convenience requires. They are neatly constructed, but are less roomy and convenient than those in the Society Isles. The floors are a little raised, and covered with thick strong mats. The same sort of matting serves to inclose them on the windward side, the others being open. They have little areas before most of them, which are planted round with trees or ornamental shrubs, whose fragrance perfumes the air. Their household furniture consists of a few wooden platters, cocoa-nut shells, and pillows made of wood, and shaped like four-footed stools or forms: their common clothing, with the addition of a mat, serves them for bedding.

The natives are of a clear mahogany or chesnut brown, with black hair, in short frizzled curls, which seems to be burnt at the tips; their beards are cut or shaven. The general stature of the men is equal to our middle size, from five feet three to five ten inches; the proportions of the body are very fine, and the *contours* of the limbs extremely elegant, though something more muscular than at O-Taheitee, which may be owing to a greater and more constant exertion of strength in their agriculture and domestic œconomy. Their features are extremely mild and pleasing; and differ from the O-Taheitian faces in being more oblong than round, the nose sharper, and the lips rather thinner. The women are, in general, a few inches shorter than the men, but not so small as the lower class of women at the Society Islands. The practice of puncturing the skin, and blacking it, which is called *tattowing*, is in full force among the men here, for their belly and loins are very strongly marked in configurations more compounded than those at O-Taheitee. The tenderest parts of the body were not free from these punctures; the application of which, besides being very painful, must be extremely dangerous on glandulous extremities.

The men in general go almost naked, having only a small piece of cloth round the loins, but some wrap it in great abundance round them from their waist: this cloth is manufactured much like that at O-Taheitee, but overspread with a strong glue, which makes it stiff, and fit to resist the wet. The women are likewise covered from the waist downwards: they often have loose necklaces, consisting of several strings of small shells, seeds, teeth of fishes; and in the middle of all, the round *operculum*, or cover of a shell as large as a crown-piece. The men frequently wear a string round their necks, from which a mother-of-pearl shell hangs down on the breast; both the ears of the women were perforated with two holes, and a cylinder cut out of tortoise-shell or bone was struck through both the holes. The most remarkable circumstance observed of this people was, that most of them wanted the little finger on one, and sometimes on both hands: the difference of sex or age did not exempt them from this amputation; for even among the few children that were seen running about naked, the greater part had already suffered such loss. This circumstance was observed by Tasman. Another singularity which was observed to be very general among these

Middleburg these people was, a round ſpot on each cheek-bone, which appeared to have been burnt or bliſtered. On ſome it ſeemed to have been recently made, on others it was covered with ſcurf, and many had only a ſlight mark of its former exiſtence: how, or for what purpoſe it was made, could not be learnt. The women here, in general, were reſerved; and turned, with diſguſt, from the immodeſt behaviour of ungovernable ſeamen: there were not, however, wanting ſome who appeared to be of eaſy virtue, and invited their lovers with laſcivious geſtures. The language ſpoken here is ſoft, and not unpleaſing; and whatever they ſaid was ſpoken in a kind of ſinging tone. O-Mai and Mahine, who were both paſſengers on board the ſhip, at firſt declared that the language was totally new, and unintelligible to them; however, the affinity of ſeveral words being pointed out, they ſoon caught the particular modification of this dialect, and converſed much better with the natives than any on board the ſhips could have done, after a long intercourſe. They have the neateſt ornaments imaginable, conſiſting of a number of little flat ſticks, about five inches long, of a yellow wood like box, firmly and elegantly connected together at the bottom by a tiſſue of the fibres of cocoa-nut, ſome of which were of their natural colour, and others dyed black; the ſame fibres were likewiſe uſed in the making of baſkets, the taſte of which was highly elegant, and varied into different forms and patterns. Their clubs are of a great variety of ſhapes, and many of them ſo ponderous as ſcarce to be managed with one hand. The moſt common form was quadrangular, ſo as to make a rhomboid at the broad end, and gradually tapering into a round handle at the other. Far the greater part were curved all over in many chequered patterns, which ſeemed to have required a long ſpace of time, and incredible patience, to work up; as a ſharp ſtone, or a piece of coral, are the only tools made uſe of: the whole ſurface of the plain clubs was as highly poliſhed as if an European workman had made them with the beſt inſtruments. Beſides clubs, they have ſpears of the ſame wood, which were ſometimes plain ſharp-pointed ſticks, and ſometimes barbed with a ſting-ray's tail. They have likewiſe bows and arrows of a peculiar conſtruction: the bow, which is ſix feet long, is about the thickneſs of a little finger, and when ſlack forms a ſlight curve; its convex part is channelled with a ſingle deep groove, in which the bow-ſtring is lodged. The arrow is made of reed, near ſix feet long, and pointed with hard wood: when the bow is to be bent, inſtead of drawing it ſo as to increaſe the natural curvature, they draw it the contrary way, make it perfectly ſtraight, and then form the curve on the other ſide. Moſt of their canoes have outriggers, made of poles, and their workmanſhip is very admirable: two of theſe canoes are joined together with a ſurpriſing exactneſs, and the whole ſurface receives a very curious poliſh. Their paddles have ſhort broad blades, ſomething like thoſe at O-Taheitee, but more neatly wrought, and of better wood.

They keep their dead above ground, after the manner of the Society Iſlands; as a corpſe was ſeen depoſited on a low hut.

Here were ſeen ſeveral men and women afflicted with leprous diſeaſes, in ſome of whom the diſorder had riſen to a high degree of virulence; one man in particular had his back and ſhoulders covered with a large cancerous ulcer, which was perfectly livid within, and of a bright yellow all round the edges. A woman was likewiſe unfortunate enough to have her face deſtroyed by it in the moſt ſhocking manner; there was only a hole left in the place of her noſe; her cheek was ſwelled up, and continually oozing out a purulent matter; and her eyes ſeemed ready to fall out of her head, being bloody and ſore: though theſe were ſome of the moſt miſerable objects that could poſſibly be ſeen, yet they ſeemed to be quite unconcerned about their misfortunes, and traded as briſkly as any of the reſt.

Middleſex, MIDDLESEX, a county of England in which ſtands the city of London. This county, which derives its name from its ſituation amidſt the three kingdoms of the Eaſt, Weſt, and South Saxons, is bounded on the weſt by Buckinghamſhire, from which it is ſeparated by the little river Coln and the ſhireditch; on the north by Hertfordſhire; on the eaſt by the river Lea, which parts it from Eſſex; and on the ſouth by the Thames, which divides it from Surry. It is but of ſmall extent, in length not exceeding 21 miles, in breadth 15, and in circumference eighty; but, by reaſon of the cities of London and Weſtminſter, and the numerous large villages in their nighbourhood, it is by far the moſt populous and wealthy in England. The whole of it lies in the dioceſe of London; and is divided into ſix hundreds, two liberties, and ſeventy-three pariſhes, which, beſides London and Weſtminſter, contains five market-towns. There are ſeveral royal parks in it, and a great many chapels of eaſe. The ſheriffs are not appointed by the king, but choſen by the liverymen of London.

As the ſoil is gravelly, and exceedingly well cultivated, in conſequence of the great number of inhabitants, the air is very pure and wholeſome. The great quantities of rich manure produced by ſuch multitudes of people and cattle has ſo improved and enriched the lands, that they are extremely fruitful in vegetables of all kinds. In the neighbourhood of London there is little or no corn, the land being employed either for feeding cows, raiſing hay, or as garden grounds.

Middleton. MIDDLETON (Dr Conyers), a very celebrated Engliſh divine, the ſon of a clergyman in Yorkſhire, was born at Richmond in 1683. He diſtinguiſhed himſelf, while fellow of Trinity-college Cambridge, by his controverſy with Dr Bentley his maſter, relating to ſome mercenary conduct of the latter in that ſtation. He afterwards had a controverſy with the whole body of phyſicians, on the dignity of the medical profeſſion; concerning which he publiſhed, *De medicorum apud veteres Romanos degentium conditione diſſertatio; qua, contra viros celeberrimos Jacobum Sponium et Richardum Meadium, ſervilem atque ignobilem eam fuiſſe, oſtenditur:* and in the courſe of this diſpute much reſentment and many pamphlets appeared. Hitherto he had ſtood well with his clerical brethren; but he drew the reſentment of the church on him in 1729, by writing "A letter from Rome, ſhewing an exact conformity between popery and paganiſm," &c.; as this letter, though politely written, yet attacked popiſh miracles with a gaiety that appeared dangerous to the cauſe of miracles in general. Nor

were his Objections to Dr Waterland's manner of vindicating Scripture againſt Tindal's "Chriſtianity as old as the Creation," looked on in a more favourable point of view. In 1741, came out his great work, "The hiſtory of the life of M. Tullius Cicero," 2 vols 4to; which is indeed a fine performance, and will probably be read as long as taſte and polite literature ſubſiſt among us: the author has nevertheleſs fallen into the common error of biographers, who often give panegyrics inſtead of hiſtory. In 1748, he publiſhed, "A free inquiry into the miraculous powers which are ſuppoſed to have ſubſiſted in the Chriſtian church from the earlieſt ages, through ſeveral ſucceſſive centuries." He was now attacked from all quarters; but before he took any notice of his antagoniſts, he ſupplied them with another ſubject in "An examination of the lord biſhop of London's diſcourſes concerning the uſe and extent of prophecy," &c. Thus Dr Middleton continued to diſplay talents and learning, which were highly eſteemed by men of a free turn of mind, but by no means in a method calculated to invite promotion in the clerical line. He was, in 1723, choſen principal librarian of the public library at Cambridge; and if he roſe not to dignities in the church, he was in eaſy circumſtances, which permitted him to aſſert a dignity of mind often forgot in the career of preferment. He died in 1750, at Hilderſham in Cambridgeſhire, an eſtate of his own purchaſing; and in 1752, all his works, except the life of Cicero, were collected in 4 vols, 4to.

MIDIAN, or *Madian*, (anc. geog.) a town on the ſouth ſide of Arabia Petræa; ſo called from one of the ſons of Abraham by Keturah. Another Midian, near the Arnon and Æoplis, in ruins in Jerome's time; with the daughters of theſe Midianites the Iſraelites committed fornication, and were guilty of idolatry. A branch of the Midianites dwelt on the Arabian gulph, and were called *Kenites;* ſome of whom turned proſelytes, and dwelt with the Iſraelites in the land of Canaan.

MID-LOTHIAN. See Lothian.

MIDSHIP-frame, a name given to that timber, or combination of pieces formed into one timber, which determines the extreme breadth of the ſhip, as well as the figure and dimenſion of all the inferior timbers.

In the article Ship-*Building*, the reader will find a full explanation of what is meant by a frame of timbers. He will alſo perceive the outlines of all the principal frames, with their gradual dimenſions, from the midſhip-frame delineated in the plane of projection annexed to that article. As the parts of which the ſeveral frames are compoſed have the ſame relation to each other throughout the veſſel; and as all the correſponding pieces, without and within thoſe frames, are alſo nearly alike, and fixed in the ſame manner; it will be here ſufficient for our purpoſe to repreſent the principal, or midſhip-frame, together with its correſponding parts, which are as follow:

Plate CLXXV. fig. 8. A, the keel, with *a* the falſe keel beneath it.

B, the chocks fixed upon the kelſon, to retain the oppoſite pieces of the *riders* firmly together.

C, one of the beams of the orlop.

D, one of the lower-deck beams; with *d* the beams of the upper deck.

E, the hanging-knees, by which the beams are attached to the timbers.

F, the ſtandards, which are fixed above the decks to which they belong.

G, the clamps, which ſuſtain the extremities of the beams.

H, the gun-ports of the lower-deck; with *h* the ports of the upper-deck.

I, K, L, different pieces of *thick-ſtuff*, placed oppoſite to the ſeveral ſcarfs, or joinings, in the frame of timbers.

M, the planks of the deck.

N, the water-ways.

O, the planks of the ceiling, between the ſeveral ranges of thick-ſtuff.

P, the ſpirketing.

Q, the main-wale, to fortify the ſhip's ſide oppoſite to the lower deck.

R, the channel-wale, oppoſite to the upper-deck.

S, the waiſt-rail.

T, the ſtring, with the moulding under the gunwale.

U, the floor-timbers, which are laid acroſs the keel, and bolted to it.

V, the ſeveral futtocks; and W the top-timbers, which are all united into one frame.

X, the kelſon.

MIDSHIPMAN, a ſort of naval cadet, appointed by the captain of a ſhip of war, to ſecond the orders of the ſuperior officers, and aſſiſt in the neceſſary buſineſs of the veſſel, either aboard or aſhore.

The number of midſhipmen, like that of ſeveral other officers, is always in proportion to the ſize of the ſhip to which they belong. Thus a firſt-rate man of war has 24, and the inferior rates a ſuitable number in proportion. No perſon can be appointed lieutenant without having previouſly ſerved two years in the royal navy in this capacity, or in that of *mate*, beſides having been at leaſt four years in actual ſervice at ſea, either in merchant-ſhips, or in the royal navy.

Midſhipman is accordingly the ſtation in which a young volunteer is trained in the ſeveral exerciſes neceſſary to attain a ſufficient knowledge of the machinery, movements, and military operations of a ſhip, to qualify him for a ſea-officer.

On his firſt entrance in a ſhip of war, every midſhipman has ſeveral diſadvantageous circumſtances to encounter. Theſe are partly occaſioned by the nature of the ſea-ſervice; and partly by the miſtaken prejudices of people in general reſpecting naval diſcipline, and the genius of ſailors and their officers. No character, in their opinion, is more excellent than that of the common ſailor, whom they generally ſuppoſe to be treated with great ſeverity by his officers, drawing a compariſon between them not very advantageous to the latter. The midſhipman uſually comes aboard tinctured with theſe prejudices, eſpecially if his education has been amongſt the higher rank of people; and if the officers happen to anſwer his opinion, he conceives an early diſguſt to the ſervice, from a very partial and incompetent view of its operations. Blinded by theſe prepoſſeſſions, he is thrown off his guard, and very ſoon ſurpriſed to find, amongſt thoſe honeſt ſailors,

Midshipman. sailors, a crew of abandoned miscreants, ripe for any mischief or villainy. Perhaps, after a little observation, many of them will appear to him equally destitute of gratitude, shame, or justice, and only deterred from the commission of any crimes by the terror of severe punishment. He will discover, that the pernicious example of a few of the vilest in a ship of war are too often apt to poison the principles of the greatest number, especially if the reins of discipline are too much relaxed, so as to foster that idleness and dissipation, which engender sloth, diseases, and an utter profligacy of manners. If the midshipman, on many occasions, is obliged to mix with these, particularly in the exercises of extending or reducing the sails in the tops, he ought resolutely to guard against this contagion, with which the morals of his inferiors may be infected. He should, however, avail himself of their knowledge, and acquire their expertness in managing and fixing the sails and rigging, and never suffer himself to be excelled by an inferior. He will probably find a virtue in almost every private sailor, which is entirely unknown to many of his officers: that virtue is emulation, which is not indeed mentioned amongst their qualities by the gentlemen of *terra firma*, by whom their characters are often copiously described with very little judgment. There is hardly a common tar who is not envious of superior skill in his fellows, and jealous on all occasions to be outdone in what he considers as a branch of his duty: Nor is he more afraid of the dreadful consequences of whistling in a storm, than of being stigmatized with the opprobrious epithet of *lubber*. Fortified against this scandal, by a thorough knowledge of his business, the sailor will sometimes sneer in private at the execution of orders which to him appear aukward, improper, or unlike a seaman. Nay, he will perhaps be malicious enough to suppress his own judgment, and, by a punctual obedience to command, execute whatever is to be performed in a manner which he knows to be improper, in order to expose the person commanding to disgrace and ridicule. Little skilled in the method of the schools, he considers the officer who cons his lesson by rote as very ill qualified for his station, because particular situations might render it necessary for the said officer to assist at putting his own orders in practice. An ignorance in this practical knowledge will therefore necessarily be thought an unpardonable deficiency by those who are to follow his directions. Hence the midshipman who associates with these sailors in the tops, till he has acquired a competent skill in the service of extending or reducing the sails, &c. will be often entertained with a number of scurrilous jests, at the expence of his superiors. Hence also he will learn, that a timely application to those exercises can only prevent him from appearing in the same despicable point of view, which must certainly be a cruel mortification to a man of the smallest sensibility.

If the midshipman is not employed in these services, which are undoubtedly necessary to give him a clearer idea of the different parts of his occupation, a variety of other objects present themselves to his attention. Without presuming to dictate the studies which are most essential to his improvement, we could wish to recommend such as are most suitable to the bent of his inclination. Astronomy, geometry, and mechanics, which are in the first rank of science, are the materials which form the skilful pilot, and the superior mariner. The theory of navigation is entirely derived from the two former, and all the machinery and movements of a ship are founded upon the latter. The action of the wind upon the sails, and the resistance of the water at the stem, naturally dictate an inquiry into the property of solids and flusds: and the state of the ship, floating on the water, seems to direct his application to the study of hydrostatics and the effects of gravity. A proficiency in these branches of science will equally enlarge his views, with regard to the operations of naval war, as directed by the efforts of powder and the knowledge of projectiles. The most effectual method to excite his application to those studies is, perhaps, by looking round the navy, to observe the characters of individuals. By this inquiry he will probably discover, that the officer, who is eminently skilled in the sciences, will command universal respect and approbation; and that whoever is satisfied with the despicable ambition of shining the hero of an assembly, will be the object of universal contempt. The attention of the former will be engaged in those studies which are highly useful to himself in particular, and to the service in general. The employment of the latter is to acquire those superficial accomplishments that unbend the mind from every useful science, emasculate the judgment, and render the hero infinitely more dextrous at falling into his station in the dance than in the line of battle.

Unless the midshipman has an unconquerable aversion to the acquisition of those qualifications, which are so essential to his improvement, he will very rarely want opportunities of making a progress therein. Every step he advances in those meritorious employments will facilitate his accession to the next in order. If the dunces, who are his officers or mess-mates, are rattling the dice, roaring bad verses, hissing on the flute, or scraping discord from the fiddle, his attention to more noble studies will sweeten the hours of relaxation. He should recollect that no example from fools ought to influence his conduct, or seduce him from that laudable ambition which his honour and advantage are equally concerned to pursue.

MIDWIFERY,

THE art of assisting women in the birth of children. It is supposed to comprehend also the management of women both before and after delivery, as well as the treatment of the child in its most early state.

History. The art of midwifery is certainly almost coeval with mankind. The first midwife of whom mention is made under that name, assisted at the second labour of Rachel, the wife of Jacob. Another midwife is spoken of in Genesis, at the lying-in of Thamar, who was deli-

delivered of twins. But the most honourable mention of midwives is that in Exodus, when Pharaoh king of Egypt, who had a mind to destroy the Hebrews, commanded two midwives to kill all the male children of the Hebrew women; which command they disobeyed, and thereby obtained a recompence from God.

From all the passages in Scripture where midwives are mentioned, it is plain, that women were the only practitioners of this art among the Hebrews. Among the Greeks also women assisted at labours. Phanarete the mother of Socrates was a midwife. Plato speaks at large of midwives, explains their functions, regulates their duty, and remarks that they had at Athens the right of proposing or making marriages. Hippocrates makes mention of midwives, as well as Aristotle, Galen, and Aëtius. This last even frequently quotes a woman called *Aspasia*, who was probably a midwife. They were called among the Greeks Μαιαι, or Ιατρομαιαι; that is to say, *mamma*, or *grand-mamma*.

We are still better acquainted with the customs of the Romans, and know that they employed women only. This may be deduced from the comedies of Plautus and Terence alone. We there see that they are women only who are called to assist persons in labour. Besides, Pliny, in his Natural History, frequently speaks of midwives and their duties; and names two, *Sotira* and *Salpe*, who had apparently the greatest reputation. Women were also employed after the fall of the empire; and it is certain, that, till lately, all civilized nations have employed women only as midwives. This appears even from their names in many different languages, which are all feminine. There were, however, especially in great cities, surgeons who applied themselves to the art of midwifery, and made it their peculiar study. They were sent for in difficult cases, where the midwives found their incapacity; and then the surgeon endeavoured to deliver the woman by having recourse to instruments useful in those cases, as by crotchets, crows-bills, &c.; but as these cases happened but seldom, women remained in possession of this business. It is certain, according to Astruc, that Maria Theresia wife of Lewis XIV. employed women only in her labours; and the example of the queen determined the conduct of the princesses and court-ladies, and likewise of the other ladies of the city. The same author tells us, that he has been assured, that the epoch of the employment of men-midwives goes no farther back than the first lying-in of Madam de la Valiere in 1663. As she desired it might be kept a profound secret, she sent for Julian Clement a surgeon of reputation. He was conducted with the greatest secrecy into an house where the lady was, with her face covered with a hood; and where it is said the king was concealed in the curtains of the bed. The same surgeon was employed in the subsequent labours of the same lady; and as he was very successful with her, men-midwives afterwards came into repute, and the princesses made use of surgeons on similar occasions; and as soon as this became fashionable, the name of *acoucheur* was invented to signify this class of surgeons. Foreign countries soon adopted the custom, and likewise the name of *acoucheurs*, though they had no such term in their own language; but in Britain they have more generally been called *men-midwives*.

In opposition to this account, which is taken from Astruc, that author tells us, that he is aware of an objection from Hyginus, who asserts, that the ancients had no midwives; which made the women, through modesty, rather choose to run the risk of death than to make use of men on this occasion. For the Athenians, he adds, had forbid women and slaves to study physic, that is to say, the art of midwifery. A young woman, named *Agnodice*, desirous of learning this art, cut off her hair, dressed herself in the habit of a man, and became a scholar to one Hierophilus. She afterwards followed this business. The women at first refused assistance from her, thinking she was a man; but accepted thereof when she had convinced them that she was a woman.

To this account our author replies, that the authority of Hyginus is by no means to be depended upon. His book is full of solecisms and barbarisms; and therefore cannot be attributed to any writer who lived before the fall of the empire; but must have been the work of an author who lived when the Latin tongue was corrupted; that is, about the seventh or eighth century. The contradictions met with in this book also give room to suspect that it is not the work of one hand, but of several. The authority of such a work, therefore, is by no means sufficient to destroy the testimonies of those writers who affirm, that among the Greeks the care of lying-in women was committed entirely to others of their own sex.

The art of midwifery seems not to have been so soon improved as that of physic. Hippocrates, though an excellent physician, seems to have been a very bad midwife. He was acquainted with no other kind of natural labour than that in which the head presents; and condemns footling labour as fatal both to mother and child: he would have the children in such cases turned, so that the head may present: but, says he, if the arm, or leg, or both, of a living child present, they must, as soon as discovered, be returned into the womb, and the child brought into the passage with its head downwards. For this purpose he advises to roll the woman on the bed to shake her, and make her jump: he proposes the same expedients to procure the child's delivery; and if they do not succeed, he advises to extract it with crotchets, and, whatever happens, to dismember it.

From the time of Hippocrates to that of Celsus, who lived in the reign of the emperor Tiberius, we have no accounts of any improvements in midwifery; but this author gives two very useful directions. 1. In dilating the womb: "We must (says he) introduce the fore-finger, well moistened with hog's lard, into the mouth of the womb, when it begins to open, and in like manner afterwards a second, and so on until all the fingers are introduced, which are then to be used by separating them, as a kind of dilater, to distend the orifice, and facilitate the introduction of the hand which is to act in the womb. 2. Children may be delivered by the feet easily and safely, without crotchets, by taking hold of their legs. For this purpose we must take care to turn children, which are otherwise placed in the womb, with their head or feet downwards."

wards." It is true, Celfus fpeaks of a dead child only; but it was eafy to conclude from thence, that the fame practice might be ufed with fuccefs to deliver a living child. Neverthelefs, this was not done; and, notwithftanding the authority of Celfus, the former prejudice continued for a long time. Tho' Pliny, who lived under the emperors Vefpafian and Titus, was not a phyfician himfelf, yet by condemning footling labour he attefts the opinion of the phyficians of his time. He afferts, as a known fact, that footling labour was a preternatural kind of labour: he adds, that children which came into the world in this manner were called *Agrippa*, that is to fay, born with a great deal of difficulty.

But however common this opinion was, it was never univerfally received; and feveral phyficians of character rofe up, who, without fuffering themfelves to be dazzled with the common prejudice, or feduced by the authority of Hippocrates or Galen, recommended and approved of footling delivery. The queftion then was a long time undecided; and even in 1657, Riverius, a phyfician of reputation, condemned footling labour. Mauriceau alfo remarks, in the firft edition of his book, on the diforders of pregnant women, printed in 1664, that many authors were ftill of opinion, that when the child prefented with its feet, it fhould be turned to make it come with its head foremoft; but after having obferved that it is difficult, if not impoffible, to execute this, he concludes, "it is much better to extract the child by its feet when they prefent, than to run the hazard of doing worfe by turning it." All practitioners, however, are now of the fame opinion; and the knowledge of midwifery has been fo much increafed within this century, that it feems to have nearly attained its ultimate perfection, and its operations reduced almoft to a geometrical certainty: And this, fays Aftruc, is not furprifing; for, after all, the art of midwifery is reduced to the following mechanical problem, "An extenfible cavity of a certain capacity being given, to pafs a flexible body of a given length and thicknefs through an opening dilatable to a certain degree." This might be refolved geometrically, if the different degrees of elafticity of the womb, and ftrength and weaknefs of the child, the greater or leffer difpofition of the blood to inflammation, and the greater or leffer degree of irritability of the nerves, did not occafion that uncertainty which phyfical facts conftantly produce in all phyfico-mathematical queftions.

Chap. I. *Of Pregnancy.*

At the time of conception, and for fome time after, the parts which form the fmall fœtus are fo blended together, that one cannot be diftinguifhed from another. The whole mafs is then called an *ovum*. This ovum confifts of four membranes; the placenta, or after-birth; the funis umbilicalis or navel-ftring, leading to the child; and the furrounding watery fluid in which it floats. Before the child acquires a diftinct and regular form, it is called *embryo*, and afterwards retains the name of *fœtus* till its birth. For the increafe and nutrition of the fœtus, fee the article Generation.

During the progrefs of impregnation the uterus fuffers confiderable changes; but, though it enlarges as the ovum increafes, yet, in regard to its contents, it is never full; for, in early geftation, thefe are confined to the fundus only: and though the capacity of the uterus increafes, yet it is not mechanically ftretched, for the thicknefs of its fides do not diminifh; there is a proportional increafe of the quantity of fluids, and therefore pretty much the fame thicknefs remains as before impregnation.

The gravid uterus is of different fizes in different women; and muft vary according to the bulk of the fœtus and involucra. The fituation will alfo vary according to the increafe of its contents and the pofition of the body. For the firft two or three months, the cavity of the fundus is triangular as before impregnation; but as the uterus ftretches, it gradually acquires a more rounded form. In general, the uterus never rifes directly upwards, but inclines a little obliquely, moft commonly to the right fide; its pofition is never, however, fo oblique, as to prove the fole caufe either of preventing or retarding delivery: its increafe of bulk does not feem to arife merely from diftention, but to depend on the fame caufe as the extenfion of the fkin in a growing child. This is proved from fome late inftances of extra-uterine fœtufes, where the uterus, though there were no contents, was nearly of the fame fize, from the additional quantity of nourifhment tranfmitted, as if the ovum had been contained within its cavity.

The internal furface, which is generally pretty fmooth, except where the placenta adheres, is lined with a tender efflorefcence of the uterus, which, after delivery, appears as if torn, and is thrown off with the cleanfings. This is the *membrana decidua* of Dr Hunter.

Though the uterus, from the moment of conception, is gradually diftended, by which confiderable changes are occafioned, it is very difficult to judge of pregnancy from appearances in the early months. For the firft three months the os tincæ feels fmooth and even, and its orifice as fmall as in the virgin ftate. When any difference can be perceived, about the fourth or fifth month from the defcent of the fundus through the pelvis, the tubercle or projecting part of the os tincæ will feem larger, longer, and more expanded; but, after this period, it fhortens, particularly at its fore-parts and fides, and its orifice or labia begin to feparate, fo as to have its conical appearance deftroyed. The cervix, which in the early months is nearly fhut, now begins to ftretch and to be diftended to the os tincæ; but during the whole term of utero-geftation, the mouth of the uterus is ftrongly cemented with a ropy mucus, which lines it and the cervix, and begins to be difcharged on the approach of labour. In the laft week, when the cervix uteri is completely diftended, the uterine orifice begins to form an elliptical tube, inftead of a fiffure, or to affume the appearance of a ring on a large globe; and often at this time, efpecially in pendulous bellies, difappears entirely, fo as to be out of the reach of the finger in touching. Hence the os uteri is not in the direction of the axis of the womb, as has generally been fuppofed.

About the fourth, or between the fourth and fifth month, the fundus uteri begins to rife above the pubes or brim of the pelvis, and its cervix to be diftended nearly

Spurious gravidity.

nearly one third. In the fifth month the belly swells, like a ball, with the skin tense, the fundus about half way between the pubes and navel, and the neck one half distended. After the sixth month the greatest part of the cervix uteri dilates, so as to make almost one cavity with the fundus. In the seventh month the fundus advances as far as the umbilicus. In the eighth it reaches mid-way between the navel and scrobiculus cordis; and in the ninth to the scrobiculus itself, the neck then being entirely distended, which, with the os tincæ, become the weakest parts of the uterus. Thus at full time the uterus occupies all the umbilical and hypogastric regions; its shape is almost pyriform, that is, more rounded above than below, and having a stricture on that part which is surrounded by the brim of the pelvis.

The appendages of the uterus suffer very little change during pregnancy, except the ligamenta lata, which diminish in breadth as the uterus enlarges, and at full time are almost entirely obliterated.

The most remarkable change happens in the ovarium. A cicatrice of a roundish figure and yellowish colour appears in this body, called by anatomists the *corpus luteum*. It is always to be found in one of the ovaria, and in cases of twins a corpus luteum often appears in both ovaria. It was formerly considered as the calyx ovi; but modern physiologists think it a gland, from whence the seminal fluid is ejected. In early gestation it is most conspicuous, when a cavity is observable, which afterwards collapses; no vessels appear at the centre of this cavity which has the appearance of cicatrix, but all around that centre the substance is vascular.

During the progress of distention, the substance of the uterus becomes much looser, of a softer texture, and more vascular than before conception; its veins particularly, in their diameters, being enlarged in such a manner as to get the name of *sinuses;* they observe a more direct course than the arteries, which run in a serpentine manner, anastomosing with one another and through its whole substance, especially where the placenta adheres, where this vascular appearance is most conspicuous.

The arteries pass from the uterus through the decidua, and open into the substance of the placenta in a slanting direction. The veins also open into the placenta, and by injecting these veins from the uterus with wax, the whole spungy or cellular part of the placenta will be filled.

The muscular structure of the gravid uterus is extremely difficult to be shewn: in the wombs of women who die in labour, or soon after delivery, fibres running in various directions are observable more or less circular, that seem to arise from three distinct origins; viz. from the place where the placenta adheres, and from the aperture or orifice of each of the tubes; but it is almost impossible to demonstrate regular plans of fibres, continued any length without interruption.

Chap. II. *Spurious Gravidity.*

The various diseases incident to the uterine system, and other morbid affections of the abdominal viscera, will frequently excite the symptoms and assume the appearance of utero-gestation. Complaints arising from a simple obstruction, are sometimes mistaken for those of breeding; when a tumour about the region of the uterus is also formed, and gradually becomes more and more bulky, the symptoms it occasions are so strongly marked, and the resemblance to pregnancy so very striking, that the ignorant patient is often deceived, and even the experienced physician imposed on.

Scirrhous, polypous, or sarcomatous tumours in or about the uterus or pelvis; dropsy or ventosity of the uterus or tubes; steatoma or dropsy of the ovaria, and ventral conception, are the common causes of such fallacious appearances. In many of these cases the menses disappear; nausea, retchings, and other symptoms of breeding, ensue; flatus in the bowels will be mistaken for the motion of the child; and in the advanced stages of the disease, from the pressure of the swelling on the adjacent parts. Tumefaction and hardness of the mammæ supervene, and sometimes a viscid or serous fluid distills from the nipple; circumstances that strongly confirm the woman in her opinion, till time, or the dreadful consequences that often ensue, at last convince her of her fatal mistake.

False Conception.—Mola. Other kinds of spurious gravidity, less hazardous in their nature than any of the preceding, may under this head also be classed; diseases commonly known by the names of *false conception* and *mola:* The former of these is nothing more than the dissolution of the fœtus in the early months; the placenta is afterwards retained in the uterus, and from the addition of coagula, or in consequence of disease, is excluded in an indurated or enlarged state; when it remained for months or longer, and came off in the form of a fleshy or schirrous-like mass, without having any cavity in the centre, it was formerly distinguished by the name of *mola*.

Mere coagula of blood, retained in the uterus after delivery, or after immoderate floodings at any period of life, and squeezed, by the pressure of the uterus, into a fibrous or compact form, constitute another species of mola, that more frequently occurs than any of the former. These, though they may assume the appearances of gravidity, are generally however expelled spontaneously, and are seldom followed with dangerous consequences.

Superfœtation.

Chap. III. *Superfœtation.*

Soon after impregnation takes place, the cervix uteri becomes entirely shut up by means of a thick viscid gluten: the internal cavity is also lined by the external membrane of the ovum, which attaches itself to the whole internal surface of the fundus uteri· the fallopian tubes also become flaccid; and are, as gravidity advances, supposed to be removed at such a distance, that they cannot reach the ovaria to receive or convey another ovum into the uterus. For these, and other reasons, the doctrine of *superfœtation* is now pretty generally exploded.—A doctrine that seems to have arisen from the case of a double or triple conception, where, some time after their formation in utero, one fœtus has been expelled, and another has remained; or after the extinction of life at an early period, one or more may be still retained, and

thrown

Monsters. thrown off in a small and putrid state, after the birth of a full-grown child.

The uterus of brutes is divided into different cells; and their ova do not attach themselves to the uterus so early as in the human subject, but are supposed to receive their nourishment for some time by absorption. Hence the os uteri does not close immediately after conception; for a bitch will admit a variety of dogs while she is in season, and will bring forth puppies of these different species: thus it is common for a grey-hound to have, in the same litter, one of the grey-hound kind, a pointer, and a third, or more, different from both; another circumstance that has given rise to *super-fœtation* in the human subject, which can *only* happen when there is a double set of parts, instances of which are very rare.

Chap. IV. *Extra-uterine Fœtuses, or ventral Conception.*

The impregnated ovum, or rudiments of the fœtus, is not always received from the ovarium by the tuba Fallopiana, to be thence conveyed into the cavity of the uterus; for there are instances where the fœtus sometimes remains in the ovarium, and sometimes even in the tube; or where it drops out of the ovarium, misses the tubes, and falls into the cavity of the abdomen, takes root in the neighbouring parts, and is thereby nourished: But as these fœtuses cannot there receive so much nourishment as in the succulent uterus, they are less, and generally come to their full growth before the common term.

Of these some burst in the abdomen; and others form abscesses, and are thereby discharged; others dry, and appear bony, and remain so during life, or are discharged as above, or by stool, &c.

Chap. V. *Monsters.*

When two or more ova contained in the uterus attach themselves so near one another as to adhere in whole or in part, so as to form only one body with membranes and water in common, this body will form a confused irregular mass called *monstrous*; and thus a monster may be either defective in its organic parts, or be supplied with a supernumerary set of parts derived from another ovum. This seems a rational conjecture; but, while every thing relative to generation is a mystery, how can we account for the extraordinary phænomena? Some authors enumerate a third species of monster, the product of a mixed breed, exemplified, for instance, in the mule, produced by the mixed generation of an ass and a mare. In this animal there are organical parts different from what preexisted in the parents; there is a defect of some parts, a luxuriant growth of others; and the defect in the parts of generation, which renders the animal unfit for propagation, constitutes a very curious and particular species.

Chap. VI. *Diseases of Pregnancy.*

After conception, a remarkable change is soon produced in the genital system. This is the source from whence arise different symptoms, that are however liable to considerable variation, not only in the constitution of different women, but in the same woman in different pregnancies, and at different periods of the same pregnancy. Diseases.

Pregnancy,—though a natural alteration of the animal-œconomy, which every female seems originally formed to undergo, and hence not to be considered as a state of disease, occasions, however, sooner or later, in many women, various complaints, which evidently depend on it as a cause.

Diseases incident to the pregnant state may be considered, either, 1. As arising from sympathy in the early months; or, 2. As depending on the stretching and pressure of the uterus towards the more advanced stages.

I. Though the former of these complaints are generally to be accounted for from other causes than that of plethora; yet, in many constitutions, a certain plethoric disposition in the early months of pregnancy seems to prevail in the vascular system: And therefore, though many inconveniencies may ensue from a too frequent, a too copious, or an indiscriminate use of venesection; yet, if prudently and judiciously employed, abortion by this means will not be endangered, as some late authors have alleged; but, on the contrary, on many occasions, a seasonable bleeding will be attended with the most beneficial and salutary effects.

In young women, suddenly affected with severe sickness and loathing, febrile commotion, head-ach, vertigo, and other symptoms of breeding, more especially in full sanguineous habits, besides a spare light diet and suitable exercise, recourse must be had to proper evacuations, the chief of which is venesection: this may be safely performed at any term of gravidation, and occasionally repeated according to the urgency of the symptoms: small breedings, at proper intervals, are preferable to copious evacuations, which in early pregnancy ought always to be carefully guarded against.

When the stomach is loaded with putrid bile or acrid saburra, the offensive matter should be discharged by gentle vomits of ipecacuan, or of infusions of chamomile flowers. The violent efforts to retch and vomit, and the commotions thence excited, which often occasion the expulsion of the fœtus, will by this means frequently be removed, in most cases greatly diminished. During the term of breeding, the state of the belly must be also attended to: When laxative medicines become necessary, those of the mildest and gentlest kind should be administered.

In women liable to nervous complaints, where the stomach is weak, and the sickness violent and continued, the patient should be put on a course of light, aromatic, and strengthening bitters; such as infusions of bark, columbo, &c. and her diet, air, exercise, company, and amusement, should be regulated: In order to settle the stomach, and lessen the sensibility of the system, opiates will often happily succeed, when every other remedy fails.

Heart-burn and *diarrhœa*,—common symptoms of breeding, or of pregnancy, must be treated pretty much as at other times: Both complaints chiefly depend on the state of the stomach.

Tumefaction, *tension*, and *pains* in the *mammæ*.—If tight lacing here be only avoided, and the breasts have room to enlarge and swell, no inconvenience ever follows:

Diseases of Pregnancy.

follows: These effects arise from a natural cause, and seldom require medical treatment. If very troublesome and uneasy, bathing with oil, or anointing with pomatum, and covering with soft flannel or fur, will in most cases prove the cure.

The *menstrual evacuation*—is in some women regular for the first, second, or third period after conception. This seldom happens but in women of sanguinary plethoric habits, such as have been accustomed to large copious evacuations at other times, when the discharge is to be considered as beneficial.

Deliquia, nervous, or *hysteric fits*.—When these are occasioned by falls, frights, and passions of the mind, they frequently end in the loss of the child: But when they happen about the term of quickening, they seem to arise from the escape of the uterus from its confinement within the capacity of the pelvis; in which case they are commonly slight, of short duration, and never threaten any dangerous consequence.

II. The second class of complaints, viz. those that are incident to the advanced stages of utero-gestation, and that depend on the change of situation of the gravid uterus, its enlargement and pressure on the neighbouring parts, are more painful in their symptoms, and more dangerous in their consequences, than those enumerated in the preceding class. The premature exclusion of the fœtus is generally the worst inconvenience resulting from the *one*; the death of the mother, along with the loss of the child, is too frequently an attendant of the *other*.

Difficulty or *suppression* of *urine*—is sometimes occasioned by the pressure of the uterus on the neck of the bladder, before the fundus uteri escapes from its confinement within the brim of the pelvis. This complaint, if early attended to, will seldom prove troublesome or hazardous; but cannot be entirely removed till the uterus rises above the brim of the pelvis, and by its enlargement becomes supported by resting on the expanded bones of the ossa ilia. But if neglected in the beginning,

A retroversion of the uterus—is generally the consequence, a case that demands particular attention. Here the fundus uteri, instead of being loose, falls back in a reclined state within the hollow of the os sacrum: thus a tumor is formed in the vulva, whereof the os tincæ makes the superior part; the body of the uterus, by this means, becomes strongly wedged between the rectum and bladder; and, from the enlargement of the uterus itself, and accumulating load of fæces and urine, the reduction will prove in many instances utterly impracticable. A total suppression of urine, or a rupture of the coats of the bladder, fever, inflammation, or gangrene of the uterus, often ensue; and these are succeeded by delirium, convulsions, death.

The indications of cure, in this dangerous disease, are sufficiently obvious: For, in the first place, every obstacle that prevents the reduction should be removed: thus the contents of the rectum and bladder must, if possible, be evacuated; emollient fomentations and cataplasms must be applied, if indicated by inflammation or tumefaction of the parts. Secondly, The reduction of the prolapsed uterus must be attempted, by placing the patient upon her knees, with her head low and properly supported. While this is attempted within the vagina, a finger or two should also be passed within the rectum, by which the operation in some cases may be facilitated: but, at other times, no power whatever will be sufficient for this purpose. Lastly, If the reduction be accomplished, the fever, inflammatory symptoms, and other consequences of the disease, must be subdued; and a recurrence prevented by an open belly, rest, and recumbent posture, and promoting a free discharge of urine: means that ought to be persisted in till the uterus rises within the abdomen, when the patient will be secured from future danger.

Costiveness in pregnancy—is inconvenient. It may proceed from the same cause with the preceding complaint; it may depend of the stomach; the febrile heat, that in many women prevails, will also prove an occasional cause. It may be obviated or prevented by a proper regulation of the regimen, and by such gentle laxative medicines as are best suited to the state of the woman; the chief of which are ripe fruit, magnesia, lenitive electuary, cream of tartar, sulphureous and aloetic medicines, oleum ricini, emollient glysters.

The piles—frequently arise in consequence of costiveness, or from pressure of the gravid uterus on the hæmorrhoidal veins. These are also to be removed or palliated by the same means employed on other occasions; regard being had to this distinction, which may be applied universally to the gravid state, that all violent remedies are to be avoided: a light diet should be enjoined; the belly should be kept moderately open; and topical liniments or cataplasms should be applied, such as Bals. sulphur. Bals. traumaticum, Liniment. ex ol. palmæ, Ung. sambucin. cum laud. liquid. Poultices of bread and milk with opium, &c. according to the various circumstances of the case.

Oedematous swellings of the legs and *labia*,—are occasioned by the languid state of the circulation, by the interruption of the refluent blood from the pressure of the distended uterus on the vena cava, &c. These, though very troublesome and inconvenient, are seldom however of dangerous consequence, except where the habit is otherwise diseased; and seldom require puncture, as the swelling generally subsides very quickly after delivery. They can only, therefore, at this time, admit of palliation; for which purpose, along with a proper diet and moderate exercise, a frequent recumbent posture, open belly, and dry frictions applied to the legs evening and morning, will prove the most effectual means.

Varicous swellings in the legs and thighs—from the interruption of the venal blood in these parts, occasioned by the pressure of the gravid uterus, are to be treated in the same manner with the preceding complaint.

Pains in the back, loins, cholic-pains, cramp,—occasioned by the stretching of the uterus and appendages, and from the pressure of the uterus on the neighbouring parts, symptoms that are most troublesome in a first pregnancy, are to be palliated by venesection, an open belly, and light spare diet. If the patient be of a full habit, and pre-disposed to inflammatory complaints, where the pressure is very great in the advanced months, or in twins, &c. if proper

proper remedies are neglected, inflammation of the uterus and adjacent viscera, or dreadful epileptic fits, may quickly ensue; the event whereof is generally fatal. Crampish spasms in the belly and legs require the same palliative treatment; to which may be added friction, and the application of æther, ol. volatil. balf. anodyn. or the like, to the parts affected.

Cough, dyspnœa, vomitings, difficulty or incontinency of urine, occasioned by the pressure of the bulky uterus on the stomach, liver, diaphragm, &c.—Complaints that can only be alleviated by frequent small bleedings, a light spare diet, and open belly. The patient should be placed in an easy posture, something between sitting and lying; and when the uterus rises high, a moderate degree of pressure from the superior part downwards, may in in some cases prove useful. But this must be used with great caution; for dreadful are the effects of violent pressure, or tight lacing, during pregnancy. It frequently kills both mother and child, and ought to be guarded from the earliest months.

Epileptic fits,—are a very dreadful and alarming appearance. They generally depend on the same cause with the above complaints: they may also arise from irritation, excited by the motion and stirring of the fœtus; and from various other causes. Such as have had convulsions when young, are most liable to have them during pregnancy: they happen most frequently in first pregnancies, or where the fœtus is very large, or in twins, triplets, &c. In such cases, the distention of the uterine fibres is so great, that actual laceration is sometimes the consequence.

At whatever period of pregnancy they seize, the utmost danger may be dreaded. This, however, will be in proportion to the severity, duration, and recurrence of the paroxysm, to the term of gravidation, to the constitution of the patient, and her condition during the remission. The danger is greater towards the latter end of pregnancy than in the earlier months or in time of labour.

Such as arise from inanition, from excessive and profuse hæmorrhages, from violent blows, falls, &c. or from a ruptured uterus, are for the most part fatal.

Hysteric or nervous spasms must be carefully distinguished from true epileptic fits. The former are milder than the latter; they are not attended with foamings; they do not affect the posture; the pulse is smaller, feebler, and more frequent; the woman is pretty hearty after they are over; they are followed with no bad consequences, and yield to the common treatment. Women of strong, robust, vigorous constitutions, are more generally the subjects of the *one*; the delicate, the nervous, and the irritable, of the *other*.

Epileptic fits generally come on very rapidly; if any previous symptoms occur, the fit is commonly announced by an intense pain in the scrobiculum cordis, or violent head-ach.

In the pregnant state, these fits are for the most part symptomatic, and will therefore only admit of a palliative cure. They may be distinguished into three classes; those of the early months, those of the latter, and those that come on with labour-pains.

With regard to the cure, the term of pregnancy, as well as the constitution of the patient, and particular cause of the disease, must carefully be considered.

1. Convulsions at an early period of pregnancy chiefly happen to young women of a plethoric sanguine habit; and can therefore only be removed or palliated by a free and bold use of the lancet, by an open belly, cool regimen, and spare diet. After plentiful evacuations, if the stomach be loaded with acrid saburra or putrid bile, a gentle puke may be of use: but such remedies, on those occasions, must be employed with great caution. Instead of a plethoric, if the patient is of a nervous habit, a very necessary and important distinction, the intentions of cure will essentially vary. For here opiates in large doses and frequently repeated, emollient glysters, stupes applied to the legs, the semicupium, and every other means to soothe the nerves and remove spasmodic stricture, will prove the most effectual remedies. If insensible or comatous, opium, musk, and other antispasmodics, should be exhibited by way of glyster, and the patient ought to be roused by epispastic and stimulating cataplasms applied to the legs and hams. Convulsions succeeding profuse evacuations, are generally mortal. The vis vitæ, in such circumstances, must be supported, by replenishing the vessels with the utmost speed: this is to be done by pouring in nourishing fluids as fast as possible by the mouth, and by glyster; warm applications should also be made to the stomach and feet, and nervous cordials given internally along with opium.

The treatment of epileptic fits, depending on other causes than those now mentioned, must be regulated by a proper attention to the particular symptoms with which they are attended.

2. In the advanced months, such complaints are more to be dreaded than in early gestation, as they generally proceed from the irritation occasioned by the distention of the uterine fibres, or by the pressure of the uterus on the contiguous viscera: hence the natural functions of these parts will be interrupted, the circulation of their fluids will be impeded, and the blood, being thus prevented from descending to the inferior parts, will be derived in greater proportion to the brain, and overcharge that organ.

The cure must, in this case, chiefly rest on copious and repeated bleedings, an open belly, and spare diet.

3. Lastly, when fits come on with labour-pains, a speedy delivery, if it can be done with safety, either by turning the child, or by extracting with the forceps when the head is within reach, will prove the most effectual cure

When the bladder is distended, the contents must be evacuated: if a stone sticks in the urethra, it must be pushed back or extracted. If the fits are the effects of a ruptured uterus, immediate death is generally the consequence.

With regard to the treatment of such complaints, no other change is generally requisite, than what arises from the symptoms peculiar to this situation. In general, till after delivery, they will only admit of palliation.

CHAP. VII. *Floodings*.

THESE, tho' confined to no particular term, may hap-

Diseases.

pen at every period of gravidation. The one is a frequent consequence of the other; the event of both is often hazardous, as the earlier miscarriages are generally preceded by an effusion of blood from the uterus, which, in the advanced stages of pregnancy, besides the loss of the child, always endangers the life of the mother.

The *menorrhagia gravidarum*—may be defined, an effusion of blood from the uterus, confined to no regular or stated periods, in quantity and duration various, and liable to recur on the slightest occasions.

The immediate cause is, a separation of some portion of the placenta or chorion from the internal surface of the uterus. Whatever occasions this separation may be considered as the remote cause, which, though various, may be reduced to

I. Those that affect the general system: as,

1. External accidents changing the state of the circulation.
2. Changes in the circulation from internal causes.
3. Debility.
4. Plethora.

II. Those that affect the uterus and placenta: as,

1. Direct affections.
2. Stimuli communicated from an affection of other parts.

With regard to the cure.—Though a flooding in some constitutions may happen, even in early gestation, and may remit and recur from time to time, and the woman go on to the end of her reckoning; and tho' it seldom or never happens, that this complaint proves mortal to the mother in the first five months of pregnancy; yet every appearance of this kind, even the slightest, is to be dreaded; as in the early months it will often throw off the fœtus, and, in the latter, always threatens the utmost danger both to mother and child. Floodings of gravid women we cannot propose radically to cure; they will only admit of palliation. With this view, the indications are,

I. To lessen the force and velocity of the blood in general.

II. To promote the constriction of the patulous mouths of the bleeding vessels, or the formation of coagula in their orifices.

1. To answer the first indication, rest and a recumbent posture, cool air, tranquillity of mind, a light diet, venesection, and opiates, are the chief means.

2. To restrain the violence of the hæmorrhage, internal astringent medicines are recommended; but this is to be accomplished chiefly by means of cold styptic applications to the parts and their neighbourhood. But, as these floodings often arise from so various and opposite causes, it is difficult to lay down particular indications, or to point out a method of cure suited to every case that may occur. The intention of cure can only be regulated by a careful and judicious consideration of the cause, and of those particular circumstances with which the case may be attended. In early pregnancy, it may be restrained by keeping the patient quiet and cool, by giving internally cooling things and opiates; but, in the advanced stages, the deluge is sometimes so profuse as to kill very suddenly. Under such circumstances, when the woman is near her time, emptying the uterus by delivery, if practicable, is the only safe expedient both for preserving the life of the mother and of the child.

Abortion.

If the hæmorrhage can be restrained, a recurrence must be guarded against, by avoiding or counteracting the occasional or remote causes.

Chap. VIII. *Abortion, or Miscarriage,*

May be defined, the premature expulsion of the embryo or fœtus. Some, however, make the following distinction: When a woman miscarries in early gestation, this they consider as an abortion; but if in the latter months, that they term a *premature birth*. The symptoms that threaten abortion are:

Flooding.
Pain in the back and belly.
Bearing down pains with regular intermissions.
The evacuation of the waters.

The death of the child, which discovers itself by the following symptoms; though in general these are so doubtful and fallacious, that none of them afford an infallible sign:

1. The subsiding of the abdominal tumour.
2. Cessation of motion in the fœtus.
3. The sensation of a heavy weight falling from side to side, as the woman turns herself in bed.
4. Sickness, faintings, rigors, cold sweats.
5. The breasts turning flaccid.
6. Coldness of the abdomen, and putrid discharge from the vagina.

Abortions are seldom dangerous in the first five months; but a frequent habit of miscarriage debilitates the system, shatters the constitution, and lays the foundation of chronic diseases of the most obstinate and dangerous nature.

In the advanced months, the prognosis will be more or less favourable, according to the patient's former state of health, the occasional cause, and symptoms with which it is attended. The proximate cause of abortion is the same with that of true labour, *viz.* a contracting effort of the uterus and abdominal muscles, assisted by the other expulsive powers. The remote causes cannot be explained with precision; as many circumstances, with regard to the nature of impregnation, and connection of the fœtus with the placenta and uterus, are subjects still involved in darkness. They may in general, however, be reduced,

I. To whatever interrupts the regular circulation between the uterus and placenta.

II. To every cause that excites the spasmodic contraction of the uterus, or other assisting powers.

III. To whatever occasions the extinction of life in the fœtus.

Amongst the first are:

1. Diseases of the uterus.
2. Imperviousness or spasmodic constriction of the extremities of the uterine blood-vessels.
3. Partial or total separation of the placenta or chorion from the uterus.
4. Determination to other parts.

To the second general head belong all causes that produce a strong contraction of the elastic fibres of the uterus, or of the parts that can press upon it, or that occasion a rupture of the membranes; such as,

1. Violent agitation of mind or body.
2. A disease of the membranes.
3. Too large a quantity of liquor amnii.

4. The

Abortion.

4. The crofs pofition of the fœtus.

5. Its motion and kicking.

The laft head includes the numerous caufes of the death of the child, which, befides thofe referred to in the preceding claffes, may be occafioned by,

1. Difeafes peculiar to itfelf.
2. Difeafes communicated by the parents.
3. External accidents happening to the mother: or,
4. Accidents incident to the fœtus in utero.
5. Difeafes of placenta or funis.
6. Knots and circumvolutions of the chord.
7. Too weak an adhefion of placenta or chorion to the uterus: and,
8. Every force that tends to weaken or deftroy this attachment.

With regard to the treatment. This muft be varied according to the particular circumftances of the cafe: nor is it poffible to point out particular indications, or propofe any regular plan to be purfued for this purpofe. Abortion is often preceded by no apparent fymptom, till the rupture of the membranes, and evacuation of the waters, announce the approaching expulfion of the fœtus. Either to remove threatening fymptoms, or to prevent mifcarriage when there is reafon to apprehend it, often baffles our utmoft fkill; becaufe it generally happens, that there is a ceffation of growth in the ovum; or, in other words, an extinction of life in the fœtus, fome time previous to any appearance of abortion. For inftance, in early geftation, a woman commonly mifcarries about the 11th or 12th week; but the age of the fœtus at this time is generally no more than eight weeks. At other times, when by accident the fœtus perifhes, perhaps about the fifth or fixth month, it will ftill be retained in utero, and the expulfion will not happen till near the completion of full time.

As women who have once aborted are fo liable to a recurrence from a like caufe, at the fame particular period, fuch an accident, in future pregnancies, fhould therefore be guarded againft with the utmoft caution. On the firft appearance of threatening fymptoms, the patient fhould be confined to a horizontal pofture; her diet fhould be light and cooling; her mind fhould be kept as tranquil as poffible; a little blood from the arm may be taken occafionally; and opiates adminiftered according to circumftances; but excepting fo far as depends on thefe, and fuch like precautions, for the moft part, in the way of medicine, very little can be done.

Manual affiftance is feldom or never neceffary during the firft five months of pregnancy: the exclufion of fœtus and placenta fhould very generally be trufted to nature.

The medical treatment of abortion muft therefore be confidered with a view only to the prophylactic cure: and this again will chiefly confift in a proper

Chap. IX. *Regimen during Pregnancy.*

Regimen.

Women, when pregnant, fhould live a regular temperate life; moderation in eating and drinking fhould now be very carefully obferved, and every thing that has any tendency to difagree with the ftomach fhould be avoided; otherwife the manner of life fhould be much as ufual. If complaints do occur, thefe fhould be treated as at other times; only guarding againft fuch things as, by violent operation, may endanger mifcarriage. If the woman has formerly been fubject to this accident, the caufe fhould be carefully confidered, and fuitable remedies applied; if plethoric, for inftance, fhe fhould be blooded, live fparingly, and keep quiet, till fhe gets beyond the dangerous period. If fhe be weak, delicate, and nervous, bark, light aromatic bitters, mineral waters, and the cold bath (if able to bear it), will prove the beft prophylactic remedies. The cold bath has, in many cafes, cured the moft obftinate fluor albus, and fometimes even fterility itfelf; and, in relaxed habits difpofed to mifcarriage, when every other means has failed, the cold bath has done confiderable fervice: the practice may fafely be continued for fome months after conception, when it has been early begun, or when the patient has been accuftomed to it. Such a fhock will, however, act very differently on different fyftems: hence, it is an expedient by no means to be indifcriminately ufed in the pregnant ftate.

Abortions that happen in early geftation, and that come on fuddenly without any prefaging fign, if ever they are to be prevented, it can only be done by avoiding all occafional caufes, by counteracting morbific difpofition, and by confinement to a horizontal pofture, for fome time before, and till the critical period be over.

When a venereal taint in the parents is fufpected to be the caufe either of abortion or the death of the fœtus, the like accident can only be prevented by putting both parties on a mercurial courfe.

Pregnant women require a free pure air; their amufement fhould often be varied; their company fhould be agreeable and cheerful; their exercife fhould be moderate, and fuited to their inclination, conftitution, and the feafon; they fhould avoid crowds, confinement, travelling over rough roads in a carriage, or being expofed to fea-voyages. Riding a-horfeback fhould alfo be practifed with great caution, that difagreeable objects may be fhunned, and fhocks of every kind prevented. For this reafon, when riding is judged proper, the woman fhould be a courageous rider; fhe fhould never ride without fomebody being in company; the horfe fhould be tame and well trained; the road fhould be fmooth as well as private; and the exercife fhould be gentle and eafy, and never carried the length of fatigue. Women fhould, with the utmoft care, guard againft confining the breafts or belly; early recourfe fhould be had to jumps, and they fhould keep themfelves as loofe and eafy as poffible through the whole term of utero-geftation. An open belly is neceffary and important in the pregnant ftate; it keeps the ftomach in good condition, prevents cholics and other complaints that may terminate in mifcarriage. When the abdomen is pendulous towards the latter months, a gentle fupport by proper bandage will prove ufeful; and the woman, when fatigued, fhould occafionally, through the day, indulge in reft on a bed or couch.

LABOURS.

Labours are divided into three claffes: *natural*, *laborious*, and *preternatural.*

In whatever manner the head of the child prefents, where the delivery at full time is performed by nature, the labour is with great propriety called *natural;* when the

Natural Labour.

the birth is protracted beyond the usual time, or cannot be accomplished without extraordinary assistance, it is deemed *laborious*; and *preternatural*, when any other part but the head presents.

Chap. X. *Natural Labour.*

By whatever power the uterus is enlarged, when any further increase is prevented, a stimulus to contraction must ensue; by this means an uneasy sensation is excited, which must, in the woman, produce an effort to procure relief: and thus arise the true labour-pains, which at first are slight and of short duration, a considerable remission intervening: the periods of recurrence soon become more frequent; the pains acquire an increased force, producing more and more change on the os uteri; which, yielding to the impelling cause, gradually opens and expands; till at length it becomes completely dilated, the membranes protruded and ruptured, and the child, by the expulsive force of the uterus, assisted by that of the diaphragm and abdominal muscles, is thus pushed along and delivered.

The symptoms of approaching labour are, The subsiding of the abdominal tumour: hence a discharge of mucus from the vagina, sometimes tinged with blood; incontinency, or suppression of urine; tenesmus; pains of the belly, loins, and about the region of the pubes; restlessness, hot and cold fits, &c.

Spurious pains are to be carefully distinguished from those of genuine labour. The former arise from the stretching of the uterus and its pressure on the neighbouring parts, or from costiveness; and are to be distinguished from the latter by the following symptoms: They are most troublesome towards the evening, increase in the night, and abate through the day; they are more trifling and irregular than true uterine pains; the uterine orifice is not affected; and there is no increased flow of mucus from the parts.

True pains begin about the region of the kidneys, strike forward towards the pubes, and down the thighs: they return at regular periods: there is a copious discharge of mucus from the vagina; the os uteri gradually opens, and can be felt to dilate in time of a pain; while the membranous bag, in a tense state, forcibly pushes against the finger.

The event of labours is so precarious, that no certain judgment can be formed from almost any symptoms, till the labour itself be considerably advanced. A prognosis in general is chiefly to be formed from the age, state of health, and temperament of the patient; from the force, duration, and recurrence of the pains; and from their effect on the uterine orifice; from the time of the rupture of the membranes; from the general make and form of the woman, but, in particular, of that of the pelvis; from the bulk and position of the child, &c.

With regard to the method of delivery, and position of the woman, this has been different at different ages, and in different countries: the chief thing, however, is to guard against cold and fatigue, observing that the woman be placed in the most favourable posture for supporting the back, for the action of the abdominal muscles, &c. and most convenient for the necessary assistants: till the labour is considerably advanced, she may be indulged in whatever posture is most agreeable; after which the bed or couch is the most proper.

Natural Labour.

With regard to assistance in natural parturition, the accoucheur for the most part has little to do, till the membranes are ruptured, and the head in perinæo. In time of labour, the woman should be kept very cool, and every means of being overheated should be avoided. She should be put to bed in proper time, placed on her side or back, with her head and shoulders a little raised, a cloth tied to the bed-post, or held by an assistant, to support her hands in time of pain, and her feet resting against a foot-board; her knees should be drawn up towards the belly, and a folded pillow put between them. All efforts to press or strain, except what nature excites, are improper, hurtful, and should be avoided: the membranes, if possible, ought not to be ruptured till they almost protrude at the os externum: the perinæum must be lubricated when formed into a tumour, and carefully supported while overstretched; for this purpose, a cloth smoothly folded should be applied over the part, to enable the accoucheur to have a firmer hold. This is an important part of his office; and must be attended to with the strictest care. From the time this protrusion begins to form till the head of the child be completely delivered, the perinæum must be carefully preserved by the palm of the hand firmly applied against it, which should be carried backwards in a direction towards the anus, and kept so during every pain. Thus the miserable consequences will be prevented to which the neglect of this pressure exposes: for by this support the overstretching of the perinæum will be greatly lessened, the parts will dilate gently and gradually, the vertex will easily slip from under the pubes, and the fore-head will rise from under the perinæum in a safe, slow, and gentle manner. The perinæum must now be released, by cautiously sliding it over the face and chin of the child; and this ought to be made further sure of, by passing a finger under it round and round. After the head has thus mechanically advanced through the pelvis and vagina, a pain or two must be waited for, when in like manner the body will follow; nothing more being necessary than to support the child while it is gradually pushed forwards by the expulsive force of the natural pains.

When the child has cried, and the change in the circulation freely taken place, the funis umbilicalis must be tied and divided, the infant must be wrapped in a warm receiver, and given to the nurse to be washed and dressed.

The parts of the woman must now be gently wiped, a warm soft cloth must be applied, and a proper time waited for the separation of the placenta.

This is also the work of nature, and seldom requires more force to bring it along than if it lay entirely loose within the cavity of the uterus. Thus, in pulling, no greater force should be employed than is just sufficient to put the funis on the stretch: for if it is already separated, no violence is necessary to extract it; and if the adhesion is very firm, all violent efforts are improper, and often followed with most dangerous consequences. Its advancing is known by the contraction of the uterus, and shifting of the abdominal tumour, and by the lengthening of the cord. By the spontaneous contraction of the uterus, this separation is effected; the expulsion will be slower or more expeditious,

ditious, according to the ſtate and condition of the woman, according to the number of children ſhe has born, and according to the duration or violence of the labour; it is eaſier and ſooner ſeparated in a firſt birth, when the woman is in good health, and when the labour has been properly managed. In moſt caſes, this ſeparation is accompliſhed within half an hour after the delivery of the child. It adheres moſt firmly after premature births, when the woman has been ſickly during pregnancy, where the labour has been tedious and difficult, or when haſty attempts have been made to extract it. A finger, or finger and thumb, guided by the funis, and introduced within the vagina, to bring down the edge, will remove any difficulty occaſioned by the centre or bulky part paſſing the uterine or vaginal orifice.

When it becomes neceſſary to employ force in extracting the placenta, which is never requiſite but in caſes of flooding, when the woman has been in bad health during pregnancy, when ſhe has ſuffered much in time of labour, or when the ſtring has been torn from it, (though the firſt of theſe caſes is perhaps the only one wherein the practice is abſolutely proper), the method of doing it is as follows: In ordinary caſes, the woman ſhould be laid on her back or ſide; but when the belly is pendulous, or when the placenta is attached to the fundus uteri, ſhe muſt be placed on her knees, which is the moſt convenient poſture.

The acoucheur, though with a certain degree of courage, yet with the utmoſt poſſible tenderneſs, muſt then paſs his hand well lubricated through the vagina into the uterus, and feel for the convex body of the after-birth; if the chord be entire, this will direct him; if not, he muſt feel for the looſe membranes at the edge of the cake; and muſt not be deceived by coagula of blood that lie in the way: if the uterus be conſtricted in the middle like a ſand-glaſs, a circumſtance that ſometimes, though rarely, occurs, this muſt be overcome by a gradual dilatation with one finger after another, till the whole hand in a conical manner can ſafely be paſſed. He muſt not content himſelf with feeling a part; he ſhould be able to move his fingers round the whole body of the cake; the adheſion muſt be ſeparated very gradually, in a direction from the ſides round and round. The placenta is diſtinguiſhed from the uterus, as well by its ſoftneſs as by its convex puckered feel. This convexity increaſes in the ſame proportion as the uterus contracts: hence the middle part or centre of the placenta is firſt detached; and if the edges are carefully ſeparated, by gently paſſing the fingers behind, the whole body becomes looſe and diſengaged, which muſt now be brought along with great caution, that no part be left behind, and that no injury be done to the woman in making the extraction.

Though bad conſequences ſometimes follow from the retention of the placenta, yet it is much to be queſtioned, if theſe are not leſs to be dreaded than the dangerous floodings, convulſions, deliquia, inflammation of the uterus, fever, &c. that may be induced from the prepoſterous practice of paſſing the hand to make the extraction: and would it not in general be better to confine the practice of introducing the hand, to caſes of uterine hæmorrhages only? Where the adheſion is ſo firm as to require force, or where its place of attachment is out of the reach of the finger, by which, for the moſt part, the edge may be brought down, is it not by far the ſafeſt and the moſt rational practice univerſally to truſt to nature? Should the mouth or body of the uterus become conſtricted before the ſeparation is effected, no matter; little is to be dreaded: it will afterwards kindly dilate; and the ſeparation and expulſion will ſpontaneouſly be accompliſhed with as much ſafety as in other animals, where no force is ever uſed. Let every candid practitioner acknowledge, that for one inſtance where the retention of the placenta has been attended with dangerous conſequences, a precipitate or forcible extraction has proved fatal to hundreds.

After the delivery of child and placenta, the woman muſt reſt a few minutes; her ſtrength and ſpirits may be recruited by ſome light nouriſhing cordial; the wet cloths, &c. muſt then be removed; the bed muſt be properly ſhifted and adjuſted; and a gentle compreſſion muſt be made on the abdomen.

During lying-in, the woman ſhould avoid company and noiſe; her dreſs and bed-linens ſhould be often changed; ſhe ſhould avoid every means of being overheated; and with regard to her diet, it ſhould, for the firſt week at leaſt, be very light and of eaſy digeſtion.

Chap. XI. *Laborious or difficult labour.*

When the birth is protracted beyond the ordinary time, or when the child's head, though naturally preſenting, cannot be brought forwards without aſſiſtance, the labour is accounted difficult or laborious.

Though the cauſes of laborious births are various and complicated, they may in general be conſidered as depending,

I. On the mother.
II. On the child.
III. On the ſecundines.

I. The birth may be protracted, or the labour-pains interrupted, by,
 (1.) Debility in the mother, ariſing,
  a From diſeaſe, *viz.*
   1. Flooding.
   2. Epileptic fits.
   3. Crampiſh ſpaſms.
   4. Lowneſs and faintiſhneſs.
   5. Inflammatory diatheſis.
   6. Colic.
   7. Nauſeating ſickneſs and vomiting.
   8. Hectic or conſumptive habit.
  b From paſſions of the mind.
  c From miſmanagement in time of labour.
 (2.) Local complaints in the parts, or their neighbourhood, *viz.*
  a In the bones, occaſioning narrowneſs and diſtortion.
  b In the ſoft parts, *viz.*
   1. Dryneſs and conſtriction of the vagina.
   2. Thickneſs and rigidity of the os tincæ.
   3. Scirrhous or polypous tumours about theſe parts.
   4. Accumulated fæces in the inteſtines.
   5. Stone in the urethra.
   6. Prolapſus of the uterus, vagina, and rectum.

7. Ob-

Natural Labour.

7. Obliquity of the uterus.

II. Difficulties alfo arife on the part of the child, *viz.*

1. From the bulk and offification of the head.
2. The fituation in which the head prefents.
3. Large broad fhoulders, or their tranfverfe defcent through the pelvis.

III. The fecundines, *viz.*

1. The rigidity of the membranes, and the contrary.
2. Too great a quantity of water.
3. The funis umbilicalis too long, or too fhort.
4. The prolapsus of the funis before the child's head: and,
5. The attachment of the placenta towards the cervix or os uteri.

The treatment of laborious births requires a very nice and careful attention to the condition of the patient and other circumftances, from whence only we can judge when affiftance becomes requifite, and how it may be applied to the beft advantage. That pain and mifery is the unavoidable and infeparable attendant of child-bearing, though dealt out in different proportions to different fubjects, the teftimony of all nations, and all ages, as well as daily experience, bear witnefs: nor is the eafieft labour altogether exempted from pain, even under the moft favourable circumftances. The delivery, however, promifes to be fafe and eafy, when the woman is of proper age, in good health, the child prefenting right, and the pelvis well proportioned: but the force of the natural pains may be interrupted, and of confequence labour be retarded, from,

I. Debility in the mother, arifing from

a Difeafe. This may appear under various forms; as,

1ft, A flooding. Which is very alarming, even along with labour-pains: though lefs fo in this cafe than when at a diftance from full time; becaufe as the labour-pains increafe, the hæmorrhage very generally abates; or if not, breaking the membranes when the aperture of the os uteri is fufficient to admit the hand, feldom fails to produce that effect. The woman in this cafe muft be kept cool. Opiates muft be adminiftered; fhe muft be comforted with the beft affurances of a happy delivery; and the natural pains muft be waited for.

But if the hæmorrhage proceeds from a feparation of the placenta, attached towards the cervix or orificium uteri; in this unhappy cafe, the whole body of the cake may be completely feparated before the aperture of the uterus be fufficient for allowing the head to pafs; and the deluge may be fo fudden and impetuous, that the woman will fink immediately under it. Breaking the membranes, and making the delivery, either by turning the child, or extracting with the forceps or crotchet, according to circumftances, with as much expedition as is confiftent with the mother's fafety, is the only expedient by which the threatening cataftrophe may be prevented.

2dly, Epileptic fits may in like manner retard labour, and endanger the life of the mother. If the child is not thrown off by a few fits, which is often the cafe, the delivery fhould be effected as foon as poffible.

3dly, Crampifh fpafms in the thighs, legs, rarely in the belly, are very troublefome. They depend on the preffure of the head on the nerves as it paffes through the pelvis, and can only be removed by delivery, which, as thefe pains are feldom, if ever, attended with danger, is not to be forced on this account. Breaking the membranes will fometimes remove them.

4thly, Lownefs and faintifhnefs often occur, and frequently prove the caufe of protracted labour.

No general rules with regard to the management of flow labour can be recommended. The mode of treatment, where fo many circumftances may occur, muft be fuited to the condition of the patient, as every particular cafe will in fome meafure require a different management. Much depends on the prudence and judgment of the attentive practitioner. For inftance, when the woman is nervous, low-fpirited, or weakly, from whatever caufe, in general her ftrength muft be fupported: fhe muft not be put on labour too early: fhe muft avoid heat, fatigue, and every means of exhaufting her ftrength or fpirits. When fhe is reftlefs, or the pains trifling and unprofitable, opiates are particularly indicated; they remove fpurious or grinding pains, recruit the fpirits, procure reft, and amufe time. Little elfe for the moft part is to be done. If the uterus once begins to dilate, though the dilatation goes on flowly, it is by much the beft and fafeft practice to do nothing but regulate the management as above. The pains at laft will become ftrong and forcing; and the delivery, even where the patient has been very weakly, will often have a fafe and happy termination. In thefe tedious labours, if the ftrength of the woman be properly fupported, every thing almoft is to be expected from nature. Forcible means fhould be the laft refource.

5thly, Inflammatory diathefis, in young fubjects of ftrong rigid fibres and plethoric habits, muft be obviated by venefection, an open belly, and cooling regimen.

6thly, Colic.—Many women have fevere attacks of this difeafe immediately before the labour-pains come on; the reafon of which is fufficiently obvious: the belly, which formerly rofe fo high, that the fundus of the womb preffed againft the pit of the ftomach, afterwards fubfiding, by the child's finking to the lower part of the womb, and the oval of the head being applied to the oval of the bafin, the contents of the inteftines will be forced lower and lower, and the ftrait gut will be diftended. Hence colic-pains, irritation, and uneafinefs, a frequent defire to go to ftool, or frequent loofe ftools, generally enfue. The beft palliative remedy is to inject emollient glyfters repeatedly till the bowels be entirely emptied. Although fome degree of purging fhould attend the tenefmus, it will be neceffary to wafh the ftrait gut, by the ufe of one or more glyfters. The irritating caufe being in this way removed, an opiate, if no inflammatory heat or fever prevents, may be afterwards given with advantage.

7thly, Naufeating ficknefs, with vomiting.—When thefe fymptoms occur, warm water or chamomile-tea muft be drunk freely. Ficknefs and vomiting happen in fome degree in the eafieft labours. Sometimes they proceed from a difordered ftate of the ftomach; but in general are to be accounted for from the well-

known

Difficult Labour.

known sympathy of the womb with the stomach; and accompany the stretching of the os uteri only.

8thly, Hectic or consumptive habit.—It is a melancholy thing to attend a labouring woman in this state. The pains are weak and trifling; she cannot force much down; and she is feeble, and liable to faint when the pain goes off. But however apparently exhausted, the progress of labour goes on, in most cases, much better than could be well expected. The orifice of the womb gives little resistance to the force of the pains, weak and trifling as they are; the parts are soft and lax, and soon stretch in such a manner, that, if there be no fault in the pelvis, the child readily obtains a passage.

Here little is to be done, but supplying the patient, from time to time, with light nourishment; with cordials that do not heat; and keeping up a free circulation of cool air all around her: for this purpose the curtains should be quite drawn aside, doors and windows widely opened; and she should be placed in a position with her head and breast well raised, that an easy respiration may be promoted. Hectic women under proper management rarely sink immediately after delivery; they generally survive a week, or longer, tho' they seldom outlive the month.

b. Passions of the mind. Any piece of news in which the patient, her family or relations, are interested, should be carefully concealed, as well as every thing that tends in general to affect the passions; as labour may not only be interrupted from this cause, but the most dangerous symptoms, as floodings, convulsions, deliquia, and fatal syncope, may be induced.

c. From mismanagement in time of labour often arises debility; so that the patient's strength is exhausted, the pains at length entirely cease, and the head of the child remains locked in the pelvis, merely from want of force of pain to push it forwards. In all cases where the labour has the appearance of being tedious, the woman's patience must, as much as possible, be supported. During the grinding pains, she must be kept cool and quiet; opiates may be exhibited to pass the time, till the forcing throes ensue, when she will acquire resolution, the parts will dilate kindly, and the labour end happily; whereas, if she considers herself in labour from the earliest appearance of grinding pains, she is frightened at the length of time, and her patience runs out. Slow lingering labours happen chiefly to elderly women having a rigidity in the parts, to nervous subjects, and to such as have been weakly during pregnancy. It is of great consequence, and the advice cannot be too much inculcated, to avoid exhausting the woman's strength too much at first.

2. *Local complaints in the parts, or their neighbourhood.*

a. Narrowness or distortion of the bones of the pelvis. Where there is any material defect in this cavity, a superficial knowledge of the form and structure of the parts will enable us to judge. If, from the figure of the woman's body, there is reason to suspect a faulty pelvis; if the spine is twisted, the legs crooked, the breast-bone raised, or the chest narrow; whether the pelvis be affected or not, she will require a particular management; for the constitution of such women is weak and feeble, and they cannot be much confined to bed on account of their breathing. We can never be absolutely certain of a distortion of the pelvis, (except when the distortion is confined to the inferior aperture), till the uterine orifice is considerably dilated. After this time, if the pains are strong and forcible, and the head of the child makes no advance, a narrow pelvis or large head is to be suspected. The pelvis may be faulty at the brim, bottom, or in the cavity or capacity. The first of these, which most frequently occurs, is the most difficult to be discovered. The second can be readily perceived by the touch: for we can feel the defects in the shape of the os sacrum and coccyx, in the position of the ischia, and in the bending of the pubes; and where the distortion is so general, that the whole cavity of the pelvis is affected, the shape of the woman's body, the slow progress of the labour, and the state of the parts to the touch, will afford sufficient information.

In the first case, we can only know the distortion by the symptoms; for we should not attempt to introduce the hand till the mouth of the womb be dilated: it is afterwards unnecessary; for we know that the pelvis is too small, or the head too large, by its not advancing in proportion to the pains, and by feeling a sharp ridge like a sow's back on the top of the child's head, which is occasioned by the bones rising over each other in consequence of the pressure.

How long nature, in such circumstances, can support the conflict, it is difficult to say. It is sufficient to observe, that when things are properly prepared for the advance of the child, when the first stage of the labour is accomplished, but its progress is then suspended, it is of little consequence to the midwife whether the obstacle is to be referred to the child, or to the mother; and a man-midwife ought to be immediately called in.

If the patient's strength declines; if the head, from being locked in the bones of the pelvis, begins to swell, and the parts of the woman to be affected with tumefaction and inflammation; nature, in this case, seems insufficient, and it will be dangerous longer to delay the proper means of making the delivery; as mother, or child, or both, may fall a victim to our neglect. We must not, however, allow ourselves to be imposed on, either by the impatience of the distressed mother, or by the clamours of the officious impertinents about her. In affording that assistance we are able to give, we are only to be directed by the symptoms of the case: we must remember that the gentlest assistance our hands or instruments in laborious births can afford, is always attended with hazard and risk; that if instruments be applied too early, nature will be thus interrupted in her work, and the most fatal consequences may ensue; and that if assistance be delayed too long, the mother may die undelivered: we ought, however, to be informed, that the former practice of having too early recourse to forcible means, where, in time, nature unassisted might do her business, has proved by far more fatal than the latter. We ought therefore carefully to consider the general history of the patient, and particular circumstances of the case, that we may hit the proper time of making the delivery; which, in these laborious labours, is exceedingly difficult to determine; yet is a matter of the utmost importance, as there is always one, often two or more lives at stake, and the accoucheur is accountable for the consequences of his mis-

Difficult Labour.

misconduct or neglect.

b. The fault may be in the soft parts: as,

1. Dryness and constriction of the vagina. Here all stretching and scooping is to be avoided. The natural moisture is to be supplied by lubricating with pomatum or butter, or by throwing up injections of warm oil; the parts are likewise to be relaxed by the application of warm stupes, or by warm steams directed to them.

2. Thickness and rigidity of the os tincæ. This happens chiefly in women well advanced in life, where the parts open more slowly, and the labour generally proves more tedious. Here also little is to be done but waiting on with patience, comforting the woman as well as possible, and giving an opiate from time to time. The parts may be relaxed with butter or pomatum, by throwing into the vagina injections of warm oil, or by the application of warm stupes to the os externum. Every forcible attempt to open or stretch the uterus, as some authors presume to advise, is apt to induce inflammation and its consequences, and to interrupt the natural pains: it is therefore universally the safest practice to trust in every case to these; tho' tedious, or even violent, the labour for the most part will end more happily, and the woman recover better, than if force had been employed.

3. Polypous tumours, &c.—There is seldom occasion, in case of cicatrices in the vagina, to dilate with the scalpel, to remove polypous tumors by excision, or to cut upon and extract a stone from the urethra in time of labour. But, if circumstances are urgent, such expedients are safe and practicable, and warranted by many precedents.

4. Accumulated fæces in the intestines, ought always to be removed by repeated emollient glysters, on the first appearance of approaching labour.

5. A stone in the urethra, if it cannot be pushed back, must be cut upon and extracted, as already advised.

6. Prolapsus of the uterus may happen even at full time, in a pelvis too wide in all its dimensions; for which, however, nothing can be done, but to support the uterus in time of a pain, that the stretching of the parts may be gradual. Prolapsi of the vagina and rectum must be reduced at the remission of the pain, and a return by gentle pressure must be prevented.

7. Obliquity of the uterus, though a favourite theory of some authors, never happens in such a degree as to influence delivery, except in the case of a pendulous abdomen, or where it depends on the make or distortion of the pelvis. The first of these, tho' it may, by throwing the child's head over the pubes, occasion perhaps some little delay, will seldom prove any material obstacle to the progress of the labour.

II. The protraction of labour may depend on the child, and may arise from,

1st, The bulk or ossification of the head.

There may be either a natural disproportion between the head and body, or the swelling may be occasioned by a putrid emphysema in consequence of the child's death, or the enlargement may proceed from a hydrocephalus. The first of these cases can only be discovered by the slow progress of the labour, when the pains are strong and frequent, the soft parts sufficiently dilated, the woman in good health, and no other apparent cause to account for the remora. The second is discovered from the history of the case, from the common symptoms of a dead child, viz. the puffy emphysematous feel of the presenting part of the head, and from the separation of the cuticle when touched. Lastly, the hydrocephalus is discovered by the head falling down in the pelvis in a large bulky form, by the bones of the head being separated at considerable distances, and by a fluctuation evident to the touch. On the whole, however, it may here be observed, that the most probable or suspicious symptoms of the child's death are often deceitful.

Difficult Labour.

From whatever cause the head is enlarged, if the difficulty arises from this cause, and the force of the pains prove insufficient to push the head forwards, recourse must be had to instruments; and, if the bulk of the head is too large to pass the diameter of the pelvis, the cranium must be opened to diminish its size, and the brain evacuated previous to the extraction.

2dly, The position of the head, which may be squeezed into the pelvis in such a manner as not to admit of that compression necessary for its passing. Such a cause of difficulty, however, more seldom occurs than many authors have imagined. The rash and preposterous application of instruments has, in such cases, proved the bane of thousands. Here though the labour will prove more painful and more tedious, yet nature in general, unassisted, will accomplish her own work with more safety to mother and child, than by the intrusion of officious hands. Turning here is always difficult, often dangerous. The same observation will hold of instruments, which should never be employed but when alarming symptoms occur: the assertion perhaps is not more bold than true, that, in general, the most disadvantageous position in which the head can offer is not sufficient, without some other cause concurring, either to prevent delivery, or to endanger the life of mother or child so much as would be done by the movement of the gentlest hands. Yet, in some cases, where the woman is weak and exhausted, and the pains trifling; if the head of the child be large, the bones firm, and the sutures closely connected; or if there by any degree of narrowness in the pelvis, a difficult labour is to be expected; and the life of both mother and child will depend on a well-timed and skilful application of the surgeon's hands.

The unfavourable position of the head may be referred to two kinds, which include a considerable variety. 1. When the fontanella, or open of the head, presents instead of the vertex. 2. Face-cases.

If no other obstacle appears but the presenting of the fontanella, the labour will, by proper management, generally end well; and much injury may be done by the intrusion of officious hands.

Face-cases are the most difficult and laborious of all kinds of births; and our success in these will chiefly depend upon a prudent management, by carefully supporting the strength of the woman. The varieties of face-cases are known by the direction of the chin; for the face may present, 1. With the chin to the pubes. 2. To the sacrum. 3. To either side. The rule in all these cases is to allow the labour to go on till the face be protruded as far down as possible. It is often as difficult and hazardous to push back the child, and to bring down the crown or vertex, as to turn the child,

Difficult Labour.

child, and deliver it by the feet. Sometimes a ſkilful artiſt may ſucceed in his attempt to alter the poſition, when he has the management of the delivery from the beginning; or, in thoſe caſes where the face is conſiderably advanced in the pelvis, may be able to give aſſiſtance by paſſing a finger or two in the child's mouth, and pulling down the jaw; which leſſens the bulk of the head; or, by preſſing on the chin, to bring it under the arch of the pubes; when the crown getting into the hollow of the os ſacrum, the head will afterwards paſs eaſily.

3dly, The breadth of the ſhoulders, or their tranſverſe deſcent through the pelvis, rarely proves the cauſe of protracted labour. The head is always pretty far advanced before any obſtruction can ariſe from this cauſe; and if the head has already paſſed, in a pain or two the ſhoulders will follow. The ſame reaſoning will alſo apply with regard to the aperture of the uterus itſelf: if the head paſſes freely, in like manner will the ſhoulders; the os uteri rarely, if ever, is capable of contracting upon the neck of the child, and thus preventing the advance of the ſhoulders; and, ſhould this prove the caſe, what can we do but wait with patience? After the delivery of the head, if the woman falls into deliquia, or if, after ſeveral pains, the ſhoulders do not follow, and the child's life be in danger from delay, we ſhould naturally be induced to help it forward in the gentleſt manner we are able, by paſſing a finger on each ſide as far as the axilla, and thus gradually pulling along.

III. Laſtly, From the ſecundines, difficulty and danger ſometimes ariſe.

1ſt, The rigidity of the membranes, and the contrary. From the firſt of theſe cauſes, the birth is ſometimes rendered tedious; but as the ſame effect is much oftener produced by the oppoſite cauſe, and the conſequences of the latter are more troubleſome and dangerous than the former, we ſhould always be exceedingly cautious of having recourſe to the common expedient of breaking the membranes, which ought never to be done, till we be certain the difficulty depends upon this cauſe; and, even then, the head of the child ſhould be well advanced, and the membranes protruded almoſt as far as the os externum. Many inconveniencies ariſe from a premature evacuation of the waters; for thus the parts become dry and rigid, a conſtriction of the os uteri for a time enſues, the pains often either remit or become leſs ſtrong and forcing, though not leſs painful and fatiguing; the dilatation goes on ſo ſlow, and the labour becomes ſo ſevere, that the woman's ſtrength and ſpirits, by the unprofitable labour, are quite overcome and exhauſted; ſo that the head remains confined in the paſſage, merely from want of force of pain to puſh it forwards. The woman in the beginning of labour ſhould therefore be treated with the utmoſt delicacy and gentleneſs. The work of nature is too often ſpoiled by officious hands. She ſhould be ſeldom touched while the membranes are whole, leſt they ſhould be ruptured; and, even when touching is neceſſary, this ſhould only be done when the pains begin to remit, and the tenſe membranous bag to relax.

2dly, Too great a quantity of water may prevent the uterus from contracting, and thus weaken the force of the pains. Though this may, however, occaſion a delay, it will never be attended with more dangerous conſequences; and the ſame advice already given will hold equally good in this caſe, that the membranes ſhould never be broken till the ſoft parts be completely dilated; and we are aſſured that the difficulty or delay proceeds only from this cauſe.

3dly, The funis umbilicalis too long. The funis may be faulty from its too great length, or the contrary: thus the extraordinary length, by forming circumvolutions round the child's neck or body, ſometimes proves the cauſe of protracting the labour. But as this can only happen when the chord is of an uncommon length, there is generally enough left to admit of the exit of the child with ſafety; and it is time enough, in general, after the child is born, to ſlip the nooſe over the ſhoulders or head: there is ſeldom occaſion to divide the chord in the birth, a practice that may be attended with trouble and hazard.

The practice of introducing a finger in ano, to preſs back the coccyx, or to prevent the head, when it advances, from being retracted by circumvolutions of the chord, is now entirely laid aſide; an expedient that can anſwer no end, but that of fretting and bruiſing the parts of the mother, and injuring thoſe of the child.

Funis too ſhort. The funis is ſometimes thick and knotty, or preternaturally thickened by diſeaſe. In this caſe, part of the placenta may be ſeparated as the child advances through the pelvis, and thus a flooding will enſue; or the funis may be actually ruptured and occaſion the death of the child, if the birth does not quickly follow. Such caſes, however, rarely happen.

An inconvenience, at leaſt fully as bad as the former, may ariſe from the too great length of the funis, though it may depend on other circumſtances: *viz.*

4thly, The prolapſus of the funis before the head. In this caſe, the funis, if poſſible, ſhould be puſhed up above the preſenting part; for, if the labour pains are ſlow, and the chord becomes cold, or the pulſation in it begins to grow languid, the circulation will thus be interrupted, and the life of the child deſtroyed. If the head is far advanced in the pelvis, and the child's life in danger, the delivery may be performed with the forceps. But to puſh up the head, and turn the child with a view to preſerve its life, as many authors recommend, is a practice by no means adviſeable: we ſhould ſeldom, in this poſition, be enabled to ſave the child; and turning under ſuch circumſtances can never be done, but at the immediate hazard of loſing the mother.

5thly, Placenta attached towards the cervix or os uteri. This caſe is truly melancholy; for, if the delivery is not ſpeedily accompliſhed, the effuſion from the uterine veſſels will be ſo copious and profuſe, that the unfortunate woman muſt, in a very ſhort time, periſh. On this occaſion the delivery muſt be conducted in the beſt manner the judgment and ſkill of the operator can direct, and with as much expedition as the ſafety of the mother will admit.

Thus, in moſt laborious caſes, provided the woman's ſtrength be ſupported, the management properly regulated, the natural moiſture of the parts when deficient ſupplied, manual aſſiſtance very ſeldom becomes

comes requifite: but as cafes do occur, wherein nature, with all advantages, will fail, and the common methods of relief prove unfuccefsful, recourfe muft be had to more powerful means, while the woman is able to fuport the conflict. In all fuch cafes, the condition of the patient, the ftructure and ftate of the parts, and pofition of the prefenting part of the child, muft very carefully be confidered.

Method of Delivery by Inftruments.

When the powers of nature are infufficient to expel the child, extraordinary affiftance muft be had recourfe to. In laborious births, this is chiefly of two kinds.

I. The head is either extracted as it prefents: or,

II. Its diameter is diminifhed previous to the extraction.

The head may be detained from advancing thro' the pelvis by all the caufes formerly enumerated. Thefe are chiefly included in four general ones,

1. Weaknefs in the mother.
2. Narrownefs of the pelvis.
3. The bulk of the head of the child: or,
4. Its difadvantageous pofition.

Whatever is the caufe, when the natural pains begin to remit, and the parts of the woman begin to fwell; when her ftrength declines, her pulfe grows feeble, and there is no profpect of advantage to be gained by delay; meafures muft be taken for affifting the delivery, otherwife both mother and child may perifh from neglect.

As inftruments are never to be employed but in the moft urgent and neceffitous cafes, and exprefsly with a view to preferve the life of mother or child, or both; thofe of a fafe and harmlefs kind fhould always be made trial of, in preference to thofe of a deftructive nature.

Ufe of the Forceps.

The forceps, is an inftrument intended to lay hold of the head of the child in laborious births, and to extract it as it prefents. This inftrument, as now improved, in the hands of a prudent and cautious operator, may be employed without doing the leaft injury either to mother or child.

In every obftetrical cafe, wherein manual affiftance becomes neceffary, the contents of rectum and bladder fhould, if poffible, be previoufly emptied.

The membranes alfo fhould be broken, the foft parts completely dilated, and the head of the child as far as poffible advanced, previous to the ufe of any inftrument.

The form and ftructure of the parts of the woman, the fituation and progrefs of the prefenting part of the child, muft at this time be carefully confidered. The concavity of the facrum, for inftance, will determine the progrefs of the labour. The touch of the vertex, fontanella, lambdoidal, or fagittal future, the fore or back part of the ear, or fome part of the face, will afcertain the true prefentation of the child.

The lower the head is advanced in the pelvis, our fuccefs with the forceps is the more to be depended on. For when it has proceeded as far as the inferior aperture, by means of this inftrument, it may be readily relieved: but when the head of the child is confined at the brim, both the application of inftruments, and the extraction by this means, are exceedingly difficult and dangerous.

The head may be fo firmly wedged in the pelvis, that the forceps can neither be introduced nor fixed without bruifing or tearing the parts of the woman: wherever, therefore, infurmountable difficulties occur, either in applying or extracting with the forceps, the life of the mother muft not be endangered by fruitlefs efforts; the head of the child muft immediately be opened, and the delivery accomplifhed without further delay.

In laborious births, the proper forceps cafes may be reduced to two, which include, however, a confiderable variety. Thefe are,

I. The fmooth part of the cranium,

II. The face, prefenting.

The head may prefent,

1ft, Naturally, when low advanced in the pelvis, with the vertex to the pubes, and the forehead or face in the hollow of the facrum. Or,

2dly, When higher in the pelvis, the vertex may prefent with the face laterally, the ears to the pubes and facrum. Or,

3dly, The fontanel may prefent with the face to the pubes, and vertex to the facrum; or with the vertex to the pubes, and face to the facrum.

1. When the head prefents naturally. The woman in this cafe muft be placed on her back a-crofs the bed, properly fupported; the accoucheur, feated before or in a kneeling pofture, after gradually lubricating the perinæum and vagina, muft proceed gently to ftretch the parts, by paffing the hand in a conical manner through the os externum vaginæ, pufhing it forwards by the fide of the child's head, till it advances as far as an ear, if poffible; along this hand he is to guide a blade of the forceps, which with the other hand he introduces in the direction of the line of the pelvis, holding the handle backwards towards the perinæum, and keeping the clam clofely applied to the child's head. This muft be infinuated very gradually by a kind of wriggling motion, pufhing it on till the blade is applied along the fide of the head over the ear: he muft then gently withdraw the firft hand from the pelvis, with which he muft fecure the handle of the blade of the forceps already introduced, till the other blade be paffed along the other hand, in the fame flow cautious manner: the handles muft then be brought oppofite to each other, carefully locked, and, left they flip in extracting, properly fecured by tying a fillet or garter round them; but this muft be loofed during the remiffion of pulling, to prevent the brain from being injured by the preffure. The extraction muft be made by very flow and gentle degrees, and with one hand only, while the other is employed to guard the perinæum: the motion in pulling, fhould be from blade to blade; the accoucheur muft reft from time to time, and, if the pains are not gone, fhould always in his efforts only co-operate with thofe of nature. The child and mother will fuffer lefs by going on in this gradual manner than by precipitating the birth, which can never be done but at the rifk of deftroying both. If, in making the extraction, the forceps flip, they muft be cautioufly withdrawn blade by blade, and again introduced in the fame manner.

manner. When the tumour of the perinæum forms, and the vertex begins to protrude at the os externum, the accoucheur muft rife from his feat, raife the handle gently upwards, and, by a half-round turn, bring the hind-head from under the fymphyfis or arch of the pubes; remembering carefully to guard the perinæum from laceration and its confequences, to which it is now fo greatly expofed.

In attempting the introduction of either blade, if it meets with any interruption, it muft be as often withdrawn, and pufhed up again in a proper direction, till every difficulty be furmounted; and if, from the fmallnefs or conftriction of the parts, the introduction of the fecond blade fhall feem impracticable, the former one muft be withdrawn, and the latter muft be firft introduced.

2. The vertex may prefent with the face laterally in the pelvis. It is always difficult to apply the forceps till the bulky part of the head has paffed the brim; and here it is not only difficult to the operator, but extremely hazardous to the patient, to introduce this inftrument till the ear of the child has got under the pubes. When the ears thus prefent to pubes and facrum, the woman fhould be placed on her fide or knees; the moft difficult blade of the forceps fhould be firft applied, which is the one under the pubes; when both are paffed, and properly fecured, the patient fhould again be turned to her back, before the operator attempts to extract, and the head in this cafe (as the quarter-turn can feldom be made with fafety) fhould be delivered in the manner wherein it prefents; becaufe, when confined any time in the paffage, its figure is altered by the overlapping of the bones, in fuch a manner that it paffes along, in general, with far lefs difficulty than to attempt to pufh up and make the mechanical turns; a work often altogether impracticable, by which contufion or laceration of the parts of the woman, and the moft fatal confequences, may be occafioned. The handles of the forceps muft here particularly be well preffed backwards towards the perinæum, that the clams may humour the curvature and intrufion of the facrum, and accommodate themfelves to the form of the child's head.

This is a cafe wherein the forceps often fail; if fo, they will fometimes fucceed by varying the mode of application, and fixing them over the forehead and occiput; if this method fails alfo, the fize of the head muft be diminifhed, and the extraction made with the blunt hook or crotchet.

3. The fontanella may prefent with the face to the pubes. This is the moft common of the fontanel cafes; though fometimes the face is lateral in the pelvis, fometimes diagonal, and fometimes it is turned to the facrum. The true pofition is afcertained by the direction of the fontanel, and that of the ear. Here, as in other laborious births, nature fhould be intrufted as long as we dare. The head does not always defcend mechanically through the capacity of the pelvis, as fome practitioners have fuppofed; nor will the deviation from its ordinary mode of defcent always of itfelf influence the delivery, at leaft very rarely in fuch a manner as to require extraordinary affiftance. In whatever manner the head prefents, when it is fituated high in the pelvis, the delivery cannot be effected without difficulty and hazard: in fuch circumftances, the application of the forceps will frequently baffle the utmoft efforts of the accoucheur, and the confequences of fuch attempts may prove fatal to mother and child.

When extreme weaknefs in the mother, floodings, convulfions, or other urgent fymptoms, render it neceffary to force the delivery, whether the face be to pubes or facrum, the forceps may be applied along the ears, in the fame manner as directed in a natural labour; and the head, for the reafons already given, fhould be brought along in the manner it prefents; the extraction fhould be made with great deliberation, that the parts of the woman may have time to ftretch; the perinæum muft be carefully fupported; the forceps muft be gently releafed, when the head is delivered; and the reft of the delivery conducted as in a natural labour.

In this cafe, when fituated high in the pelvis, the fontanel prefenting, and the face either to pubes or facrum, the long axis of the head interfects the fhort diameter of the pelvis, and very often, though the forceps be applied, and a firm hold of the head be obtained, it is not poffible to bring it along with all the force we dare exert. If this method therefore fails, the common forceps fhould be cautioufly withdrawn, and the long ones applied, if poffible, over the fore-head and occiput, when, the fize of the head, by the compreffion it fuffers in paffing along, being perhaps fomewhat diminifhed, the extraction will be fuccefsfully performed. This method alfo failing, previous to the operation of embryotomy, Dr Leak's forceps, with the third blade, may be had recourfe to. But of this little can be faid with confidence, till the inftrument has been more generally employed. From the difficulty of fucceeding in the application of the common forceps, it may, *à priori*, be concluded, that the introduction of a third blade, even in the hands of an expert practitioner, however ingenious the invention, is an expedient not eafily to be put in practice. Neither is Roonhuyfe's lever, or a blade of the forceps paffed up between the pubes and fore-head or hind-head of the child, in order to procure the delivery of the head, to be recommended in fuch cafes: however fome have boafted of its fuccefs, it is an inftrument that may do much mifchief; and few practitioners can ufe it with fafety.

II. *Face prefenting.*—Of laborious births, face-cafes, as we have already obferved, are the moft difficult and the moft dangerous. From its length, roughnefs, and inequality, the face muft occafion greater pain; and from the folidity of the bones, it muft yield to the propelling force with much more difficulty, than the fmooth moveable body of the cranium. Face-cafes are the moft troublefome that occur in the practice of midwifery, and in which the moft expert practitioners may be foiled in their attempts; and thefe attempts, if too early exerted, will be followed in many inftances with fatal confequences. Whatever way the face prefents, it fhould be allowed to advance as low as poffible in the pelvis; by which means, the accefs will be more eafy, and the pofition, for the application of inftruments, more favourable. In this aukward fituation, much mifchief may be done by rafhnefs; whereas, if time be allowed, and the

the patient be properly ſupported, the delivery will generally end well.

The face may preſent with,

1. The chin to the pubes.
2. to the ſacrum.
3. laterally.

From the difficulty of applying inſtruments in theſe caſes, ſome authors recommend, as an univerſal practice, to turn the child, and deliver by the feet. But this in general is a dangerous practice, and ſeldom or never adviſeable, except when the membranes remain entire, till the os uteri is completely dilated, and the head continues looſe above the brim of the pelvis: and even then the propriety of the practice is doubtful; becauſe, if the head is ſmall, or the pelvis be well proportioned, the face will deſcend without much difficulty; and if otherwiſe, beſides the riſk in attempting to turn, the child may be loſt from the preſſure of the chord, or the difficulty of extracting the head after the delivery of the body.

When aſſiſtance becomes neceſſary, the beſt practice in face-caſes is the following: Having placed the patient in a convenient poſture, let the accoucheur in the gentleſt manner paſs his hand within the pelvis; and, during the remiſſion of pain only, endeavour to raiſe the head of the child, ſo that he may puſh up the ſhoulders entirely above the brim of the pelvis, and thus change the poſition of the face: by this means, if ſucceſsful, he will be able to reduce the firſt of theſe caſes, ſo as to make the fontanel preſent with the face to the pubes; he will reduce the ſecond ſo as to bring down the vertex, with the face to the ſacrum; and the third, he will reduce to a vertex caſe, with the face lateral. The delivery may be afterwards truſted to nature; which failing, there is eaſier acceſs for the application of inſtruments to make the extraction, as already directed. The ſucceſs, however, of the accoucheur, in altering the poſition of the head, by puſhing it up, will entirely depend on the time he is called; for, ſhould the head be firmly wedged in the pelvis, no force he dares employ will be ſufficient to alter the poſture.

If therefore every attempt to reduce the face, and make the vertex or fontanel preſent, ſhall prove unſucceſsful, and ſymptoms are urgent, the forceps muſt be applied over the ears of the child, and the extraction performed in the beſt manner the operator is able. And, failing theſe, immediate recourſe muſt be had to the crotchet.

1. In the firſt caſe, previous to the introduction of the forceps, the chin, if poſſible, ſhould be advanced below the pubes.

2. In the ſecond, the chin ſhould be advanced to the inferior part of the ſacrum. And,

3. In the third, the chin ſhould be as low as the under-part of the tuber iſchii: and although in general the head is to be extracted as it preſents, if the operator meets with conſiderable reſiſtance, it muſt be gently puſhed up and turned with the chin, either laterally, below the pubes, or into the hollow of the ſacrum, according to the particular circumſtances of the caſe, and in a direction beſt accommodated to the form and diameter of the pelvis.

Uſe of the Sciſſars, Crotchet, and Blunt Hook.

When the head of the child, from its ſize, unfavourable poſition, or from a fault in the pelvis, cannot be protruded by the force of natural pains, nor extracted by the forceps, recourſe muſt be had to more violent means, and the life of the child muſt be deſtroyed in order to preſerve that of the mother. This operation was by the ancients called *embryotomy*.

When the head, from its extraordinary bulk, is detained at the brim of the pelvis; on evacuating the contents, the bones of the cranium immediately collapſe, and the head is afterwards propelled by the force of the labour-pains; failing which only, the extraction muſt be made with the blunt-hook or crotchet.

The unfavourable poſition of the head is of itſelf a cauſe inſufficient to juſtify the uſe of deſtructive inſtruments, which ought never to be employed but in extreme caſes, after every milder method has failed. From the difficult acceſs to the cranium in order to make a perforation and evacuate the brain, a face-caſe makes a very troubleſome and dangerous crotchet one. Very luckily, in narrow pelviſes, the face rarely preſents, and very ſeldom advances far in that direction; at other times, the poſition may be ſo altered, that the crown, the back of the ear, or ſome other part of the cranium, can be reached; otherwiſe the crotchet muſt be fixed in the mouth, orbit of the eye, &c. and the head brought along in that direction, till the ſciſſars can be employed to open the ſkull.

But the grand cauſe of difficult labour is, the narrowneſs or diſtortion of the pelvis. For when, at the brim, inſtead of four inches and a quarter from pubes to ſacrum, it meaſures no more than one and a half, one and three-fourths, two, or two inches and one-fourth, the uſe of inſtruments becomes abſolutely requiſite, and very frequently in thoſe of two inches and one-half, and three inches; or when the diameters through the capacity, or at the inferior aperture, are retrenched in the ſame proportion, difficulties will in like manner ariſe, and the delivery, except the labour be premature, or the child of a ſmall ſize, cannot be accompliſhed without the aſſiſtance of deſtructive inſtruments.

We judge of the form and ſize of the pelvis by the external make and form of the woman; by the progreſs of the labour; by the touch. When the fault is at the inferior aperture, the touch is pretty deciſive; *e. g.* if a bump is felt in the os ſacrum inſtead of a concavity; if the coccyx is angulated; if the ſymphyſis pubis projects inwards in form of an acute angle; if the tuberoſities of the iſchia approach too near each other; or the one tuber be higher than the other; ſuch appearances are infallible marks of a diſtorted pelvis. But when the narrowneſs is confined to the brim, this is only to be diſcovered by the introduction of the hand within the pelvis: the projection of the lumbar vertebræ over the ſacrum, is a ſpecies of narrow pelvis, that moſt frequently occurs in practice. In this caſe, the child's head, by the preſſure it ſuſtains between pubes and ſacrum, is moulded into a conical or ſugar-loaf form, the parietal bones are ſqueezed together, over-lapping one another, and will be felt to the touch when the labour is advanced, like an acute ridge, ſomething in the form of a ſow's back.

In-

Inftead of the complicated inftrumental apparatus invented by the ancients, fuch as fcrews, hooks, &c. for fixing in, laying hold of, and extracting the head, as it prefented, an operation in many cafes difficult and dangerous, when the head was bulky or the pelvis narrow, as the woman frequently loft her life in the attempt; the practice of diminifhing the fize of the head, by opening the cranium and evacuating the brain, previous to the extraction, is a modern improvement, and an important one: the inftruments for this purpofe confift fimply of a pair of long fciffars, a fharp curved crotchet, and a blunt hook: thefe are preferable to every other, whether of ancient or modern conftruction.

When the accoucheur is under the difagreeable neceffity of deftroying the child to preferve the mother, fhe muft be laid in the fame pofition as already advifed for the application of the forceps; and the fame rules, recommended for the one operation, will in general apply to the other.

Thus, in the narroweft pelvis that occurs, previous to opening the cranium, the foft parts fhould be completely dilated, and the head of the child fhould be fixed fteadily in the pelvis and advanced as far as poffible; for while the head is high and loofe above the brim, the application of inftruments is very difficult as well as hazardous.

The long fciffars muft be cautioufly introduced into the vagina, directed by the hand of the accoucheur; the points muft be carefully guarded, till they prefs againft the cranium of the child, which they muft be made to perforate with a boring kind of motion, till they are pufhed on as far as the refts; they muft then be opened fully, carefully re-fhut, half turned, and again widely opened, fo as to make a crucial hole in the fkull. They muft afterwards be pufhed beyond the refts, opened diagonally again and again, in fuch a manner as to tear and break to pieces the bones of the cranium; they muft then be fhut with great care, and withdrawn along the hand, in the fame cautious manner as they were introduced, left they fhould bruife or tear the uterus, vagina, or any other part of the woman. After a free opening in the cranium has thus been made, the brain muft be fcooped out with the fingers or blunt-hook, and the loofe fharp pieces of bone muft be carefully feparated and removed, that no part of the woman be tore while the head is extracting. The teguments of the fcalp fhould now be brought over the ragged bones of the cranium, and the woman fhould be allowed to reft an hour or two, according to her ftrength and other circumftances: the bones of the cranium will now collapfe; and if the woman has as much ftrength remaining, or the pelvis be not much diftorted, the head being thus diminifhed, will be protruded by the force of natural pains; otherwife it muft be extracted, either by means of two fingers introduced within the cavity of the cranium, by the blunt-hook introduced in the fame manner, guarding the point on the oppofite fide while making the extraction; or, failing thefe, by the crotchet, which, though dangerous in the hands of an ignorant rafh operator, may be employed by the prudent practitioner with as much fafety as the blunteft inftrument.

The method of introduction is the fame with a blade of the forceps. The chief thing to be attended to is, to guard the point till it be applied againft the head, and firmly fixed in its hold, which fhould always be fomewhere on the outfide of the cranium; provided a firm hold is obtained, no matter where, behind the ears, about the os petrofum, orbits of the eyes, maxilla inferior, &c. according to the prefentation of the head. The woman being properly fecured, and the handle of the inftrument covered with a cloth, the operator muft then pull, at firft gently, afterwards more forcibly, refting from time to time, and endeavouring to make the extraction in the beft manner the circumftances of the cafe will admit of. If the pelvis be much diftorted, fo that, by means of the utmoft ftrength the accoucheur can exert, little purchafe is made, he may apply to the oppofite fide a blade of the forceps, which are now fo conftructed as to lock with the crotchet; let him then bring the handles together, fecure properly, and thus endeavour to make the extraction. Should this expedient alfo fail, the blade of the forceps muft be withdrawn, the other blade of the crotchet muft be applied, the handles brought together and fecured, and the extraction made, moving from blade to blade.

Should the head prefent in fuch a manner, that, in attempting to extract it, the crotchet divides the vertebræ of the neck, and the head is thus fevered from the body, an accident that can only happen in the hands of an ignorant blundering practitioner; the head muft be pufhed up above the brim of the pelvis, the crotchet or blunt hook muft be fixed under the axilla, the arms muft be brought down, and the body extracted, by fixing the crotchet below the fcapula on the fternum, or among the ribs; the head muft afterwards be extracted in the manner already advifed: or fhould the head in extracting be pulled from the body, as may happen when the child has been long dead, or when it is putrid, the delivery of the body muft be effected by means of the crotchet as now directed; a method preferable to that of turning, as fome advife.

If the head, inftead of yielding to the force of pulling, be at laft cut and broken in pieces, the operator muft endeavour to bring down an arm of the child, to fix the crotchet about the jaw or neck, pull at both holds, and thus attempt to make the extraction; this alfo failing, he muft bring down the other arm, fix the crotchet in the thorax, and, in a word, muft tear the child in pieces, that the delivery may be accomplifhed by any means.

In face-cafes, where it is impracticable to alter the pofition, and when the pelvis is much diftorted, the double crotchet is fometimes requifite; the handles muft be well fecured, kept well backwards towards the perinæum, and the motion always from blade to blade. It very feldom, however, happens, that there is occafion for the double crotchet: by this means the head is flattened in pulling; whereas if one blade only can be employed, the head is lengthened, and, in pulling, can better accommodate itfelf to the fhape of the pelvis as it paffes along.

Chap. XII. *Preternatural Labour.*

In whatever manner the child prefents when the body is delivered before the head, the birth is accounted preternatural.

Preternatural labours may be referred to one of the four following claffes.

I. When

I. When one or both feet, knees, or the breech, present.

II. When the child lies acrofs in a rounded or oval form, with the arm, fhoulder, fide, back, or belly, prefenting.

III. When one or both of the upper extremities prefent, the child lying in the form of a fheath, the feet towards the fundus uteri, the waters evacuated, and the uterus ftrongly contracted round the body of the child.

IV. Laftly, Premature or flooding cafes, or others in which it may be neceffary to force the delivery, either previous to the rupture of the membranes, or quickly after it.

The caufes of crofs labours moft commonly affigned by authors, are, The obliquity of the uterus, circumvolutions of the funis umbilicalis round the child's body; the fhortnefs of the funis, or attachment of the placenta towards the fundus uteri; fhocks affecting the mother when pregnant, &c. The pofition of the fœtus may alfo be influenced by its own motion and ftirrings, by the particular form and bulk of its body, by the manner of ftretching of the uterus, by the quantity of liquor amnii, and by many other circumftances.

The fymptoms that indicate an unfavourable pofition of the child, before it can be difcovered by the touch, are very uncertain and fallacious: a crofs birth may, however, be fufpected,

1ft, If the pains be more flack and trifling than ordinary.

2dly, If the membranes be protruded in a long form like a gut, or the finger of a glove.

3dly, If no part of the child can be difcovered when the uterine orifice is confiderably opened.

4thly, If the prefenting part through the membranes be fmaller, feels lighter, and gives lefs refiftance than the bulky ponderous head.

5thly, Laftly, after the rupture of the membranes, if the meconium of the child be paffed along with the waters, it is a fign that the breech prefents, or that the child is dead.

Preternatural labours are difficult or hazardous, according to,

1. The form of the pelvis, and general health and conftitution of the woman.

2. The bulk of the child, and its manner of prefenting.

3. The time the waters have been evacuated, and the uterus contracted round the body of the child.

4. When complicated with plurality of children; the prolapfus of the funis umbilicalis; the limbs of the child intangled with the chord; profufe and violent floodings from the attachment of the placenta towards the cervix uteri, &c.

Turning is often laborious, and always dangerous in proportion to the force ufed in fearching for and bringing down the feet; though, in general, the difficulty and hazard are not fo great, as in many cafes ftrictly called *laborious*, when the head prefents; the treatment of preternatural labours being better known, and for the moft part eafier put in practice.

Each clafs of the general divifion of crofs labours includes a variety of different cafes. By confidering a few of every clafs, a general idea of the whole will be formed.

CLASS I.

Case 1. The fimpleft and eafieft cafe is the Agrippan pofture, when the child prefents with the feet.

The foot is to be diftinguifhed from the hand, firft, by the weight and refiftance it gives to the touch; fecondly, by the fhortnefs of the toes; thirdly, by the projecting heel.

When the feet prefent in the paffage, the labour fhould be allowed to go on as if natural. If the child be of an ordinary fize, the woman in health, the parts well proportioned, in the way of affiftance nothing further feems neceffary but the application of a warm cloth round the body of the child, which muft be properly fupported till it advances as far as the pains are able to force it. If the fize be ordinary, or rather fmall, it will fometimes make the mechanical turns, and be entirely pufhed along by the force of the natural pains; but it generally ftops at the fhoulders, after the breech protrudes without the os externum, where the refiftance is fo great, that the accoucheur's affiftance becomes requifite.

In this cafe, the patient muft be placed on her back, properly fupported; the hand of the accoucheur muft be cautioufly introduced; the parts of the woman muft be gently ftretched; the feet of the child muft be laid hold of, and brought as low in the vagina as poffible; a foft warm cloth muft be wrapped round them, and the extraction muft be performed in a flow, cautious manner, making large motions in a circular or lateral direction, refting from time to time, if the pains are gone; and if not, always waiting for the natural efforts. When advanced as far as the breech, the body, if not already in a proper direction, muft be pufhed up, and gently turned with the face towards the mother's back; and to make fure that the face turns with the body, or to prevent the chin, vertex, or fhoulders from catching on the pubes, or angle of the facrum, an extraordinary quarter-turn more muft be made: this muft be reverfed previous to the extraction; and the difficulty arifing from the obftruction of the fhoulders muft be removed in the following manner. While the breaft and legs of the child are fupported over the palm and forearm of the one hand of the accoucheur, which he draws towards one fide, he muft introduce two fingers of the other hand at the oppofite fide into the vagina, over the back-part of the fhoulder, as far as the elbow, ande ndeavour in the moft gentle manner to bring down the arm, always remembering, in his movements, to humour the natural motions of the joint: he muft then fhift hands, when the other arm is to be relieved in the fame manner: both arms being brought down, the woman muft now reft a little, when a pain or two generally follows, and the head is alfo forced along. But fhould the woman be much exhaufted, and if the head does not quickly advance, the child may be loft from delay. The extraction of the head in preternatural labours, is often the moft difficult and the moft dangerous part of the delivery; the caufe of refiftance, when it does not advance, is chiefly owing to its confinement between the angle of the facrum and pubes, when the bulky part of the head is detained at the brim; whether the refiftance be here or towards the inferior aperture of the pelvis, if the head does not advance in a pain or two, the extraction muft be made in this manner:

Preternatural Labour.

ner: While the right hand of the accoucheur supports the body of the child below, with two fingers preffing on either fhoulder, the left hand and fingers muft in the fame manner be placed over the back of the neck, and pulling gently in the direction from pubes to facrum, he muft thus endeavour to bring it along: but, fhould the pelvis be narrow, or the child's head of a large fize, or the face be laterally or anteriorly placed in the pelvis, or, what rarely happens, the os uteri contracted round the neck of the child; in either of thefe cafes, the accoucheur will fometimes meet with the utmoft difficulty. When the above method therefore fails, he muft introduce two fingers of the right-hand into the child's mouth, while thofe of the left-hand are expanded over the fhoulders, as already directed; and in this way he muft endeavour to relieve it, pulling from pubes to facrum, alternately raifing and depreffing the head till it advances low down, fo that the face defcends from the hollow of the facrum, when the accoucheur muft rife from his feat, and bring the hind-head from under the pubes with a half-round turn, imitating that of a natural labour.

If the pofition be unfavourable, the face, if poffible, fhould be turned to the facrum, by pufhing up the head, or by pufhing back the chin: If the contraction of the uterus is the caufe of refiftance, which rarely occurs, it muft be gently ftretched with the fingers. Or if the difficulty arifes from circumvolutions of the chord round the legs, thighs, body, or neck of the child, thefe muft be difengaged in the eafieft manner poffible; it is rarely neceffary to divide the funis on this account.

Should every method fail in bringing down the head, the delivery muft be effected by means of the forceps cautioufly paffed over the ears, with the handles under the child's body, in a direction downwards towards the perinæum. If the pelvis be very narrow, or the head of a large fize, it muft be opened by pufhing the fciffars through the occipital bone, fo that the contents of the cranium may be evacuated, and the extraction made by means of the forceps, blunt-hook, or crotchet. But if the head, by the efforts to extract it, be actually fevered from the body, and left behind in the uterus, an accident which fometimes occurs, it muft be delivered by inclofing it in the forceps, while fecured from rolling by preffing externally on the abdomen. If the forceps cannot be applied, the cranium muft be opened, the texture of the brain deftroyed, and the extraction performed by the fingers of the accoucheur, by the blunt-hook, or by the crotchet. If the under-jaw remains, the head may be effectually fecured till locked in the forceps, or till its bulk be diminifhed, by introducing a finger into the mouth, thrufting it through the jaw under the chin, drawing it down, and paffing a ligature through the perforation.

In cafes where the child has been long dead, fhould the belly or thorax be diftended with air or water, and prove the caufe of obftruction, the contents muft be evacuated by opening with the fciffars, or tearing with the crotchet; and in general, where difficulties occur, the delivery muft be accomplifhed in that manner the circumftances of the cafe will beft admit of.

Cafe 2. When inftead of two, one foot only falls into the vagina, the other is fometimes detained by catching on the pubes, and, if eafily come at, fhould be brought down, always remembering to humour the natural motion of the joint; but, fhould the leg be folded up along the child's body, the attempt is fometimes both difficult and dangerous, and ought not to be perfifted in, as the breech will either be forced down by the affiftance of natural pains, or by gently pulling by one leg only.

Preternatural Labour.

Cafe 3. When one or both knees prefent, the delivery muft be conducted in the fame manner with that of the feet.

Cafe 4. When the feet offer along with the breech, this laft muft be pufhed up, while the former are fecured and brought down, till it be reduced to a footling cafe, and otherwife managed as above.

Cafe 5. The breech may prefent with the fore-parts to the mother,

1ft, Anteriorly.

2dly, Laterally. Or,

3dly, Pofteriorly.

Sometimes the breech may be difcovered, previous to the rupture of the membranes; but afterwards with more certainty, by the meconium of the child paffed with the waters, and by the touch.

In whatever manner the breech prefents, the delivery fhould be fubmitted to nature, till the child be advanced as far as the thorax, when the feet are to be brought down and laid hold of, the child, if neceffary, pufhed up, the mechanical turns effected, and the delivery otherwife conducted as in a footling cafe. There is much lefs hazard in general, agreeable to an old obfervation of Mauriceau, in allowing the child to advance double, than in precipitating the extraction by pufhing up to bring down the feet before the parts have been fufficiently dilated; a practice difficult and troublefome to the operator; painful, and fometimes dangerous, to the mother; and by which the child is expofed to the rifk of ftrangulation, from the retention of the head after the delivery of the body. If the child be fmall, though doubled, it will eafily pafs in that direction; if large, though the labour be painful, the natural throes are lefs violent and lefs dangerous than the prepofterous help of the accoucheur: If the child thus advances naturally, it will be lefs expofed to fuffer; if it does not advance, the parts of the mother will be prepared for the accoucheur to pafs his hand into the pelvis, to raife up the breech, to bring down one or both feet, and deliver as above.

Weaknefs in the mother, floodings and convulfions, a very large child, or narrow pelvis, the prolapfus of the funis, or its compreffion between the thighs of the child, or between the child and pelvis, by which its life is endangered, if the chord cannot be reduced above the prefenting part, are the only exceptions to the general rule of treating the breech as a natural labour.

The practice of helping forward the breech, by paffing the blunt-hook under the ham, is now entirely laid afide: this can never be done with fafety, till the breech be fo low advanced, that the hand of the accoucheur can be ufed, which may be employed with more advantage as well as fafety.

Preternatural Labour.

CLASS II.

In the former claſs of preternatural labours, it is adviſeable to truſt to nature in many caſes, as the birth will often be accompliſhed without manual aſ-ſiſtance: but when the child lies a-croſs, no force of pain can make it advance in that poſition; and, without proper aſſiſtance, both the mother and child would periſh.

If the accoucheur has the management of the labour from the beginning, the child may be turned, in the worſt poſition, without difficulty; but when the waters have been for ſome time evacuated, and the uterus ſtrongly contracted, turning is laborious to the operator, painful and dangerous to the mother. In ſuch caſes, the ancients endeavoured to make the head preſent; but, from its bulk, they often failed, and the attempt was often attended with fatal conſequences. The method of delivering by the feet is the moſt important modern improvement in the practice of midwifery; an improvement to which many thouſands owe their lives.

When the child lies in a tranſverſe poſition, the accoucheur muſt inſinuate his hand through the vagina into the uterus in the gentleſt manner, ſearch for the feet, bring them down with the utmoſt caution, and finiſh the delivery as in footling-caſes. To effect this, the following rules ſhould be obſerved.

1. The patient muſt be placed in a convenient poſture, that the operator may be able to employ either hand, as the various circumſtances of the caſe may require.

2. Though the beſt poſture, in general, is laying the woman on her back, it will be ſometimes neceſſary to turn her to her ſide; and, in theſe caſes, where the abdomen is pendulous, where it is difficult to reach the feet, or where they lie towards the fundus uteri, the woman ſhould be placed on her knees and elbows.

3. An exact knowledge of the true poſition of the child, and of the ſtructure and ſtate of the parts, ſhould be acquired, before attempting to make the delivery.

4. The orifice of the uterus ſhould be enlarged, ſo as freely to admit the hand; and the ſtrong pains ſhould be abated, before any attempt be made to deliver.

5. Should the waters be drained off, the parts dry and rigid, and the uterus contracted round the child, warm oil muſt be injected into the uterus, otherwiſe its rupture may be endangered.

6. In paſſing the hand into the uterus, this muſt be done in the gentleſt manner; the parts muſt be well lubricated with butter or pomatum; the line of the pelvis muſt be attended to; the efforts of the operator muſt be ſlow and gradual; and thus the utmoſt rigidity in the ſoft parts will, in time, be overcome.

7. The hand muſt be introduced only during the remiſſion of pain; when pain comes, the accoucheur muſt always reſt; otherwiſe he may puſh his hand, or the fœtus, through the body of the uterus.

8. In puſhing up, to come at the feet, this muſt never be done with the points of the fingers, nor with the hand clenched, but with the palm of the hand, or the broad expanded fingers, and always during the remiſſion of pain, and the latter ſhould alſo be obſerved in bringing down the legs; but, in making the extraction of the body, the efforts of the operator ſhould always co-operate with thoſe of nature.

9. The hand ſhould, if poſſible, be introduced along the anterior parts of the child; and both feet, if eaſily come at, ſhould be laid hold of.

10. In turning, the accoucheur ſhould never conſider the child as dead, nor allow himſelf to be deceived by ſymptoms doubtful and fallacious; the child is ſometimes born alive when he would leaſt of all expect it; therefore, in puſhing up, bringing down the legs, or extracting the body, it ſhould be handled with the greateſt delicacy.

11. When the hand is within the pelvis, it ſhould not always be moved in the line of the umbilicus, but rather towards one ſide of the ſpine, by which more room is gained, and the prominent angle of the ſacrum avoided.

12. The hand ſhould be paſſed as far as the middle of the child's body, before attempting to ſearch for the feet; or before attempting to break the membranes, ſhould theſe remain entire, till the aperture of the uterus will admit of the hand.

13. If the hand cannot paſs the preſenting part of the child to come at the feet, inſtead of violently puſhing back, the part ſhould be as it were lifted up in the pelvis, and moved towards a ſide; by which means difficulties may be ſurmounted, and great danger often prevented.

By attending carefully to the above rules, laceration of the uterus, floodings, convulſions, inflammations, and their conſequences, may be prevented; accidents that frequently happen in the hands of ignorant raſh operators.

Caſe 1.—*The arm preſenting.* The right is to be diſtinguiſhed from the left by laying hold of the child's hand, in the ſame manner as in ſhaking hands; and thus the general poſition of the child may be judged of.

When the accoucheur is called in early, the reduction is generally practicable: but if the arm protrudes through the vagina, and the ſhoulder be locked in the pelvis, it is needleſs, by fruitleſs efforts, for the accoucheur to fatigue himſelf, and diſtreſs his patient, to attain a point by which he will gain no very material advantage; as the hand can be paſſed into the uterus by the ſide of the child's arm, which will, of courſe, return into the uterus when the feet are brought down into the vagina.

In order to make the delivery, the hand of the accoucheur, well lubricated, muſt be conducted into the uterus by the ſide of the child's arm, along the thorax, at the oppoſite ſide of the pelvis where the head lies; if any difficulty occurs in coming at the feet, this hand muſt be withdrawn, and the other introduced in its ſtead; and if ſtill the hand cannot eaſily paſs beyond the child's head or ſhoulder, the preſenting part muſt be raiſed up, or gently puſhed to a ſide, that one or both feet may be laid hold of, which muſt be brought as low as poſſible, puſhing up the head and ſhoulders, and pulling down the feet alternately, till they advance into the vagina, or ſo low that a nooſe or fillet can be applied; and thus by pulling with

Preternatural Labour.

with the one hand by means of the noofe, and pufhing with the other, the feet can be brought down and the delivery finifhed, however difficult.

The method of forming the noofe is by paffing the two ends of a tape or garter through the middle when doubled; or fhould the garter be thick, by making an eye on one extremity, and paffing the other end through it: this, mounted on the points of the fingers and thumb of the accoucheur's hand, muft be conveyed into the uterus, paffed over one or both feet and ankles, and fecured by pulling at the other extremity.

Cafe 2.—*The fide.* This is difcovered by feeling the ribs.

Cafe 3.—*The back.* This is difcovered by feeling the fpine.

Cafe 4.—*The belly.* This is known by the funis.

Thefe cafes occur rarely, as the uterus muft with difficulty admit of fuch pofitions. When any of thefe parts do prefent, the child feldom paffes any part of the brim of the pelvis, and is, in general, more eafily turned than in feveral poftures in which it may offer. The belly, from the difficulty with which the legs can be bended backwards, except the child be flaccid, putrid, or before the time, will very feldom directly prefent; if fo, it will be early and readily difcovered by the prolapfus of the funis, and there will be no great difficulty to come at the feet, and deliver. The rule in all thefe cafes is, to pafs the hand into the womb in the gentleft manner poffible, and to fearch for the feet and bring them down.

CLASS III.

When the child lies longitudinally in the uterus, with the arm or fhoulder prefenting, and the head more or lefs over the pubes, or laterally in the pelvis, the feet towards the fundus uteri, the waters evacuated, and uterus contracted round the child's body; thefe are the moft difficult and laborious of all the cafes of preternatural labours. Here the protruding arm ought, if poffible, to be reduced, and the head brought into the pelvis; for unlefs the child be very fmall, it is impoffible for the head and arm to pafs along together.

In order to effect the reduction of the arm, different inftruments have been invented; but the hand of the accoucheur is preferable to every thing of this kind, whether of ancient or modern invention. This, conducted by the arm that protrudes, muft be infinuated through the vagina into the uterus, as far as the fhoulder of the child, which, if the accoucheur can raife up, he will generally fucceed in reducing the arm. Should this method fail, he muft attempt to pufh up the fore-arm at the elbow; but, in bending it, muft be very cautious, to avoid overftraining or diflocating the joint. In whatever manner the reduction is accomplifhed, if any method proves fuccefsful, the arm muft be retained till the head, by the force of natural pain, enters the pelvis, and prevents its return; otherwife the arm will defcend, as often as it is reduced.

But if the attempts for reduction prove impracticable, the woman muft be placed on her knees and elbows, and the accoucheur, with great deliberation, muft endeavour gently to flide up his hand between the uterus and child as far in the uterus as poffible, to lift up the head and fhoulders, and fearch for and bring down one or both feet, in the beft manner the various circumftances of the cafe will admit of. As foon as they can be laid hold of, they muft be gradually brought down into the vagina, fo low that the noofe can be applied over them, which muft be fixed and pulled with the one hand, while the head and upper parts of the body are raifed and gently pufhed up with the other.

Should the arm have been long protruded without the os externum, much fwelled, and cold; the waters drained off; the uterus ftrongly contracted; and the pofition of the child fuch as to render it impracticable, either to reduce the protruded limb, or to fearch for and bring down the feet; the head, if eafily come at, muft be opened and extracted with the blunt-hook or crotchet; or a crotchet muft be fixed amongft the ribs, and the breech or feet thus pulled down.

Should the pelvis be very narrow, and unfurmountable difficulties occur, the arm muft be twifted off at the elbow, though this expedient is rarely neceffary; and the delivery muft in general be accomplifhed as the prudence and judgment of the operator can beft direct; always remembering, when one life muft fall a facrifice, that the tree muft be preferved at the expence of the fruit.

In this, as in other cafes, the fwelling and coldnefs of the arm, and even want of pulfation in the artery, are not infallible figns of the child's death; and fhould this even be fo, it makes little difference in the mode of delivery, unlefs that it will lead us to pay all our attention to the mother: For a living child gives no more affiftance in the birth than a dead one, whatever authors have faid to the contrary.

When both arms prefent, the delivery muft be conducted in the fame manner as when one only prefents. The former cafe is lefs difficult than the latter, as the head feldom advances far when both arms fall into the paffage, fo that they can either be reduced, or there is eafy accefs to come at the feet to bring them down and deliver.

CLASS IV.

When the membranes remain entire, till the foft parts are fo much dilated, that the hand will readily find admittance; or when the hand can be paffed within the cavity of the uterus, immediately after the rupture of the membranes, fo that part of the water may be retained; the delivery may be accomplifhed, in the moft troublefome preternatural cafes, with the greateft fafety and expedition. But when the waters have been long evacuated, and the uterus clofely contracted round the body of the child, the cafe will prove laborious to the operator, painful and dangerous to the mother and child.

When there is reafon to fufpect that the child lies acrofs, which can often be afcertained, either by feeling the prefenting part through the membranes, or by fome of the figns of preternatural labours already mentioned; the woman fhould be managed in fuch a manner, that the membranes may be preferved entire as long as poffible; for this purpofe fhe fhould keep quiet in bed, and her pofture fhould be fuch as is leaft favourable for ftraining, or exerting force during the pain:

Preternatural Labour.

pain: ſhe ſhould be touched as ſeldom as poſſible, till the os internum be ſufficiently dilated. The accoucheur ſhould then introduce his hand in a conical form, well lubricated, into the vagina, and through the aperture of the internal orifice, inſinuating it between the uterus and the membranes, till it advances almoſt as high as the fundus uteri, when he muſt break the membranes, by pinching ſome part of them between a finger and thumb, or by forcibly puſhing a finger thro' them; he muſt then ſearch for, and endeavour to lay hold of, one or both feet, and deliver.

Should the membranes be ruptured in the attempt, he muſt be ready to run up his hand as quickly as can be done with ſafety, when, part of the waters by his arm being retained, the operation of turning will be facilitated. Should the placenta adhere on that ſide of the uterus where the hand is paſſed, it muſt again be withdrawn, and the other hand be introduced in the oppoſite ſide.

Floodings. It has been already obſerved, that a flooding ſeldom proves fatal to the mother before the ſeventh month of pregnancy; after which period, from its duration or exceſs, the life of both the mother and child may ſuffer. Should therefore a flooding attack a woman in the two laſt months of pregnancy, from whatever cauſe it may ariſe, and whether attended with labour-pains or not, if the hæmorrhage be ſo conſiderable that ſhe is ready to ſink under it, and that cold applications and other means of checking the evacuation ſhall fail, the woman muſt be placed in a proper poſture, her friends prudently appriſed of her danger, and the delivery muſt be immediately performed, by ſtretching the vagina and os uteri, till the hand of the operator can eaſily gain admittance to break the membranes, catch hold of the feet, and extract the child.

If it can poſſibly be prevented, the membranes in flooding caſes ſhould never be broken till the aperture of the uterine orifice will freely admit the hand to paſs, that, after the evacuation of the waters, the accoucheur may have it in his power either to make the delivery or not, according as the effuſion continues or abates.

Soon after attempting to ſtretch the parts, ſhould the labour-pains come on, the waters begin to be collected, and the uterine hæmorrhage diminiſh, the accoucheur muſt then withdraw his hand, and manage the delivery according to circumſtances. And if, for inſtance, the child preſents naturally, the delivery muſt be truſted to nature; otherwiſe, if the flooding continues, or the child preſents acroſs, the accoucheur muſt perſiſt in his work, going on ſlowly, and with the utmoſt delicacy, till he be able to reach the feet, to bring them down, and deliver; always remembering, during this proceſs, that the ſtrength of the woman, by proper nouriſhment, be ſupported.

But ſhould the placenta adhere to the cervix, or upon the os uteri, the greateſt danger is to be dreaded; for thus the flooding will commence from the moment the os uteri begins to ſtretch, and will increaſe ſo rapidly, that the woman, if not ſpeedily delivered, muſt inevitably ſink under it. The whole body of the placenta, in ſuch caſes, is ſometimes ſeparated when the labour has made but little progreſs; ſo that the woman will often periſh, whether delivery be attempted or not. As this, however, is the only expedient by which her life, and that of the child, can be ſaved; in every caſe where the placenta preſents, which the accoucheur will readily diſcover by the touch of the ſoft pappy ſubſtance of that body, he muſt immediately place the woman in a proper poſture, inſinuate his hand gently by the ſide of the protruding placenta, break the membranes, ſearch for the feet of the child, and bring them down, ſo that the delivery may be finiſhed with all poſſible expedition; for, in this unhappy caſe, a few minutes delay may prove fatal.

Preternatural Labour.

The after-birth ought never to be extracted before the child, if it can poſſibly be avoided.

After delivery, time ſhould be given for the uterus to contract, that nature may thus throw off the placenta, which never ought to be hurried away, unleſs the continuance or a recurrence of the hæmorrhage render it neceſſary.

Prolapſus of the funis. Difficulties ariſing from the funis falling down into the vagina, and preſenting along with ſome part of the child, may, in this claſs of the diviſion of preternatural labours, be included.

A preſſure on the chord, in ſuch a degree as to interrupt the circulation, muſt infallibly deſtroy the life of the child: hence a coldneſs and want of pulſation in the chord is the trueſt criterion of the death of the child; and hence, in every caſe where the chord is prolapſed before any bulky part of the child, if the delivery be not accompliſhed with expedition, the child will periſh. This is only to be prevented by replacing the chord, and retaining it above the preſenting part, till this laſt, by the force of labour-pains, be ſo far advanced as to prevent the return of the former; or the child muſt be turned and brought by the feet, provided this can be done with ſafety to the mother. But it is often difficult to ſucceed in the attempt of the one or other; and, if the woman has ſtrong pains, ſuch attempts are not to be hazarded, as the conſequences may prove fatal.

When the accoucheur is thus ſituated between two puzzling difficulties, the preference muſt always be given to the mother. If the child be ſmall, and the pelvis well formed, which may be known by the hiſtory of former deliveries, and if the labour goes on quickly, the child will generally be born alive; but if, on the contrary, the child be above the ordinary ſize, and the pelvis rather narrow, turning will prove a dangerous operation to the mother, and there is little proſpect of ſaving the infant by this means.

Beſides our former diviſion of labours, *plurality of children*, *monſters*, *extra-uterine fœtuſes*, and the *Cæſarean operation*, are parts of the ſubject that yet remain to be conſidered.

Chap. XIII. *Plurality of Children.*

The caſe of twins often occurs: of triplets ſeldom: of quadruplets rarely: nor is there perhaps a ſingle inſtance, where five or more diſtinct fœtuſes have been found contained in the human uterus, though many ſuch fabulous hiſtories have been recorded by credulous authors.

The ſigns of two or more children, ſuch as the ſudden or extraordinary increaſe of the uterine tumour, motion felt in different parts of the abdomen, &c. are very

Plurality of Children. very doubtful and fallacious: this can only be afcertained after the delivery of one child; and even then a recurrence or continuance of labour-pains is not a certain and infallible criterion; neither is the abfence of pains a fure indication of the contrary; as many cafes have occurred, where feveral days have intervened between the birth of a firft and fecond child. The chief fymptoms to be depended on are, 1ft, The child being of a fmall fize, and the quantity of liquor amnii fo inconfiderable as not to account for the bulk of the woman in time of pregnancy. 2dly, The bleeding of the funis umbilicalis next the mother. 3dly, The remora of the placenta. 4thly, The uterine tumour not fenfibly diminifhed, which, very foon after delivery, in ordinary births, will be found gradually fhifting lower and lower, and will feel at laft as if a hard circumfcribed tumour like a ball between the umbilicus and pubes. Hence the utility of the general practice of applying the hand externally on the abdomen, in every cafe after delivery; by which an accurate knowledge will be formed of the nature and manner of the uterine contraction. When, from any of thefe circumftances, there is reafon to fufpect another child, the moft certain and infallible method of difcovering it is, the paffing of a finger, or the introduction of the hand, into the uterus, where another fet of membranes will be perceived, and probably fome part of the child prefenting through them.

The pofition of twins or triplets is commonly that which is moft commodious, and which will occupy the leaft room in utero: their fituation is often diagonal; tho' they may prefent in every poffible pofture. Thus, therefore, the general rules recommended for the delivery of one child, are equally applicable in the cafe of twins, triplets, &c.

It has been the general practice with many, after the birth of one child, to pafs the hand immediately into the uterus, to break the membranes, catch hold of the feet of the child, and thus deliver. But this is certainly bad practice, whatever authors have faid to the contrary. If the woman is healthy, and the child prefents favourably, that is, with the head, breech, or feet, natural pains ought to be waited for, when the child will be expelled by the force of thefe only; failing which, manual affiftance, as in other cafes, muft be had recourfe to.

It very rarely happens, when the firft birth is preternatural, that the fecond membranes are ruptured in making the extraction. Should this prove the cafe, the limbs of the children may be confounded, fo that a leg and an arm, or three legs, or arms of different children, may prefent; which, however, will make little difference in the mode of delivery: the accoucheur will endeavour to lay hold of the foot or feet moft readily within his reach, and will be cautious in bringing them down, to make fure they belong to the fame body.

If the child prefents crofs; if floodings, convulfions, or other dangerous fymptoms, fhall take place; if the woman has fuffered much in the firft labour; and if, after feveral hours, a recurrence of labour-pains does not enfue; the hand muft then be introduced into the uterus, the membranes muft be broken, and the child muft be extracted by the feet: or, if the head remains locked in the pelvis, and, from want of ftrength in the woman, cannot be expelled, the treatment is the fame as in other laborious births.

In twin-cafes it may be recommended as a general rule, to avoid precipitating the delivery of the fecond child till the woman fhall have refted a proper time, and till, by the contraction of the fundus uteri, the fecond fet of membranes occupy the place of the firft, and be protruded as far as the os externum, when, and not before, the delivery may fafely be affifted, fhould circumftances occur to render fuch affiftance neceffary: whereas, by breaking the membranes and evacuating the waters when the child lies high in the uterus, a flooding may be brought on, or a fpafmodic conftriction of the uterus round the body of the child may be occafioned, which may render the delivery both difficult and dangerous.

The placentæ of twins, triplets, &c. generally adhere, though fometimes they are diftinct, and may be thrown off at different times after the birth of the different children; fo that the practitioner fhould be on his guard, and never fhould leave his patient till he makes fure there be no more children. When a fecond child is difcovered, no attempts ought to be made to extract the placenta till after the birth of the remaining child or children; as the woman would be fubject to flooding, which might prove of fatal confequence before the uterus could be emptied of its contents.

In cafe of plurality of children, a fecond ligature fhould be applied on the funis, on that end next the mother, immediately after the birth of every child; and a gentle compreffion fhould be made on the abdomen of the woman after the firft delivery, which muft be gradually tightened after every fucceeding one, to prevent the confequences of a fudden removal of uterine preffure, which is to be dreaded where the diftention has been confiderable.

The placenta, in fuch cafes, muft be managed in much the fame manner as ufual. In twins, &c. it generally feparates with great facility, provided time has been given for the uterus to contract. Both chords fhould be gently pulled; and when it advances towards the uterine orifice, where, being large and bulky, it commonly meets with confiderable refiftance, it requires the introduction of a finger or two into the vagina for bringing down the edge, after which the body readily follows.

CHAP. XIV. *Monfters.*

Monfters. THESE are of various fizes and forms, and, unlefs very fmall, the pofture favourable, and the woman well made, will prove the caufe of a difficult and troublefome delivery. Sometimes a child is monftrous from a preternatural conformation of parts, fuch as a monftrous head, thorax, abdomen, &c. At other times, there is a double fet of parts, as two heads, two bodies with one head, four arms, legs, &c. But fuch appearances very feldom occur in practice; and, when they do, the delivery muft be regulated entirely according to the circumftances of the cafe. A large head, thorax, or belly, muft be opened. If two bodies united together are too bulky to pafs entire, they muft be feparated; the fame of fupernumerary limbs. If the pofture be unfavourable, it muft be reduced when practicable; otherwife the extraction

muft

Cæfarean Operation.

muft be made with the crotchet, in the beft manner the circumftances of the cafe will admit of; always, in cafes of danger or difficulty, giving the preference to the fafety of the mother, without regarding that of the child.

Chap. XV. *Cæfarean Operation.*

When the delivery could not be accomplifhed by other means, or when a woman died fuddenly with a living child in her belly, an operation to preferve the life of mother and child in the former cafe, and to fave the child in the latter, has been recommended, and fuccefsfully performed, by different authors, and in different ages.

This operation is of ancient date; it is the *fectio Cæfarea* or *partus Cæfareus* of the Latins, and the *hyfterotomia* of the Greeks. Whether it was ever fuccefsfully performed on the living fubject amongft the ancients, feems uncertain; but that it has been fuccefsfully practifed by the moderns on various occafions, and in feveral different countries of Europe, there are fo many authentic hiftories on record, that the fact will fcarce admit of doubt: but as this, like many other falutary inftitutions, has been much abufed, and in many cafes improperly and injudicioufly employed, (for fome of thofe women who furvived the operation, were afterwards fafely delivered of living children), the circumftances which render this operation neceffary, demand a very particular inquiry, viz.

1. A narrownefs, or bad conformation of the bones of the pelvis.
2. Imperforated vagina, or contractions in the vagina, cicatrices, tumors, or callofities in the os uteri, &c.
3. The efcape of the child through the uterus when torn.
4. Ventral conceptions.
5. Herniæ of the uterus.
6. The pofition or bulk of the child.

It will be neceffary carefully to examine thefe different caufes, in order to fhew, that they are by no means, in every cafe, fufficiently powerful motives for having recourfe to it.

I. Bad conformation of the bones of the pelvis. When the hand of the operator cannot be introduced within the pelvis; or, in other words, when its largeft diameter does not exceed one inch, or one inch and a half, this conformation is perhaps the only one which renders the Cæfarean operation abfolutely neceffary: happily, however, fuch a ftructure very feldom occurs in practice; and when it does, the accoucheur will readily difcover it, by attending to the following circumftances, and to the common marks of a narrow pelvis. Wherever the capacity of the pelvis is fo ftrait as not to admit any part of the child's head to enter, nor two fingers of the accoucheur's hand to conduct proper inftruments to tear, break down, and extract the child piece-meal; in this cafe, recourfe muft be had to the Cæfarean fection: an expedient, though dreadful and hazardous, that will give the woman and child the only chance of life; and which, if timely and prudently conducted, notwithftanding of the many inftances wherein it has failed, may be performed with fome probability of fuccefs.

It is true, the fuccefs of the operation in the city of Edinburgh, where it has been done five times, has proved difcouraging, as none of the women had the good fortune to furvive it many days. This, however, is not the fault of the operation; but is to be imputed to the low, weak ftate of the patients at the time, who had previoufly been feveral days in labour, and their ftrength greatly exaufted, before the operator was called. Delivery by every other means was utterly impracticable; the operation, tho' the event was doubtful, alone gave a chance of life; and three of the children by this means were extracted alive.

Cæfarean Operation.

Mr Hamilton furgeon and profeffor of midwifery in Edinburgh, having been an eye-witnefs of the operation the laft time it was performed here, gives the following account of the cafe which fell under his obfervation.

Elifabeth Clerk, aged 30, had been married for feveral years, became pregnant, and mifcarried in the third month; the expulfion of the abortion occafioned fo fevere a ftrefs, as actually to lacerate the perinæum. Some time after her recovery, fhe was irregular, afterwards had one fhew of the menfes, again conceived, and the child, as fhe imagined, arrived at full time. She was attacked on Monday the 3d of January 1774, about midnight, with labour-pains, which went on flowly, gradually increafing till Saturday the 15th, when fhe was brought from the country to the Royal Infirmary here. Upon examination, the pelvis feemed confiderably diftorted; but the body was otherwife well fhaped, though of fmall fize; the os externum vaginæ was entirely fhut up, nor could any veftige of vagina be obferved, nor any appearance of labia pudendorum: inftead of this, there was a fmall aperture at the fuperior part of the vulva, immediately under the mons veneris, probably about the middle anterior part of the fymphyfis pubis. This aperture (which had a fmall procefs on the fuperior part, fomewhat refembling the clitoris) was no larger than juft to allow the introduction of a finger; the meatus urinarius lay concealed within it: a confulation of furgeons was called, and the Cæfarian fection was determined on. Having had no ftool, nor voided any urine for two days, an injection was attempted to be thrown up; but it did not pafs, nor was it poffible to pufh the female catheter into the bladder. Mr William Chalmer was the operator in this cafe. At fix in the evening, he made an incifion on the left fide of the abdomen in the ordinary way, through the integuments, till the peritonæum was expofed; two fmall arteries fprung, which were foon ftopped by a flight compreffion: the wound was then continued through the peritonæum into the cavity of the abdomen, when the bladder appeared, flightly inflamed, much diftended, reaching with its fundus near as far as the fcrobiculus cordis: another unfuccefsful attempt was made to pafs the female catheter; at length a male catheter was procured, which was, after fome difficulty, introduced into the bladder, and the urine evacuated to the quantity of above four pounds, high-fmelled and fetid. This occafioned a neceffary interruption for a few minutes, between making the opening into the abdomen and uterus; the bladder collapfing, the uterus, which before lay concealed, now came in view, through which an incifion was made, and a ftout male child was extracted alive; and immediately afterwards the fecundines. The uterns contracted rapidly. After cleanfing the wound, the lips were brought together by the quill-future, and dreffed

dreffed fuperficially. The patient fupported the operation with furprifing courage and refolution; nor was there more than five or fix ounces of blood loft on the occafion.

Being laid in bed, fhe complained of ficknefs, and had a flight fit of vomiting; but, by means of an anodyne, thefe fymptoms foon abated: fhe was affected with univerfal coldnefs over her body, which alfo abated on the application of warm irons to the feet: fhe then became eafy, and flept for four or five hours. Next morning, the 16th, about two o'clock, fhe complained of confiderable pain in the oppofite fide, for which fhe was blooded; and an injection was given, but without effect; for the pain increafed, ftretching from the right fide to the fcrobiculus cordis; nor did fomentations feem to relieve her; her pulfe became frequent, fhe was hot, and complained of drought. At 7 A. M. the injection was repeated, but with no better fuccefs; and eight ounces more of blood were taken from the arm; a third injection ftill failed to evacuate any fæces; the drought increafed; and the pulfe rofe to 128 ftrokes in a minute. At 11 A. M. the pulfe became fuller; and the refpiration much oppreffed. No ftool nor urine paffed fince the operation. At 12 fhe was blooded again, when the fizinefs appeared lefs than formerly. She now took a folution of *fal Glauber, manna and cr. tart.* at fhort intervals; fhe vomited a little after the laft dofe, had a foft ftool, and voided a fmall quantity of urine. At 3 P. M. her pulfe was 136, and fhe had another ftool, when thin fæces were evacuated; fhe was then ordered two fpoonfuls of a cordial anodyne mixture every fecond hour: the vomiting now abated; the pulfe became fmaller and more frequent; fhe paffed urine freely; but the pain and oppreffed breathing increafed. At feven P. M. her pulfe rofe to 142, and became weak and fluttering; fhe called for bread, and fwallowed a little with fome difficulty; her drought was intenfe; the dyfpnœa ftill increafed. She was now much oppreffed, and began to tofs; the pulfe funk and became imperceptible; fhe complained of faintifhnefs, but on belching wind her breathing was relieved, and the pulfe returned, growing fuller and ftronger: the pain of the fide ftill increafing, 12 ounces of blood, very fizy, were taken away; and two glyfters of warm water with oil were injected without effect: at 8 P. M. the pulfe became lefs frequent and fmaller; fhe complained much of the pain towards the fcrobiculus cordis; her breathing was much oppreffed; her belly was tenfe, and fwelled as big as before the operation; her pulfe was now fmall and feeble; fhe looked ghaftly; and expired a little after eight, 26 hours after the operation.

It is to be regretted that the relations would not permit the body to be opened.

Since the firft certain accounts of the operation fuccefsfully practifed by a fow-gelder on his own wife, in the beginning of the 16th century, there are on record above 70 well-attefted hiftories, wherein it has been fuccefsfully performed: for, of all the cafes related by authors, it has not proved fatal to the patient above once in ten or nine inftances; which evidently fhews the propriety of the practice, and probability of fuccefs, both in regard to the mother's own recovery, and for certainly preferving the life of the child. But it fhould never be attempted, excepting in thofe cafes only where it is abfolutely impoffible to deliver the woman by any other means whatever; for there are pelvifes to be met with, where, without having recourfe to this operation, both mother and child muft inevitably perifh: fuch have occurred to many practitioners, who, from want of refolution, or from ill-founded prejudice, have allowed their patients to perifh from neglect, contrary to a well known maxim in phyfic, That in a defperate cafe, it is better to employ a doubtful, and even defperate remedy, than to abandon the patient to certain and utter ruin. Such, for inftance, is a cafe related by Saviard, of a girl aged 27, whofe ftature was only three feet, who came to lie in at Paris, in the *Hotel Dieu;* every method but the operation was in vain attempted; both mother and child died. Mauriceau alfo relates the hiftory of a woman who was left to die, where the aperture of the pelvis was fo fmall as not to admit the hand of the accoucheur. And, not to multiply inftances, Mr De la Roche gives a cafe where the woman had been feven days in labour; the child was faved by the operation; but the woman died the fifth day after, probably from its being too long delayed: the diftance, in this fubject, from the lower vertebra lumborum and os pubis, was no more than two fingers breadth. The operation, when the neceffity is evident, ought therefore to be early performed, that the patient, who from her make and conftitution is generally delicate and puny may have every chance of recovery in her favour, without being exhaufted by the fruitlefs efforts of a tedious and painful labour, as too often has been the cafe. On thefe occafions, the prudent accoucheur fhould call in the advice of his elder brethren of the profeffion, and, by his cautious and prudent conduct, avoid every caufe of cenfure or reproach.

Exoftofes from the bones of the pelvis is a fpecies of deformity very rarely met with in practice, and which feldom or never takes place to fuch a degree as to render this operation neceffary.

II. Conftriction, callofity, tumours, &c. about the vagina or os tincæ. The vagina and os tincæ are often affected with conftrictions from cicatrices, with callofities and tumours; but it is feldom, if ever, neceffary to perform the Cæfarean fection on this account. Tumours in the vagina many generally be removed with fafety, even after the commencement of labour, and delivery happily fucceed; or it may be fometimes practicable for the accoucheur to pafs his hand by the fide of the tumour, to turn the child, and deliver. With regard to conftrictions in the vagina, and callofities in the os uteri, there are many inftances where, at the commencement of labour, it was impoffible to introduce a finger into the vagina; yet the parts have dilated as labour increafed, and the delivery terminated happily. At other times, the dilatation has begun during pregnancy, and been completed before delivery. There is a hiftory, for inftance, in the *Mem. de l'Acad. des Scienc.* 1712, of a woman whofe vagina was no larger than to admit a common writing quill; fhe had been married at 16, and conceived 11 years after: towards the fifth month of her pregnancy, the vagina began to dilate, and continued to do fo till full time, when fhe was fafely delivered. Guilemeau dilated, and La Mott extirpated callofities in the vagina and os tincæ, when the children were fuccefsfully expelled:

expelled by the force of natural labour.

Harvey relates a cafe where the whole vagina was grown together with cicatrices; nature, after a tedious labour, made the dilatation, and a large child was born.

La Mott mentions his having delivered three women, who had not the fmalleft veftige of an orifice through the vagina to the uterus. Dr Simpfon cut through a callofity of an os uteri which was half an inch thick, &c.

Upon the whole, tumours in the vagina, or about the orificium uteri, may be fafely extirpated without danger of hæmorrhagy or other fatal fymptoms, and the delivery will happily fucceed: and if the vagina be impervious, the os externum fhut up, or the labia grown together, the parts fhould be opened with the fcalpel, rather than rifk an operation, at beft in the iffue doubtful and precarious; an operation never allowable in fuch cafes, and therefore univerfally improper in difeafes or malconformation of the foft parts of generation. If the os externum be entirely clofed, if the cavity of the vagina be entirely filled up, or the paffage confiderably obftructed by tumours, callofity, or conftriction from cicatrice, and there is no reafon to fufpect a fault in the pelvis, of which a judgment may be formed by the common marks of deformity, under fize, or a ricketty habit; it is by much the beft practice to open a paffage through the vagina, and deliver the woman in the ordinary way. If there be no defect in the pelvis, the head of the child, or any other bulky part that prefents, will advance in this direction, till it meets with a refiftance in the foft parts: thus the teguments will at length be protruded before the child's head, in form of a tumour, when a fimple incifion downwards to the perinæum, in the direction of the anus, will remove the caufe of difficulty, by relieving the head; the child will afterwards fafely pafs, and the wound will heal without any bad confequence.

The ftate of the pelvis, and progrefs of the labour in thefe cafes, may often be learned by the touch of the finger in ano.

III. Lacerated uterus is another caufe for which this operation has been recommended. The uterus may be ruptured from violence in making the delivery; or fuch an accident may happen naturally, either from the crofs prefentation of the child in time of pregnancy, or in time of labour, when the pelvis is narrow: thefe cafes are generally fatal; and it is very feldom, if ever, that the life of the mother can be faved by the Cæfarian fection, after the fœtus efcapes through the torn uterus into the cavity of the abdomen; becaufe it often happens, that inflammation and fphacelus has affected the parts of the uterus that fuftained the preffure previous to the rupture; or, if otherwife, convulfions or other fatal fymptoms foon enfue, from the quantity of blood, waters, &c. poured into the cavity of the abdomen.

When the child cannot be extracted by the natural paffages, tremours, fingultus, cold fweats, fyncope, and the death of the mother, for the moft part, fo quickly follow, that it will at leaft feem doubtful, to a prudent humane practitioner, how far it would be advifeable, after fo dreadful an accident, the woman apparently in the agonies of death, rafhly to perform another dangerous operation, even with a view to preferve the child, till he had waited till the mother recruits or expires.

If part of the child be contained within the uterus, and the feet can be reached, the practice is to deliver by the orifice of the womb: but when the whole fœtus has efcaped entirely without the uterus, the Cæfarean operation is recommended as the only means of preferving both mother and child.

If the operation on this occafion be ever allowable, it may be afked,

1. At what time muft it be performed?

2. Would it not have the appearance of inhumanity to have recourfe to this expedient immediately after the uterus burfts, when the woman is feemingly ready to expire, although it be the only time when there is a chance of faving the child?

3. In moft cafes where this accident happens, fhould the Cæfarean fection be made, is it not highly improbable that the mother will furvive fo terrible a laceration?

4. For if it be done with a view to fave the mother, in what manner is the extravafated blood, &c. to be evacuated from the cavity of the abdomen?

What feems to make cafes of this kind unfavourable, when the accident happens in time of labour, is,

1*mo*, That here, the parts before rupture, in moft cafes, are in a gangrenous ftate.

2*do*, As the rupture is commonly towards the cervix, there is generally a much greater hæmorrhagy by reafon of the flow contraction of the uterus at this place.

3*tio*, The uncertainty, whether, or how long, the patient will furvive it, feems alfo a confiderable obftacle to the operation under fuch difagreeable circumftances, *Ne occidiffe videatur, quem fors interemit.*

IV. Ventral conceptions is a fourth indication for this operation. Thefe are either in the ovaria, tubes, or cavity of the abdomen, and feldom arrive at great fize; or are retained, very often a long time, without occafioning much complaint. The iffue of thefe conceptions has alfo been no lefs various than extraordinary; for after being retained for a great many years in an indolent ftate, at length abfceffes or ulcerations have formed, and they have been difcharged through all the different parts of the abdomen.

Moft women feel pain and violent motion at the time of ordinary delivery in thefe cafes of ventral conception; if therefore the operation be ever neceffary, now is the proper time to perform it. But in general, as the feparation of extra-uterine fœtufes from their involucra, may occafion immediate death in many cafes, from the vaft hæmorrhagy that might enfue from the non-contractile power of the parts to which they adhere; unlefs they point outwardly, or excite the moft violent fymptoms, they ought univerfally to be left to nature.

V. Herniæ of the uterus are feldom or never fufficient to induce us to perform the Cæfarian fection, as the uterus is very rarely influenced in fuch a manner, that the orifice cannot be reached, and the delivery fuccefsfully made. Many inftances are to be found among furgical authors, where deliveries, under fuch circumftances, have been happily performed, without having recourfe to fo hazardous an expedient. Thus Mauriceau mentions a cafe, where the uterus, in a ventral hernia, was pufhed along with the inteftines above the hernia

belly, and contained in a tumour of a prodigious ſize; the woman, however, was delivered at the end of her time, in the ordinary way. La Mott relates the hiſtory of a woman in a preternatural labour, whoſe uterus and child hung down pendulous to the middle of her thigh, but whom, notwithſtanding, he ſafely delivered: and Ruyſch gives a caſe where the midwife reduced the hernia before delivery; although it was prolapſed as far as the knee, the delivery was ſafely performed, and the woman had a good recovery.

Laſtly, The poſition or bulk of the child.

Since the practice of turning the child and delivering by the feet, and the late improvement of obſtetrical inſtruments, this operation is never to be performed on account of poſition, monſtroſity, or any other obſtacle on the part of the child.

Upon the whole, when the pelvis is faulty to ſuch a degree, that no inſtrument can be conducted to tear and extract the child, this perhaps is the only caſe wherein this operation ſhould be performed on the living ſubject. Inciſions through the teguments of the abdomen to extract extra-uterine fœtuſes, or bones of fœtuſes, do not properly fall under the name of *Cæſarean ſection*, as that name implies inciſion of the uterus alſo.

When a woman advanced in pregnancy dies ſuddenly, either by accident or by natural diſeaſe, the Cæſarean ſection is recommended as an expedient to preſerve the life of the child. This is a very proper meaſure, provided the death of the mother be aſcertained; but ſometimes it is a very nice and difficult point to diſtinguiſh between a deliquium and death; and therefore the accoucheur, on ſuch an occaſion, muſt act with the utmoſt circumſpection. If the operation be delayed but a very ſhort while after the mother expires, it will probably be in vain to make the attempt; for, whatever fabulous ſtories may be related to the contrary, there are few authentic caſes of the fœtus of any animal ſurviving the mother, perhaps an hour; and therefore every thing ſhould be in readineſs to extract the child with all poſſible expedition, after the event of the mother's death. But, in ſuch caſes, the agonies of death often perform the part of labour, and the child is ſometimes thrown off *in articulo mortis;* or the os uteri is ſo much dilated, that there is eaſy acceſs to paſs the hand, turn the child, and deliver. Thus one ſhould be very cautious in having recourſe to this operation, even in the above circumſtances; which ſhould never be done,

1. Till the death of the mother be aſcertained beyond doubt;

2. Till the ſtate of the os uteri be examined;

3. Till the conſent of the relations be obtained; And,

Laſtly, It need not be undertaken, except where the mother dies ſuddenly, between the 7th and 9th month.

It is unneceſſary where the diſeaſe has been lingering; in ſuch caſes the child commonly dies before the mother.

When it is doubtful whether the child be alive or not, it may be determined by applying the hand on the abdomen of the mother about the time of, and for a little while after, her death, when the life of the child will be diſcovered by its motions and ſtruggling.

Thus having pointed out the different cauſes that determine this operation, it may be obſerved, that it is a frightful and hazardous one; and although performed ſucceſsfully in a number of caſes, yet, in many others, it has failed, and the woman has died either immediately or ſoon after. It ſhould never, therefore, be undertaken but on extraordinary and deſperate occaſions; and then it is not only adviſeable, but incumbent on every practitioner to whom ſuch caſes occur.

To conclude, it may not be improper to give a few directions with regard to the method of performing the operation on the living ſubject.

Having emptied the bladder, and evacuated the contents of the inteſtines with repeated emollient glyſters; the patient being encouraged, with proper cordials, and every other requiſite in readineſs, ſhe muſt be placed on a table or bed, with her left ſide gently raiſed with pillows or bolſters, and properly ſecured by aſſiſtants. An inciſion muſt be made with a common convex ſcalpel, beginning rather below the navel at the middle ſpace between it and the ſpine of the os ilium, carrying it obliquely forwards towards this bone, ſo that the wound in length may exceed ſix inches. This external wound is to be carried through the common teguments of the abdomen till the peritonæum is expoſed, when the operator ſhould reſt a little, till the hæmorrhage be entirely abated. He muſt then, with great caution, make a ſmall opening through this membrane, introduce his finger, and upon this a ſcalpel (which is preferable to ſciſſars), and with great expedition make a complete dilatation; he muſt now wipe away the blood with a ſpunge, preſs the omentum or inteſtines gently to a ſide, if in the way, and endeavour to diſcover to what part of the uterus the placenta adheres, that it may be avoided in making the inciſion. This may eaſily be known by a thickneſs and ſolidity in the part, which diſtinguiſh it from the reſt of the uterus; it is ſtill more eaſily diſcovered when the membranes are entire. The blood-veſſels are leſs in number, and ſmalleſt in the middle and interior part of the uterus, which therefore, if the placenta does not interfere, is the proper place for making the inciſion, which muſt be performed with the utmoſt attention leſt the child ſhould be wounded: if the membranes are entire, more freedom may be uſed, and *vice verſa*. The direction and length of the wound of the uterus muſt be the ſame with the external one. The child muſt now be quickly extracted, and the placenta carefully ſeparated: theſe muſt be given to an aſſiſtant, who will divide the chord, and take care of the child, as the operator's attention muſt be wholly beſtowed on the mother. The coagulated blood, &c. being removed by a ſpunge wrung out of warm water, (leſt the uterus or inteſtines be protruded, which are very troubleſome to reduce), the lips of the external wound muſt be quickly brought together, and retained by an aſſiſtant till ſecured by a few ſtitches; generally three will be ſufficient: as many needles ſhould be ready threeded with pretty large broad ligatures; the middle ſtitch ought to be made firſt; the needle ſhould be introduced at a proper diſtance, i. e. about an inch and one-fourth from the ſide of the wound, carrying

Cæfarean Operation.

it firft from without inwards, and then from within outwards, fecuring with a double flip a knot, to be ready to untie, left violent tenfion or inflammation fhould enfue; under the knot a foft comprefs of lint, fharpee, or rolled plafter, fhould be applied, and the whole dreffings muft be fecured by a proper comprefs and bandage. The patient muft be afterwards treated in the fame manner as after lithotomy, or any other capital operation.

Quæritur, To what caufe is the unfuccefsful event of this operation to be imputed? When the operation proves fatal, to what immediate caufe are we to afcribe the death of the patient? Is it nervous, or uterine irritation, from cutting, that kills? Is it internal hæmorrhage, or the extravafation of fluids into the cavity of the abdomen? Or are not the fatal confequences rather to be imputed to the accefs of the air on the irritable vifcera? This can only therefore be prevented by expofing thefe parts for as fhort a fpace of time as poffible. Dr Mouro, the prefent anatomical profeffor at Edinburgh, in making experiments on young fmall animals, fuch as bitches, cats, frogs, &c. by opening the cavity of the abdomen, and tying the biliary ducts, remarks, that though a large opening into the abdomen be made by incifion, if the wound be quickly clofed and ftitched, the animal will recover, and no bad confequences follow; but if expofed a few minutes to the air, dreadful pain foon comes on, which the creature expreffes by the fevereft agonies; convulfions at laft enfue, and death within four or fix hours after the operation. On opening the abdomen after death, the whole vifcera are found to be in an inflamed ftate, and univerfally adhering to one another. He has often repeated the experiment, and the fame appearances as often take place.

May not the analogy here juftly apply to the human fubject? And, in performing the Cæfarean operation, fhould we not be very careful that the vifcera be expofed as little as poffible, and that the wound be covered with the utmoft poffible expedition?

The ill fuccefs which generally attends the Cæfarean operation fome years ago, induced fome French practitioners to try a new method of extracting the child when, through the narrownefs of the pelvis, or any other caufe, it is impoffible to deliver the woman either naturally or by means of inftruments. This was by cutting the fymphyfis of the os pubis; by which operation it was thought that the bones would feparate to a fufficient degree to make room for the paffage of the child. This operation is found not to be fo fatal in itfelf as the Cæfarean fection; but unhappily it doth not promife with any certainty to afford the neceffary relief to the woman. Dr Vaughan remarks, 1. That it is extremely difficult to execute it with a thick knife, however fharp in the edge. The ligamentous and griftly fubftance between the bones is fo incompreffible that it will hardly make room for the thicker part of the knife to follow its edge; but a thin knife goes through it with great eafe.

2. Whoever has had a little practice, will find, that it may be executed without any danger of wounding the bladder or urethra; becaufe, in cutting cautioufly with a thin knife, from above downwards and inwards, the inftant that the whole is cut through, there is both a particular found, which informs us that the bufinefs is done, and the two bones fly afunder to a fenfible diftance.

3. When the fymphyfis is completely divided, the offa pubis feparate fo little a way, that fome force is neceffary to produce an interval of half an inch; and upon increafing the force till the fpace of interval comes to two inches and an half, there is a continued crafh, from the tearing of the ligamentous fibres at the pofterior joints, viz at the fides of the facrum. This, though requiring great force, is eafily affected, by bringing the thighs to right angles with the trunk of the body, and preffing the knees gradually outwards and backwards. In that way, a fmall force has a great effect, becaufe it has the advantage of a long lever, and is affifted by almoft the whole weight of the lower extremities.

4. When fuch a violent feparation of the offa pubis has been produced, the facrum and offa innominata remain in contact only at their pofterior parts; the ligaments that connect them at the fore-part being all, more or lefs, torn afunder.

5. The mifchief that may enfue upon cutting one joint of the pelvis, and tearing the other two afunder, can be afcertained by experience only. It is propofed, that the incifion at the pubes fhall not penetrate into the cavity of the abdomen. If, by accident, that fhould happen, the operation would of courfe be very dangerous. Lacerations of tendons, ligaments, and flefhy parts, when not complicated with an external wound, generally heal up in a kindly manner, as we fee in cafes of the ruptured tendo achillis, diflocations, and fractures.

But, on the other hand, at the time of parturition, the body is remarkably difpofed to an inflammatory fever, which is alway very dangerous when it rifes to any height; and therefore, whatever expofes the body to confiderable inflammation at that time, we may prefume, muft be attended with fome danger. And it muft likewife be remembered, that women who are exceedingly crooked, are commonly fo weak that they eafily fink under any great difeafe.

At the fame time our author allows, that the Cæfarean fection, though it may fave the child, yet will almoft always be fatal to the mother. The cutting of the fymphyfis, on the other hand, hath no probability of faving the child, and the effect on the mother muft be doubtful. He indeed gives no inftance of the bad fuccefs of the cutting the fymphyfis, though he gives an additional one of the fatality of the Cæfarean operation. As a decifive proof of the inefficacy of the cutting the fymphyfis to fave the child, he gives the figures of the diftorted pelvis of two women; by which it appears, that the utmoft dilatation ufed by this means could have amounted to no more than to enlarge the paffage to a circle of two inches and a quarter, which is not at all fufficient to afford an exit to a living child. In all cafes therefore, when the mother cannot be delivered without deftroying the child, he gives the preference to the crotchet; after the ufe of which, he fays, if the operation is flowly performed, by allowing intervals of eafe, as in the natural labour, women recover almoft as foon as in other cafes. Yet, notwithftanding all that can be argued againft this operation, it is plain, that as it gives

Management after Delivery.

gives a probable chance of faving the mother's life, though at the expence of the child, it ought always to be preferred to the Cæfarean fection, which faves the child, but deftroys the mother. Neverthelefs, it would be fhocking to think of performing even this operation where there was a poffibility of accomplifhing the delivery by any other means.

Chap. XVI. *Of the Management of Women after delivery.*

The woman being delivered of the child and placenta, let a foft linen-cloth, warmed, be applied to the external parts; and if fhe complains much of a fmarting forenefs, fome pomatum may be fpread upon it. The linen that was laid below her, to fpunge up the difcharges, muft be removed, and replaced with others that are clean, dry, and warm. Let her lie on her back, with her legs extended clofe to each other; or upon her fide, if fhe thinks fhe can lie eafier in that pofition, until fhe recovers from the fatigue: if fhe is fpent and exhaufted, let her take a little warm wine or caudle, or, according to the common cuftom, fome nutmeg and fugar grated together in a fpoon: the principal defign of adminiftering this powder, which among the good women is feldom neglected, is to fupply the want of fome cordial draught, when the patient is too weak to be raifed, or fuppofed to be in danger of retchings from her ftomach's being overloaded. When fhe hath in fome meafure recovered her ftrength and fpirits, let the cloths be removed from the parts, and others applied in their room; and, if there is a large difcharge from the uterus, let the wet linen below her be alfo fhifted, that fhe may not run the rifk of catching cold.

When the patient is either weak or faintifh, fhe ought not to be taken out of bed, or even raifed up to have her head and body fhifted, until fhe is a little recruited; otherwife fhe will be in danger of repeated faintings, attended with convulfions, which fometimes end in death. To prevent thefe bad confequences, her fkirt and petticoats ought to be loofened and pulled down over the legs, and replaced by another well warmed, with a broad head-band to be flipt in below, and brought up over her thighs and hips: a warm double cloth muft be laid on the belly, which is to be furrounded by the head-band of the fkirt pinned moderately tight over the cloth, in order to comprefs the vifcera and the relaxed parietes of the abdomen, more or lefs, as the woman can eafily bear it; by which means the uterus is kept firm in the lower part of the abdomen, and prevented from rolling from fide to fide when the patient is turned: but the principal end of this compreffion is to hinder too great a quantity of blood from rufhing into the relaxed veffels of the abdominal contents, efpecially when the uterus is emptied all of a fudden by a quick delivery. The preffure being thus fuddenly removed, the head is all at once robbed of its proportion of blood, and the immediate revulfion precipitates the patient into dangerous lypothymia.

For this reafon the belly ought to be firmly compreffed by the hands of an affiftant, until the bandage is applied; or, in lieu of it, a long towel, fheet, or roller, to make a fuitable compreffion: but for this purpofe different methods are ufed in different countries, or according to the different circumftances of the patients. The head-cloaths and fhift ought alfo to be changed, becaufe with fweating in time of labour they are rendered wet and difagreeable. Several other applications are neceffary, when the external or internal parts are rent or inflamed, misfortunes that fometimes happen in laborious and preternatural cafes.—We fhall conclude this chapter with giving fome neceffary directions with regard to air, diet, &c.

Although we cannot remove the patient immediately after delivery into another climate, we can qualify the air fo as to keep it in a moderate and falutary temper, by rendering it warm or cold, moift or dry, according to the circumftances of the occafion. With regard to diet, women, in time of labour, and even till the ninth day after delivery, ought to eat little folid food, and none at all during the firft five or feven: let them drink plentifully of warm diluting fluids, fuch as barley-water, gruel, chicken-water, and teas; caudles are alfo commonly ufed, compofed of water-gruel boiled up with mace and cinnamon, to which, when ftrained, is added a third or fourth part of white wine, or lefs, if the patient drinks plentifully, fweetened with fugar to their tafte: this compofition is termed *white caudle;* whereas, if ale is ufed inftead of wine, it goes under the name of *brown caudle.* In fome countries, eggs are added to both kinds; but, in that cafe, the woman is not permitted to eat meat or broths till after the fifth or feventh day: in this country, however, as eggs are no part of the ingredients, the patient is indulged with weak broth fooner, and fometimes allowed to eat a little boiled chicken. But all thefe different preparations are to be prefcribed weaker or ftronger, with regard to the fpices, wine, or ale, according to the different conftitutions and fituations of different patients: for example, if fhe is low and weak, in confequence of an extraordinary difcharge of any kind, either before or after delivery, or if the weather is cold, the caudles and broths may be made the ftronger; but if fhe is of a full habit of body, and has the leaft tendency to a fever, or if the feafon is exceffively hot, thefe drinks ought to be of a very weak confiftence, or the patient reftricted to gruel, tea, barley and chicken water, and thefe varied according to the emergency of the cafe.

Her food muft be light and eafy of digeftion, fuch as panada, bifcuit, and fago; about the fifth or feventh day fhe may eat a little boiled chicken, or the lighteft kind of young meat; but thefe laft may be given fooner or later, according to the circumftances of the cafe and the appetite of the patient. In the regimen as to the eating and drinking, we fhould rather err on the abftemious fide than indulge the woman with meat and ftrong fermented liquors, even if thefe laft fhould be moft agreeable to her palate: for we find by experience, that they are apt to increafe or bring on fevers, and that the moft nourifhing and falutary diet is that which we have above prefcribed. Every thing that is difficult of digeftion, or quickens the circulating fluids, muft of neceffity promote a fever; by which the neceffary difcharges are obftructed, and the patient's life endangered.

Management after Delivery.

As to the article of fleeping and watching, the patient muft be kept as free from noife as poffible, by covering the floors and ftairs with carpets and cloths, oiling the hinges of the doors, filencing the bells, tying up the knockers, and in noify ftreets ftrowing the pavement with ftraw; if, notwithftanding thefe precautions, fhe is difturbed, her ears muft be ftuffed with cotton, and opiates adminiftered to procure fleep; becaufe watching makes her reftlefs, prevents perfpiration, and promotes a fever.

Motion and reft are another part of the nonnaturals to which we ought to pay particular regard. By toffing about, getting out of bed, or fitting up too long, the perfpiration is difcouraged and interrupted; and in this laft attitude the uterus, not yet fully contracted, hangs down, ftretching the ligaments, occafioning pain, cold fhiverings, and a fever: for the prevention of thefe bad fymptoms, the patient muft be kept quiet in bed till after the fourth or fifth day, and then be gently lifted up in the bed-cloaths, in a lying pofture, until the bed can be adjufted, into which fhe muft be immediately reconveyed, there to continue, for the moft part, till the ninth day, after which period women are not fo fubject to fevers as immediately after delivery. Some there are who, from the nature of their conftitutions, or other accidents, recover more flowly; and fuch are to be treated with the fame caution after as before the ninth day, as the cafe feems to indicate: others get up, walk about, and recover, in a much fhorter time; but thefe may fome time or other pay dearly for their foolhardinefs, by encouraging dangerous fevers: fo that we ought rather to err on the fafe fide than run any rifk whatfoever.

What next comes under confideration is the circumftance of retention and excretion. We have formerly obferved, that, in time of labour, before the head of the child is locked into the pelvis, if the woman has not had an eafy paffage in her belly that fame day, the rectum and colon ought to be emptied by a glyfter, which will affift the labour, prevent the difagreeable excretion of the fœces before the child's head, and enable the patient to remain two or three days after, without the neceffity of going to ftool. However, fhould this precaution be neglected, and the patient very coftive after delivery, we muft beware of throwing up ftimulating glyfters, or adminiftering ftrong cathartics, left they fhould bring on too many loofe ftools, which, if they cannot be ftopt, fometimes produce fatal confequences, by obftructing the perfpiration and lochia, and exhaufting the woman, fo as that fhe will die all of a fudden; a cataftrophe which hath frequently happened from this practice. Wherefore, if it be neceffary to empty the inteftines, we ought to prefcribe nothing but emollient glyfters, or fome very gentle opener, fuch as manna, or *elect. lenitivum.* But no excretion is of more confequence to the patient's recovery than a free perfpiration; which is fo abfolutely neceffary, that unlefs fhe has a moifture continually on the furface of her body, for fome days after the birth, fhe feldom recovers to advantage: her health, therefore, in a great meafure, depends upon her enjoying undifturbed repofe, and a conftant breathing fweat, which prevents a fever, by carrying off the tenfion, and affifts the equal difcharge of the lochia: and when thefe are obftructed, and a fever enfues with pain and reftleffnefs, nothing relieves the patient fo effectually as reft and profufe fweating, procured by opiates and fudorifics at the beginning of the complaints; yet thefe laft muft be more cautioufly prefcribed in exceffive hot than in cool weather.

The laft of the nonnaturals to be confidered are the paffions of the mind, which alfo require particular attention. The patient's imagination muft not be difturbed by the news of any extraordinary accident which may have happened to her family or friends: for fuch information hath been known to carry off the labour-pains entirely, after they were begun, and the woman has funk under her dejection of fpirits: and, even after delivery, thefe unfeafonable communications have produced fuch anxiety as obftructed all the neceffary excretions, and brought on a violent fever and convulfions, that ended in death.

Floodings.

Chap. XVII. *Of violent Floodings.*

All women, when the placenta feparates, and after it is delivered, lofe more or lefs red blood, from the quantity of half a pound to that of one pound, or even two; but fhould it exceed this proportion, and continue to flow without diminution, the patient is in great danger of her life: this hazardous hæmorrhage is known by the violence of the difcharge, wetting frefh cloaths as faft as they can be applied; from the pulfe becoming low and weak, and the countenance turning pale; then the extremities grow cold, fhe finks into faintings, and, if the difcharge is not fpeedily ftopped or diminifhed, is feized with convulfions, which often terminate in death.

This dangerous efflux is occafioned by every thing that hinders the emptied uterus from contracting, fuch as great weaknefs and laffitude, in confequence of repeated floodings before delivery; the fudden evacuation of the uterus; fometimes, though feldom, it proceeds from part of the placenta's being left in the womb; it may happen when there is another child, or more, ftill undelivered; when the womb is kept diftended with a large quantity of coagulated blood; or when it is inverted by pulling too forcibly at the placenta.

In this cafe, as there is no time to be loft, and internal medicines cannot act fo fuddenly as to anfwer the purpofe, we muft have immediate recourfe to external application. If the diforder be owing to weaknefs, by which the uterus is difabled from contracting itfelf, fo that the mouths of the veffels are left open; or, though contracted a little, yet not enough to reftrain the hæmorrhage of the thin blood; or if, in feparating the placenta, the accoucheur has fcratched or tore the inner furface or membrane of the womb; in thefe cafes, fuch things muft be ufed as will affift the contractile power of the uterus, and hinder the blood from flowing fo faft into it and the neighbouring veffels; for this purpofe, cloths dipped in any cold aftringent fluid, fuch as oxycrate, or red tart wine, may be applied to the back and belly. Some prefcribe venefection in the arm, to the amount of five or fix ounces, with a view of making revulfion: if the pulfe is ftrong, this may be proper; otherwife, it will do more harm than good. Others order ligatures, for compreffing the returning veins at the hams, arms, and

After-pains and neck, to retain as much blood as poſſible in the extremities and head. Beſides theſe applications, the vagina may be filled with tow or linen-rags, dipped in the abovementioned liquids, in which a little alum, or ſachar-ſaturni hath been diſſolved: nay, ſome practitioners inject proof-ſpirits warmed, or, ſoaking them up in a rag or ſpunge, introduce and ſqueeze them into the uterus, in order to conſtringe the veſſels.

If the flooding proceeds from another child, the retention of the placenta, or coagulated blood, theſe ought immediately to be extracted; and if there is an inverſion of the uterus, it muſt be ſpeedily reduced. Should the hæmorrhage, by theſe methods, abate a little, but ſtill continue to flow, though not in ſuch a quantity as to bring on ſudden death, ſome red wine and jelly ought to be preſcribed for the patient, who ſhould take it frequently, and a little at a time; but above all things chicken or mutton broths, adminiſtered in the ſame manner, for fear of overloading the weakened ſtomach, and occaſioning retchings: theſe repeated in ſmall quantities, will gradually fill the exhauſted veſſels, and keep up the circulation. If the pulſe continues ſtrong, it will be proper to order repeated draughts of barley-water, acidulated with elixir vitriol: but if the circulation be weak and languid, extract of the bark, diſſolved in *aq. cinnamomi tenuis*, and given in ſmall draughts, or exhibited in any other form, will be ſerviceable; at the ſame time, lulling the patient to reſt with opiates. Theſe, indeed, when the firſt violence of the flood is abated, if properly and cautiouſly uſed, are generally more effectual than any other medicine.

Chap. XVIII. *Of the After-pains.*

After-pains commonly happen when the fibrous part of the blood is retained in the uterus or vagina, and formed into large clots, which are detained by the ſudden contraction of the os internum and externum, after the placenta is delivered: or, if theſe ſhould be extracted, others will ſometimes be formed, tho' not ſo large as the firſt, becauſe the cavity of the womb is continually diminiſhing after the birth. The uterus, in contracting, preſſes down theſe coagulums to the os internum; which being again gradually ſtretched, produces a degree of labour-pains, owing to the irritation of its nerves: in conſequence of this uneaſineſs, the woman ſqueezes the womb as in real labour; the force being increaſed, the clots are puſhed along, and when they are delivered ſhe grows eaſy. The larger the quantity is of the coagulated blood, the ſeverer are the pains, and the longer they continue.

Women in the firſt child ſeldom have after-pains; becauſe, after delivery, the womb is ſuppoſed to contract; and puſh off the clots with greater force in the firſt than in the following labours: after-pains may alſo proceed from obſtructions in the veſſels, and irritations at the os internum. In order to prevent or remove theſe pains, as ſoon as the placenta is ſeparated and delivered, the hand being introduced into the uterus, may clear it of all the coagula. When the womb is felt through the parietes of the abdomen larger than uſual, it may be taken for granted that there is either another child, or a large quantity of this clotted blood; and, which ſoever it may be, there is a neceſſity for its being extracted. If the placenta comes away of itſelf, and the after-pains are violent, they may be alleviated and carried off by an opiate: for, by ſleeping and ſweating plentifully, the irritation is removed, the evacuations are increaſed, the os uteri is inſenſibly relaxed, and the coagula ſlide eaſily along. When the diſcharge of the lochia is ſmall, the after-pains, if moderate, ought not to be reſtrained; becauſe the ſqueezing which they occaſion promotes the other evacuation, which is neceſſary for the recovery of the patient. After-pains may alſo proceed from an obſtruction in ſome of the veſſels, occaſioning a ſmall inflammation of the os internum and ligaments; and the ſqueezing thereby occaſioned may not only help to propel the obſtructing fluid, but alſo (if not too violent) contribute to the natural diſcharges.

Chap. XIX. *Of the Lochia.*

Lochia.

We have already obſerved, that the delivery of the child and placenta is followed by an efflux of more or leſs blood, diſcharged from the uterus, which, by the immediate evacuation of the large veſſels, is allowed to contract itſelf the more freely, without the danger of an inflammation, which would probably happen in the contraction, if the great veſſels were not emptied at the ſame time: but as the fluids in the ſmaller veſſels cannot be ſo ſoon evacuated, or returned into the vena cava, it is neceſſary that, after the great diſcharge is abated, a ſlow and gradual evacuation ſhould continue, until the womb ſhall be contracted to near the ſame ſize which it had before pregnancy; and to this it attains about the 18th or 20th day after delivery, though the period is different in different women.

When the large veſſels are emptied immediately after delivery, the diſcharge frequently ceaſes for ſeveral hours, until the fluids in the ſmaller veſſels are propelled into the larger, and then begins to flow again, of a paler colour.

The red colour of the lochia commonly continues till the fifth day, though it is always turning more and more ſerous from the beginning: but, about the fifth day, it flows off a clear, or ſometimes (though ſeldom) of a greeniſh tint; for, the mouths of the veſſels growing gradually narrower by the contraction of the uterus, at laſt allow the ſerous part only to paſs: as for the greeniſh hue, it is ſuppoſed to proceed from a diſſolution of the cellular or cribriform membrane or mucus, that ſurrounded the ſurface of the placenta and chorion; part of which, being left in the uterus, becomes livid, decays, and, diſſolving, mixes with and tinctures the diſcharge as it paſſes along.

Though the lochia, as we have already obſerved, commonly continue till the 18th or 20th day, they are every day diminiſhing in quantity, and ſooneſt ceaſe in thoſe women who ſuckle their children, or have had an extraordinary diſcharge at firſt; but the colour, quantity, and duration, differ in different women: in ſome patients, the red colour diſappears on the firſt or ſecond day; and in others, though rarely, it continues more or leſs to the end of the month: the evacuation in ſome is very ſmall, in others exceſſive: in one woman it ceaſes very ſoon, in another flows during

Milk fever. during the whole month: yet all of thefe patients fhall do well.

Some allege, that this difcharge from the uterus is the fame with that from a wound of a large furface; but it is more reafonable to fuppofe, that the change of colour and diminution of quantity proceed from the flow contraction of the veffels; becaufe, previous to pus, there muft have been lacerations and impofthumes, and, in women who have fuddenly died after delivery, no wound or excoriation hath appeared upon the inner furface of the womb, which is fometimes found altogether fmooth, and at other times rough and unequal, on that part to which the placenta adhered. The fpace that is occupied before the delivery, from being fix inches in diameter, or 18 inches in circumference, will, foon after the birth, be contracted to one third or fourth of thefe dimenfions.

Chap. XX. *Of the Milk-fever.*

About the fourth day, the breafts generally begin to grow turgid and painful. We have formerly obferved, that, during the time of uterine geftation, the breafts in moft women gradually increafe till the delivery, growing fofter as they are enlarged by the veffels being more and more filled with fluids; and by this gradual diftenfion they are prepared for fecreting the milk from the blood after delivery. During the two or three firft days after parturition, efpecially when the woman has undergone a large difcharge, the breafts have been fometimes obferved to fubfide and grow flaccid; and about the 3d or 4th day, when the lochia begin to decreafe, the breafts fwell again to their former fize, and ftretch more and more, until the milk, being fecreted, is either fucked by the child, or frequently of itfelf runs out at the nipples.

Moft of the complaints incident to women after delivery, proceed either from the obftruction of the lochia in the uterus, or of the milk in the breafts, occafioned by any thing that will produce a fever; fuch as catching cold, long and fevere labour, eating food that is hard of digeftion, and drinking fluids that quicken the circulation of the blood in the large veffels; by which means the fmaller, with all the fecretory and excretory ducts, are obftructed.

The difcharge of the lochia being fo different in women of different conftitutions, and befides in fome meafure depending upon the method of management, and the way of life peculiar to the patient, we are not to judge of her fituation from the colour, quantity, and duration of them, but from the other fymptoms that attend the difcharge; and if the woman feems hearty, and in a fair way of recovery, nothing ought to be done with a view to augment or diminifh the evacuation. If the difcharge be greater than fhe can bear, it will be attended with all the fymptoms of inanition; but as the lochia feldom flow fo violently as to deftroy the patient of a fudden, fhe may be fupported by a proper nourifhing diet, affifted with cordial and reftorative medicines. Let her, for example, ufe broths, jellies, and affes milk; if the pulfe is languid and funk, fhe may take repeated dofes of the *confect. cardiac.* with mixtures compofed of the cordial waters and volatile fpirits: fubaftringents and opiates frequently adminiftered, with the *cort. Peruvian.* in different forms, and auftere wines, are of great fervice. Milk-fever. On the other hand, when the difcharge is too fmall, or hath ceafed altogether, the fymptoms are more dangerous, and require the contrary method of cure: for now the bufinefs is to remove a too great plenitude of the veffels in and about the uterus, occafioning tenfion, pain, and labour, in the circulating fluids; from whence proceed great heat in the part, reftlefsnefs, fever, a full, hard, quick pulfe, pains in the head and back, naufea, and difficulty in breathing. Thefe complaints, if not at firft prevented, or removed by reft and plentiful fweating, muft be treated with venefection and the antiphlogiftic method.

When the obftruction is recent, let the patient lie quiet, and encourage a plentiful diaphorefis, by drinking frequently of warm, weak, diluting fluids, fuch as water-gruel, barley-water, tea, or weak chickenbroth.

Should thefe methods be ufed without fuccefs, and the patient, far from being relieved by reft, plentiful fweating, or a fufficient difcharge of the obftructed lochia, labour under an hot, dry fkin, anxiety, and a quick, hard, and full pulfe, the warm diaphoretics muft be laid afide; becaufe, if they fail of having the defired effect, they muft neceffarily increafe the fever and obftruction, and recourfe be had to bleeding at the arm or ankle to more or lefs quantity, according to the degree of fever and obftruction; and this evacuation muft be repeated as there is occafion. When the obftruction is not total, it is fuppofed more proper to bleed at the ankle than at the arm; and at this laft, when the difcharge is altogether ftopped, her ordinary drink ought to be impregnated with nitre.

If fhe is coftive, emollient and gently opening glyfters may be occafionally injected; and her breafts muft be fomented and fucked, either by the mouth or pipe-glaffes. If by thefe means the fever is abated, and the neceffary difcharges return, the patient commonly recovers; but if the complaints continue, the antiphlogiftic method muft ftill be purfued. If, notwithftanding thefe efforts, the fever is not diminifhed or removed by a plentiful difcharge of the lochia from the uterus, the milk from the breafts, or by a critical evacuation by fweat, urine, or ftool, and the woman is every now and then attacked with cold fhiverings; an abfcefs or abfceffes will probably be formed in the uterus or neighbouring parts, or in the breafts; and fometimes the matter will be tranflated to other fituations, and the feat of it foretold from the part's being affected with violent pains: thefe abfceffes are more or lefs dangerous, according to the place in which they happen, the largenefs of the fuppuration, and the good or bad conftitution of the patient.

If, when the pains in the epigaftric region is violent, and the fever increafed to a very high degree, the patient fhould all of a fudden enjoy a ceffation from pain, without any previous difcharge or critical eruption, the phyfician may pronounce that a mortification is begun; efpecially if, at the fame time, the pulfe becomes low, quick, wavering, and intermitting: if the woman's countenance, from being florid, turns dufky and pale, while fhe herfelf, and all the attendants, conceive her much mended; in that cafe, fhe will grow delirious,

Milk-fever. rious, and die in a very short time.

What we have said on this subject regards that fever which proceeds from the obstructed lochia, and in which the breasts may likewise be affected: but the milk-fever is that in which the breasts are originally concerned, and which may happen tho' the lochia continue to flow in sufficient quantity; nevertheless, they mutually promote each other, and both are to be treated in the manner already explained; namely, by opiates, diluents, and diaphoretics, in the beginning; and, these prescriptions failing, the obstructions must be resolved by the antiphlogistic method described above. The milk-fever alone, when the uterus is not concerned, is not so dangerous, and much more easily relieved. Women of an healthy constitution, who suckle their own children, have good nipples, and whose milk comes freely, are seldom or never subject to this disorder, which is more incident to those who do not give suck, and neglect to prevent the secretion in time; or, when the milk is secreted, take no measures for emptying their breasts. This fever likewise happens to women who try too soon to suckle, and continue their efforts too long at one time; by which means the nipples, and consequently the breasts, are often inflamed, swelled, and obstructed.

In order to prevent a too great turgency in the vessels of the breasts, and the secretion of milk, in those women who do not choose to suckle, it will be proper to make external application of those things which, by their pressure and repercussive force, will hinder the blood from flowing in too great quantity to this part, which is now more yielding than at any other time: for this purpose, let the breasts be covered with *emp. de minia*, *diapalma*, or *emp. simp.* spread upon linen, or cloths dipped in camphorated spirits, be frequently applied to these parts and the arm-pits; while the patient's diet and drink is of the lightest kind, and given in small quantities. Notwithstanding these precautions, a turgency commonly begins about the third day; but by rest, moderate sweating, and the use of these applications, the tension and pain will subside about the fifth or sixth day, especially if the milk runs out at the nipples: but if the woman catches cold, or is of a full habit of body, and not very abstemious, the tension and pain increasing, will bring on a cold shivering succeeded by a fever; which may obstruct the other excretions, as well as those of the breast.

In this case, the sudorifics above recommended must be prescribed; and if a plentiful sweat ensues, the patient will be relieved; at the same time the milk must be extracted from her breasts, by sucking with the mouth or glasses: should these methods fail, and the fever increase, she ought to be blooded in the arm; and instead of the external applications hitherto used, emollient liniments and cataplasms must be substituted, in order to soften and relax. If, in spite of these endeavours, the fever proceeds for some days, the patient is frequently relieved by critical sweats, a large discharge from the uterus, miliary eruptions, or loose stools mixed with milk, which is curdled in the intestines; but should none of these evacuations happen, and the inflammation continue with increasing violence, there is danger of an imposthume, which is to be brought to maturity, and managed like other inflammatory tumours; and no astringents ought to be applied, lest they should produce schirrhous swellings in the glands. Evacuations.

As the crisis of this fever, as well as of that last described, often consists in miliary eruptions over the whole surface of the body, but particularly on the neck and breast, by which the fever is carried off, nothing ought to be given which will either greatly increase or diminish the circulating force, but such only as will keep out the eruptions. But if, notwithstanding these eruptions, the fever, instead of abating, is augmented, it will be necessary to diminish its force, and prevent its increase, by those evacuations we have mentioned above. On the contrary, should the pulse sink, the eruptions begin to retreat inwardly, and the morbific matter be in danger of falling upon the viscera, we must endeavour to keep them out by opiates and sudorific medicines; and here blisters may be applied with success.

Chap. XXI. *Of the Evacuations necessary at the end of the Month after Delivery.*

Those who have had a sufficient discharge of the lochia, plenty of milk, and suckle their own children, commonly recover with ease, and, as the superfluous fluids of the body are drained off at the nipples, seldom require evacuations at the end of the month; but if there are any complaints from fullness, such as pains and stitches, after the 20th day, some blood ought to be taken from the arm, and the belly gently opened by frequent glysters, or repeated doses of laxative medicines.

If the patient has tolerably recovered, the milk having been at first sucked or discharged from the nipples, and afterwards discussed, no evacuations are necessary before the third or fourth week; and sometimes not till after the first flowing of the menses, which commonly happens about the fifth week; if they do not appear within that time, gentle evacuations must be prescribed, to carry off the plethora, and bring down the catamenia.

EXPLANATION of the PLATES.

Fig. 1. gives a front-view of the uterus *in situ* suspended in the vagina; the anterior parts of ossa ischium, with the ossa pubis; pudenda, perinæum, and anus, being removed in order to shew the internal parts. Plate CLXXVIII.

A, the last vertebra of the loins.

BB, the ossa ilium.

CC, the acetabula.

DD, the inferior and posterior parts of the ossa ischium.

E, the part covering the extremity of the coccyx.

F, the inferior part of the rectum.

GG, the vagina cut open longitudinally, and stretched on each side of the collum uteri, to shew in what manner the uterus is suspended in the same.

HH, part of the vesica urinaria stretched on each side of the vagina, and inferior part of the fundus uteri.

I, the collum uteri.

K, the fundus uteri.

LL, the tubi Fallopiani and fimbriæ.

MM, the ovaria.

NN, the

Explanat. of Plates.

NN, the ligamenta lata and rotunda.

OO, the fuperior part of the rectum.

Fig. 2. gives a front-view of the uterus in the beginning of the firft month of pregnancy; the anterior part being removed that the embryo might appear through the amnios, the chorion being diffected off.

A, the fundus uteri.

B, the collum uteri, with a view of the rugous canal that leads to the cavity of the fundus.

C, the os uteri.

Fig. 3. In the fame view and fection of the parts as in fig. 1. fhews the uterus as it appears in the fecond or third month of pregnancy.

F, the anus.

G, the vagina, with its plicæ.

HH, the pofterior and inferior part of the urinary bladder extended on each fide; the anterior and fuperior part being removed.

II, the mouth and neck of the womb, as raifed up when examining the fame by the touch, with one of the fingers in the vagina.

KK, the uterus as ftretched in the fecond or third month, containing the embryo, with the placenta adhering to the fundus.

Fig. 4. In the fame view and fection of the parts with the former figures, reprefents the uterus in the eighth or ninth month of pregnancy.

A, the uterus as ftretched to near its full extent, with the waters, and containing the fœtus entangled in the funis, the head prefenting at the upper part of the pelvis.

BB, the fuperior part of the offa ilium.

CC, the acetabula.

DD, the remaining pofterior parts of the offa ifchium.

E, the coccyx.

F, the inferior part of the rectum.

GGG, the vagina ftretched on each fide.

H, the os uteri, the neck being ftretched to its full extent or entirely obliterated.

II, part of the vefica urinaria.

KK, the placenta, at the fuperior and pofterior part of the uterus.

LL, the membranes.

M, the funis umbilicalis.

Fig. 5. gives a front view of twins *in utero* in the beginning of labour.

A, the uterus as ftretched, with the membranes and waters.

BB, the fuperior parts of the offa ilium.

CC, the acetabula.

DD, the offa ifchium.

E, the coccyx.

F, the lower part of the rectum.

GG, the vagina.

H, the os internum ftretched open about a finger-breadth, with the membranes and waters in time of labour-pains.

II, The inferior part of the uterus, ftretched with the waters which are below the head of the child that prefents.

KK, the two placentas adhering to the pofterior part of the uterus, the two fœtufes lying before them, one with its head in a proper pofition at the inferior part of the uterus, and the other fituated preternaturally with the head to the fundus: the bodies of each are here entangled in their proper funis, which frequently happens in the natural as well as preternatural pofitions.

LLL, the membranes belonging to each placenta.

Fig. 6. fhews, in a lateral view and longitudinal divifion of the parts, the gravid uterus when labour is fomewhat advanced.

A, the loweft vertebra of the back; the diftance from which to the laft-mentioned vertebra is here fhewn by dotted lines.

CC, the ufual thicknefs and figure of the uterus when extended by the waters at the latter end of pregnancy.

D, the fame contracted and grown thicker after the waters are evacuated.

EE, the figure of the uterus when pendulous.

FF, the figure of the uterus when ftretched higher than ufual, which generally occafions vomitings and difficulty of breathing.

G, the os pubis of the left fide.

HH, the os internum.

I, the vagina.

K, the left nympha.

L, the labium pudendi of the fame fide.

M, The remaining portion of the bladder.

N, the anus.

OP, the left hip and thigh.

Fig. 7. fhews the forehead of the fœtus turned backwards to the os facrum, and the occiput below the pubes, by which means the narrow part of the head is to the narrow part of the pelvis, that is, between the inferior parts of the offa ifchium.

A, the uterus contracted clofely to the fœtus after the waters are evacuated.

BCD, the vertebræ of the loins, os facrum, and coccyx.

E, the anus.

F, the left hip.

G, the perinæum.

H, the os externum beginning to dilate.

I, the os pubis of the left fide.

K, the remaining portion of the bladder.

L, the pofterior part of the os uteri.

Fig. 1. is principally intended to fhew in what manner the perinæum and external parts are ftretched by the head of the fœtus, in a firft pregnancy, towards the end of the labour. Plate CLXXIX.

A, the abdomen.

B, the labia pudendi.

C, the clitoris and its preputium.

D, the hairy fcalp of the fœtus, fwelled at the vertex, in a laborious cafe, and protruded to the os externum.

E, F, the perinæum and anus pufhed out by the head of the fœtus in form of a large tumour.

GG, the parts that cover the tuberofities of the offa ifchium.

H, the part that covers the os coccygis.

Fig. 2. fhews in what manner the head of the fœtus is helped along with the forceps, as artificial hands, when it is neceffary for the fafety of either mother or child.

AABC, the vertebræ of the loins, os facrum, and coccyx.

D, the

A. Bell. Sc.

Explanat. of Plates.

D, the os pubis of the left fide.

E, the remaining part of the bladder.

FF, the inteftinum rectum.

GGG, the uterus.

H, the mons veneris.

I, the clitoris, with the left nymph.

X, the corpus cavernofum clitoridis.

V, the meatus urinarius.

K, the left labium pudendi.

L, the anus.

N, the perinæum.

QP, the left hip and thigh.

R, the fkin and mufcular parts of the loins.

Fig. 3. fhews the head of the fœtus, by ftrong labour-pains, fqueezed into a longifh form, with a tumour on the vertex, from a long compreffion of the head in the pelvis.

K, the tumour on the vertex.

L, the forceps.

M, the vefica urinaria much diftended with a large quantity of urine from the long preffure of the head againft the urethra.

N, the under part of the uterus.

OO, the os uteri.

Fig. 4. fhews, in the lateral view, the face of the child prefenting and forced down into the lower part of the pelvis, the chin being below the pubes, and the vertex in the concavity of the os facrum: the water being likewife all difcharged, the uterus appears clofely joined to the body of the child.

Fig. 5. fhews, in a lateral view, the head of the child in the fame pofition as in the former figure.

AB, the vertebræ of the loins, os facrum, and coccyx.

C, the os pubis of the left fide.

D, the inferior part of the rectum.

E, the perinæum.

F, the left labium pudendi.

GGG, the uterus.

Fig. 6. gives a lateral internal view of a diftorted pelvis, divided longitudinally, with the head of a fœtus of the feventh month paffing the fame.

ABC, the os facrum and coccyx.

D, the os pubis of the left fide.

E, the tuberofity of the os ifchium of the fame fide.

Fig. 7. gives a fide-view of a diftorted pelvis, divided longitudinally, with the head of a full grown fœtus fqueezed into the brim, the parietal bones decuffating each other, and compreffed into a conical form.

ABC, the os facrum and coccyx.

D, the os pubis of the left fide.

E, the tuberofity of the os ifchium.

F, the proceffus acutus.

G, the foramen magnum.

Plate CLXXX. Fig. 1. fhews, in a front view of the pelvis, the breech of the fœtus prefenting, and dilating the os internum, the membranes being too foon broke.

Fig. 2. is the reverfe of fig. 1. the fore-parts of the child being to the fore-part of the uterus.

Fig. 3. reprefents, in a front-view of the pelvis, the fœtus compreffed, by the contraction of the uterus, into a round form, the fore-parts of the former being towards the inferior part of the latter, and one foot and hand fallen down into the vagina. In this figure, the anterior part of the pelvis is removed, by a longitudinal fection through the middle of the foramen magnum.

AA, the fuperior parts of the offa ilium.

BB, the uterus.

C, the mouth of the womb ftretched and appearing in

OOOO, the vagina.

D, the inferior and pofterior part of the os externum.

EEEE, the remaining parts of the offa pubis and ifchium.

FFFF, the membrana adipofa.

Fig. 4. reprefents, in the fame view with fig. 3. the fœtus in the contrary pofition; the breech and fore-parts being towards the fundus uteri, the left arm in the vagina, and the fore-arm without the os externum, the fhoulder being likewife forced into the os uteri.

Fig. 5. reprefents, in a lateral view of the pelvis, the method of extracting, by means of a curved crotchet, the head of the fœtus, when left in the uterus, after the body is delivered and feparated from it; either by its being too large, or the pelvis too narrow.

ABC, the os facrum and coccyx.

D, the os pubis of the left fide.

EE, the uterus.

F, the locking part of the crotchet.

g, h, i, the point of the crotchet on the infide of the cranium.

Fig. 6. reprefents the forceps and blunt-hook.

A, the ftreight forceps, in the exact proportion as to the width between the blades, and length from the points to the locking-part; the firft being two and the fecond fix inches, which, with three inches and a half, (the length of the handles), make in all eleven inches and a half.

B reprefents the pofterior part of a fingle blade in order to fhew the width and length of the open part of the fame, and the form and dimenfions of the whole.

C, the blunt hook, which is ufed for three purpofes: 1. To affift the extraction of the head, after the cranium is opened with the fciffars, by introducing the fmall end along the ear on the outfide of the head to above the under-jaw, where the point is to be fixed; the other extremity of the hook being held with one hand, whilft two fingers of the other are to be introduced into the forefaid opening, by which holds the head is to be gradually extracted. 2. The fmall end is ufeful in abortions, in any of the firft four or five mouths, to hook down the fecundines, when lying loofe in the uterus, when they cannot be extracted by the fingers or labour-pains, and when the patient is much weakened by floodings. 3. The large hook at the other end is ufeful to affift the extraction of the body, when the breech prefents; but fhould be ufed with great caution, to avoid the diflocation or fracture of the thigh.

Fig. 7. A reprefents the whale-bone fillet, which may be fometimes ufeful in laborious cafes, when the operator is not provided with the forceps, in fudden and unexpected exigencies.

BB, two views of a peffary for the prolapfus uteri. After the uterus is reduced, the large end of the peffary is to be introduced into the vagina, and the os uteri retained in the concave part, where there are three holes

Explanat. of Plates.

holes to prevent the ſtagnation of any moiſture. The ſmall end without the os externum has two tapes drawn through the two holes, which are tied to four other tapes, that hang down from a belt that ſurrounds the woman's body, and by this means keep up the peſſary. This peſſary may be taken out by the patient when ſhe goes to bed, and introduced again the morning; but as this ſometimes rubs the os externum, ſo as to make its uſe uneaſy, the round kind, marked C, are of more general uſe. They are made of wood, ivory, or cork, (the laſt covered with cloth and dipped in wax:) the peſſary is to be lubricated with pomatum, the edge forced through the paſſage into the vagina, and a finger introduced in the hole in the middle lays it acroſs within the os externum. They ought to be larger or ſmaller, according to the wideneſs or narrowneſs of the paſſage, to prevent their being forced out by any extraordinary ſtraining.

DD gives two views of a female catheter, to ſhew its degree of curvature and different parts.

Fig. 8. *a*, repreſents a pair of curved crotchets locked together in the ſame manner as the forceps. The dotted lines along the inſide of one of the blades repreſent a ſheath contrived to guard the point till it is introduced high enough: the ligature at the handles marked with two dotted lines is then to be untied, the ſheath withdrawn, and the point being uncovered is fixed as in fig. 5.

b, gives a view of the back-part of one of the crotchets, which is 12 inches long.

c, a front view of the point, to ſhow its proportional length and breadth.

d, the ſciſſars for perforating the cranium in very narrow and diſtorted pelviſes. They ought to be made very ſtrong, and at leaſt nine inches in length, with ſtops or reſts in the middle of the blades, by which a large dilatation is more eaſily made.

Migdol || Migration.

MIGDOL, or MAGDOL, (anc. geog.), a place in the Lower Egypt, on this ſide Pihahiroth, or between it and the Red-Sea, towards its extremity. The term denotes a tower or fortreſs. It is probably the *Magdolus* of Herodotus; ſeeing the Septuagint render it by the ſame name.

MIGNARD (Nicholas), a very ingenious French painter, born at Troyes in 1628; but, ſettling at Avignon, is generally diſtinguiſhed from his brother Peter by the appellation of *Mignard of Avignon*. He was afterwards employed at court and at Paris, where he became rector of the royal academy of painting. There are a great number of his hiſtorical pieces and portraits in the palace of the Tuilleries. He died in 1690.

MIGNARD (Peter), the brother of Nicholas, was born at Troyes in 1610; and acquired ſo much of the taſte of the Italian ſchool as to be known by the name of the *Roman*. He was generally allowed to have a ſuperior genius to his brother Nicholas; and had the honour of painting the popes Alexander VII. and Urban VIII. beſides many of the nobility at Rome, and divers of the Italian princes: his patron, Lewis, ſat ten times to him for his portrait, and reſpected his talents ſo much as to ennoble him, make him his principal painter after the death of Le Brun, and appoint him director of the manufactories. He died in 1695; and many of his pieces are to be ſeen at St Cloud.

MIGNON (Abraham), a celebrated painter, born at Francfort, acquired a great reputation by his ſkill in repreſenting flowers, fruits, inſects, flies, birds, and fiſhes. His colouring is admirable; and the dew ſpread on the flowers is ſo well imitated in his pictures, that one is tempted to take hold of them.

MIGRATION, the paſſage or removal of a thing out of one place into another.

MIGRATION *of Birds*.—It has been generally believed that many different kinds of birds annually paſs from one country to another, and ſpend the ſummer or the winter where it is moſt agreeable to them; and that even the birds of our own iſland will ſeek the moſt diſtant ſouthern regions of Africa, when directed by a peculiar inſtinct to leave their own country. It hath long been an opinion pretty generally received, that ſwallows reſide during the winter-ſeaſon in the warm ſouthern regions; and Mr Adanſon particularly relates his having ſeen them at Senegal when they were obliged to leave this country. But beſides the ſwallow, Mr Pennant enumerates many other birds which migrate from Britain at different times of the year, and are then to be ſound in other countries; after which they again leave theſe countries, and return to Britain. The reaſon of theſe migrations he ſuppoſes to be a defect of food at certain ſeaſons of the year, or the want of a ſecure aſylum from the perſecution of man during the time of courtſhip, incubation, and nutrition.—The following is his liſt of the migrating ſpecies.

Migration.

1. *Crows*. Of this genus, the hooded crow migrates regularly with the woodcock. It inhabits North Britain the whole year: a few are ſaid annually to breed on Dartmoor, in Devonſhire. It breeds alſo in Sweden and Auſtria: in ſome of the Swediſh provinces it only ſhifts its quarters, in others it reſides throughout the year. Our author is at a loſs for the ſummer retreat of thoſe which viſit us in ſuch numbers in winter, and quit our country in the ſpring; and for the reaſon why a bird, whoſe food is ſuch that it may be found at all ſeaſons in this country, ſhould leave us.

2. *Cuckoo*. Diſappears early in autumn; the retreat of this and the following bird is quite unknown to us.

3. *Wryneck*. Is a bird that leaves us in the winter. If its diet be ants alone, as ſeveral aſſert, the cauſe of its migration is very evident. This bird diſappears before winter, and reviſits us in the ſpring a little earlier than the cuckoo.

4. *Hoopoe*. Comes to England but by accident: Mr Pennant once indeed heard of a pair that attempted to make their neſt in a meadow at Selborne, Hampſhire, but were frighted away by the curioſity of people. It breeds in Germany.

5. *Grous*. The whole tribe, except the quail, lives here all the year round: that bird either leaves us, or elſe retires towards the ſea-coaſts.

6. *Pigeons*. Some few of the ring-doves breed here; but the multitude that appears in the winter, is ſo diſproportioned to what continue here the whole year, as to make it certain that the greateſt part quit the

the country in the fpring. It is moft probable they go to Sweden to breed, and return from thence in autumn; as Mr Ekmark informs us they entirely quit that country before winter. Multitudes of the common wild pigeons alfo make the northern retreat, and vifit us in winter; not but numbers breed in the high cliffs in all parts of this ifland. The turtle alfo probably leaves us in the winter, at leaft changes its place, removing to the fouthern counties.

7. *Stare.* Breeds here. Poffibly feveral remove to other countries for that purpofe, fince the produce of thofe that continue here feems unequal to the clouds of them that appear in winter. It is not unlikely that many migrate into Sweden, where Mr Berger obferves they return in fpring.

8. *Thrufhes.* The fieldfare and the redwing breed and pafs their fummers in Norway and other cold countries; their food is berries, which abounding in our kingdoms, tempts them here in the winter. Thefe two and the Royfton crow are the only land-birds that regularly and conftantly migrate into England, and do not breed here. The hawfinch and crofsbill come here at fuch uncertain times as not to deferve the name of *birds of paffage.*

9. *Chatterer.* The chatterer appears annually about Edinburgh in flocks during winter; and feeds on the berries of the mountain-afh. In South Britain it is an accidental vifitant.

10. *Grofbeaks.* The grofbeak and crofsbill come here but feldom; they breed in Auftria. The pine grofbeak probably breeds in the forefts of the Highlands of Scotland.

11. *Buntings.* All the genus inhabits England throughout the year; except the greater brambling, which is forced here from the north in very fevere feafons.

12. *Finches.* All continue in fome parts of thefe kingdoms, except the fifkin, which is an irregular vifitant, faid to come from Ruffia. The linnets fhift their quarters, breeding in one part of this ifland, and remove with their young to others. All finches feed on the feeds of plants.

13. *Larks, fly-catchers, wagtails, and warblers.* All of thefe feed on infects and worms; yet only part of them quit thefe kingdoms; though the reafon of migration is the fame to all. The nightingale, blackcap, fly-catcher, willow-wren, wheat-ear, and whitethroat, leave us before winter, while the fmall and delicate golden-crefted wren braves our fevereft frofts. The migrants of this genus continue longeft in Great Britain in the fouthern counties, the winter in thofe parts being later than in thofe of the north; Mr Stillingfleet having obferved feveral wheat-ears in the ifle of Purbeck on the 18th of November. As thefe birds are incapable of very diftant flights, Spain, or the fouth of France, is probaby their winter-afylum.

14. *Swallows and goat-fucker.* Every fpecies difappears at the approach of winter.

WATER-FOWL.

Of the vaft variety of water-fowl that frequent Great Britain, it is amazing to reflect how few are known to breed here: the caufe that principally urges them to leave this country, feems to be not merely the want of food, but the defire of a fecure retreat. Our country is too populous for birds fo fhy and timid as the bulk of thefe are: when great part of our ifland was a mere wafte, a tract of woods and fen; doubtlefs many fpecies of birds (which at this time migrate) remained in fecurity throughout the year. Egrets, a fpecies of heron, now fcarce known in this ifland, were in former times in prodigious plenty; and the crane, that has totally forfaken this country, bred familiarly in our marfhes: their place of incubation, as well as of all other cloven-footed water-fowl (the heron excepted) being on the ground, and expofed to every one: as rural œconomy increafed in this country, thefe animals were more and more difturbed; at length, by a feries of alarms, they were neceffitated to feek, during the fummer, fome lonely fafe habitation.

On the contrary, thofe that build or lay in the almoft inacceffible rocks that impend over the Britifh feas, breed there ftill in vaft numbers, having little to fear from the approach of mankind: the only difturbance they meet with in general being from the defperate attempts of fome few to get their eggs.

CLOVEN-FOOTED WATER-FOWL.

15. *Herons.* The white heron is an uncommon bird, and vifits us at uncertain feafons; the common kind and the bittern never leave us.

16. *Curlews.* The curlew breeds fometimes on our mountains; but, confidering the vaft flights that appear in winter, it is probable that the greater part retire to other countries: the whimbrel breeds on the Grampian hills, in the neighbourhood of Invercauld.

17. *Snipes.* The woodcock breeds in the moift woods of Sweden, and other cold countries. Some fnipes breed here, but the greateft part retire elfewhere; as do every other fpecies of this genus.

18. *Sandpipers.* The lapwing continues here the whole year; the ruff breeds here, but retires in winter; the redfhank and fandpiper breed in this country, and refide here. All the others abfent themfelves during fummer.

19. *Plovers and oyfter-catcher.* The long-legged plover and fanderling vifit us only in winter; the dottrel appears in fpring and in autumn; yet, what is very fingular, we do not find it breeds in South Britain. The oyfter-catcher lives with us the whole year. The Norfolk plover and fea-lark breed in England. The green plover breeds on the mountains of the north of England, and on the Grampian hills.

We muft here remark, that every fpecies of the genera of curlews, woodcocks, fandpipers, and plovers, that forfake us in the fpring, retire to Sweden, Poland, Pruffia, Norway, and Lapland, to breed: as foon as the young can fly, they return to us again, becaufe the frofts which fet in early in thofe countries totally deprive them of the means of fubfifting; as the drynefs and hardnefs of the ground, in general, during our fummer, prevent them from penetrating the earth with their bills, in fearch of worms, which are the natural food of thefe birds. Mr Ekmark fpeaks thus of the retreat of the whole tribe of cloven-footed water fowl out of his country (Sweden) at the approach of winter; and Mr Klein gives much the fame account of thofe of Poland and Pruffia.

20. *Rails and gallinules.* Every fpecies of thefe two genera continue with us the whole year; the land-rail excepted, which is not feen here in winter. It likewife continues in Ireland only during the fummer-months, when

Migration.

when they are very numerous, as Mr Smith tells us in the *Hiſtory of Waterford*, p. 336. Great numbers appear in Angleſea the latter end of May; it is ſuppoſed that they paſs over from Ireland, the paſſage between the two iſlands being but ſmall. As we have inſtances of theſe birds lighting on ſhips in the channel and the Bay of Biſcay, we may conjecture their winter-quarters to be in Spain.

FINNED-FOOTED WATER-BIRDS.

21. *Phalaropes*. Viſit us but ſeldom; their breeding place is Lapland, and other arctic regions.

22. *Grebes*. The great-creſted grebe, the black and white grebe, and little grebe, breed with us, and never migrate; the others viſit us accidentally, and breed in Lapland.

WEB-FOOTED BIRDS.

23. *Avoſet*. Breed near Foſsdike in Lincolnſhire; but quit their quarters in winter. They are then ſhot in different parts of the kingdom, which they viſit, not regularly, but accidentally.

24. *Auks and guillemots*. The great auk or pinguin ſometimes breeds in St Kilda. The auk, the guillemot, and puffin, inhabit moſt of the maritime cliffs of Great Britain, in amazing numbers, during ſummer. The black guillemot breeds in the Baſs Iſle, and in St Kilda, and ſometimes in Llandidno rocks. We are at a loſs for the breeding place of the other ſpecies; neither can we be very certain of the winter reſidence of any of them, excepting of the leſſer guillemot and black-billed auk, which, during winter, viſit in vaſt flocks the Frith of Forth.

25. *Divers*. Theſe chiefly breed in the lakes of Sweden and Lapland, and ſome in countries near the pole; but ſome of the red-throated divers, the northern and the imber, may breed in the north of Scotland and its iſles.

26. *Terns*. Every ſpecies breeds here; but leaves us in the winter.

27. *Petrels*. The fulmar breeds in the Iſle of St Kilda, and continues there the whole year, except September and part of October: the ſhearwater viſits the Iſle of Man in April; breeds there; and, leaving it in Auguſt or the beginning of September, diſperſes over all parts of the Atlantic ocean. The ſtormfinch is ſeen at all diſtances from land on the ſame vaſt watery tract; nor is ever found near the ſhore except by ſome very rare accident, unleſs in the breeding ſeaſon. Mr Pennant found it on ſome little rocky iſles, off the north of Skie. It alſo breeds in St Kilda. He alſo ſuſpects that it neſtles on the Blaſquet Iſles off Kerry, and that it is the gourder of Mr Smith.

28. *Merganſers*. This whole genus is mentioned among the birds that fill the Lapland lakes during ſummer. Mr Pennant has ſeen the young of the red-breaſted in the north of Scotland: a few of theſe, and perhaps of the gooſanders, may breed there.

29. *Ducks*. Of the numerous ſpecies that form this genus, we know of few that breed here. The ſwan and gooſe, the ſhield-duck, the eider-duck, a few ſhovelers, garganies, and teals, and a very ſmall portion of the wild ducks.

The reſt contribute to form that amazing multitude of water-fowl that annually repair from moſt parts of Europe to the woods and lakes of Lapland and other arctic regions, there to perform the functions of incubation and nutrition in full ſecurity. They and their young quit their retreat in September, and diſperſe themſelves over Europe. With us they make their appearance the beginning of October; circulate firſt round our ſhores; and, when compelled by ſevere froſt, betake themſelves to our lakes and rivers. Of the web-footed fowl there are ſome of hardier conſtitutions than others: theſe endure the ordinary winters of the more northern countries; but when the cold reigns there with more than common rigour, repair for ſhelter to theſe kingdoms: this regulates the appearance of ſome of the diver kind, as alſo of the wild ſwans, the ſwallow-tailed ſhield-duck, and the different ſorts of gooſeanders which then viſit our coaſts. Barentz found the barnacles with their neſts in great numbers in Nova Zembla. *Collect. Voy. Dutch Eaſt-India Company*, 8vo. 1703. p. 19. Cluſius, in his *Exot.* 368. alſo obſerves, that the Dutch diſcovered them on the rocks of that country and in Waygate Straits. They, as well as the other ſpecies of wild-geeſe, go very far north to breed, as appears from the hiſtories of Greenland and Spitzbergen, by Egede and Crantz. Theſe birds ſeem to make Iceland a reſting place, as Horrebow obſerves: few continue there to breed, but only viſit that iſland in the ſpring, and after a ſhort ſtay retire ſtill further north.

30. *Corvorants*. The corvorant and ſhag breed on moſt of our high rocks: the gannet in ſome of the Scotch iſles, and on the coaſt of Kerry: the two firſt continue on our ſhores the whole year. The gannet diſperſes itſelf all round the ſeas of Great Britain, in purſuit of the herring and pilchard, and even as far as the Tagus to prey on the ſardina.

But of the numerous ſpecies of fowl here enumerated, it may be obſerved how very few entruſt themſelves to us in the breeding ſeaſon, and what a diſtant flight they make to perform the firſt great dictate of nature.

There ſeems to be ſcarcely any but what we have traced to Lapland, a country of lakes, rivers, ſwamps, and alps, covered with thick and gloomy foreſts, that afford ſhelter during ſummer to theſe fowls, which in winter diſperſe over the greateſt part of Europe. In thoſe arctic regions, by reaſon of the thickneſs of the woods, the ground remains moiſt and penetrable to the woodcocks, and other ſlender-billed fowl: and for the web-footed birds, the waters afford larvæ innumerable of the tormenting knat. The days there are long; and the beautiful meteorous nights indulge them with every opportunity of collecting ſo minute a food: whilſt mankind is very ſparingly ſcattered over that vaſt northern waſte.

Why then ſhould Linnæus, the great explorer of theſe rude deſarts, be amazed at the myriads of water-fowl that migrated with him out of Lapland? which exceeded in multitude the army of Xerxes; covering, for eight whole days and nights, the ſurface of the river Calix. His partial obſervation as a botaniſt, would confine their food to the vegetable kingdom, almoſt denied to the Lapland waters; inattentive to a more plenteous table of inſect-food, which the all-bountiful Creator had ſpread for them in the wilderneſs. It may be remarked, that the lakes of mountainous rocky countries in general are deſtitute of plants: few or none are ſeen on thoſe of Switzerland; and Linnæus

makes

makes the ſame obſervation in reſpect to thoſe of Lapland; having, during his whole tour, diſcovered only a ſingle ſpecimen of a *lemna triſulca*, or "ivy-leaved duck's meat," *Flora Lap.* n° 470.; a few of the *ſcirpus lacuſtris*, or "bullruſh," n° 18.; the *alopecurus geniculatus*, or "flote foxtail graſs," n° 38.; and the *ranunculus aquatilis*, n° 234.; which are all he enumerates in his *Prolegomena* to that excellent performance.

Under the article HIRUNDO, we have given the principal arguments for and againſt the migration of ſwallows. Here we ſhall give a ſhort abſtract of the arguments uſed by the Hon. Daines Barrington againſt the migration of birds in general, from a paper publiſhed by him in the 62d volume of the Philoſophical Tranſactions. This gentleman denies, that any well-atteſted inſtances can be produced of this ſuppoſed migration, which, if there were any ſuch periodical flight, could not poſſibly have eſcaped the frequent obſervation of ſeamen. It has indeed been aſſerted that birds of paſſage become inviſible in their flight, becauſe they riſe too high into the air to be perceived, and becauſe they chooſe the night for their paſſage. The author, however, expreſſes his doubts "whether any bird was ever ſeen to riſe to a greater height than perhaps twice that of St Paul's croſs;" and he further endeavours to ſhew, that the extent of ſome of theſe ſuppoſed migrations (from the northern parts of Europe, for inſtance, to the line) is too great to be accounted for, by having recourſe to the argument founded on a nocturnal paſſage.

The author next recites, in a chronological order, all the inſtances that he has been able to collect, of birds having been actually ſeen by mariners when they were croſſing a large extent of ſea; and he endeavours to ſhew that no ſtreſs can be laid on the few caſual obſervations of this kind that have been produced in ſupport of the doctrine of a regular and periodical migration.

Mr Barrington afterwards proceeds to invalidate M. Adanſon's celebrated obſervation with reſpect to the migration of the ſwallow in particular, and which has been conſidered by many as perfectly deciſive of the preſent queſtion. He endeavours to ſhew that the four ſwallows which that naturaliſt caught, on their ſettling upon his ſhip, on the 6th of October at about the diſtance of 50 leagues from the coaſt of Senegal, and which he ſuppoſes to have been then proceeding from Europe to paſs the winter in Africa, could not be true European ſwallows; or, if they were, could not have been on their return from Europe to Africa. His objections are founded principally on ſome proofs which he produces of M. Adanſon's want of accuracy on this ſubject, which has led him, in the preſent inſtance, to miſtake two African ſpecies of the ſwallow-tribe, deſcribed and engraved by Briſſon, for European ſwallows, to which they bear a general reſemblance: or granting even that they were European ſwallows, he contends, that they were flitting from the Cape de Verd Iſlands to the coaſt of Africa; "to which ſhort flight, however, they were unequal, and accordingly fell into the ſailor's hands."

After many obſervations and reflections on the ſubject, the author endeavours to ſupport the opinion that ſwallows, and perhaps ſome other ſuppoſed birds of paſſage, remain with us during the winter in a torpid ſtate; obſerving that, notwithſtanding the great care which they take to conceal themſelves, it is certain that they have been frequently found, during the period of their ſuppoſed abſence, lying hid in caverns, or hollow trees, and even under water. Beſides other inſtances, well known to thoſe who have attended to this ſubject, the author gives us the teſtimony of Mr Stephens A. S. S. who aſſured him that he had himſelf picked up a cluſter of three or four ſwallows (or martins) out of a pond of his father's at Shrivenham in Berkſhire, in the month of February; that they were caked together in the mud; and that, on carrying them into the kitchen, they ſoon flew about the room, in the preſence of his father, mother, and others. The ſame fact was afterwards confirmed to the author by Dr Pye, who was then Mr Stephens's ſchool-fellow at Shrivenham, and by another gentleman who now lives in that village.

It may naturally be aſked, why ſwallows, in particular, are not frequently thus found in their torpid ſtate. In anſwer to this queſtion the author obſerves, that the ſame inſtinct which prompts the bird thus to conceal itſelf, inſtructs it to chooſe ſuch a place of ſecurity, that common accidents will not diſcover it;—that ponds are ſeldom cleaned in the winter, as it is ſuch cold work for the labourers;—that facts of this ſort are little attended to; and that the common labourers who have the beſt chance of finding torpid birds, make no mention of the diſcovery to others, as they conſider it as a thing of courſe, and conſequently not intereſting to any one. He adds, that ſwallows may be conſtantly taken in the month of October, and even ſo late as November, during the dark night, while they ſit on the willows in the Thames; and that one may almoſt inſtantaneouſly fill a large ſack with them, becauſe at this time they will not ſtir from the twigs when you lay your hands upon them. This, ſays the author, looks very much like their beginning to be torpid, before they hide themſelves under the water.

To this argument, however, the monthly reviewers oppoſe the following, which appears to them deciſive in favour of migration. The ſwallow, it is ſuppoſed, like other birds, moults once a-year at leaſt: but during the whole time this bird is ſeen with us, it appears in full feather. The proceſs of moulting, therefore, muſt be performed ſomewhere: but as it is abſurd to ſuppoſe that this great change can be effected in theſe birds while they are lying aſleep, or torpid in caverns and hollow-trees, or immerſed in cluſters in the mud at the bottom of ponds or rivers, they muſt moult in ſome diſtant country, to which they retire when they diſappear in theſe parts.

MIGRATION *of Fiſhes*. See CLUPEA.

St MIGUEL, one of the Azore iſlands, ſituated in W. Long. 22. 45, N. Lat. 38. 10. This iſland appears to be entirely volcanic. The beſt account we have of it hath been publiſhed in the 68th volume of the Philoſophical Tranſactions by Mr Francis Maſſon. Acording to him, the productions differ greatly from thoſe of Madeira, inſomuch that none of the trees of the latter are found here, except the faya: it has a nearer affinity to Europe than Africa. The mountains are covered with the erica vulgaris, and an elegant

elegant ever-green ſhrub very like a phillyrea, which gives them a moſt beautiful appearance.

It is one of the principal and moſt fertile of the Azorian iſlands, lying nearly eaſt and weſt; its length is about 18 or 20 leagues; its breadth unequal, not exceeding five leagues, and in ſome places not more than two. It contains about 80000 inhabitants.

Its capital, the city of Ponta del Guda, which contains about 12000 inhabitants, is ſituated on the ſouth ſide of the iſland, on a fine fertile, plain country, pretty regularly built; the ſtreets ſtraight, and of a good breadth. It is ſupplied with good water, which is brought about the diſtance of three leagues from the neighbouring mountains. The churches and other religious edifices are elegant and well built for ſuch an iſland. There is a large convent of Franciſcan friars and one of the order of St Auguſtin, four convents for profeſſed nuns, and three Recolhimentos for young women and widows who are not profeſſed. The veſſels anchor in an open road; but it is not dangerous, as no wind can prevent their going to ſea in caſe of ſtormy weather.

The country round the city is plain for ſeveral miles, well cultivated, and laid out with good taſte into ſpacious fields, which are ſown with wheat, barley, Indian corn, pulſe, &c. and commonly produce annually two crops; for as ſoon as one is taken off, another is immediately ſown in its place. The ſoil is remarkably gentle and eaſy to work, being for the moſt part compoſed of pulverized pumice-ſtone. There are in the plains a number of pleaſant country-ſeats, with orchards of orange trees, which are eſteemed the beſt in Europe.

The ſecond town is Ribeira Grande, ſituated on the north ſide of the iſland, containing about as many inhabitants as the city; a large convent of Franciſcan friars, and one of nuns. It gives title to a count, called the *Conde Ribeira Grande*, who firſt inſtituted linen and woollen manufactories in the iſland.

The third town is Villa Franca, on the ſouth ſide of the iſland, about ſix leagues eaſt of Ponta del Guda. It has a convent of Franciſcan friars, and one of nuns, which contains about 300. Here, about half a mile from the ſhore, lies a ſmall iſland (Ilhao), which is hollow in the middle, and contains a fine baſon with only one entrance into it, fit to hold fifty ſail of veſſels ſecure from all weather; at preſent it wants cleaning out, as the winter's rain waſhes down great quantities of earth into it, which has greatly diminiſhed its depth. But veſſels frequently anchor between this iſland and the main.

Beſide theſe towns are ſeveral ſmaller, viz. Alagoa, Agoa de Pao, Brelanha, Fanaes de Ajuda, and a number of hamlets, called *lugars*, or *places*.

About four leagues north-eaſt from Villa Franca, lies a place called the *Furnas*, being a round deep valley in the middle of the eaſt part of the iſland, ſurrounded with high mountains, which, though ſteep, may be eaſily aſcended on horſeback by two roads. The valley is about five or ſix leagues in circuit. The face of the mountains, which are very ſteep, is entirely covered with beautiful ever-greens, viz. myrtles, laurels, a large ſpecies of bilberry called *uva de ſerra*, &c. and numberleſs rivulets of the pureſt water run down their ſides. The valley below is well cultivated, producing wheat, Indian corn, flax, &c. The fields are planted round with a beautiful ſort of poplars, which grow into pyramidal forms, and by their careleſs, irregular diſpoſition, together with the multitude of rivulets, which run in all directions through the valley, a number of boiling fountains throwing up clouds of ſteam, a fine lake in the ſouth-weſt part about two leagues round, compoſe a proſpect the fineſt that can be imagined. In the bottom of the valley the roads are ſmooth and eaſy, there being no rocks but a fine pulverized pumice-ſtone that the earth is compoſed of.

There are a number of hot fountains in different parts of the valley, and alſo on the ſides of the mountains: but the moſt remarkable is that called the *chaldeira*, ſituated on the eaſtern part of the valley, on a ſmall eminence by the ſide of a river, on which is a baſon about 30 feet diameter, where the water continually boils with prodigious fury. A few yards diſtant from it is a cavern in the ſide of the bank, in which the water boils in a dreadful manner, throwing out a thick, muddy, unctuous water ſeveral yards from its mouth with a hideous noiſe. In the middle of the river are ſeveral places where the water boils up ſo hot, that a perſon cannot dip his finger into it without being ſcalded; alſo along its banks are ſeveral apertures, out of which the ſteam riſes to a conſiderable height, ſo hot that there is no approaching it with one's hand: in other places, a perſon would think that 100 ſmiths bellows were blowing all together, and ſulphureous ſteams iſſuing out in thouſands of places; ſo that native ſulphur is found in every chink, and the ground covered with it like hoar-froſt; even the buſhes that happen to lie near theſe places are covered with pure brimſtone, condenſing from the ſteam that iſſues out of the ground, which in many places is covered over with a ſubſtance like burnt alum. In theſe ſmall caverns, where the ſteam iſſues out, the people often boil their yams.

Near theſe boiling fountains are ſeveral mineral ſprings; two in particular, whoſe waters have a very ſtrong mineral quality, of an acid taſte, and bitter to the tongue.

About half a mile to the weſtward, and cloſe by the river ſide, are ſeveral hot ſprings, which are uſed by ſick people with great ſucceſs. Alſo, on the ſide of a hill weſt of St Ann's church, are many others, with three bathing-houſes, which are moſt commonly uſed. Theſe waters are very warm, altho' not boiling hot; but at the ſame place iſſue ſeveral ſtreams of cold mineral water, by which they are tempered, according to every one's liking.

About a mile ſouth of this place, and over a low ridge of hills, lies a fine lake about two leagues in circumference, and very deep, the water thick, and of a greeniſh colour. At the north end is a plain piece of ground, where the ſulphureous ſteams iſſue out in many places, attended with a ſupriſing blowing noiſe. Our author could obſerve ſtrong ſprings in the lake, but could not determine whether they were hot or cold: this lake ſeems to have no viſible evacuation. The other ſprings immediately form a conſiderable river, called *Ribeira Quente*, which runs a courſe about two or three leagues, thro' a deep rent in the mountains, on each ſide of which are ſeveral places where the ſmoke iſſues

 iſſues out. It diſcharges itſelf into the ſea on the ſouth ſide, near which are ſome places where the water boils up at ſome diſtance in the ſea.

This wonderful place had been taken little notice of until very lately; ſo little curioſity had the gentlemen of the iſland, that ſcarcely any of them had ſeen it, until of late ſome perſons, afflicted with very virulent diſorders, were perſuaded to try its waters, and found immediate relief from them. Since that time it has become more and more frequented; ſeveral perſons who had loſt the uſe of their limbs by the dead palſy have been cured; and alſo others who were troubled with eruptions on their bodies.

A clergyman, who was greatly afflicted with the gout, tried the ſaid waters, and was in a ſhort time perfectly cured, and has had no return of it ſince. When Mr Maſſon was there, ſeveral old gentlemen, who were quite worn out with the ſaid diſorder, were uſing the waters, and had received incredible benefit from them; in particular, an old gentleman, about 60 years of age, who had been tormented with that diſorder more than 20 years, and often confined to his bed for ſix months together: he had uſed theſe waters about three weeks, had quite recovered the uſe of his limbs, and walked about in the greateſt ſpirits imaginable. A friar alſo who had been troubled with the ſaid diſorder about 12 years, and reduced to a cripple, by uſing them a ſhort time was quite well, and went a-hunting every day,

There are ſeveral other hot ſprings in the iſland, particularly at Ribeira Grande; but they do not poſſeſs the ſame virtues, at leaſt not in ſo great a degree.

The eaſt and weſt part of the iſland riſes into high mountains; but the middle is low, interſperſed with round conic hills, all of which have very recent marks of fire; all the parts below the ſurface conſiſting of melted lava lying very hollow.

Moſt of the mountains to the weſtward have their tops hollowed out like a punch-bowl, and contain water. Near the weſt end is an immenſe deep valley, like the Furnas called the *Sete Cidades*. This valley is ſurrounded with very abrupt mountains, about ſeven or eight leagues round; in the bottom is a deep lake of water, about three leagues in circuit, furniſhed with great number of water-fowls. This water has no mineral quality; neither are there any hot ſprings in the valley. All theſe mountains are compoſed of a white crumbly pumice-ſtone, which is ſo looſe, that, if a perſon thruſt a ſtick into the banks, whole waggon-loads of it will tumble down. The inhabitants of the iſland relate a ſtory, that he who firſt diſcovered it obſerved an extraordinary high peak near the weſt end; but the ſecond time he viſited it, no ſuch peak was to be ſeen, which he ſuppoſed muſt have certainly ſunk;—but, however improbable this ſtory may be, at ſome period or another it muſt have certainly been the caſe.

MILAN, or the duchy of the Milaneſe, a country of Italy, bounded on the weſt by Savoy, Piedmont, and Montferrat; by Switzerland on the north; by the territories of Venice, the duchies of Mantua, Parma, and Placentia, on the eaſt; and by the territories of Genoa on the ſouth. Anciently this duchy, containing the north part of the Old Liguria, was called *Inſubria*, from its inhabitants the *Inſubres*; who were conquered by the Romans, as theſe were by the Goths; who in their turn were ſubdued by the Lombards. Didier, the laſt king of the Lombards, was taken priſoner by Charlemagne, who put an end to the Longobardic empire, and appointed governors of Milan. Theſe governors, being at a diſtance from their maſters, ſoon began to aſſume an independency, which brought a dreadful calamity on the country; for, in 1152, the capital itſelf was levelled with the ground by the emperor Frederic Barbaroſſa, who committed great devaſtations otherwiſe throughout the duchy. Under this emperor lived one Galvian, a nobleman who was deſcended from Otho a Milaneſe. Galvian, along with William prince of Montferrat, ſerved in the cruſade, when Godfrey of Boulogne took Jeruſalem: he killed in ſingle combat the Saracen general, whom he ſtripped of his helmet, which was adorned with the image of a ſerpent ſwallowing a youth; and this ever afterwards was the badge of that family. His grandſon Galvian, having oppoſed the emperor, was taken priſoner, and carried in irons into Germany, from whence he made his eſcape, and returning to Milan, died in the ſervice of his country. From him deſcended another Otho, at the time that Otho IV. was emperor of Germany, and who ſoon diſtinguiſhed himſelf by the accompliſhments both of his mind and body. When he grew up, he was received into the family of cardinal Octavian Ubaldini at Rome. This prelate, who was himſelf aſpiring at the popedom, was in a ſhort time greatly taken with the addreſs and accompliſhments of young Otho, and predicted his future greatneſs. In the mean time, one Torreſs, or Torriano, a Milaneſe nobleman of unbounded ambition, was attempting to make himſelf maſter of Milan. The popular faction had ſome time before been caballing againſt the nobility; and at laſt, Torriano, putting himſelf at their head, expelled the biſhop, and put to death or baniſhed all the nobility: by which means the popular government was fully eſtabliſhed; and Torriano, under this pretence, ruled every thing as he pleaſed. He was, however, ſoon oppoſed by one Franciſco Sepri, who formed a great party, pretending to deliver the city from Torriano's haughtineſs and cruelty. But while the two parties were collecting their forces againſt each other, cardinal Ubaldini was projecting the deſtruction of both, by means of his favourite Otho. This prelate had for ſome time borne an implacable hatred to Torriano, becauſe he had been by him prevented from carrying out of the treaſury of St Ambroſe's church at Milan, a carbuncle or jewel of great value, which he pretended to reſerve for adorning the papal tiara; for which reaſon he now determined to oppoſe his ambition.

Ubaldini began with naming Otho archbiſhop of Milan; which, as the pope's legate, he had a right to do. This nomination was confirmed by Pope Urban IV.; and the party of the nobility having now got a head from the pope himſelf, began to gather ſtrength. Otho in the mean time employed himſelf in collecting troops; and had no ſooner procured a ſhew of an army, than he advanced towards Lago Maggione, and took poſſeſſion of Arona, a ſtrong poſt near that lake: but Torriano, marching immediately

againſt him with all his troops, obliged him to abandon the place, and leave his party to make the beſt terms they could with the conqueror. This was followed by the deſtruction of the caſtles of Arona, Anghiari, and Brebia: ſoon after which Torriano died; and was ſucceeded by his brother Philip, who had ſufficient intereſt to get himſelf elected podeſta, or prætor of Milan, for ten years. During his lifetime, however, the party of the nobility increaſed conſiderably under Otho, notwithſtanding the check they had received. Philip died in 1265, having loſt ground conſiderably in the affections of the people, though he obtained a great reputation for his courage and conduct. His ſucceſſor Napi rendered himſelf terrible to the nobility, whom he proſcribed, and put to death as often as he could get them into his power. He proceeded ſuch lengths, and acted with ſuch fury againſt that unfortunate party, that pope Clement IV. who had ſucceeded Urban, at laſt interdicted Milan, and excommunicated Napi and all his party. By this Napi began to loſe his popularity, and the public diſaffection towards him was much heightened by the natural cruelty of his temper. But in the mean time, the party of the nobility was in the utmoſt diſtreſs. Otho himſelf and his friends, having ſpent all their ſubſtance, wandered about from place to place; the pope not being in a capacity of giving them any aſſiſtance. Otho, however, was not diſcouraged by his bad ſucceſs, but found means ſtill to keep up the ſpirits of his party, who now choſe for their general Squarcini Burri, a man of great eminence and courage, whoſe daughter was married to Matthew Viſconti, afterwards called *Matthew the Great*. At the ſame time they renewed their confederacy with the marquis of Montferrat, who was ſon-in-law to the king of Spain. The marquis agreed to this confederacy chiefly with a view to become maſter of the Milaneſe.

The nobility now again began to make head; and having collected an army, which was joined by 600 Spaniſh cavalry and a body of foot, gained ſome advantages. But in the mean time Napi, having gathered together a ſuperior army, ſuddenly attacked Otho and Burri, and defeated them. After this diſaſter Otho applied to the pope; from whom, however, he did not obtain the aſſiſtance he deſired; and in the mean time Napi invited the emperor Rodolph into Italy, with the promiſe of being crowned at Milan. This invitation was accepted of with great readineſs by Rodolph; who conſtituted Napi his governor and vicar-general in Lombardy, ſending to him at the ſame time a fine body of German horſe, the command of which was given to Caſſoni, Napi's nephew. On this Otho again applied to the pope, (Gregory X.): but he was ſo far from granting him any aſſiſtance, that he is ſaid to have entered into a ſcheme of aſſaſſinating him privately; but Otho eſcaped the danger, and in 1276 began to recover his affairs. The reaſon of pope Gregory's enmity to him was, that he and his party were thought to be Gibelines, and were oppoſed by great numbers of the nobility themſelves; but after that pope's death, the Milaneſe exiles being united under one head, ſoon became formidable. They now choſe for their general Godfrey count of Languſio, a noble Pavian, and an inveterate enemy of the Torriano family. This nobleman being rich and powerful, enliſted many German and other mercenaries, at whoſe head he marched towards the Lago Maggiore. All the towns in that country opened their gates to him through the intereſt of the Viſconti family, who reſided in theſe parts. But this ſucceſs ſoon met with a ſevere check in an unfortunate engagement, wherein Godfrey was defeated and taken priſoner; after which he and 34 nobles had their heads ſtruck off, and ſent from the field of battle piled up in a common waggon.

This defeat greatly affected Otho; but having in a ſhort time recovered himſelf, he again attacked his enemies, and defeated them; but, ſuffering his troops to grow remiſs after their victory, the fugitives rallied, and entirely defeated him. The next year, however, Otho had better ſucceſs, and totally defeated and took priſoner Napi himſelf. After this victory Caſſoni was obliged to abandon Milan to his competitor, who kept poſſeſſion of it till his death, which happened in 1295, in the 87th year of his age.

Otho was ſucceeded by Matthew Viſconti abovementioned; and Milan continued in ſubjection to that family without any very memorable occurrence, till the year 1378, when, by the death of Galeazzo II. his brother Barnabo became ſovereign of Milan. He was of a brave and active diſpoſition; but exceſſively profuſe in his expences, as his brother Galeazzo had alſo been; and, to procure money to ſupply his extravagancies, was obliged to oppreſs his ſubjects. Galeazzo had engaged in an enterpriſe againſt Bologna, and the ſiege of it was continued by Barnabo. It laſted for nine years, and during this time is ſaid to have coſt 300 millions of gold, a prodigious ſum in thoſe days, near 40 millions ſterling; the loweſt gold coin being in value ſomewhat more than half-a-crown Engliſh. Both the brothers were exceſſively fond of building. Barnabo erected a bridge over the Adda, conſiſting of three ſtories, the loweſt for chariots and heavy carriages, the middle for horſes; and the uppermoſt for foot-paſſengers. He built alſo another bridge which was carried over houſes without touching them. To accompliſh theſe, and many other expenſive ſchemes, he became one of the greateſt tyrants imaginable, and every day produced freſh inſtances of his rapacity and cruelty. He inſtituted a chamber of inquiry, for puniſhing all thoſe who had for five years before been guilty of killing boars, or even of eating them at the table of another. They who could not redeem themſelves by money were hanged, and above 100 wretches periſhed in that manner. Thoſe who had any thing to loſe were ſtripped of all their ſubſtance, and obliged to labour at the fortifications and other public works. He obliged his ſubjects to maintain a great many hunting-dogs, and each diſtrict was taxed a certain number. The overſeers of his dogs were at the ſame time the inſtruments of his rapacity. When the dogs were poor and ſlender, the owners were always fined; but when the dogs were fat, the owners were alſo fined, for ſuffering them to live without exerciſe.

The extravagant behaviour of Barnabo ſoon rendered public affairs ready for a revolution, which was at laſt accompliſhed by his nephew John Galeazzo. He affected a ſolitary life, void of ambition, and even incling to devotion; but at the ſame time took care to have his uncle's court filled with ſpies, who gave

him

Milan. him information of all that paffed. He reduced his table and manner of living, pretending that he took thefe fteps as preparatives to a retirement from the world, which was foon to take place, after he had paid a religious vow. In fhort, he acted his part fo well, that even Barnabo, though abundantly cautious, had no fufpicion of his having any defigns againft him; and fo entirely did he conceal his ambition, that he feveral times made application to his uncle for his intereft to procure him a quiet retreat as foon as his religious vows were performed. One of thefe was to pay a vifit to the church of the bleffed Virgin upon mount Varezzio. This was to be done with fo much fecrecy that all kinds of eye-witneffes were to be excluded; and it was with difficulty that Barnabo himfelf and two of his fons were allowed to accompany our devotee. But, in the mean time, the hypocritical Galeazzo had foldiers advancing from all quarters, fo that Barnabo and his fons were immediately feized, and the houfes of thofe who had fided with them given up to be plundered. The booty in plate, money, and all kinds of rich furniture, was immenfe. The minifters of the late government were dragged from their hiding-places, and put to death; and at laft the citadel itfelf fell into the hands of Galeazzo, who found in it an immenfe fum of money. Barnabo was carried prifoner to Tritici, a caftle of his own building, where he had the happinefs to find one perfon ftill faithful to him. This was his miftrefs, named *Doninia Porra;* who, when he was abandoned by all the world, fhut herfelf up a voluntary prifoner in his chamber, and remained with him as long as he lived, which was only feven months after his degradation.

John Galeazzo was the firft who took upon him the title of the *duke of Milan*, and was a prince of great policy and no lefs ambition. He made war with the Florentines, became mafter of Pifa and Bologna, and entirely defeated the emperor in 1401, fo that he entertained hopes of becoming mafter of all Lombardy, and cutting off all poffibility of invading it either from France or Germany; but his defigns were fruftrated by death, which happened in 1402, in the 55th year of his age. After his deceafe the Milanefe government fell into the moft violent diftractions, fo that it could not be fupported, even in time of peace, without an army of 20,000 foot and as many horfe. In the year 1421, however, Philip duke of Milan became mafter of Genoa; but though he gained great advantages in all parts of Italy, the different ftates ftill found means to counterbalance his fucceffes, and prevent him from enflaving them: fo that Milan never became the capital of any extenfive empire; and in 1437 Genoa revolted, and was never afterwards reduced.

Philip died in 1448, and by his death the male line of the Vifconti family was at an end. The next lawful heir was Valentina his fifter, who had married the duke of Orleans fon to Charles V. of France. By the contract of that marriage, the lawful progeny of it was to fucceed to the duchy of Milan in failure of the heirs-male of the Vifconti family; but this fucceffion was difputed by Sforza, who had married Philip's natural daughter. It is certain, however, that the rightful fucceffion was vefted in the houfe of Orleans and the kings of France; and therefore though the Sforza family got poffeffion of the duchy for the prefent, Lewis XII. afterwards put in his claim, as being grandfon to John Galeazzo. For fome time he was fuccefsful; but the French behaved in fuch an infolent manner, that they were driven out of the Milanefe by the Swifs and Maximilian Sforza. The Swifs and Milanefe were in their turn expelled by Francis I. who obliged the Sforza family to relinquifh the government for a penfion of 30,000 ducats a-year. Francis Sforza, the fon of Maximilian, however, being affifted by the emperor and the pope, regained the poffeffion of the Milanefe about the year 1521; and, eight years after, the French king, by the treaty of Cambray, gave up his claim on the duchy. Milan.

But, in fact, the emperors of Germany feem to have had the faireft title to the Milanefe in right of their being for a long time fovereigns of Italy. On the death of Francis Sforza, therefore, in the year 1536, the emperor Charles V. declared the Milanefe to be an imperial fief, and granted the inveftiture of it to his fon Philip II. king of Spain. In his family it continued till the year 1706, when the French and Spaniards were driven out by the imperialifts, and the emperor again took poffeffion of it as a fief. It was confirmed to his houfe by the treaty of Baden in 1714, by the quadruple alliance in 1718, and by the treaty of Aix la Chapelle in 1748.

The duchy of Milan is one of the fineft provinces in Italy. It is bounded on the fouth by the Appenine mountains, and the territory of Genoa; on the north by Switzerland; on the eaft by the Venetian territories, and the duchies of Mantua, Parma, and Placentia; and on the weft by Savoy, Piedmont, and Montferrat; extending from north to fouth about 100 miles, and from eaft to weft about 108. It is well watered by the Teffino, the Sefia, the Adda, the Po, the Oglio, the Lombro, Serio, &c. and alfo by feveral canals and lakes. Of the latter the Lago Maggiore is between 30 and 40 miles in length, and in fome places fix or feven miles broad. In it lie the *Boromean iflands*, as they are called, viz. Ifola Bella and Ifola Madre, the beauty of which almoft exceeds imagination: art and nature feem to have vied with one another in embellifhing them. In each of them is a palace with delicious gardens, belonging to the Boromean family. The water of the lake is clear and of a greenifh colour, and abounds with fifh. The hills with which it is furrounded prefent a moft charming landfcape, being planted with vines and chefnut-trees, interfperfed with fummer-houfes. There is a canal running from it towards Switzerland, with which the city of Milan has a communication. It was anciently called *Lacus Verbanus*. The Lago de Como, which was called by the Latin poets *Lacus Larius*, but had its modern name from the city, near which it lies, extends itfelf about 30 miles northward from Como, but its greateft breadth is not above five miles. From the Lago Maggiore iffues the Teffino; and from that of Como the Adda. Of the other lakes, that of Lugano and Guarda are the chief: that of Guarda was anciently called *Benacus*.

The trade and manufactures of this duchy confift principally in filks, ftuffs, ftockings, gloves, and handkerchiefs, linen and woollen cloth, hardware, curious works

works of cryſtal, agate, hyacinths, and other gems; but their exports are uſually far ſhort of their imports.

As to the revenue of the duchy, it muſt without doubt be very conſiderable. It is ſaid to have amounted to 2,000,000 of dollars while the duchy was in the hands of the Spaniards.

In the year 1767, the Auſtrian government of Milan publiſhed a law, by which all the rights which the pope or the biſhops had till then exerciſed over eccleſiaſtics, either with regard to their effects or perſons, is transferred to a council eſtabliſhed for that purpoſe at Milan. By the ſame edict, all eccleſiaſtics were obliged to ſell the eſtates which they had become poſſeſſed of ſince the year 1722; and no ſubject, whether eccleſiaſtic or ſecular, was to go to Rome to ſolicit any favour, except letters of indulgence, without the conſent of the ſaid council.

Milan, the capital of the duchy of that name, in Latin *Mediolanum*, is a very large city, and has a wall and rampart round it, with a citadel; yet is thought to be incapable of making any great reſiſtance. The gardens within the city take up a great deal of ground. In the citadel is a foundery for cannon, and an arſenal furniſhed with arms for 12,000 men. The governor of it is quite independent of the governor-general of the Milaneſe, who reſides in the city, in a large, but old and ill-contrived palace. The yearly income of the governor of Milan is ſaid to be 200,000 guilders. The council belonging to the city is compoſed of a preſident and 60 doctors of law, who are all nobles, and independent of the governor-general. Milan hath experienced a great variety of fortune, having been ſubject ſometimes to the French, ſometimes to the Spaniards, and ſometimes to the Germans. A great number of perſons of rank and fortune live in it, eſpecially during the winter. The ladies in France are not allowed more liberty than thoſe of this city: even the auſterities of the monaſtic life are ſo far mitigated here, that gentlemen have not only the liberty of talking with the nuns, and of rallying and laughing at the grate, but alſo of joining with them in concerts of muſic, and of ſpending whole afternoons in their company. The place where the *beau monde* take the air, either in their coaches or on foot, is the rampart betwixt the Porta Orientale, and the Porta Toſa, where it is ſtraight and broad, and extremely pleaſant, being planted with white mulberry-trees, and commanding a proſpect on one ſide of the open country, and on the other of the gardens and vineyards between the ramparts and the city. Milan, which is ſaid to have been built by the Gauls about 200 years after the foundation of Rome, contains a great number of ſtately edifices, as churches, convents, palaces, and hoſpitals. The cathedral is a vaſt pile, all of marble; and though ſomething has been doing for near 400 years towards the outward or inward ornament thereof, it is not yet finiſhed. Of the great number of ſtatues about it, that of St Bartholomew, juſt flead alive, with his ſkin hanging over his ſhoulders, and of Adam and Eve, over the main portal, are the fineſt. The pillars ſupporting the roof of the church are all of marble, and the windows finely painted. This church contains a treaſure of great value, particularly a ſhrine of rock-cryſtal, in which the body of St Charles Boromæo is depoſited. The other churches moſt worthy a ſtranger's notice are thoſe of St Alexander, St Jerom, St Giovanni di Caſarotti della Paſſione, that of the Jeſuits, and of St Ambroſe, in which lie the bodies of the ſaint, and of the kings Pepin and Bernard. In the Ambroſian college, founded by Frederic Boromæo, 16 profeſſors teach gratis. In the ſame college is alſo an academy of painting, with a muſæum, and a library, containing a vaſt number of printed books and manuſcripts; among the laſt of which is a tranſlation of Joſephus's Hiſtory of the Jews, done by Rufinus about 1200 years ago, and written on the bark of a tree; St Ambroſe's works on vellum, finely illuminated; the orations of Gregory Nazianzen, and the works of Virgil, in folio, with Petrarch's notes. In the muſæum are Leonardi da Vinci's mathematical and mechanical drawings, in 12 large volumes. The ſeminary for ſciences, the college of the nobles, the Helvetian college, and the mathematical academy, are noble foundations, and ſtately buildings. Of the hoſpitals, the moſt remarkable are the Lazaretto, and that called the *great hoſpital;* the latter of which receives ſick perſons, foundlings, and lunatics, and has ſix ſmaller hoſpitals depending on it, with a revenue of 100,000 rixdollars. The number of the inhabitants of this city is ſaid to be about 250,000. It has been 40 times beſieged, taken 20 times, and four times almoſt entirely demoliſhed; yet it hath always recovered itſelf. It is ſaid that gunpowder is ſold here only by one perſon, and in one place. The court of inquiſition is held in the Dominican convent, near the church of Madonna della Gratia. The houſes of entertainment, and the ordinaries here, are repreſented as very indifferent. Mr Keyſler ſays, it is not unuſual for young travellers, when they go to any of the taverns in Milan, to be aſked, "whether they chooſe a *letto fornito*, or female bed-fellow," who continues maſked till ſhe enters the bed-chamber. Deformed dwarfs, and people with wens, ſome of them of a prodigious ſize, are very common in the ſtreets of Milan. The wens are ſaid to be hereditary. The common method of burying here is, to throw the corpſes into vaults, without coffins, to the amount of two or three hundred, which cannot fail to fill the air in theſe places with noxious effluvia. Mr Keyſler tells us, that when he was at Milan, goods of any kind might have been brought into the city without ſearch or inquiry, provided a ſmall gratuity was given to the officer. Milan is far ſhort of Turin both in beauty and conveniency, many of the ſtreets being crooked and narrow, and paper-windows much more frequent than in that city; even in grand palaces, the windows are often compoſed promiſcuouſly of glaſs and paper. It is not uncommon here for beggars, when they aſk alms, to hold out to you a diſh, in which is a human ſkull. Two large canals extend from hence, the one to the Teſſino, and the other to the Adda; the Teſſino having a communication with the Lago Maggiore, and, by a canal, with the Seſia; and the Adda iſſuing from the Lago di Como, and having a communication by canals with the Lambro and Serio. In a void ſpace in one of the ſtreets of Milan, where ſtood the houſe of a barber who had conſpired with the commiſſary of health to poiſon his fellow-citizens, is erected a pillar called *Colonna Infame*, with an inſcription to perpetuate the memory of

of the execrable defign. The environs of this city are very pleafant, being adorned with beautiful feats, gardens, orchards, &c. About two Italian miles from it, at the feat of the Simonetti family, is a building, that would have been a mafter-piece of its kind had the architect defigned it for an artificial echo. It will return or repeat the report of a piftol above 60 times; and any fingle mufical inftrument, well touched, will have the fame effect as a great number of inftruments, and produce a moft furprifing and delightful concert. E. Long. 15. 35. N. Lat. 38. 32.

MILBORN-PORT, a town of Somerfetfhire in England, feated on a branch of the river Parret, and fends two members to parliament. W. Long. 2. 28. N. Lat. 51. 5.

MILDEW is faid to be a kind of thick, clammy, fweet juice, exhaled from, or falling down upon, the leaves and bloffoms of plants. By its thicknefs and clamminefs it prevents perfpiration, and hinders the growth of the plant. It fometimes refts on the leaves of trees, in form of a fatty juice, and fometimes on the ears of corn. It is naturally very tough and vifcous, and becomes ftill more fo by the fun's heat exhaling its more fluid parts; by which means the young ears of corn are fo daubed over, that they can never arrive at their full growth. Bearded wheat is lefs fubject to the mildew than the common fort; and it is obferved, that newly-dunged lands are more liable to mildew than others. The beft remedy is a fmart fhower of rain, and immediately afterwards a brifk wind. If the mildew is feen before the fun has much power, it has been recommended to fend two men into the field with a long cord, each holding one end, and drawing this along the field through the ears, the dew will be diflodged from them, before the heat of the fun is able to dry it to that vifcous ftate in which it does the mifchief. Some alfo fay, that lands which have for many years been fubject to mildews, have been cured of it by fowing foot along with the corn, or immediately after it.

Mr J. S. Segar, the author of a treatife upon this fubject, obferves, that the mildew is of fuch a fharp corrofive nature, that it raifes blifters on the feet of the fhepherds who go barefoot, and even confumes the hoofs of the cattle. He fufpects that it poffeffes fome arfenical qualities, though he does not pretend to affirm this pofitively. Its pernicious influence, according to him, is rendered ftill more powerful by a variety of circumftances; fuch as fending the cattle into the fields too early in the fpring; their drinking water mixed with ice, or but lately thawed; their being kept in ftables that are too clofe and filthy, and which are not fufficiently aired. The fame author confiders the mildew as a principal caufe of epidemical diftempers among the cattle. The mildew producing thefe difeafes, he fays, is that which dries and burns the grafs and leaves. It falls ufually in the morning, particularly after a thunder-ftorm. Its poifonous quality (which does not continue above 24 hours) never operates but when it has been fwallowed immediately after its falling. The diforder attacks the ftomach, is accompanied with pimples on the tongue, lofs of appetite, a deficcation of the aliments in the ftomach, a cough, and difficulty of refpiration. As a prefervative, the author prefcribes purging in fpring and in winter. The medicine he advifes is compofed of 30 grains of fulphur of antimony, and 60 grains of refin of jalap. He is againft vomiting, and every thing that is of a heating nature.

MILE, a meafure of length or diftance, containing eight furlongs. The Englifh ftatute-mile is 80 chains, or 1760 yards; that is, 5280 feet.

We fhall here give a table of the miles in ufe among the principal nations of Europe, in geometrical paces, 60,000 of which make a degree of the equator.

	Geometrical paces.
Mile of Ruffia	750
of Italy	1000
of England	1200
of Scotland and Ireland	1500
Old league of France	1500
The fmall league, *ibid.*	2000
The mean league, *ibid.*	2500
The great league, *ibid.*	3000
Mile of Poland	3000
of Spain	3428
of Germany	4000
of Sweden	5000
of Denmark	5000
of Hungary	6000

MILETUS (anc. geogr.), a town of Crete mentioned by Homer; but where fituate does not appear. It is faid to be the mother-town of Miletus in Caria, whither a colony was led by Sarpedon, Minos's brother, (Ephorus, quoted by Strabo). *Milefii*, the people, (Ovid).

MILETUS (anc. geogr.), the capital of Ionia, formerly a leading and principal town in the arts of war and peace, (Mela); of great antiquity, (Nonnus); built by Miletus the companion of Bacchus, (Apollodorus); famous above all for its colonies, (Herodotus, Strabo). The only town that made head againft Alexander, and with much difficulty taken, (Arrian). The country of Thales, one of the feven wife men, and the firft who applied himfelf to the ftudy of nature. It was alfo the country of Anaximander, the fcholar and fucceffor of Thales, the inventor of fun-dials and the gnomon, and the firft that publifhed a geographical map; of Anaximenes, fcholar and fucceffor to the foregoing; and of other great men. It was famous for its excellent wool, according to Virgil. *Milefii*, the people; who, from being powerful, becoming afterwards opulent and abandoned to pleafures, loft both their riches and their power.

MILFOIL, or YARROW. See ACHILLEA.

MILFORD-HAVEN, one of the fineft harbours in Europe, and indifputably the beft in Britain, is fituated in Pembrokefhire in South-Wales, and lies on the north fide of the Briftol Channel. It is very large, fafe, and deep; there is no danger of going in or out with the tide, or almoft with any wind. If a fhip comes in without a cable or anchor, fhe may run afhore on the ooze, and there lie fafe till fhe is refitted; and in an hour's time fhe may get out of the harbour into the open fea. It lies extremely convenient for fhips bound from the Englifh or Briftol Channels to Ireland, or farther weft, and from thence to the Channels. It is faid, that 1000 fail of any fize may ride

ride secure in this haven. Yet Dr Campbell informs us, that, in some places, even this singular and wonderful haven is not safe. As, for instance, in Nangle-road, in Milford-haven, at about half-flood, all Nangle-flutch is covered; about the middle of which flutch or ooze there lie a parcel of straggling stones called the *Oyster-rocks;* most of them loose, and about four feet high, which renders the place very dangerous for ships which are obliged to run in there when it blows too hard in the road; and the more so, because they do not appear at low-water neap-tides, being quarter-tide stones. These, and some others on Nangle-point, may be removed at the expence of 100l.; but though the improvement and fortification of Milford-haven have been much talked of, and even a large sum granted by parliament for that purpose, very little hath been done, and it still continues in a great measure neglected. The pier, which lies now in ruins, would be very useful if repaired. In the time of queen Elizabeth, before the Spanish invasion, there were two forts begun at the entrance of Milford, one on each side, as may be seen in Speed's maps, called *Nangle* and *Dale Block-houses;* but they were never finished. The situation of these block-houses was very ill chosen, since a vessel being obliged to bring-to before she has well entered the mouth of the haven, may either drive ashore on the rocks, or miss the harbour. A small fort might be built on the Stack, and another on Sandy-haven Point, which would command the entrance of Milford-haven, and not be liable to the former objection, or in any way prejudice the shipping. Pennamouth is the opening of that branch of the haven upon which the town of Pembroke lies, where the custom-house of Milford is kept. The entrance, or breadth from rock to rock, is but 200 yards at high-water, and 112 at low-water, and from 9 to 12 feet deep. The navigation up this river to Pembroke-town is much impeded by the rubbish of the limestone-quarries being thrown into the river; which ought to be prevented, or the place will in time be stopped up. Within Pennamouth a dock might be made, which would contain all the shipping in England, and which would be the greatest thing of the kind in the whole world. Milford-haven contains five large bays, 13 good roads, and 16 safe creeks.

MILIARY, in general, something resembling millet-seed.

Miliary *Fever*. See Medicine, n° 336.

MILITANT, or Church-militant, denotes the body of Christians while here on earth.

MILITARY, something belonging to the soldiery or militia.

Military-*Discipline*, the training of soldiers, and the due enforcement of the laws and regulations instituted by authority for their conduct.

Next to the forming of troops, military discipline is the first object that presents itself to our notice: it is the soul of all armies; and unless it be established amongst them with great prudence, and supported with unshaken resolution, they are no better than so many contemptible heaps of rabble, which are more dangerous to the very state that maintains them, than even its declared enemies.

Military *Execution*, the ravaging or destroying of a country or town that refuses to pay the contribution inflicted upon them.

Military-*Exercise*. See Exercise and Words *of Command*.

Military-*State*, in British polity, one of the three divisions of the laity. See Laity.

This state includes the whole of the soldiery; or such persons as are peculiarly appointed among the rest of the people, for the safeguard and defence of the realm.

In a land of liberty, it is extremely dangerous to make a distinct order of the profession of arms. In absolute monarchies, this is necessary for the safety of the prince; and arises from the main principle of their constitution, which is that of governing by fear: but, in free states, the profession of a soldier, taken singly and merely as a profession, is justly an object of jealousy. In these no man should take up arms but with a view to defend his country and its laws: he puts not off the citizen when he enters the camp; but it is because he is a citizen, and would wish to continue so, that he makes himself for a while a soldier. The laws, therefore, and constitution of these kingdoms, know no such state as that of a perpetual standing soldier, bred up to no other profession than that of war: and it was not till the reign of Henry VII. that the kings of England had so much as a guard about their persons.

In the time of the Anglo-Saxons, as appears from Edward the confessor's laws, the military force of England was in the hands of the dukes or heretochs, who were constituted through every province and county in the kingdom; being taken out of the principal nobility, and such as were most remarkable for being *sapientes, fideles, et animosi.* Their duty was to lead and regulate the English armies, with a very unlimited power; *prout eis visum fuerit, ad honorem coronæ et utilitatem regni.* And because of this great power they were elected by the people in their full assembly, or folkmote, in the same manner as sheriffs were elected: following still that old fundamental maxim of the Saxon constitution, that where any officer was entrusted with such power, as, if abused, might tend to the oppression of the people, that power was delegated to him by the vote of the people themselves. So too, among the ancient Germans, the ancestors of our Saxon forefathers, they had their dukes, as well as kings, with an independent power over the military, as the kings had over the civil state. The dukes were elective, the kings hereditary: for so only can be consistently understood that passage of Tacitus, *Reges ex nobilitate, duces ex virtute sumunt.* In constituting their kings, the family or blood-royal was regarded; in choosing their dukes or leaders, warlike merit: just as Cæsar relates of their ancestors in his time, that whenever they went to war, by way either of attack or defence, they elected leaders to command them. This large share of power, thus conferred by the people, though intended to preserve the liberty of the subject, was perhaps unreasonably detrimental to the prerogative of the crown: and accordingly we find a very ill use made of it by Edric duke of Mercia, in the reign of king Edmond Ironside; who, by his office of duke or heretoch, was entitled to a large command in the king's army, and by his repeated treacheries

 cheries at laft transferred the crown to Canute the Dane.

It feems univerfally agreed by all hiftorians, that king Alfred firft fettled a national militia in this kingdom, and by his prudent difcipline made all the fubjects of his dominion foldiers: but we are unfortunately left in the dark as to the particulars of this his fo celebrated regulation; though, from what was laft obferved, the dukes feem to have been left in poffeffion of too large and independent a power: which enabled duke Harold on the death of Edward the confeffor, though a ftranger to the royal blood, to mount for a fhort fpace the throne of this kingdom, in prejudice of Edgar Atheling the rightful heir.

Upon the Norman conqueft, the feodal law was introduced here in all its rigour, the whole of which is built on a military plan. In confequence thereof, all the lands in the kingdom were divided into what were called knights fees, in number above 60,000; and for every knight's fee a knight or foldier, *miles*, was bound to attend the king in his wars, for 40 days in a year; in which fpace of time, before war was reduced to a fcience, the campaign was generally finifhed, and a kingdom either conquered or victorious. By this means the king had, without any expence, an army of 60,000 men always ready at his command. And accordingly we find one, among the laws of William the conqueror, which in the king's name commands and firmly enjoins the perfonal attendance of all knights and others; *quod habeant et teneant fe femper in armis et equis, ut decet et oportet: et quod femper fint prompti et parati ad fervitium fuum integrum nobis explendum et peragendum, cum opus adfuerit, fecundum quod debent de feodis et tenementis fuis de jure nobis facere.* This perfonal fervice in procefs of time degenerated into pecuniary commutations or aids; and at laft the military part of the feodal fyftem was abolifhed at the Reftoration, by ftatute 12 Car. II. c. 24. See FEODAL *Syftem.*

In the mean time we are not to imagine that the kingdom was left wholly without defence in cafe of domeftic infurrections, or the profpect of foreign invafions. Befides thofe who by their military tenures were bound to perform 40 days fervice in the field, firft the affife of arms, enacted 27 Hen. II. and afterwards the ftatute of Winchefter, under Edward I. obliged every man, according to his eftate and degree, to provide a determinate quantity of fuch arms as were then in ufe, in order to keep the peace; and conftables were appointed in all hundreds by the latter ftatute, to fee that fuch arms were provided. Thefe weapons were changed, by the ftatute 4 & 5 Ph. & M. c. 2. into others of more modern fervice; but both this and the former provifions were repealed in the reign of James I. While thefe continued in force, it was ufual from time to time for our princes to iffue commiffions of array, and fend into every county officers in whom they could confide, to mufter and array (or fet in military order) the inhabitants of every diftrict; and the form of the commiffion of array was fettled in parliament in the 5 Hen. IV. But at the fame time it was provided, that no man fhould be compelled to go out of the kingdom at any rate, nor out of his fhire, but in cafes of urgent neceffity; nor fhould provide foldiers unlefs by confent of parliament. About the reign of king Henry VIII. and his children, lord-lieutenants began to be introduced, as ftanding reprefentatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the ftatute 4 & 5 Ph. & M. c. 3. tho' they had not been then long in ufe; for Cambden fpeaks of them in the time of queen Elizabeth as extraordinary magiftrates, conftituted only in times of difficulty and danger.

In this ftate things continued till the repeal of the ftatutes of armour in the reign of king James I.; after which, when king Charles I. had, during his northern expeditions, iffued commiffions of lieutenancy, and exerted fome military powers which, having been long exercifed, were thought to belong to the crown, it became a queftion in the long-parliament, how far the power of the militia did inherently refide in the king; being now unfupported by any ftatute, and founded only upon immemorial ufage. This queftion, long agitated with great heat and refentment on both fides, became at length the immediate caufe of the fatal rupture between the king and his parliament: the two houfes not only denying this prerogative of the crown, the legality of which claim perhaps might be fomewhat doubtful; but alfo feizing into their hands the entire power of the militia, the illegality of which ftep could never be any doubt at all.

Soon after the reftoration of king Char. II. when the military tenures were abolifhed, it was thought proper to afcertain the power of the militia, to recognize the fole right of the crown to govern and command them, and to put the whole into a more regular method of military fubordination: and the order in which the militia now ftands by law, is principally built upon the ftatutes which were then enacted. It is true, the two laft of them are apparently repealed; but many of their provifions are re-enacted, with the addition of fome new regulations, by the prefent militia-laws: the general fcheme of which is to difcipline a certain number of the inhabitants of every county, chofen by lot for three years, and officered by the lord-lieutenant, the deputy-lieutenants, and other principal landholders, under a commiffion from the crown. They are not compellable to march out of their counties, unlefs in cafe of invafion or actual rebellion, nor in any cafe compellable to march out of the kingdom. They are to be exercifed at ftated times: and their difcipline in general is liberal and eafy; but, when drawn out into actual fervice, they are fubject to the rigours of martial law, as neceffary to keep them in order. This is the conftitutional fecurity which our laws have provided for the public peace, and for protecting the realm againft foreign or domeftic violence; and which the ftatutes declare is effentially neceffary to the fafety and profperity of the kingdom.

When the nation was engaged in war, more veteran troops and more regular difcipline were efteemed to be neceffary, than could be expected from a mere militia; and therefore at fuch times more rigorous methods were put in ufe for the raifing of armies and the due regulation and difcipline of the foldiery: which are to be looked upon only as temporary excrefcences bred out of the diftemper of the ftate, and not as any part of the permanent and perpetual laws of the kingdom. For martial law, which is built upon no fettled principles, but is entirely arbitrary in its decifions, is,

as

as Sir Matthew Hale obferves, in truth and reality no law, but fomething indulged rather than allowed as a law. The neceffity of order and difcipline in an army is the only thing which can give it countenance; and therefore it ought not to be permitted in time of peace, when the king's courts are open for all perfons to receive juftice according to the laws of the land. Wherefore, Thomas earl of Lancafter being conducted at Pontefract, 15 Edw. II. by martial law, his attainder was reverfed 1 Edw. III. becaufe it was done in time of peace. And it is laid down, that if a lieutenant, or other, that hath commiffion of martial authority, doth in time of peace hang or otherwife execute any man by colour of martial law, this is murder; for it is againft *magna carta*. And the petition of right enacts, that no foldier fhall be quartered on the fubject without his own confent; and that no commiffion fhall iffue to proceed within this land according to martial law. And whereas, after the Reftoration, king Ch. II. kept up about 5000 regular troops, by his own authority, for guards and garrifons; which king James II. by degrees increafed to no lefs than 30,000, all paid from his own civil lift; it was made one of the articles of the bill of rights, that the raifing or keeping a ftanding army within the kingdom in time of peace, unlefs it be with confent of parliament, is againft law.

But as the fafhion of keeping ftanding armies (which was firft introduced by Charles VII. in France, 1445) has of late years univerfally prevailed over Europe, (tho' fome of its potentates, being unable themfelves to maintain them, are obliged to have recourfe to richer powers, and receive fubfidiary penfions for that purpofe), it has alfo for many years paft been annually judged neceffary by our legiflature, for the fafety of the kingdom, the defence of the poffeffions of the crown of Great Britain, and the prefervation of the balance of power in Europe, to maintain even in time of peace a ftanding body of troops, under the command of the crown; who are however *ipfo facto* difbanded at the expiration of every year, unlefs continued by parliament. And it was enacted by ftatute 10 W. III. c. 1. that not more than 12,000 regular forces fhould be kept on foot in Ireland, tho' paid at the charge of that kingdom: which permiffion is extended by ftat. 8. Geo. III. c. 13. to 16,235 men in time of peace.

To prevent the executive power from being able to opprefs, fays baron Montefquieu, it is requifite that the armies with which it is entrufted fhould confift of the people, and have the fame fpirit with the people; as was the cafe at Rome, till Marius new-modelled the legions by enlifting the rabble of Italy, and laid the foundation of all the military tyranny that enfued. Nothing then, according to thefe principles, ought to be more guarded againft in a free ftate, than making the military power, when fuch a one is neceffary to be kept on foot, a body too diftinct from the people. Like ours, therefore, it fhould wholly be compofed of natural fubjects; it ought only to be enlifted for a fhort and limited time; the foldiers alfo fhould live intermixed with the people; no feparate camp, no barracks, no inland fortreffes fhould be allowed. And perhaps it might be ftill better, if, by difmiffing a ftated number, and enlifting others at every renewal of their term, a circulation could be kept up between the army and the people, and the citizen and the foldier be more intimately connected together.

To keep this body of troops in order, an annual act of parliament likewife paffes, "to punifh mutiny and defertion, and for the better payment of the army and their quarters." This regulates the manner in which they are to be difperfed among the feveral inn-keepers and victuallers throughout the kingdom; and eftablifhes a law-martial for their government. By this, among other things, it is enacted, that if any officer or foldier fhall excite, or join any mutiny, or, knowing of it, fhall not give notice to the commanding officer, or fhall defert, or lift in any other regiment, or fleep upon his poft, or leave it before he is relieved, or hold correfpondence with a rebel or enemy, or ftrike or ufe violence to his fuperior officer, or fhall difobey his lawful commands; fuch offender fhall fuffer fuch punifhment as a court-martial fhall inflict, tho' it extend to death itfelf.

However expedient the moft ftrict regulations may be in time of actual war, yet, in times of profound peace, a little relaxation of military rigour would not, one fhould hope, be productive of much inconvenience. And, upon this principle, tho' by our ftanding laws (ftill remaining in force, tho' not attended to) defertion in time of war is made felony without benefit of clergy, and the offence is triable by a jury and before the judges of the common law; yet, by our militia-laws beforementioned, a much lighter punifhment is inflicted for defertion in time of peace. So, by the Roman law alfo, defertion in time of war was punifhed with death, but more mildly in time of tranquillity. But our mutiny-act makes no fuch diftinction: for any of the faults abovementioned are, equally at all times, punifhable with death itfelf, if a court-martial fhall think proper. This difcretionary power of the court-martial is indeed to be guided by the directions of the crown; which, with regard to military offences, has almoft an abfolute legiflative power. "His Majefty (fays the act) may form articles of war, and conftitute courts-martial, with power to try any crime by fuch articles, and inflict fuch penalties as the articles direct." A vaft and moft important truft! an unlimited power to create crimes, and annex to them any punifhments not extending to life or limb! Thefe are indeed forbidden to be inflicted, except for crimes declared to be fo punifhable by this act; which crimes we have juft enumerated, and among which, we may obferve, that any difobedience to lawful commands is one. Perhaps in fome future revifion of this act, which is in many refpects haftily penned, it may be thought worthy the wifdom of parliament to afcertain the limits of military fubjection, and to enact exprefs articles of war for the government of the army, as is done for the government of the navy: efpecially as, by our prefent conftitution, the nobility and gentry of the kingdom, who ferve their country as militia officers, are annually fubjected to the fame arbitrary rule during their time of exercife.

One of the greateft advantages of our law is, that not only the crimes themfelves which it punifhes, but alfo the penalties which it inflicts, are afcertained and no-

notorious: nothing is left to arbitrary discretion: the king by his judges dispenses what the law has previously ordained; but is not himself the legislator. How much therefore is it to be regretted, that a set of men, whose bravery has so often preserved the liberties of their country, should be reduced to a state of servitude in the midst of a nation of freemen! for Sir Edward Coke will inform us, that it is one of the genuine marks of servitude, to have the law, which is our rule of action, either concealed or precarious: *Misera est servitus, ubi jus est vagum aut incognitum.* Nor is this state of servitude quite consistent with the maxims of sound policy observed by other free nations. For the greater the general liberty is which any state enjoys, the more cautious has it usually been in introducing slavery in any particular order or profession. These men, as baron Montesquieu observes, seeing the liberty which others possess, and which they themselves are excluded from, are apt (like eunuchs in the eastern seraglios) to live in a state of perpetual envy and hatred towards the rest of the community, and indulge a malignant pleasure in contributing to destroy those privileges to which they can never be admitted. Hence have many free states, by departing from this rule, been endangered by the revolt of their slaves: while, in absolute and despotic governments, where no real liberty exists, and consequently no invidious comparisons can be formed, such incidents are extremely rare. Two precautions are therefore advised to be observed in all prudent and free governments: 1. To prevent the introduction of slavery at all: or, 2. If it be already introduced, not to entrust those slaves with arms; who will then find themselves an overmatch for the freemen. Much less ought the soldiery to be an exception to the people in general, and the only state of servitude in the nation.

Blackst. Comment.

But as soldiers, by this annual act, are thus put in a worse condition than any other subjects; so, by the humanity of our standing laws, they are in some cases put in a much better. By statute 43 Eliz. c. 3. a weekly allowance is to be raised in every county for the relief of soldiers that are sick, hurt, and maimed: not forgetting the royal hospital at Chelsea for such as are worn out in their duty. Officers and soldiers, that have been in the king's service, are by several statutes, enacted at the close of several wars, at liberty to use any trade or occupation they are fit for, in any town in the kingdom (except the two universities), notwithstanding any statute, custom, or charter to the contrary. And soldiers in actual military service may make nuncupative wills, and dispose of their goods, wages, and other personal chattels, without these forms, solemnities, and expences, which the law requires in other cases. Our law does not indeed extend this privilege so far as the civil law, which carried it to an extreme that borders upon the ridiculous: for if a soldier, in the article of death, wrote any thing in bloody letters on his shield, or in the dust of the field with his sword, it was a very good military testament.

MILITARY *Court*. See CHIVALRY (*Court of*).

MILITARY *Tenures*. See TENURE, FEODAL SYSTEM, and KNIGHT.

MILITIA, in general, denotes the body of soldiers, or those who make profession of arms.

In a more restrained sense, militia denotes the trained bands of a town or country, who arm themselves, upon a short warning, for their own defence. So that, in this sense, militia is opposed to regular or stated troops. See MILITARY *State*, and FEODAL *System*.

MILIUM, MILLET; a genus of the digynia order, belonging to the triandria class of plants. There are five species, of which the most remarkable is the panicum or common millet. This is a native of India, but is now commonly cultivated in many parts of Europe as an esculent grain. It rises, with a reed-like stalk, three or four feet high, and channelled: at every joint there is one reed-like leaf, which is joined on the top of the sheath, and embraces and covers that joint of the stalk below the leaf: this sheath is closely covered with soft hairs, but the leaf which is expanded has none. The top of the stalk is terminated by a large loose panicle, which hangs on one side, having a chaffy flower, which is succeeded by a small round seed. There are two varieties; one with white, and the other with black seeds; but they do not differ in any other particular. This plant is greatly cultivated in the oriental countries, and from whence we are annually furnished with it. It is seldom cultivated in Britain but in small gardens, for feeding of poultry, where the seeds generally ripen very well. It is used as an ingredient in puddings, and is by some people greatly esteemed. The seeds must be sown in the beginning of April, upon a warm dry soil, but not too thick, because the plants divide into several branches, and should have much room. When they come up they should be cleaned from weeds; after which they will in a short time get the better of them, and prevent the future growth. In August the seeds will ripen, when the plant most be cut down, and the seeds beaten out as is practised for other grain; but if it is not protected from birds, they will devour it as soon as it begins to ripen.

MILK, a well-known fluid, prepared by nature in the breasts of women, and the udders of other animals, for the nourishment of their young.—According to Dr Cullen, milk is a connecting and intermediate substance between animals and vegetables. It seems immediately to be secreted from the chyle, both being a white liquor of the same consistence: it is most copiously secreted after meals, and of an acescent nature. In most animals who lives on vegetables, the milk is acescent; and it is uncertain, though at the same time no observation proves the contrary, whether it is not so likewise in carnivorous animals. But, whatever be in this, it is certain, that the milk of all animals who live on vegetables is acescent. Milk being derived from the chyle, we thence conclude its vegetable nature; for in those who live on both promiscuously, more milk is got, and more quickly, from the vegetable than the animal food. Milk, however, is not purely vegetable; though we have a vegetable liquor that resembles its taste, consistence, colour, acescency, and the separability of the oily part, viz. an emulsion of the nuces oleosæ and farinaceous substances. But these want the coagulable part of milk, which seems to be of animal-nature, approaching to that of the coagulable lymph of the blood. Milk, then, seems to be of an intermediate nature, between chyle taken

up

Milk.

up from the inteftines and the fully elaborated animal-fluid.

Its contents are of three kinds: firft, an oily part, which, whatever may be faid concerning the origin of other oils in the body, is certainly immediately derived from the oil of the vegetables taken in, as with thefe it agrees very exactly in its nature, and would entirely if we could feparate it fully from the coagulable part. Another mark of their agreemen is the feparability, which proves that the mixture has been lately attempted, but not fully performed. 2dly, Befides this oily, there is a proper coagulable part: And, 3dly, Much water accompanies both, in which there is diffolved a faline faccharine fubftance. Thefe three can be got feparate in cheefe, butter, and whey; but never perfectly fo, a part of each being always blended with every other part.

Nothing is more common, from what has been faid of its immediate nature, than to fuppofe that it requires no affimilation; and hence has been deduced the reafon of its exhibition in the moft weakly ftate of the human body. But wherever we can examine milk, we always find that it coagulates, fuffers a decompofition, and becomes acefcent. Again, infants, who feed entirely on milk, are always troubled with eructations, which every body obferves are not of the fame quality with the food taken; and therefore it appears, that, like all other food, milk turns naturally acefcent in the ftomach, and only enters the chyle and blood in confequence of a new recompofition. It approaches then to the nature of vegetable aliment, but is not capable of its noxious vinous fermentation, and therefore has an advantage over it; neither from this quality, like animal-food, is it heating in the ftomach, and productive of fever; though at the fame time, from its quantity of coagulable matter, it is more nourifhing than vegetables.

Milk is the food moft univerfally fuited to all ages and ftates of the body; but it feems chiefly defigned by nature as the food of infants. When animals are in the fœtus-ftate, their folids are a perfect jelly, incapable of an affimilatory power. In fuch ftate nature has perfectly affimilated food, as the albumen ovi in the oviparous, and in the viviparous animals certainly fomewhat of the fame kind, as it was neceffary the veffels fhould be filled with fuch a fluid as would make way for an after-affimilation. When the infant has attained a confiderable degree of firmnefs, as when it is feparated from the mother, yet fuch a degree of weaknefs ftill remains as makes fomewhat of the fame indication neceffary, it behoves the infant to have an alkalefcent food ready prepared, and at the fame time its noxious tendency to be avoided. Milk then is given, which is alkalefcent, and, at the fame time, has a fufficient quantity of acidity to correct that alkalefcency. As the body advances in growth, and the alkalefcent tendency is greater, the animal, to obviate that tendency, is led to take vegetable food, as more fuited to its ftrength of affimilation.

Dr Cullen obferves, that milk is almoft fuited to all temperaments; and it is even fo to ftomachs difpofed to acefcency, more than thofe fubftances which have undergone the vinous fermentation; nay, it even cures the heart-burn, checks vinous fermentation, and precipitates the lees, when, by renewal of fermentation, the wine happens to be fouled. It therefore very properly accompanies a great deal of vegetable aliment; although fometimes its acefcency is troublefome, either from a large proportion taken in, or from the degree of it; for, according to certain unaccountable circumftances, different acids are formed in the ftomach in different ftates of the body; in a healthy body, *e. g.* a mild one; in the hypochondriac difeafe, one fometimes as corrofive as the foffil acid. When the acidity of milk is carried to a great degree, it may prove remarkably refrigerant, and occafion cold crudities, and the recurrence of intermittent fevers. To take the common notion of its paffing unchanged into the blood, it can fuffer no folution. But if we admit its coagulum in the ftomach, then it may be reckoned among foluble or infoluble foods, according as that coagulum is more or lefs tenacious. Formerly rennet, which is employed to coagulate milk, was thought an acid; but, from late obfervations, it appears, that, if it be an acid, it is very different from other acids, and that its coagulum is ftronger than that produced by acids. It has been imagined, that a rennet is to be found in the ftomachs of all animals, which caufes coagulation of milk; but, to Dr Cullen, the coagulation of milk feems to be owing to a weak acid in the ftomach, the relicts of our vegetable food, inducing, in healthy perfons, a weak and foluble coagulum; but in different ftomachs this may be very different, in thefe becoming heavy and lefs foluble food, and fometimes even evacuated in a coagulated undiffolved ftate both by ftomach and ftool.

As milk is acefcent, it may be rendered fometimes purgative by mixing with the bile; and fome examples of this have been remarked. More commonly, however, it is reckoned among thofe foods which occafion coftivenefs.

Hoffman, in his experiments on milk, found that all kinds of it contained much water; and when this was diffipated, found the refiduum very different in their folubility. But we muft not thence conclude, that the fame infolubility takes place in the ftomach; for extracts made from vegetables with water are often very infoluble fubftances, and hardly diffufible through water itfelf: therefore, in Hoffman's extracts, if we may fo call them, of milk, fomewhat of the fame kind might have appeared; and thefe fubftances, which in their natural ftate were not fo, might appear very infoluble. However, we may allow that milk is always fomehow infoluble in the inteftines, as it is of a drying nature, and, as cheefe, &c. is very coftive. And this effect fhows that milk is always coagulated in the ftomach; for if it remained fluid, no fæces would be produced, whereas fometimes very hard ones are obferved. In the blood-veffels, from its animal-nature, it may be confidered as nutritious; but when we confider its vegetable contents, and acefcency in the primæ viæ, we find, that, like animal-food, it does not excite that degree of fever in the time of digeftion, and that from its acefcency it will refift putrefaction. Hence its ufe in hectic fevers, which, whatever be their caufe, appear only to be exacerbations of natural feverifh paroxyfms, which occur twice every day, commonly after meals, and at night. To obviate thefe, therefore, we give fuch an aliment as produces the leaft exacerbation of thefe fevers; and of this nature is milk, on

 on account of its acefcent vegetable nature.

There appears alfo fomewhat peculiar to milk, which requires only a fmall exertion of the animal-powers in order to its affimilation; and befides, in hectic complaints there is wanted an oily, bland food, approaching to the animal-nature: fo that on all thefe accounts, milk is a diet peculiarly adapted to them, and, in general, to moft convalefcents, and to thofe of inflammatory temperaments.—So far of milk in general.—We fhall now fpeak of the particular kinds which are in common ufe.

The milk of women, mares, and affes, agree very much in their qualities, being very dilute, having little folid contents, and, when evaporated to drynefs, having thefe very foluble, containing much faccharine matter, of a very ready acefcency, and, when coagulated, their coagulum being tender and eafily broke down. From this view they have lefs oil, and feem to have lefs coagulable matter, than the reft.

The milk of cows, fheep, and goats, agree, in oppofite qualities to the three juft mentioned; but here there is fomewhat more of gradation. Cows milk comes neareft to the former milk: goats milk is lefs fluid, lefs fweet, lefs flatulent, has the largeft proportion of infoluble part after coagulation, and indeed the largeft proportion of coagulable part; its oily and coagulable parts are not fpontaneoufly feparable, never throwing out a cream, or allowing butter to be readily extracted from it. Hence the virtues of thefe milks are obvious, being more nourifhing, though, at the fame time, lefs eafily foluble in weak ftomachs, than the three firft, lefs acefcent than thefe, and fo more rarely laxative, and peculiarly fitted for the diet of convalefcents without fever. The three firft, again, are lefs nourifhing, more foluble, more laxative, as more acefcent, and adapted to the convalefcents with fever.

Thefe qualities, in particular milks, are confiderably diverfified by different circumftances. Firft, Different animals, living on the fame diet, give a confiderably different milk; for there feems to be fomething in the conftitution, abftracting from the aliment, which conftitutes a confiderable diverfity of milk, not only in the fame fpecies of animals, but alfo in the fame animal, at different ages, and at different diftances after delivery: this applies to the choice of nurfes. Secondly, Milk follows the nature of the aliment more than any other juice in the human body, being more or lefs fluid and dilute, more or lefs folid and nourifhing, in proportion as thefe qualities are more or lefs in the aliment. The nature of the aliment differs according to its time of growth, *e. g.* old grafs being always found more nourifhing than young. Aliment, too, is always varied according to the feafon, as that is warm or dry, moift or cloudy.

The milk of each particular kind of animal is fitter for particular purpofes, when fed on proper food. Thus the cow delights in the fucculent herbage of the vale: if the fheep be fed there he certainly rots, but on the higher and more dry fide of the mountain he feeds pleafantly and healthy; while the goat never ftops near the bottom, but afcends to the craggy fummit: and certainly the milks of thefe animals are always beft on their proper foil, and that of goats is beft on a mountainous country. From a differtation of Linnæus, we have many obfervations concerning the diverfity of plants on which each animal choofes to feed. All the Swedifh plants which could be collected together, were prefented alternately to domeftic animals, and then it appeared that the goat lived on the greateft variety, and even on many which were poifonous to the reft; that the cow chofe the firft fucculent fhoots of the plant, and neglected the fructification; which laft was preferred by the goat. Hence may be deduced rules concerning the pafturage of different animals; *e. g.* Farmers find, that, in a pafture which was only fit to feed a certain number of fheep, an equal number of goats may be introduced, while the fheep are no lefs nourifhed than before.

It is not eafy to affign the difference between milk frefh-drawn and that detained in the open air for fome time; but certainly there is fome material one, otherwife nature univerfally would not have directed infants to fucking; and indeed it feems, better than the other, fitted for digeftion and nourifhment. Phyficians have fuppofed that this depended on the evaporation of fome *fpt. rector.* but our author cannot conceive any fuch, except common water here; and befides, thefe volatile parts can hardly be nutritious. A more plaufible account feems deducible from mixture: milk, new drawn, has been but lately mixed, and is expofed to fpontaneous feparation, a circumftance hurtful to digeftion; none of the parts being, by themfelves, fo eafily affimilated as when they are all taken together. Hence, then, milk new-drawn is more intimately blended, and therefore then is moft proper to the weakly and infants.

Another difference in the ufe of milk expofed for fome time to the air, is taking it boiled or unboiled. Phyficians have generally recommended the former; but the reafon is not eafily affigned. Perhaps it is this: Milk kept for fome time expofed to the air has gone fo far to a fpontaneous feparation; whereas the heat thoroughly blends the whole, and hence its refolution is not fo eafy in the ftomach; and thus boiled milk is more coftive than raw, and gives more fæces. Again, when milk is boiled, a confiderable quantity of air is detached, as appears from the froth on the furface; and air is the chief inftrument of fermentation in bodies; fo that, after this procefs, it is not liable to acefcency: for thefe reafons it is proper for the robuft and vigorous.

Another difference of milk is, according as it is fluid or coagulated. The coagulated is of two kinds, as induced by rennet, or the natural acefcency of the milk. The former preparation makes the firmer and lefs eafily foluble coagulum; though, when taken with the whey unfeparated, it is lefs difficult of folution, tho' more fo than any other coagulum in the fame cafe. Many nations ufe the latter form, which is eafier foluble, but very much acefcent, and therefore, in point of folution, fhould be confined to the vigorous, in point of acefcency, to thofe who live on alkalefcent food; and in the laft cafe the Laplanders ufe it as their chief acefcent condiment. From the fame confiderations it is more cooling, and in its other effects like all other acefcent vegetables.

Milk.

Milk by evaporation yields a ſweet ſaline matter, of which Dr Lewis gives the following proportions:

Twelve ounces of	Left of dry matter	From which water extracted a ſweet ſaline ſubſtance amounting to
Cows milk	13 drams.	$1\frac{1}{2}$ drams.
Goats milk	$12\frac{1}{2}$	$1\frac{1}{2}$
Human milk	8	6
Affes milk	8	6

The ſaline ſubſtance extracted from affes milk was white, and ſweet as ſugar; thoſe of the others brown, or yellow, and conſiderably leſs ſweet; that from cows milk had the leaſt ſweetneſs of any.

On diſtilling 12 quarts of milk *in balneo mariæ*, at leaſt nine quarts of pure phlegm were obtained: the liquor which afterwards aroſe was acidulous, and by degrees grew ſenſibly more and more acid as the diſtillation was continued. After this came over a little ſpirit, and at laſt an empyreumatic oil. The remaining ſolid matter adhered to the bottom of the retort, in the form of elegant ſhining black flowers, which being calcined and elixated yielded a portion of fixed alkaline ſalt.

Milk, ſet in a warm place, throws up to the ſurface an unctuous cream, from which, by agitation, the butter is eaſily ſeparated. The addition of alkaline ſalts prevents this ſeparation, not (as ſome have ſuppoſed) by abſorbing an acid from the milk, but by virtue of their property of intimately uniting oily bodies with watery liquors. Sugar, another grand intermedium betwixt oils and water, has this effect in a greater degree, though that concrete is by no means alkaline, or an abſorbent of acids.

The ſweet ſaccharine part of the milk remains diſſolved in the whey after the ſeparation of the curd or cheeſy matter, and may be collected from it in a white cryſtalline form, by boiling the whey till all remains of the curdled ſubſtance have fallen to the bottom; then filtering, evaporating it to a due conſiſtence, ſetting it to ſhoot, and purifying the cryſtals by ſolution in water and a ſecond cryſtallization. Much has been ſaid of the medicinal virtues of this ſugar of milk, but it does not ſeem to have any conſiderable ones: It is from cows milk that it has been generally prepared; and the cryſtals obtained from this kind of milk have but little ſweetneſs.

When milk is ſuffered to coagulate ſpontaneouſly, the whey proves acid, and on ſtanding grows more and more ſo till the putrefactive ſtate commences. Sour whey is uſed as an acid, preferably to the directly vegetable or the mineral acids, in ſome of the chemical arts; as for diſſolving iron in order to the ſtaining of linen and leather. This acid was commonly made uſe of in the bleaching of linen, for diſſolving and extracting the earthy particles left in the cloth by the alkaline ſalts and lime employed for cleanſing and whitening it. Butter-milk is preferred to plain ſour-milk or ſour-whey: This laſt is ſuppoſed to give the cloth a yellow colour. Dr Home, in his ingenious treatiſe on this ſubject, recommends water acidulated with ſpirit of vitriol, (in the proportion of about half an ounce, or at moſt three quarters of an ounce, to a gallon), as preferable in many reſpects to the acid of milk, or of the more directly vegetable ſubſtances. He obſerves, that the latter are often difficultly procurable, abound with oleaginous particles, and haſten to corruption; whilſt the vitriolic acid is cheap, and pure, and indiſpoſed to putrefy: That milk takes five days to perform its office, whilſt the vitriolic acid does it in as many hours, perhaps in as many minutes: That this acid contributes alſo to whiten the cloth, and does not make it weaker though the cloth be kept in it for months. He finds, that acids as well as alkalies, extract an oily matter from the cloth, and loſe their acidity and alkalicity. Since this treatiſe appeared, the uſe of ſour-milk is very generally ſuperſeded by oil of vitriol.

It is obſervable, that affes milk is greatly diſpoſed, on ſtanding for a little time, to become thick and ropy. In the Breſlau collection for the year 1720, there is a remarkable account of milk (which probably was that of the aſs) grown ſo thick and tenacious as to be drawn out into long ſtrings, which, when dried, were quite brittle.

New cows milk, ſuffered to ſtand for ſome days on the leaves of butterwort or ſun-dew, becomes uniformly thick, ſlippery, and coherent, and of an agreeable ſweet taſte, without any ſeparation of its parts. Freſh milk, added to this, is thickened in the ſame manner, and this ſucceſſively. In ſome parts of Sweden, as we are informed in the Swediſh Memoirs, milk is thus prepared for food.

New milk has a degree of glutinous quality, ſo as be uſed for joining broken ſtone-ware. There is a far greater tenacity in cheeſe properly prepared.

Milk, when examined by a microſcope, appears compoſed of numerous globules ſwimming in a tranſparent fluid. It boils in nearly the ſame degree of heat with common water; ſome ſorts rather ſooner, and ſome a little later: after boiling, it is leſs diſpoſed to grow ſour than in its natural ſtate. It is coagulated by acids both mineral and vegetable, and by alkalies both fixed and volatile. The coagulum made by acids falls to the bottom of the ſerum; that made by alkalies ſwims on the ſurface, commonly forming (eſpecially with volatile alkalies) a thick coriaceous ſkin. The ſerum, with alkalies, proves green or ſanious; with acids, it differs little in appearance from the whey that ſeparates ſpontaneouſly. The coagulum formed by acids is diſſolved by alkalies, and that formed by alkalies is re-diſſolved by acids; but the milk does not in either caſe reſume its original properties. It is coagulated by moſt of the middle ſalts, whoſe baſis is an earth or a metallic body; as ſolution of alum, fixed ſal ammoniac, ſugar of lead, green and blue vitriol: but not by the chalybeate or purging mineral waters, nor by the bitter ſalt extracted from the purging waters. Among the neutral ſalts that have been tried, there is not one that produces any coagulation. They all dilute the milk, and make it leſs diſpoſed to coagulate with acids or alkalies: Nitre ſeems to have this effect in a greater degree than the other neutral ſalts. It is inſtantly coagulated by highly-rectified ſpirit of wine, but ſcarcely by a phlegmatic ſpirit. It does not mingle with expreſſed oils. All the coagula are diſſolved by gall.

Milk *of Lime. Milk of Sulphur*. The name of *milk* is given to ſubſtances very different from *milk* properly ſo

so called, and which resemble milk only in colour. Such is water in which quicklime has been slaked, which acquires a whiteness from the small particles of the lime being suspended in it, and has hence been called the *milk of lime*. Such also is the solution of liver of sulphur, when an acid is mixed with it, by which white particles of sulphur are made to float in the liquor.

MILK *of Vegetables*. For the same reason that milk of animals may be considered as a true animal-emulsion, the emulsive liquors of vegetables may be called *vegetable milks*. Accordingly emulsions made with almonds are commonly called *milk of almonds*. But besides this vegetable milk, which is in some measure artificial, many plants and trees contain naturally a large quantity of emulsive or milky juices. Such are lettuce, spurge, fig-tree, and the tree which furnishes the elastic American resin. The milky juices obtained from all these vegetables derive their whiteness from an oily matter, mixed and undissolved in a watery or mucilaginous liquor. Most resinous gums were originally such milky juices, which afterwards become solid by the evaporation of their most fluid and volatile parts.

These natural milky juices have not been examined by any chemist. Such an examination would, however, procure much essential knowledge concerning vegetable œconomy. We should probably find examples of all kinds of oils reduced into milky juices; and this knowledge cannot fail of throwing much light on the nature of resins and gum-resins.

MILK-*Fever*. See MIDWIFERY, Chap. XX.

MILL, a machine for grinding corn, &c. of which there are various kinds, according to the different methods of applying the moving power; as water-mills, wind-mills, mills worked by horses, &c. See MECHANICS.

The first obvious method of reducing corn into flour for bread would be, by the simple expedient of pounding. And that was for ages the only one which was practised by the various descendants of Adam, and actually continued in use among the Romans below the reign of Vespasian. But the process was very early improved by the application of a grinding power, and the introduction of mill-stones. This, like most of the common refinements in domestic life, was probably the invention of the antediluvian world, and certainly practised in some of the earliest ages after it. And, like most of them, it was equally known in the east and west. Hence the Gauls and Britons appear familiarly acquainted with the use of hand-mills before the time of their submission to the Romans; the Britons particularly distinguishing them, as the Highlanders and we distinguish them at present, by the simple appellation of *querns*, *carnes*, or *stones*. And to these the Romans added the very useful invention of water-mills. For this discovery the world is pretty certainly indebted to the genius of Italy; and the machine was not uncommon in the country at the conquest of Lancashire. This, therefore, the Romans would necessarily introduce with their many other refinements among us. And that they actually did, the British appellation of a *water-mill* fully suggests of itself; the *melin* of the Welsh and Cornish, the *mull*, *meill*, and *melin* of the Armoricans, and the Irish *muilean* and *muilind*, being all evidently derived from the Roman *mola* and *molendinum*. The subject Britons universally adopted the Roman name, but applied it, as we their successors do, only to the Roman *mill*; and one of these was probably erected at every stationary city in the kingdom. One plainly was at Manchester, serving equally the purposes of the town, and the accommodation of the garrison. *Whitaker's Hist. of Manchester.* And one alone would be sufficient, as the use of hand-mills remained very common in both, many having been found about the site of the station particularly; and the general practice having descended among us nearly to the present period. Such it would be peculiarly necessary to have in the camp, that the garrison might be provided against a siege. And the water-mill at Manchester was fixed immediately below the Castle-field and the town, and on the channel of the Medlock. There, a little above the ancient ford, the sluice of it was accidentally discovered about 30 years ago. On the margin of Dyer's-croft, and opposite to some new constructions, the current of the river, accidentally swelled with the rains, and, obstructed by a dam, broke down the northern bank, swept away a large oak upon the edge of it, and disclosed a long tunnel in the rock below. This has been since laid open in part with a spade. It appeared entirely uncovered at the top, was about a yard in width, and another in depth, but gradually narrowed to the bottom. The sides shewed every-where the marks of the tool on the rock, and the course of it was parallel with the channel. It was bared by the flood about 25 yards only in length, but was evidently continued for several further; having originally begun, as the nature of the ground evinces, just above the large curve in the channel of the Medlock.

For the first five or six centuries of the Roman state, there were no public bread-bakers in the city of Rome. They were first introduced into it from the east, at the conclusion of the war with Perseus, and about the year 167 before Christ. And, towards the close of the first century, the Roman families were supplied by them every morning with fresh loaves for breakfast. But the same custom, which prevailed originally among the Romans and many other nations, has continued nearly to the present time among the Mancunians. The providing of bread for every family was left entirely to the attention of the women in it. And it was baked upon stones, which the Welsh denominate *greidiols* and we *gredles*. It appears, however, from the kiln-burnt pottery which has been discovered in the British sepulchres, and from the British appellation of an *odyn* or *oven* remaining among us at present, that furnaces for baking were generally known among the original Britons. An odyn would, therefore, be erected at the mansion of each British baron, for the use of himself and his retainers. And, when he and they removed into the vicinity of a Roman station, the oven would be rebuilt with the mansion, and the public bakehouses of our towns commence at the first foundation of them. One bakehouse would be constructed, as we have previously shewn one mill to have been set up, for the public service of all the Mancunian families. One oven and one mill appear to have been equally established in the town. And the inhabitants of it appear immemorially accustomed to bake at the one and grind at the other. Both, therefore, were in all pro-

bability conſtructed at the firſt introduction of water-mills and ovens into the country. The great ſimilarity of the appointments refers the conſideration directly to one and the ſame origin for them. And the general nature of all ſuch inſtitutions points immediately to the firſt and actual introduction of both. And, as the ſame eſtabliſhments prevailed equally in other parts of the north, and pretty certainly obtained over all the extent of Roman Britain, the ſame erections were as certainly made at every ſtationary town in the kingdom.

MILL (John), a very learned divine, was born at Shap in Weſtmoreland, about the year 1645; and became a ſervitor of Queen's college Oxford. On his entering into orders he became an eminent preacher, and was made prebendary of Exeter. In 1681, he was created doctor of divinity; about the ſame time he was made chaplain in ordinary to king Charles II. and in 1685 he was elected principal of St Edmund's hall in Oxford. His edition of the Greek Teſtament, which will ever render his name memorable, was publiſhed about a fortnight before his death, which happened in June 1707. Dr Mill was employed 30 years in preparing this edition.

MILLENARIANS, or Chiliasts, a name given to thoſe, in the primitive ages, who believed that the ſaints will reign on earth with Chriſt 1000 years.

The Millenarians held, that after the coming of Antichriſt, and the deſtruction of all nations which ſhall follow, there ſhall be a firſt reſurrection of the juſt alone: that all who ſhall be found upon earth, both good and bad, ſhall continue alive; the good, to obey the juſt who are riſen, as their princes; the bad, to be conquered by the juſt, and to be ſubject to them: that Jeſus Chriſt will then deſcend from heaven in his glory: that the city of Jeruſalem will be rebuilt, enlarged, embelliſhed, and its gates ſtand open night and day. They applied to this new Jeruſalem what is ſaid in the Apocalypſe, chap. xxi. and to the temple all that is written in Ezekiel xxxvi. Here, they pretended, Jeſus Chriſt will fix the ſeat of his empire, and reign 1000 years with the ſaints, patriarchs, and prophets, who will enjoy perfect and uninterrupted felicity.

This reign of our Saviour on earth is uſually ſtyled the *millennium*, or reign of 1000 years.

MILLEPES, or wood-louse, in zoology; a ſpecies of Oniscus. Theſe inſects are found in cellars, under ſtones, and in cold moiſt places; in the warmer countries they are rarely met with. Millepedes have a faint diſagreeable ſmell, and a ſomewhat pungent, ſweetiſh, nauſeous taſte. They have been highly celebrated in ſuppreſſions of urine, in all kinds of obſtructions of the bowels, in the jaundice, weakneſs of ſight, and a variety of other diſorders. Whether they have any juſt title to theſe virtues is greatly to be doubted: thus much is certain, that their real effects come far ſhort of the character uſually given them.

MILLET, in botany. See Milium.

MILLING of Cloth. See Fulling.

MILLION, in arithmetic, the ſum of ten hundred thouſand, or a thouſand times a thouſand. See Arithmetic.

MILLO, a part of mount Zion at its extremity; and therefore called *Millo*, of the city of David, (2 Chron. xxxii.) taken in with the wall that encompaſſed mount Zion. Uncertain whether *Beth-Millo*, (Judges ix. 20.) denotes a place; if it did, it lay near Sechem.

MILO, an iſland in the Archipelago, about 50 miles in circumference, with a harbour, which is one of the largeſt and beſt of the Mediterranean, and which ſerves for a retreat for all the ſhips that go to or return from the Mediterranean. The inhabitants are all Greeks, except the cadi, or judge, who is a Turk. Salt is ſo cheap, that they ſell 67 pounds for ſevenpence. There are two biſhops, the one of the Greek, and the other of the Latin church; and there are 13 monaſteries in this iſland. In the ſpring the whole iſland is like a carpet thick ſet with anemonies of all ſorts and colours. There are public baths at the foot of a ſmall hill going from the town to the harbour; they are in a cavern, with a very narrow entrance of 50 paces long. When a perſon is got in, the ſweat guſhes out in large drops; and this ſweating is eſteemed good for the palſy, rheumatiſm, and other diſeaſes. Below theſe baths, near the ſhore, there are many little ſprings, ſo hot as to ſcald one's fingers. Four miles from the town, in a very ſteep place by the ſea, is a grotto, 15 paces deep, which is all cruſted over with plume-alum, in ſome places as white as ſnow, and reddiſh in others. Some paces from this cavern, on the ſea-ſhore, is another grotto, whoſe bottom is filled with ſulphur, which burns continually. Thoſe who are troubled with the itch go and ſweat here, and are generally cured. Near the chapel of St Surriacus is a ſpot of ground continually burning; and the fields about it are always ſmoking, and yet they are all covered with marigolds. Though the air of Milo is very unwholeſome, yet the inhabitants lead a merry life, and regale themſelves very cheap; but the women are not very famous for chaſtity. They have partridges, turtle-doves, quails, wheat-ears, wood-pigeons, and ducks, in great plenty; as alſo good figs, melons, excellent grapes, and very delicate fiſh. The principal town is of the ſame name as the iſland, and contains near 5000 inhabitants. It is prettily built, but abominably naſty; the houſes are two ſtories high, with flat roofs, and are built with a ſort of pumice-ſtone, which is hard, blackiſh, and yet very light. This iſland is 60 miles north of Candia, and the town is ſituated in E. Long. 25. 15. N. Lat. 36. 27.

MILT, in anatomy, a popular name for the ſpleen.

Milt, or *Melt*, in natural hiſtory, the ſoft roe in fiſhes; thus called by reaſon it yields, by expreſſion, a whitiſh juice reſembling milk. See Roe.

The milt is properly the ſeed or ſpermatic part of the male fiſh. The milt of a carp is reckoned a choice bit. It conſiſts of two long whitiſh irregular bodies, each included in a very thin fine membrane. M. Petit conſiders them as the teſticles of the fiſh wherein the ſeed is preſerved; the lower part, next the anus, he takes for the *veſiculæ ſeminales*.

MILTIADES, a celebrated Athenian captain, who, with 12,000 men, routed above 300,000 Perſians at Marathon, and, purſuing them, took many iſlands in the Archipelago: but returning to Athens without taking Paros, his fellow-citizens, forgetting the important ſervices he had rendered them, ſentenced him to pay a large fine. Being unable to advance the money, he was thrown into priſon, where he languiſh-

ed out the remainder of his days.

MILTON (John), the moſt illuſtrious of the Engliſh poets, was deſcended of a genteel family, ſeated at a place of their own name, viz. *Milton*, in Oxfordſhire. He was born December 9. 1608, and received his firſt rudiments of education under the care of his parents, aſſiſted by a private tutor. He afterwards paſſed ſome time at St Paul's ſchool, London; in which city his father had ſettled, being engaged in the buſineſs of a ſcrivener. At the age of 17, he was ſent to Chriſt's college, Cambridge; where he made a great progreſs in all parts of academical learning; but his chief delight was in poetry. In 1698, he proceeded bachelor of arts, having performed his exerciſe for it with great applauſe. His father deſigned him for the church; but the young gentleman's attachment to the muſes was ſo ſtrong, that it became impoſſible to engage him in any other purſuits. In 1632, he took the degree of maſter of arts; and having now ſpent as much time in the univerſity as became a perſon who determined not to engage in any of the three profeſſions, he left the college, greatly regretted by his acquaintance, but highly diſpleaſed with the uſual method of training up youth there for the ſtudy of divinity; and being much out of humour with the public adminiſtration of eccleſiaſtical affairs, he grew diſſatisfied with the eſtabliſhed form of church-government, and diſliked the whole plan of education practiſed in the univerſity. His parents, who now dwelt at Horton, near Colnbrook, in Buckinghamſhire, received him with unabated affection, notwithſtanding he had thwarted their views of providing for him in the church, and they amply indulged him in his love of retirement; wherein he enriched his mind with the choiceſt ſtores of Grecian and Roman literature: and his poems of *Comus*, *L'Allegro*, *Il Penſeroſo*, and *Lycidas*, all wrote at this time, would have been ſufficient, had he never produced any thing more conſiderable, to have tranſmitted his fame to lateſt poſterity. However, he was not ſo abſorbed in his ſtudies as not to make frequent excurſions to London; neither did ſo much excellence paſs unnoticed among his neighbours in the country, with the moſt diſtinguiſhed of whom he ſometimes choſe to relax his mind, and improve his acquaintance with the world as well as with books.

After five years ſpent in this manner, he obtained his father's permiſſion to travel for farther improvement.—At Paris he became acquainted with the celebrated Hugo Grotius; and from thence travelling into Italy, he was every where careſſed by perſons of the moſt eminent quality and learning.

Upon his return home, he ſet up a genteel academy in Alderſgate-ſtreet.—In 1641, he began to draw his pen in defence of the Preſbyterian party; and the next year he married the daughter of Richard Powell, Eſq; of Foreſt-Hill in Oxfordſhire. This lady, however, whether from a difference on account of party, her father being a zealous royaliſt, or ſome other cauſe, ſoon thought proper to return to her relations; which ſo incenſed her huſband, that he reſolved never to take her again, and wrote and publiſhed ſeveral tracts in defence of the doctrine and diſcipline of divorce. He even made his addreſſes to another lady; but this incident proved the means of a reconciliation with Mrs Milton.

In 1644, he wrote his Tract upon Education; and the reſtraint on the liberty of the preſs being continued by act of parliament, he wrote boldly and nobly againſt that reſtraint.

In 1645, he publiſhed his juvenile poems; and about two years after, on the death of his father, he took a ſmaller houſe in High Holborn, the back of which opened into Lincoln's-Inn Fields.—Here he quietly proſecuted his ſtudies, till the fatal cataſtrophe and death of Charles I.; on which occaſion he publiſhed his Tenure of Kings and Magiſtrates, in juſtification of the fact. He was now taken into the ſervice of the commonwealth, and made Latin ſecretary to the council of ſtate, who reſolved neither to write to others abroad, nor to receive any anſwers, except in the Latin tongue, which was common to them all. The famous Εἰκὼν Βασιλικὴ coming out about the ſame time, our author, by command, wrote and publiſhed his *Iconoclaſtes* the ſame year. It was alſo by order of his maſters, backed by the reward of 1000l. that, in 1651, he publiſhed his celebrated piece, entitled *Pro Populo Anglicano Defenſio*, "A Defence of the People of England, in anſwer to Salmaſius's Defence of the King;" which performance ſpread his fame over all Europe.—He now dwelt in a pleaſant houſe, with a garden, in Petty France, Weſtminſter, opening into St James's Park. In 1652, he buried his wife, who died not long after the delivery of her fourth child; and about the ſame time he alſo loſt his eye-ſight, by a *gutta ſerena*, which had been growing upon him many years.

Cromwell took the reins of government into his own hands in the year 1653; but Milton ſtill held his office. His leiſure-hours he employed in proſecuting his ſtudies, wherein he was ſo far from being diſcouraged by the loſs of his ſight, that he even conceived hopes this misfortune would add new vigour to his genius; which, in fact, ſeems to have been the caſe.—Thus animated, he again ventured upon matrimony: his ſecond lady was the daughter of Captain Woodcock of Hackney: ſhe died in childbed about a year after.

On the depoſition of the protector, Richard Cromwell, and on the return of the long parliament, Milton being ſtill continued ſecretary, he appeared again in print; pleading for a farther reformation of the laws relating to religion; and, during the anarchy that enſued, he drew up ſeveral ſchemes for re-eſtabliſhing the commonwealth, exerting all his faculties to prevent the return of Charles II. England's deſtiny, however, and Charles's good fortune, prevailing, our author choſe to conſult his ſafety, and retired to a friend's houſe in Bartholomew-Cloſe. A particular proſecution was intended againſt him; but the juſt eſteem to which his admirable genius and extraordinary accompliſhments entitled him, had raiſed him ſo many friends, even among thoſe of the oppoſite party, that he was included in the general amneſty.

This ſtorm over, he married a third wife Elizabeth, daughter of Mr Minſhall a Cheſhire gentleman; and not long after he took a houſe in the Artillery Walk, leading to Bunhill-Fields.—This was his laſt ſtage: here he ſat down for a longer continuance than he had been able to do any where; and though he had loſt his fortune, (for every thing belonging to him went to wreck

wreck at the Reſtoration), he did not loſe his taſte for literature, but continued his ſtudies with almoſt as much ardour as ever; and applied himſelf particularly to the finiſhing his grand work, the *Paradiſe Loſt;* one of the nobleſt poems that ever was produced by human genius.—It was publiſhed in 1667, and his *Paradiſe Regained* came out in 1670.—This latter work fell ſhort of the excellence of the former production; although, were it not for the tranſcendent merit of the Paradiſe Loſt, the ſecond compoſition would doubtleſs have ſtood foremoſt in the rank of Engliſh epic poems.—After this he publiſhed many pieces in proſe; for which we refer our readers to the edition of his Hiſtorical, Poetical, and Miſcellaneous Works, printed by Millar, in 2 vols 4to. in 1753.

In 1674, this great man paid the laſt debt to nature, at his houſe in Bunhill-Fields, in the 66th year of his age; and was interred on the 12th of November, in the chancel of St Giles's, Cripplegate.—A decent monument was erected to his memory, in 1737, in Weſtminſter Abbey, by Mr Benſon, one of the auditors of the impreſt.—As to his perſon, it was remarkably handſome; but his conſtitution was tender, and by no means equal to his inceſſant application to his ſtudies.—Though greatly reduced in his circumſtances, yet he died worth 1500l. in money, beſide his houſehold goods.—He had no ſon; but left behind him three daughters, whom he had by his firſt wife.

MILVIUS, Molvius, or *Mulvius Pons*, a bridge on the Tiber, built by Æmilius Scaurus the cenſor, in the time of Sylla, at two miles diſtance from the city, on the Via Flaminia, and repaired by Auguſtus. From this bridge the ambaſſadors of the Allobroges were brought back to Rome, by Cicero's management, and made a diſcovery of Catiline's conſpiracy (Salluſt.) Near it Maxentius was defeated by Conſtantine, (Eutropius.) Now called *Ponte Molle*.

Milvius, in ornithology, a ſpecies of Falco.

MIME, in the ancient comedy, a perſon who acted any character by mere geſtures, and hence denominated *pantomime*. See Pantomime.

MIMESIS, in rhetoric, the imitating the voice and geſtures of another perſon.

MIMNERMUS, an ancient poet and muſician, flouriſhed about the beginning of the 6th century B. C. He was of Smyrna, and cotemporary with Solon. Athenæus gives him the invention of pentameter verſe. His elegies, of which only a few fragments are preſerved, were ſo much admired in antiquity, that Horace preferred them to thoſe of Callimachus. He compoſed a poem of this kind, as we learn from Pauſanias, upon the battle fought between the people of Smyrna, and the Lydians, under Gyges. He likewiſe was author of a poem in elegiac verſe, quoted by Strabo, which he intitled *Nanno*, and in which we may ſuppoſe he chiefly celebrated a young and beautiful girl of that name, who, according to Athenæus, was a player on the flute, with whom he was enamoured in his old age. With reſpect to love-matters, according to Propertius, his verſes were more valuable than all the writings of Homer.

Plus in amore valet Mimnermi verſus Homero.
Lib. i. Eleg. 9. v. 11.

And Horace bears teſtimony to his abilities, in deſcribing that ſeducing paſſion:

Si Mimnermus uti cenſet, ſine amore jociſque
Nil eſt jucundum, vivas in amore jociſque.
Epiſt. VI. Lib. i. v. 65.

If, as wiſe Mimnermus ſaid,
Life unbleſt with love and joy,
Ranks us with the ſenſeleſs dead,
Let theſe gifts each hour employ.

Alluding to ſome much admired lines of this Greek poet, which have been preſerved by Stobæus.

Τις δε βιος, τι δε τερπνον ατερ χρυσης Ἀφροδιτης, &c.

What is life and all its pride,
If love and pleaſure be denied?
Snatch, ſnatch me hence, ye fates, whene'er
The am'rous bliſs I ceaſe to ſhare.
Oh let us crop each fragrant flow'r,
While youth and vigour give us pow'r;
For frozen age will ſoon deſtroy
The force to give or take a joy;
And then, a prey to pain and care,
Deteſted by the young and fair,
The ſun's bleſt beams will hateful grow,
And only ſhine on ſcenes of wo!

MIMOSA, the sensitive plant; a genus of the monœcia order, belonging to the polygamia claſs of plants.

This genus compriſes ſhrubby and herbaceous plants, but moſtly of the ſhrub kind, ſome trailing, others erect, all natives of the Indies, &c. retained here in ſtoves as great curioſities, particularly for the very ſingular ſenſibility of the leaves of ſome ſorts, which on being touched, ſuddenly recede, contract, and fall down in a very wonderful manner: all of them garniſhed with pinnated leaves, and monopetalous, funnel-ſhaped, five-parted, polygamous flowers at the axillas and ends of the branches in cluſters and ſpikes.

The name *mimoſa* of this genus, ſignifies mimic, originating from the ſenſibility of the leaves, which, by their motion, mimic or imitate, as it were, the motions of animals.

To this genus Linnæus joins many of the *acacias*, and it compriſes upwards of 40 different ſpecies; tho' not more than a quarter of them are common in the Engliſh gardens, or poſſeſs any particular merit either for curioſity or ornament, and none for uſe. Of the ſorts cultivated here in our ſtoves, &c. ſome are of the ſhrub and tree kind, and two or three are herbaceous perennials and annuals; are moſtly of the ſenſitive kinds, except the acacia ſorts, which are motionleſs, as expreſſed under their proper heads, i. e. ſenſitive and humble kinds, and ſenſeleſs kinds. The former of which are exceedingly curious plants in the very ſingular circumſtance of their leaves receding rapidly from the touch: the leaves are winged, each compoſed of numerous ſmall lobes, all of which on being touched, haſtily run up cloſe together; and in ſome ſorts the footſtalks and all are affected, ſo as inſtantly to fall downward, as if faſtened by hinges.

Shrubby, Senſitive, and Humble Kinds.

They have all winged leaves, each wing conſiſting of many ſmall pinnæ; ſome only contract the lobes of the leaves and pinnæ at the touch; others not only contract every part of their leaves, but their footſtalks alſo ſuddenly drop downward; and for diſtinction ſake, the former are called *ſenſitive mimoſas*, and the latter *humble ſenſitives;* but the leaves of both ſorts ſoon recover their uſual poſition. The moſt remarkable ſpecies are,

1. Sensitiva, or common sensitive humble plant. Rises with an undershrubby prickly stem, branching six or eight feet high, armed with crooked spines; conjugated, pinnated leaves, with bijugated partial lobes, or wings, having the inner ones the least, each leaf on a long footstalk; and at the sides and ends of the branches many purple flowers in roundish heads; succeeded by broad, flat, jointed pods, in radiated clusters.

This is somewhat of the humble sensitive kind; the leaves, footstalks and all, recede from the touch, though not with such facility as in some of the following sorts.

2. The pudica, or bashful humble plant. Rises with an undershr.bby, declinated, prickly stem, branching two or three feet around, armed with hairy spines; pinnated, digitated leaves, each leaf being of five or more long folioles, attached by their base to a long footstalk, and spread out above like the fingers of a hand; a d at the sides and ends of the branches roundish heads of greenish white flowers, succeeded by small, jointed, prickly pods.

This is truly of the humble sensitive kind; for by the least touch the leaves instantly recede, contract close, and, together with the footstalk, quickly decline downward, as if ashamed at the approach of the hand.

3. The pernambucana, or pernambuca slothful mimosa. Hath undershrubby, procumbent, unarmed stems, branching two or three feet around; bipinnated leaves, of three or four pair of short, winged foliola; and at the axillas drooping spikes of pentandrous flowers, the lower ones castrated.

This sort recedes very slowly from the touch, only contracting its pinnæ a little when smartly touched; hence the name *slothful mimosa*.

4. The asperata, or rough sensitive mimosa, hath a shrubby, upright, prickly, hairy, rough stem, branching four or five feet high, armed with short, broad, whitish spines; bipinnated, prickly leaves, of five or six pair of foliola, or wings, arranged opposite, having two thorns between each pair; and at the upper axillas globular heads of purple flowers, succeeded by short, flat, jointed pods, in clusters, spreading each way like a radius.

This is only moderately sensitive in its foliola, but not in the footstalks.

5. The punctata, or punctated sensitive mimosa, rises with a shrubby, upright, taper, punctated, or spotted, unarmed stem, branching erectly five or six feet high; bipinnated leaves, of four or five pair of long, winged folioles, having each about 20 pair of pinnæ; and at the axillas and termination of the branches oblong spikes of yellowish decandrous flowers, the inferior ones castrated; succeeded above by oblong seed-pods. This sort, though naturally shrubby and perennial in its native soil, yet in this country it sometimes decays in winter. It is only sensitive in the foliola, but quick in the motion.

Herbaceous Sensitive and Humble Kinds.

Of these sorts two are perennial of the trailing kind; and one is annual, of somewhat erect growth; have all winged leaves, with the wings formed of many small pinnæ.

6. The viva,—perennial, or lively sensitive mimosa, hath herbaceous, trailing, unarmed, repent stems, very branchy, spreading widely around, rooting at the joints as they advance; conjugated pinnated leaves, with quadrijugated, roundish, partial lobes, or wings; and at the axillas globular heads of yellowish flowers; succeeded by short, flat, jointed pods.

This species is only sensitive in the foliola; but is the most lively of that kind, it being so susceptible that all the folliola recede rapidly from the least touch, whereby it has the distinctive appellation of *vivacious*, or *lively mimosa*.

7. The quadrivalvis;—perennial, or quadrivalve humble mimosa, hath herbaceous slender, quadrangular, prickly stems, branching and spreading all around, armed with recurved spines; bipinnated leaves of two or three pair of winged lobes, having each many pinnæ; and at the axillas globular heads of purple flowers, succeeded by quadrivalvular pods.

This is of the humble sensitive kind, both leaves and footstalks recede from the touch.

8. The plena,—annual, or double-flowered sensitive annual mimosa, rises with an herbaceous, erect, round, unarmed stem, closely branching and spreading every way, three or four feet high; bipinnated leaves of four or five pair of winged lobes, of many pairs of pinnæ; and at the axillas and termination of the branches spikes of yellow pentandrous flowers, the lower ones double; succeeded by short broad pods.

This annual is only sensitive in the folliola, but extremely sensible of the touch or air.

Shrubby Insensible Kinds.

These are of the acacia kind, formerly a distinct genus, but now all species of Mimosa; but their leaves are destitute of motion or sensibility at the touch: there are about three noted species in the English gardens, all for the stove.

9. The cornigera, or horned Mexican mimosa, commonly called *great horned acacia*, hath a shrubby, upright, deformed stem, branching irregularly, armed with very large, horned-like white spines, by pairs, connated at the base; bipinnated leaves thinly placed; and flowers growing in spikes.

This species is esteemed a curiosity for the oddity of its large spines, resembling the horns of animals, and which are often variously wreathed, twisted, and contorted.

10. The farnesiana, or farnesian fragrant acacia, hath a shrubby stem, branching many feet high, armed with distinct spines; bipinnated leaves, having eight pair of partial lobes, or wings; and globular, close-sitting spikes of yellow sweet-scented flowers.

11. The nilotica, or nilotic true Egyptian acacia, hath an upright tree-stem, branching many feet high, armed with spreading spines; bipinnated leaves; and globular spikes of flowers, having footstalks. From the exsudation of the leaves of this sort is procured the drugs called *succus acaciæ* and *gum-arabic*.

Propagation, &c. These 11 species of mimosa are the most noted sorts in the English gardens; all the shrubby kinds are durable in root, stem, and branches; those of the perennial herbaceous kinds are also often abiding; but the annual sort always perish, root and branch, at the approach of winter. They are all natives of the Indies; and in this country require the continual shelter of a hot-house, or of a hot-bed of similar

lar temperature under frames and glaſſes; though they can hardly be ſupported alive in winter unleſs placed in a ſtove; ſo all the ſorts muſt conſtantly be kept in pots, and placed principally in that department, eſpecially during the winter; nor will they ſucceed well in the open air in ſummer, except about a month during the greateſt heat; but the ſenſitive and humble kinds, if expoſed to the open air, even in the hotteſt days, will be deprived of their ſenſibility during the time they remain ſo expoſed, therefore ſhould always be kept under glaſſes, in a ſtove if poſſible; or in default of ſuch a convenience, the plants might be raiſed from ſeed in ſpring in any common hot-bed under frames, &c. as directed for tender annuals, and continued conſtantly under the glaſſes, and thereby will afford pleaſure all ſummer by the oddity of their ſenſitive foliage; however, to have them to remain in perfection the year round, ſome muſt be continued always in a ſtove, as before obſerved; for the warmer they are kept, the ſtronger will be their ſenſible quality: but for a particular account of this quality, ſee the article SENSITIVE *Plant*.

The propagation of all the ſorts, both ſenſitives and acacias, is by ſeed in ſpring in a hot-bed, or in the bark-bed in the ſtove; and ſome of the ſenſitive kinds alſo by layers and cuttings.

MINA, in Grecian antiquity, a money of account, equal to 100 drachms.

MIND, a thinking intelligent being, otherwiſe called *ſpirit*, in oppoſition to matter, or body.

MINDANOA, a large iſland of Aſia in the Eaſt Indies, and one of the Philippines; 180 miles in length, and 120 in breadth. It is a very mountainous country, full of hills and valleys, and the mould is generally deep, black, and fruitful. The ſides of the hills and valleys are ſtony, and yet there are tall trees of kinds not known in Europe: ſome of the mountains yield very good gold, and the valleys are watered with variety of rivulets. The palm-trees † produce the ſago, which the poor people eat, inſtead of bread, three or four months in the year. They have here all ſorts of fruits proper to the climate, beſides plenty of rice: ſome affirm that there are nutmegs and cloves, but none of the trees that bear them appear near the coaſt. They have horſes, beeves, buffaloes, goats, deer, monkeys, lizards, and ſnakes; but they have neither lions nor tygers. Their hogs are very ugly creatures, having all great knobs growing over their eyes; however, their fleſh is ſweet. Their fowls are ducks, hens, pigeons, parrots, paroquets, turtle-doves, and bats as large as kites, beſides many ſmall birds. The air is temperate, they having breezes by day, and cooling land-winds at night. The winds are eaſterly one part of the year, and weſterly the other: while the former blow, it is fair weather; but while the latter, it is rainy, ſtormy, and tempeſtuous. The inhabitants are of a mean low ſtature, with ſmall limbs and little heads. Their faces are oval, with flat foreheads, black ſmall eyes, ſhort low noſes, and pretty large mouths. Their hair is black and ſtrait, and their complexion tawney, but more inclining to yellow than that of other Indians. The women are very deſirous of the company of ſtrangers, eſpecially white men. The chief trades are goldſmiths, blackſmiths, and carpenters; and they can build pretty good veſſels for the ſea. Their diſtempers are as in other places, except the leproſy, which is very common here. The ſultan has a queen, beſides 20 other women, and all the men have ſeveral wives; for their religion is Mahometaniſm. Their houſes are built on poſts, from 14 to 20 feet high; and they have ladders to go up out of the ſtreets. They have but one floor, which is divided into ſeveral rooms; and the roofs are covered with palmeto leaves. Thoſe that have been far up in the country ſay, that the people are all blacks, and go quite naked. The principal town, of the ſame name, is pretty large, and is ſeated on the eaſtern coaſt.

† See *Palma*.

MINDELHEIM, a town of Germany, in the circle of Suabia, and in Algow, with a caſtle. It is capital of a ſmall territory between the rivers Iler and Lech, ſubject to the houſe of Bavaria. It was taken by the Imperialiſts after the battle of Hochſtet, who erected it into a principality in favour of the duke of Marlborough; but it returned back to the houſe of Bavaria by the treaty of Raſtat. It is 33 miles ſouth-eaſt of Ulm. E. Long. 10. 40. N. Lat. 48. 5.

MINDELHEIM, a diſtrict of Germany, in Suabia, lying between the biſhopric of Augſburgh and the abbacy of Kempten, which is 20 miles in length and 16 in breadth.

MINDEN, a conſiderable town of Germany, in the circle of Weſtphalia, and capital of a territory of the ſame name; ſeated on the river Weſer, which renders it a trading-place. It belongs to the king of Pruſſia, who has ſecularized the biſhopric. It is 27 miles eaſt-by-ſouth of Oſnaburg, and 37 weſt of Hanover. E. Long. 9. 5. N. Lat. 52. 22.

MINDEN (the principality of), in Germany, lies in the circle of Weſtphalia, to the north of the county of Ravenſberg, and along each ſide of the river Weſer. It is about 22 miles ſquare, and Minden and Peterſhagen are the principal places. It was formerly a biſhopric, but is now ſecularized; and was ceded to the elector of Brandenburg by the treaty of Weſtphalia.

MINDORA, an iſland of Aſia, in the Eaſt Indies, and one of the Philippines, 50 miles in circumference, and ſeparated from Luconia by a narrow channel. It is full of mountains, which abound in palm-trees and all ſorts of fruits. The inhabitants are idolaters, and pay tribute to the Spaniards, to whom this iſland belongs.

MINE, in natural hiſtory, a place under ground, where metals, minerals, or even precious ſtones, are dug up.

As, therefore, the matter dug out of mines is various, the mines themſelves acquire various denominations, as *gold mines*, *ſilver mines*, *copper mines*, *iron mines*, *diamond mines*, *ſalt mines*, *mines of antimony*, *of alum*, &c.

Mines, then, in general, are veins or cavities within the earth, whoſe ſides receding from, or approaching nearer to each other, make them of unequal breadths in different places, ſometimes forming larger ſpaces, which are called *holes*: they are filled with ſubſtances, which, whether metallic or of any other nature, are called the *loads*; when the ſubſtances forming theſe loads are reducible to metal, the loads are by the miners ſaid to be alive, otherwiſe they are called *dead loads*. In Cornwall and Devon, the loads always

hold their courſe from eaſtward to weſtward; though in other parts of England they frequently run from north to ſouth. The miners report, that the ſides of the load never bear in a perpendicular, but conſtantly under-lay either to the north or to the ſouth. The load is frequently intercepted by the croſſing of a vein of earth or ſtone, or ſome different metallic ſubſtance; in which caſe it generally happens that one part of the load is moved a conſiderable diſtance to the one ſide. This tranſient load is by the miners called *flooking;* and the part of the lead which is to be moved is ſaid to be heaved.

According to Dr Nicols's obſervations upon mines, they ſeem to be, or to have been, the channels thro' which the waters paſs within the earth, and, like rivers, have their ſmall branches opening into them in all directions. Moſt mines have ſtreams of water running through them: and when they are found dry, it ſeems to be owing to the waters having changed their courſe, as being obliged to it, either becauſe the load has ſtopped up the ancient paſſages, or that ſome new and more eaſy ones are made.

Mines, ſays Dr Shaw, are liable to many contingencies; being ſometimes poor, ſometimes ſoon exhauſtible, ſometimes ſubject to be drowned, eſpecially when deep, and ſometimes hard to trace. Yet there are many inſtances of mines proving highly advantageous for hundreds of years: the mines of Potoſi are to this day worked with nearly the ſame ſucceſs as at firſt; the gold mines of Cremnitz have been worked almoſt theſe 1000 years; and our Corniſh tin mines are extremely ancient. The neat profit of the ſilver alone, dug in the Miſnian ſilver-mines in Saxony, is ſtill, in the ſpace of eight years, computed at a thouſand ſix hundred and forty-four millions, beſides ſeventy-three tons of gold. Many mines have been diſcovered by accident: a torrent firſt laid open a rich vein of the ſilver-mine at Friburg in Germany; ſometimes a violent wind, by blowing up trees, or overturning the parts of rocks, has diſcovered a mine; the ſame has happened by violent ſhowers, earthquakes, thunder, the firing of woods, or even the ſtroke of a ploughſhare or horſe's hoof.

But the art of mining does not wait for theſe favourable accidents, but directly goes upon the ſearch and diſcovery of ſuch mineral veins, ores, or ſands, as may be worth the working for metal. The principal inveſtigation and diſcovery of mines depend upon a particular ſagacity, or acquired habit of judging from particular ſigns, that metallic matters are contained in certain parts of the earth, not far below its ſurface. The principal ſigns of a latent metallic vein ſeem reducible to general heads; ſuch as, 1. The diſcovery of certain mineral waters. 2. The diſcolouration of the trees or graſs of a place. 3. The finding of pieces of ore on the ſurface of the ground. 4. The riſe of warm exhalations. 5. The finding of metallic ſands, and the like. All which are ſo many encouragements for making a ſtricter ſearch near the places where any thing of this kind appears; whence rules of practice might be formed for reducing this art to a greater certainty. But when no evident marks of a mine appears, the ſkilful mineraliſt uſually bores into the earth, in ſuch places as, from ſome analogy of knowledge, gained by experience, or by obſerving the ſituation, courſe, or nature of other mines, he judges may contain metal. As to the power of the divining wand in diſcovering mines, it ſeems to be a mere chimera. See *Divining-*WAND.

After the mine is found, the next thing to be conſidered, is whether it may be dug to advantage. In order to determine this, we are duly to weigh the nature of the place, and its ſituation, as to wood, water, carriage, healthineſs, and the like; and compare the reſult with the richneſs of the ore, the charge of digging, ſtamping, waſhing, and ſmelting.

Particularly the form and ſituation of the ſpot ſhould be well conſidered. A mine muſt either happen, 1. In a mountain. 2. In a hill. 3. In a valley. Or, 4. In a flat. But mountains and hills are dug with much greater eaſe and convenience, chiefly becauſe the drains and burrows, that is, the adits or avenues, may be here readily cut, both to drain the water and to form gang-ways for bringing out the lead, &c. In all the four caſes, we are to look out for the veins which the rains, or other accidental thing, may have laid bare; and if ſuch a vein be found, it may often be proper to open the mine at that place, eſpecially if the vein prove tolerably large and rich: otherwiſe the moſt commodious place for ſituation is to be choſe for the purpoſe, *viz.* neither on a flat, nor on the tops of mountains, but on the ſides. The beſt ſituation for a mine, is a mountainous, woody, wholeſome ſpot; of a ſafe eaſy aſcent, and bordering on a navigable river. The places abounding with mines are generally healthy, as ſtanding high, and every where expoſed to the air; yet ſome places, where mines are found, prove poiſonous, and can upon no account be dug, tho' ever ſo rich: the way of examining a ſuſpected place of this kind, is to make experiments upon brutes, by expoſing them to the effluvia or exhalations, to find the effects.

Devonſhire and Cornwall, where there are a great many mines of copper and tin, is a very mountainous country, which gives an opportunity in many places to make adits, or ſubterraneous drains, to ſome valley at a diſtance, by which to carry off the water from the mine, which otherwiſe would drown them out from getting the ore. Theſe adits are ſometimes carried a mile or two, and dug at a vaſt expence, as from 2000 l. to 4000 l. eſpecially where the ground is rocky; and yet they find this cheaper than to draw up the water out of the mine quite to the top, when the water runs in plenty, and the mine is deep. Sometimes, indeed, they cannot find a level near enough to which an adit may be carried from the very bottom of the mine; yet they find it worth while to make an adit at half the height to which the water is to be raiſed, thereby ſaving half the expence.

The late Mr Coſtar, conſidering that ſometimes from ſmall ſtreams, and ſometimes from little ſprings or collections of rain-water, one might have a good deal of water above ground, though not a ſufficient quantity to turn an overſhot-wheel, thought, that if a ſufficient fall might be had, this collection of water might be made uſeful in raiſing the water in a mine to the adit, where it may be carried off.

But now the moſt general method of draining mines is by the fire or ſteam engine. See STEAM-*Engine.*

Mine, in the military art, denotes a fubterraneous canal or paffage, dug under the wall or rampart of a fortification, intended to be blown up by gun-powder.

The alley or paffage of a mine is commonly about four feet fquare; at the end of this is the chamber of the mine, which is a cavity about five feet in width and in length, and about fix feet in height; and here the gun-powder is ftowed. The fauciffe of the mine is the train, for which there is always a little aperture left. There are various kinds of mines, which acquire various names, as *royal mines*, *ferpentine mines*, *forked mines*, according as their paffages are ftraight, oblique, winding, &c.

MINERAL, in natural hiftory, is ufed in general for all foffile bodies, whether fimple or compound, dug out of a mine; from whence it takes its denomination.

Mineral *Waters*. All waters naturally impregnated with any heterogeneous matter which they have diffolved within the earth may be called *mineral waters*, in the moft general and extenfive meaning of that name; in which are therefore comprehended almoft all thofe that flow within or upon the furface of the earth, for almoft all thefe contain fome earth or felenites. But waters containing only earth or felenites are not generally called *mineral*, but *hard* or *crude waters*.

Hard waters, which are fimply felenitic, when tried by the chemical proofs, fhew no marks of an acid or of an alkali, nor of any volatile, fulphureous, or metallic matters. Waters which contain a difengaged calcareous earth, change the colour of fyrup of violets to a green; and thofe that contain felenites, being mixed with a folution of mercury in nitrous acid, form a turbith mineral; and when a fixed alkali is added, they are rendered turbid, and a white fediment is precipitated. Thefe waters alfo do not diffolve foap well. From thefe we may know, that any water which produces thefe effects is a hard, earthy, or felenitic water. The waters impregnated with gas are alfo hard.

Although the waters of the fea and faline fprings be not generally enumerated amongft mineral waters, they might neverthelefs be juftly confidered as fuch: for befides earthy and felenitic matters, they alfo contain a large quantity of mineral falts. We fhall therefore confider them as fuch in this article.

Mineral waters, properly fo called, are thofe in which gas, or fulphureous, faline, or metallic fubftances, are difcovered by chemical trials. As many of thefe waters are employed fuccefsfully in medicine, they are alfo called *medicinal waters*.

Mineral waters receive their peculiar principles by paffing through earths containing falts, or pyritous fubftances that are in a ftate of decompofition. Some of thefe waters are valuable from the quantity of ufeful falts which they contain, particularly of common falt, great quantities of which are obtained from thefe waters; and others are chiefly valued for their medicinal qualities. The former kind of mineral waters is an object of manufacture, and from them is chiefly extracted that falt only which is moft valuable in commerce. See Salt.

Many of thefe waters have been accurately analyfed by able chemifts and phyficians. But notwithftanding thefe attempts, we are far from having all the certainty and knowledge that might be defired on this important fubject; for this kind of analyfis is perhaps the moft difficult of any in chemiftry.—Almoft all mineral waters contain feveral different fubftances, which being united with water may form with each other numberlefs compounds. Frequently fome of the principles of mineral waters are in fo fmall quantity, that they can fcarcely be perceived; altho' they may have fome influence on the virtues of the water, and alfo on the other principles contained in the water. The chemical operations ufed in the analyfis of mineral waters, may fometimes occafion effential changes in the fubftances that are to be difcovered. And alfo, thefe waters are capable of fuffering very confiderable changes by motion, by reft, and by expofure to air.

Probably alfo the variations of the atmofphere, fubterranean changes, fome fecret junction of a new fpring of mineral or of pure water, laftly the exhauftion of the minerals whence waters receive their peculiar principles, are caufes which may occafionally change the quality of mineral waters.

We need not therefore wonder that the refults of analyfes of the fame mineral waters made by different chemifts, whofe fkill and accuracy are not queftioned, fhould be very different.

The confequences of what we have faid on this fubject are, That the examination of mineral waters is a very difficult tafk; that it ought not to be attempted but by profound and experienced chemifts; that it requires frequent repetitions, and at different times; and laftly, that no fixed general rules can be given concerning thefe analyfes.

As this matter cannot be thoroughly explained without entering into details connected with all the parts of chemiftry, we fhall here mention only the principal refults, and the moft effential rules, that have been indicated by the attempts hitherto made on this fubject.

We may admit the divifion or arrangement of mineral waters into certain claffes, propofed by fome of the beft chemifts and naturalifts.

Some of thefe waters are called *cold*, becaufe they are not naturally hotter than the atmofphere. Some of them are even colder, efpecially in fummer.

Thofe are called *hot mineral waters*, which in all feafons are hotter than the air. Thefe are of various degrees of heat, and fome of them are almoft as hot as boiling water. In fome mineral waters certain volatile, fpirituous, and elaftic principles may be perceived, by a very fenfible piquant tafte: this principle is called the *gas* or the *fpirit of waters*.

The waters which contain this principle are generally lighter than pure water. They fparkle and emit bubbles, at their fpring, but efpecially when they are fhook, and poured from one veffel into another. They fometimes break the bottles containing them, when thefe are well corked, as fermenting wines fometimes do. When mixed with ordinary wine, they give to it the piquancy and fparkling quality of Champaigne wine.

This volatile principle, and all the properties of the water dependent upon it, are loft merely by expofure to air, or by agitation. The waters containing this principle are diftinguifhed by the name of *fpirituous mineral waters*, or *acidulous waters*.

Other

Other divifions of mineral waters may be made relatively to fome of their predominant principles. Hence fome waters are called *acidulous*, *alkaline*, *martial*, *neutral*, &c.

When a mineral water is to be examined, we may obferve the following rules:

Experiments ought to be made near the fpring, if poffible.

The fituation of the fpring, the nature of the foil, and the neighbouring rifing grounds, ought to be examined.

Its fenfible qualities, as its fmell, tafte, colour, are to be obferved.

Its fpecific gravity and heat are to be afcertained by the hydroftatical balance and the thermometer.

From the properties above-mentioned of fpirituous mineral waters, we may difcover whether it be one of this clafs. For greater certainty we may make the following trial. Let the neck of a wet bladder be tied to the neck of a bottle containing fome of this water. By fhaking the water, any gas that it may contain will be difengaged, and will fwell the bladder. If the neck of the bladder be then tied with a ftring above the bottle, and be cut below this ftring, fo as to feparate the bladder from the bottle, the quantity and nature of the contained gas may be further examined.

Laftly, we muft obferve the changes that are fpontaneoufly produced upon the water in clofe and in open veffels, and with different degrees of heat. If by thefe means any matter be cryftallized or depofited, it muft be fet apart for further examination.

Thefe preliminary experiments and obfervations will almoft certainly indicate, more or lefs fenfibly, fomething concerning the nature of the water, and will point out the method to be followed in our further inquiry.

We muft then proceed to the decompofition of the water, either without addition, and merely by evaporation and diftillation, or with the addition of other fubftances, by means of which the matters contained in the water may be precipitated and difcovered. It is not material which of thefe two methods be firft practifed, but it is quite neceffary that the one fhould fucceed the other. If we begin by evaporating and diftilling, thefe operations muft be fometimes interrupted, that the feveral principles which rife at different times of the diftillation may be obtained and examined feparately, and alfo to allow the feveral falts that may be contained to cryftallize by the evaporation and by cold.

The fubftances generally found in mineral waters, are almoft always combinations of vitriolic acid, and thofe of marine acid, together with the feveral matters that thefe acids are capable of diffolving.

The following combinations of vitriolic acid are found in mineral waters.

1. *Volatile fulphureous acid*. This is feldom found, both becaufe it eafily lofes its phlogifton, and becaufe it muft almoft always meet with fome fubftance that it is capable of diffolving.

2. *Sulphur*. This is found fometimes fingly, but generally in form of a liver of fulphur. In thefe waters, fulphur is formed into a hepar by means of calcareous earth or of mineral alkali.

3. *Vitriolic falts with earthy bafes*. Thefe falts are frequently *felenitic*, that is, their acid is combined with a calcareous earth; or they are of the nature of Epfom falt, the bafis of which is magnefia. Sometimes, but not fo frequently, they are *aluminous*, when their acid happens to be united with an argillaceous earth.

4. *Vitriols*. *Martial vitriol* is frequently contained in mineral waters; *vitriol of copper* is fometimes, but feldom, and *vitriol of zinc* is ftill more rarely found in thefe waters. The vitriols of other metallic fubftances are fcarcely ever, but in very fingular cafes, found in water.

5. Laftly, *vitriolic falts with bafis of fixed alkali*. This is always *Glauber's falt*. Neither *vitriolated tartar* nor *vitriolic ammoniacal falt* are ever found, unlefs by fome fingular accident, in mineral waters.

The combinations of marine acid that are contained in mineral waters are *common falt*, and *marine falt with earthy bafis*. For no combinations of this acid with phlogifton are known, and it is very feldom found united with any metallic fubftance.

Compounds formed of the nitrous acid with an earthy bafis are very common in waters in this country, infomuch that fome have thought that nitre might be extracted from them advantageoufly in the way of trade. See Chemistry, n° 178. In France, however, the cafe feems to be otherwife; for Mr Macquer determines, in his Chemical Dictionary, that the nitrous acid is not (nay that it *cannot*) be found in waters except by accident.

Thefe are the principal fubftances that form almoft all thefe waters. We fhall now fhew the proofs by means of which they may be difcovered in water, without decompofing the water by evaporation or by diftillation.

If any portion of difengaged acid or alkali be contained in water, it may be known by the tafte, by changing the colour of violets or of turnfol, and by adding the precife quantity of acid or of alkali that is neceffary for the faturation of the contained difengaged faline matter.

Sulphur, and liver of fulphur, may be difcovered in waters by their fingular fmell, and by the black colour which thefe fubftances give to white metals or to their precipitates, but efpecially to filver.

Vitriolic falts with earthy bafis may be difcovered in water by two proofs: 1. By adding fome fixed alkali, which decompofes all thefe falts, and precipitates their earthy bafis; and, 2. By adding a folution of mercury in nitrous acid, which alfo decompofes thefe falts, and forms a *turbith mineral* with their acid. But for this purpofe the folution of mercury ought to have a fuperabundant quantity of acid: for this folution, when perfectly faturated, forms a precipitate with any kind of water, as M. Rouelle has very juftly remarked; and indeed, all metallic folutions in any acids are ftrictly capable of decompofition by water alone, and fo much more eafily as the acid is more perfectly faturated with the metal.

Martial vitriol or iron combined with any acid, or even with gas, fhews itfelf in waters by blackening an infufion of galls, or by forming a Pruffian blue with the phlogifticated alkaline lixivium.

The vitriol of copper, or copper diffolved by any acid, may be difcovered by adding fome of the vola-

Mineral. tile ſpirit of ſal ammoniac, which produces a fine blue colour; or by the addition of clean iron, upon the ſurface of which the copper is precipitated in its natural or metallic ſtate.

Glauber's ſalt is diſcovered by adding a ſolution of mercury in nitrous acid, and forming with it a turbith mineral; or by cryſtallization.

Common ſalt contained in waters forms with a ſolution of ſilver in nitrous acid a white precipitate, or luna cornea. It may alſo be known by its cryſtallization. Marine ſalt with earthy baſis produces the ſame effect upon ſolution of ſilver. It alſo forms a precipitate when fixed alkali is added. The acrimony, bitterneſs, and deliqueſcency of this ſalt, ſerve to diſtinguiſh it.

The proofs related for the examination of mineral waters, are only thoſe which are moſt eſſential. Many others may be made to confirm the former proofs: but the details of theſe are too extenſive to be inſerted here. We ſhall add only two of theſe, becauſe they are very general, and may be very uſeful.

The firſt is the production of artificial ſulphur, or of the volatile ſulphureous acid; by which means the vitriolic acid may be diſcovered in any combination whatever. For this purpoſe, the matter to be examined muſt be mixed with any inflammable ſubſtance, and expoſed to a red heat. If this matter contained but a particle of vitriolic acid, it would be rendered ſenſible by the ſulphur, or by the volatile ſulphureous acid thence produced.

The ſecond general proof for mineral waters which we ſhall mention here, ſerves to diſcover any metallic ſubſtance whatever, diſſolved in water by any acid. This proof conſiſts in adding ſome of the liquor ſaturated by the colouring matter of Pruſſian blue, deſcribed under the article CHEMISTRY, n° 391. This liquor produces no effects upon any neutral ſalts with earthy or alkaline baſes, but decompoſes all metallic ſalts: ſo that if no precipitate be formed upon adding ſome of this liquor, we may be certain that the water does not contain any metallic ſalt; and on the contrary, if a precipitate be formed, we may certainly infer that the water does contain ſome metallic ſalt.

Two kinds only of gas, or the ſpirituous volatile part of ſome waters, are hitherto known; of which one is the volatile ſulphureous acid, and the other is fixed air, See AIR, FIXED *Air*, and GAS, *paſſim*. Air united ſuperabundantly with ſpirituous waters is the chief cauſe of their lightneſs, piquancy, and ſparkling.

When the nature and quantities of the principles contained in a mineral water are aſcertained by ſuitable experiments, we may imitate artificially this water, by adding to pure water the ſame proportions of the ſame ſubſtances, as Mr Venel has done in examining ſeveral waters, eſpecially that of Selters.

We may eaſily perceive the neceſſity of uſing no veſſels in theſe experiments, but ſuch as are perfectly clean and rinſed with diſtilled water; of weighing the products of the experiments very exactly; of making the experiments upon as large quantities of water as is poſſible, eſpecially the evaporations, cryſtallizations, and diſtillations; and of repeating all experiments ſeveral times. We may further obſerve, that the mixtures from which any precipitates might be expected ought to be kept two or three days, becauſe many of theſe precipitates require that time, or more, to appear, or to be entirely depoſited.

MINERALOGY,

1 IS that ſcience which teaches us the properties of mineral bodies, and by which we learn how to characteriſe, diſtinguiſh, and claſs them into a proper order.

2 Mineralogy ſeems to have been in a manner coeval with the world. Precious ſtones of various kinds appear to have been well known among the Jews and Egyptians in the time of Moſes; and even the moſt rude and barbarous nations appear to have had ſome knowledge of the ores of different metals. As the ſcience is nearly allied to chemiſtry, it is probable that the improvements both in chemiſtry and mineralogy have nearly kept pace with each other; and indeed it is but of late, ſince the principles of chemiſtry were well underſtood, that mineralogy hath been advanced to any degree of perfection. The beſt way of ſtudying mineralogy, therefore, is by applying chemiſtry to it; and not contenting ourſelves merely with inſpecting the outſides of bodies, but decompounding them according to the rules of chemiſtry. This method hath been brought to the greateſt perfection by Mr Pott of Berlin, and after him by Mr Cronſtedt of Sweden. To obtain this end, chemical experiments in the large way are without doubt neceſſary; but as a great deal of the mineral kingdom has already been examined in this manner, we do not need to repeat all thoſe experiments in their whole extent, unleſs ſome new and particular phenomena ſhould diſcover themſelves in thoſe things we are examining; elſe the tedioufneſs of thoſe proceſſes might diſcourage ſome from going farther, and take up much of the time of others that might be better employed. An eaſier way may therefore be adopted, which even for the moſt part is ſufficient, and which though made in miniature, yet is as ſcientifical as the common manner of proceeding in the laboratories, ſince it imitates that, and is founded upon the ſame principles. This conſiſts in making the experiments upon a piece of charcoal with the concentrated flame of a candle blown through a blow-pipe. The heat occaſioned by this is very intenſe; and the mineral bodies may here be burnt, calcined, melted, and ſcorified, &c. as well as in any great works.

A pocket-laboratory containing all things neceſſary for trying mineralogical experiments is repreſented, Plate CLXXXI. fig. 1. with the caſe, exactly of the form, bigneſs, and proportions as that made uſe of by Mr Cronſtedt: what alterations there may be wanted are eaſily found out by practice. 3

c, *h*. Are the two parts of which the BLOW-*Pipe* conſiſts, and which are already deſcribed under that article.

a. A wax-candle, deſtined to be made uſe of, particularly in travelling, when no other candle is to be had.

b. A

Fig. 1.

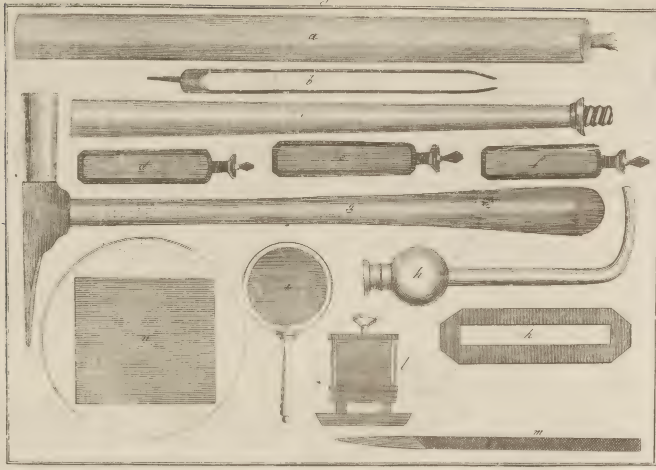

Fig. 2.

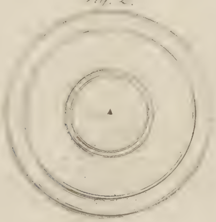

Fig. 3.

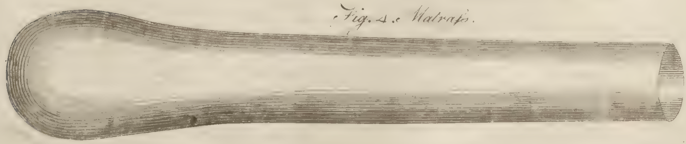
Fig. 4.

Fig. 5. Trough.

Fig. 4. Matrass.



A. Bell Sculp.

Method of making Experiments.

b. A pair of nippers, to handle ſo much the eaſier theſe things which are to be tried, becauſe they are generally ſmall particles: this ſerves alſo to touch and turn the ſubjects during the experiments, when they are hot and could not be well handled with the fingers.

d, *e*, *f*. Are three phials, to put the required fluxes in, viz. borax, the mineral alcali *ſal ſodæ*), and ſal fuſibile microcoſmicum.

g. A hammer, to break any part of a ſtone, when it is to be tried: this ſerves alſo to pound things with.

i. A magniſying-glaſs, neceſſary when the objects are too ſmall to be ſeen by the naked eye.

k. A ſteel to ſtrike fire, by which the hardneſs or ſoftneſs of the bodies is tried.

l. A loadſtone, to diſcover the preſence of iron.

m. A file, wherewith to diſtinguiſh natural gems, quartz-cryſtals, and artificial or coloured glaſſes, from one another.

n. A thin ſquare plate made of untempered ſteel, filed flat on one ſide to pound things upon, and poliſhed on the other ſide to hammer metals upon.

Above this ſteel plate *n*, and within the circle drawn round about it, is the place for a candleſtick. This candleſtick is ſhewn in plan, fig. 2. and in profile, fig. 3. It conſiſts of a round braſs plate; the point *a*, and the ring *b* round it, is inſtead of the ſocket in another candleſtick, which would here take up too much room.

Fig. 4. is a thin iron ring, a ſixth part of an inch high; within this ring the pounding and grinding of the things upon the ſteel plate, fig. 1. *n*, is performed, that they may not be loſt. In packing up, this ring is to be put looſe upon the candleſtick; and, as it is lower than the point of this, it does not take up much room in the caſe.

The whole caſe thus made, with all the inſtruments in it, is no more than one and an eighth part of an inch high, and conſequently not more troubleſome to be carried in the pocket than a ſmall book.

The pocket-laboratory here deſcribed, and the box for the acids, to be afterwards mentioned have been improved after the manner of Mr Cronſtedt, by a gentleman particularly acquainted with Mr Engeſtrom, from whom he learned this method of making mineralogical experiments. The bulk of the firſt has been reduced nine and a half cubic inches; its length being diminiſhed one ſixteenth of an inch, the breadth five and the depth two; notwithſtanding which, there is alſo added a piece of charcoal for trying the experiments, a flint, a piece of agaric tinder, and ſome matches for lighting the candle. The three phials *n m v* for the ſalts, are of different colours, to prevent any miſtake. The candleſtick has different concentric grooves for keeping the reſults of the trials ſeparate. The blow-pipe *e h* has a ſilver mouth-piece, and ſcrews in the middle of the ball, in order to clean out the moiſture with the greater eaſe; and the ſmall wire (Plate CLV. fig. 2. n° 1.) is more conveniently detached than fixed round it. The other box for the acids is reduced to leſs than a fourth of its original bulk, being exactly of the ſame ſize with the above. It contains two ſmall matraſſes (fig. 4.) for making ſolutions; a trough (fig. 5.) for waſhing the ore after its being pounded; and the three ſmall bottles with double ſtoppers, for the nitrous, muriatic, and vitriolic acids, have their reſpective initials cut on each.

Method of making Experiments.

Both theſe pocket-laboratories, made in the neateſt manner by an ingenious artiſt, may be had ready furniſhed with the pureſt acids, &c. at the General Office of Buſineſs, Arts, and Trade, N° 98. Wood-ſtreet, Cheapſide.

Whenever any thing is to be tried, one muſt not 4
begin immediately with the blow-pipe; ſome preliminary experiments ought to go before, by which thoſe in the fire may afterwards be directed. For inſtance, a ſtone is not always homogeneous, or of the ſame kind throughout, although it may appear to the eye to be ſo: the magniſying-glaſs is therefore neceſſary, to diſcover the heterogeneous particles, if there be any; and theſe ought to be ſeparated, and every thing tried by itſelf, that the effects of two different things, tried together, may not be attributed to one alone. This might happen with ſome of the finer micæ, which are now and then found mixed with ſmall particles of quartz, ſcarcely to be perceived by the eye. The trapp (in German *ſchwartzſtein*) is alſo ſometimes mixed with very fine particles of feltſpat (*ſpatum ſcintillans*), or of calcareous ſpar, &c. After this experiment follows that to try the hardneſs of the ſtone in queſtion with the ſteel. The flint and garnet kinds are commonly known to ſtrike fire with the ſteel; but there are alſo other ſtones, though very ſeldom, found ſo hard as to ſtrike fire: a kind of trapp is found of that hardneſs in which no particles of feltſpat are to be ſeen. Coloured glaſſes reſemble true gems; but as they are very ſoft in compariſon to theſe, they are eaſily diſcovered by means of the file: the common quartz-cryſtals are harder than coloured glaſſes, but ſofter than the gems. The loadſtone diſcovers the preſence of iron, when it is not mixed in too ſmall a quantity in the ſtone, and often before the ſtone is roaſted. Some kinds of hæmatites, and particularly the cœruleſcens, is very like ſome other iron ores; but diſtinguiſhes itſelf from theſe by a red colour when pounded, and others giving a blackiſh powder, and ſo forth.

To manage the blow-pipe with eaſe requires ſome 5
practice. A beginner blows generally too ſtrongly, which forces him to take breath very often, and then he draws the flame at the ſame time along into the blow-pipe: this is troubleſome for himſelf, and the experiment cools always a little at the ſame time. But the more experienced can breathe in through the noſe, and yet at the ſame time blow through the pipe, whereby a conſtant flame from the candle is kept up. The whole art conſiſts in conſtantly taking in air through the noſe, and with the tongue moderating its blowing out; ſo that the tongue performs nearly the office of a ſucker in a pump; or rather, the action of the noſe, lungs, and mouth, reſembles here the action of bellows with double partitions. In this manner there is no need of blowing violently, but only with a moderate and equal force; and thus the breath can never fail the operator. The only inconveniency attending it is, that the lips grow weak or tired, after having continued to blow for a while in one ſtrain; but they ſoon recover their former ſtrength by ceaſing to blow for ſome minutes.

The

Method of making Experiments.

6 The candle uſed for this purpoſe ought to be ſnuffed often, but ſo that the top of the wick may retain ſome fat in it, becauſe the flame is not hot enough when the wick is almoſt burnt to aſhes; ſo that only the top muſt be ſnuffed off, becauſe a low wick gives too ſmall a flame. The blue flame is the hotteſt; this ought therefore to be forced out when a great heat is required, and only the point of the flame muſt be directed upon the ſubject which is to be eſſayed.

7 The piece of charcoal made uſe of in theſe experiments muſt not be of a diſpoſition to crack. If this ſhould happen, it muſt gradually be heated until it does not crack any more, before any eſſay is made upon it. If this be not obſerved, but the eſſay made immediately with a ſtrong flame, ſmall pieces of it will ſplit off in the face and eyes of the eſſayer, and often throw along with them the matter that was to be eſſayed. Charcoal which is too much burnt conſumes too quickly during the experiment, leaving ſmall holes in it, wherein the matter to be tried may be loſt: and charcoal that is burnt too little catches flame from the candle, burning by itſelf like a piece of wood, which likewiſe hinders the proceſs.

8 Of thoſe things that are to be eſſayed, only a ſmall piece muſt be broke off for that purpoſe, not bigger than that the flame of the candle may be able to act upon it at once, if required; which is ſometimes neceſſary; for inſtance, when the matter requires to be made red-hot throughout. A piece of about an eighth part of an inch ſquare is reckoned of a moderate ſize, and fitteſt for experiments; ſeldom more, but rather leſs. This proportion is only mentioned as a direction in regard to the quantity, the figure being of no conſequence at all, a piece broke off from a ſtone ſeldom or never happening to be ſquare. But here it is to be obſerved, that the piece ought to be broke as thin as poſſible, at leaſt the edges: the advantage thereof is eaſily ſeen, the fire having then more influence upon the ſubject, and the experiment being quicker made. This is particularly neceſſary to be obſerved when ſuch ſtones are to be eſſayed, which, although in ſome reſpects fuſible by themſelves, yet reſiſt conſiderably the action of the fire; becauſe they may by theſe means be brought into fuſion, at leaſt at their edges, which elſe would have been very difficult if the piece had been thick.

9 Some of the mineral bodies are very difficult to keep ſteady upon the charcoal during the experiment, before they are made red-hot; becauſe, as ſoon as the flame begins to act upon them, they ſplit aſunder with violence, and diſperſe. Such often are thoſe which are of a ſoft conſiſtence, or a particular figure, and which preſerve the ſame figure in however minute particles they are broke; for inſtance, the calcareous ſpar, the ſparry gypſum, ſparry fluor, white ſparry lead-ore, the potters ore, *(galena teſſellata)*, the teſſellated mock-lead or blende, &c. even all the common fluors which have no determinate figure, and moſt of the *mineræ metallorum calciformes cryſtalliſatæ* or *ſpatoſæ:* all theſe are not ſo compact as common hard ſtones; and therefore, when the flame is immediately puſhed at them, the heat forces itſelf quickly through and into their clefts or pores, and cauſes this violent expanſion and diſperſion. Many of the clays are likewiſe apt to crack in the fire, which may be for the moſt part aſcribed to the humidity, of which they always retain a portion. Beſides thoſe enumerated, there may be found now and then other mineral bodies of the ſame quality.

Method of making Experiments.

The only way of preventing this inconveniency, is to heat the body as ſlowly as poſſible. It is beſt firſt of all to heat that place of the charcoal where the piece is intended to be put on, and afterwards lay it thereon; a little crackling will then enſue, but commonly of no great conſequence. After that, the flame is to be blown very ſlowly towards it, in the beginning not directly upon, but ſomewhat above it, and ſo approaching nearer and nearer with the flame until it becomes red-hot. This will do for the moſt part; but there are nevertheleſs ſome ſubſtances which, notwithſtanding all theſe precautions, it is almoſt impoſſible to keep on the charcoal. Thus the fluors are generally the moſt difficult; and as one of their principal characters is diſcovered by their effects in the fire *per ſe*, they ought neceſſarily to be tried that way. To this purpoſe it is beſt to make a little hole in the charcoal to put the fluor in, and then to put another piece of charcoal as a covering upon this, leaving only a ſmall opening for the flame to come in at, and to look at the proof. As this ſtone will nevertheleſs moſtly ſplit and fly about, a larger piece thereof than is beforementioned muſt be taken, in order to have at leaſt ſomething of it left.

10 But if the experiment is to be made upon a ſtone whoſe effects one does not want to ſee in the fire *per ſe*, but rather with fluxes, then a piece of it ought to be forced down into melted borax, when always ſome part of it will remain in the borax, notwithſtanding the greateſt part may ſometimes fly away by cracking.

11 As the ſtones undergo great alterations when expoſed to the fire by themſelves, whereby ſome of their characteriſtics, and often the moſt principal, are diſcovered, they ought firſt to be tried that way; obſerving what has been ſaid before concerning the quantity of the matter, direction of the fire, &c. The following effects are generally the reſults of this experiment, *viz.*

12 1. Calcareous earth or ſtone, when it is pure, does never melt by itſelf, but becomes white and friable, ſo as to break freely between the fingers; and, if ſuffered to cool, and then mixed with water, it becomes hot, juſt as common quick-lime. As in theſe experiments only very ſmall pieces are uſed, this laſt effect is beſt diſcovered by putting the proof on the outſide of the hand, with a drop of water to it, when inſtantly a very quick heat is felt on the ſkin. When the calcareous ſubſtance is mixed with the vitriolic acid, as in the gypſum; or with clay, as in the marle; it commonly melts by itſelf; yet more or leſs difficultly in proportion to the differences of the mixtures: the gypſum produces generally a white, and the marle a grey glaſs or ſlag. When there is any iron in it, as in white iron ore, it becames dark, and ſometimes quite black, &c.

13 2. The ſiliceæ never melt alone, but become generally more brittle after being burnt: ſuch of them as are coloured become colourleſs, and the ſooner when it does not ariſe from any contained metal; for inſtance, the topazes, amethiſts, &c. ſome of the precious ſtones, however, excepted. And ſuch as are mixed with a quantity of iron grow dark in the fire, as ſome of the jaſpers, &c.

3. The

Method of making Experiments.

3. The garnet-kind melt always into a dark ſlag; and ſometimes ſo eaſily, that it may be brought into a round globule upon the charcoal.

14 4. The argillaceæ, when pure, never melt, but be-
15 come white and hard: the ſame effects follow when they are mixed with phlogiſton: for inſtance, the ſoap-rock is eaſily cut with the knife; but, being burnt, it cuts glaſs, and would ſtrike fire with the ſteel, if as large a piece as is neceſſary for that purpoſe could be tried in this way. The ſoap-rocks are ſometimes found of a dark brown and nearly black colour, but become white in the fire, as a piece of China ware: however, care muſt be taken not to puſh the flame from the top of the wick, there being for the moſt part a ſooty ſmoke, which commonly will darken all that it touches; and if this is not obſerved, a miſtake in the experiment might eaſily happen: but if it is mixed with iron, as it is ſometimes found, it does not ſo eaſily part with its dark colour. The argillaceæ, when mixed with lime, melt by themſelves, as above-mentioned. When mixed with iron, as in the boles, they grow dark or black; and if the iron is not in too great a quantity, they melt alone into a dark ſlag: the ſame happens when they are mixed with iron and a little of the vitriolic acid, as in the common clay, &c.

16 5. The micaceæ and aſbeſtinæ become ſomewhat hard and brittle in the fire, and are more or leſs refractory, though they give ſome marks of fuſibility.

17 6. The fluors diſcover one of their chief characteriſtics by giving a light, like phoſphorus, in the dark, when they are ſlowly heated; but loſe this property, as well as their colour, as ſoon as they are made red-hot: they commonly melt in the fire into a white opaque ſlag, though ſome of them not very eaſily.

18 7. Some ſorts of the zeolites, a ſtone lately diſcovered, melt eaſily and foam in the fire, ſometimes nearly as much as borax, and become a frothy ſlag, &c.

19 8. A great many of thoſe mineral bodies which are impregnated with iron, as the boles, and ſome of the white iron ores, &c. as well as ſome of the other iron ores, *viz.* the bloodſtone, are not attracted by the loadſtone before they have been thoroughly roaſted, &c.

20 After the mineral bodies have been tried in the fire by themſelves, they ought to be melted with fluxes, to find out if they can be diſſolved or not, and ſome other phenomena attending this operation. To this purpoſe three different kinds of ſalts are uſed as fluxes, viz. *ſal ſodæ*, *borax*, and *ſal fuſibile microcoſmicum*.

21 The ſal ſodæ is not much uſed in theſe ſmall experiments, its effects upon the charcoal rendering it for the moſt part improper; becauſe, as ſoon as the flame begins to act upon it, it melts inſtantly, and is almoſt wholly attracted by the charcoal. When this ſalt is employed to make any experiment, but a very little quantity thereof is wanted at once, *viz.* about the cubical contents of an eighth part of an inch, more or leſs: this is laid upon the charcoal, and the flame blown on it with the blow-pipe; but as this ſalt commonly is in form of a powder, it is neceſſary to go on very ſoftly, that the force of the flame may not diſperſe the minute particles of the ſalt. As ſoon as it begins to melt, it runs along on the charcoal almoſt as melted tallow; and when cold, it is a glaſſy matter of an opaque dull colour ſpread on the coal. The moment it is melted, the matter which is to be tried ought to be put into it, becauſe otherwiſe the greateſt part of the ſalt will be ſoaked into the charcoal, and too little of it left for the intended purpoſe: the flame ought then to be directed on the matter itſelf, and if the ſalt ſpreads too much about, leaving the proof almoſt alone, it may be brought to it again by blowing the flame on its extremities, and directing it towards the ſubject of the experiment. In the eſſays made with this ſalt, it is true, we may find if the mineral bodies which are melted with it have been diſſoved by it or not; but we cannot tell with any certainty whether this is done haſtily and with force, or gently and ſlowly; whether only a leſs or a greater part of the matter has been diſſolved; nor can it be well diſtinguiſhed if the matter has imparted any weak tincture to the ſlag; becauſe this ſalt always bubbles upon the charcoal during the experiment, nor is it clear when cool; ſo that ſcarce any colour, except it be a very deep one, can be diſcovered, although it may ſometimes be coloured by the matter that has been tried.

The two other ſalts, *viz.* the *borax*, and the *ſal fuſibile microcoſmicum*, are very well adapted to theſe ex- 22
periments, becauſe they may by the flame be brought to a clear uncoloured and tranſparent glaſs; and as they have no attraction to the charcoal, they keep themſelves always upon it in a round globular form. The *ſal fuſibile microcoſmicum* is very ſcarce, and not to be met with in the ſhops; it is made of urine. For its preparation, ſee CHEMISTRY, n° 308.

The quantity of theſe two ſalts required for an ex- 23
periment is almoſt the ſame as the ſal ſodæ; but as theſe ſalts are cryſtalliſed, and conſequently include a great deal of water, particularly the borax, their bulk is conſiderably reduced when melted, and therefore little more may be taken than the before-mentioned quantity.

The borax and microcoſmic ſalt, when expoſed to the 24
flame of the blow-pipe, bubble very much and foam before they melt to a clear glaſs; but more ſo the borax, which for the moſt part depends on the water they contain: and as this would hinder the eſſayer to make due obſervations on the phenomena of the experiment, the ſalt which is to be uſed muſt firſt be brought to clear glaſs before it can ſerve as a flux; it muſt therefore be kept in the fire until it is become ſo tranſparent that the cracks in the charcoal may be ſeen thro' it. This done, whatſoever is to be tried, is put to it, and the fire continued.

Here it is to be obſerved, that for the eſſays made 25
with any of theſe two fluxes on mineral bodies, no larger pieces of theſe muſt be taken than that all together they may keep a globular form upon the charcoal; becauſe then it may be better diſtinguiſhed in what manner the flux acts upon the matter during the experiment: if this is not obſerved, the flux, communicating itſelf with every point of the ſurface of the mineral body, ſpreads all over it, and keeps the form of this laſt, which commonly is flat, and by that means hinders the operator to obſerve all the phenomena which may happen. Beſides, the flux being in too ſmall a quantity, in proportion to the body to be tried, is too weak to act with all its force upon it. The beſt proportion, therefore, is about a third part of the mineral body to the flux. And, as the quantity of the flux (21, 23) makes a globe of a due ſize, in regard to the greateſt

Method of making Experiments.

greateſt heat that it is poſſible to procure in theſe experiments, the ſize of the mineral body (8) required when it is to be tried in the fire by itſelf, is too large on this occaſion, the third part of it being here almoſt ſufficient.

26 The ſal ſodæ, as has been ſaid before, is not of much uſe in theſe experiments; nor has it any particular qualities in preference to the two laſt-mentioned ſalts, except that it diſſolves the zeolites eaſier than the borax and the *ſal fuſibile microcoſmicum*.

This laſt-mentioned ſalt ſhews almoſt the ſame effects in the fire as the borax; and differs from this in very few circumſtances, of which one of the principal is, that, when melted with mangaueſe, it becomes of a crimſon hue, inſtead of a jacinth colour, which borax takes.

This ſalt is, however, for its ſcarcity, ſtill very little in uſe, borax alone being that which is commonly uſed. Whenever a mineral body is melted with any of theſe two laſt mentioned ſalts, in the above-deſcribed manner, it is eaſily ſeen whether it is quickly diſſolved; becauſe in that caſe an effervefcence ariſes, which laſts till the whole is diſſolved; or whether this is ſlowly done, in which caſe few and ſmall bubbles only riſe from the matter: likewiſe, if it cannot be diſſolved at all; becauſe then it is obſerved only to turn round in the flux without the leaſt bubble, and the edges look as ſharp as they were before.

27 In order further to illuſtrate what has been ſaid about theſe experiments, we ſhall mention ſome inſtances concerning the effects of borax upon the mineral bodies, *viz.*

28 1. The calcareous ſubſtances, and all thoſe ſtones which contain any thing of lime in their compoſition, diſſolve readily, and with effervefcence, in the borax: this effervefcence is the more violent, the greater the portion of lime contained in the ſtone. This, however, is not the only reaſon in the gypſum, becauſe both the conſtituents of this do readily mix with the borax, and therefore a greater effervefcence ariſes in melting gypſum with the borax than lime alone.

29 2. The ſiliceæ do not diſſolve, unleſs ſome few, which contain a quantity of iron.

30 3. The argillaceæ, when pure, are not acted upon by the borax; but when they are mixed with ſome heterogeneous bodies, they are diſſolved, though very ſlowly; ſuch is, for inſtance, the ſtone marrow, the common clay, &c.

31 4. The granateæ, zeolites, and trapp, diſſolve but ſlowly.

32 5. The fluores, aſbeſtinæ, and micaceæ, diſſolve for the moſt part very eaſily; and ſo forth.

33 Some of theſe bodies melt to a colourleſs tranſparent glaſs with the borax; for inſtance, the calcareous ſubſtances when pure, the fluors, ſome of the zeolites, &c. Others tinge the borax with a green tranſparent colour; *viz.* the granateæ, trapp, ſome of the argillaceæ, ſome of the micaceæ and aſbeſtinæ: this green has its origin, partly from a ſmall portion of iron which the granateæ particularly contain, and partly from phlogiſton.

34 The borax cannot diſſolve but a certain quantity of a mineral body proportional to its own. Of the calcareous kind it diſſolves a vaſt quantity; but turns at laſt, when too much has been added, from a clear, tranſparent, to a white opaque ſlag. When the quantity of the calcareous matter exceeds but little in proportion, the glaſs looks very clear as long as it remains hot; but as ſoon as it begins to cool, a white half opaque cloud is ſeen to ariſe from the bottom, which ſpreads over the third, half, or more of the glaſs globe, in proportion to the quantity of calcareous matter; but the glaſs or ſlag is nevertheleſs ſhining, and of a glaſſy texture when broke: if more of this matter be added, the cloud riſes quicker and more opaque, and ſo by degrees till the ſlag becomes quite milk-white: it is then no more of a ſhining, but rather dry appearance, on the ſurface; is very brittle, and of a grained texture when broke.

All that has been ſaid hitherto of experiments upon mineral bodies, is only concerning the ſtones and earths. We now proceed to the metals and ores, in order to deſcribe the manner of examining theſe bodies, and particularly the management of the blowpipe in theſe experiments. An exact knowledge and nice proceeding are ſo much the more neceſſary here, as the metals are often ſo much digniſed in their ores as to be very difficultly known by their external appearance, and liable ſometimes to be miſtaken one for the other: ſome of the cobalt ores, for inſtance, reſemble much a pyrites arſenicalis; there are alſo ſome iron and lead ores which are nearly like one another, &c. 35

As the ores generally conſiſt of metals mineraliſed with ſulphur or arſenic, or ſometimes both together; they ought firſt to be expoſed to the fire by themſelves in order not only to determine with which of them they are mineraliſed, but alſo to ſet them free from theſe volatile mineraliſing bodies: And this alſo ſerves inſtead of calcination, by which they are prepared for further eſſays. 36

Here it muſt be obſerved, that, whenever any metal or fuſible ore is to be tried, a little concavity muſt be made in that place of the charcoal where the matter is to be put; becauſe, as ſoon as it is melted, it forms itſelf into a globular figure, and might then roll from the charcoal, if its ſurface was plain; but when borax is put to it, this inconveniency is not ſo much to be feared. 37

Whenever an ore is to be tried, a ſmall bit is broke off for that purpoſe, of ſuch a ſize as has been directed; this bit is laid upon the charcoal, and the flame blown on it ſlowly: Then the ſulphur or arſenic begins to part from it in form of ſmoke; theſe are eaſily diſtinguiſhed from one another by their ſmell, that of ſulphur being ſufficiently known, and the arſenic ſmelling like garlic. The flame ought to be blown very ſoftly, as long as any ſmoke is ſeen to ariſe from the ore; but after that the heat muſt be augmented by degrees, in order to make the calcination as perfect as poſſible. If the heat is applied very ſtrong from the beginning upon an ore that contains much of the ſulphur or arſenic, this ore will preſently melt, and yet loſe very little of its mineraliſing bodies, and by that means render the calcination very imperfect. It is, however, impoſſible to calcine the ores in this manner to the utmoſt perfection, which is eaſily ſeen in the following inſtance, viz. in melting down a calcined potter's ore with borax, it will be found to bubble upon the coal, which depends on the 38

ſulphur

sulphur which is still left, the vitriolic acid of this uniting with the borax, and causing this motion. However, lead, in its metallic form, melted in this manner, bubbles alone upon the charcoal, if any sulphur remains in it. But as the lead, as well as some of the other metals, may raise bubbles upon the charcoal, although they are quite free from the sulphur, only by the flame's being forced too violently on it, these phænomena ought not to be confounded with each other.

39 The ores being thus calcined, the metals contained in them may be discovered, either by being melted alone, or with fluxes: when they shew themselves either in their pure metallic state, or by tinging the flag with colours peculiar to each of them. In these experiments, it is not to be expected that the quantity of metal contained in the ore should be exactly determined; this must be done in larger laboratories. This cannot, however, be looked upon as any defect, since it is sufficient for a mineralogist only to find out what sort of metal is contained in the ore. There is another circumstance which is a more real defect in our little laboratory, which is, that some ores are not at all able to be tried in it by so small an apparatus: for instance, the gold ore called *pyrites aureus*, which consists of gold, iron, and sulphur. The greatest quantity of gold which this ore contains is about one ounce, or one ounce and an half, out of 100 pounds of the ore, the rest being iron and sulphur; and as only a very small bit is allowed for these experiments, the gold contained therein can hardly be discerned by the eye, even if it could be extracted; but it goes along with the iron in the flag, this last metal being in so large a quantity in proportion to the other, and both of them being capable of mixture with each other.

All the kinds of blende, black-jack, which are mineralised zinc ores, containing zinc, sulphur, and iron, cannot be tried this way, because they cannot be perfectly calcined; and besides, the zinc flies off, when the iron scorifies: neither can all those blendes which contain silver or gold mineralised with them, be tried in this manner, which is particularly owing to the imperfect calcination: nor are the quicksilver ores fit for these experiments; the volatility of this semi-metal making it impossible to bring it out of the poorer sort of ores; and the rich ores which sweat out the quicksilver, when kept close in the hand, not wanting any of these essays, &c. Those ores ought to be essayed in larger quantities, and by methods which cannot be applied upon a piece of charcoal.

40 Some of the rich silver ores are easily tried: for instance, *minera argenti vitrea*, commonly called *silver-glass*, which consists only of silver and sulphur. When this ore is exposed to the flame, it melts instantly, and the sulphur goes away in fume, leaving the silver pure upon the charcoal, in a globular form. If this silver should happen to be of a dirty appearance, which often is the case, then it must be melted anew with a very little borax; and after it has been kept in fusion for a minute or two, so as to be perfectly melted and red-hot, the proof is suffered to cool: it may then be taken off the coal, and being laid upon the steel-plate, the silver is separated from the flag by one or two strokes of the hammer. Here the use of the iron ring is manifest; for this ought first to be placed upon the plate, to hinder the proof from flying off by the violence of the stroke, which otherwise would happen. The silver is then found inclosed in the flag of a globular form, and quite shining, as if it were polished. When a large quantity of silver is contained in a lead ore, viz. in a potter's ore, it can likewise be discovered through the use of the blow-pipe.

Of the pure tin ores, the tin may be melted out in its metallic state. Some of these ores melt very easily, and yield their metal in quantity, if only exposed to the fire by themselves: but others are more refractory, and as these melt very slowly, the tin, which sweats out in form of very small globules, is instantly burnt to ashes, before these globules have time to unite in order to compose a larger globe which might be seen by the eye, and is not so soon destroyed by the fire; it is therefore necessary to add a little borax to these from the beginning, and then to blow the flame violently at the proof. The borax does here preserve the metal from being too soon calcined; and even contributes to the readier collecting of the small metallic particles, which soon are seen to form themselves into a globule of metallic tin at the bottom of the whole mass, nearest to the charcoal. As soon as so much of metallic tin is produced as is sufficient to convince the operator of its presence, the fire ought to cease, although not the whole of the ore be yet melted; because seldom, or rather never, the whole of this kind of ore can be reduced into metal by means of these experiments, a great deal thereof always being calcined: and if the fire is continued too long, perhaps even the metal, already reduced, may likewise be burnt to ashes; for the tin is very soon calcined by the fire. 41

Most part of the lead ores may be brought to a metallic lead upon the charcoal. The *mineræ plumbi calciformes*, which are pure, are easily melted into lead: but such of them as are mixed with an *ochra ferri*, or any kind of earth, as clay, lime, &c. yield very little of lead, and even nothing at all, if the heterogenea are combined therewith in any large quantity: this happens even with the *minera plumbi calciformis arsenica mixta*. These, therefore, are not to be tried but in larger laboratories. However, every mineral body suspected to contain any metallic substance, may be tried by the blow-pipe, so as to give sufficient proofs whether it contains or not, by its effects being different from those of the stone or earths, &c. 42

The *mineræ plumbi mineralisatæ* leave the lead in a metallic form, if too large a quantity of iron be not mixed with it. For example, when a tessellated or steel-grained lead-ore is exposed to the flame, its sulphur, and even the arsenic, if there be any, begins to fume, and the ore itself immediately to melt into a globular form; the rest of the sulphur continues then to fly off, if the flame is blown slowly upon the mass; instead of that, very little of the sulphur will go off, if the flame is forced violently on it: in this case, it rather happens that the lead itself crackles and dissipates, throwing about very minute metallic particles. 43

Of Experiments. The sulphur being driven out as much as possible, which is known by finding no sulphureous vapour in smelling at the proof, the whole is suffered to cool, and then a globule of metallic lead will be left upon the coal. If any iron is contained in the lead ore, the lead which is melted out of it is not of a metallic shining, but rather of a black and uneven surface: a little borax must in this case be melted with it, and as soon as no bubble is seen to rise any longer from the metal into the borax, the fire must be discontinued: when the mass is grown cold, the iron will be found scorified with the borax, and the lead left pure and of a shining colour.

44 The borax does not scorify the lead in these small experiments, when it is pure: if the flame is forced with violence on it, a bubbling will ensue, resembling that which is observed when borax dissolves a body melted with it; but when the fire ceases, the slag will be perfectly clear and transparent, and a quantity of very minute lead particles will be seen spread about in the borax, which have been torn off from the mass during the bubbling.

45 If such a lead ore is rich in silver, this last metal may likewise be discovered by this experiment; because, as the lead is volatile, it may be forced off, and the silver remain. To effect this, the lead, which is melted out of the ore, must be kept in constant fusion with a slow heat, that it may be consumed. This end will be sooner obtained, and the lead part quicker, if, during the fusion, the wind through the blow-pipe be directed immediately, though not forcibly, upon the melted mass itself, until it begins to cool, then the fire must be directed on it again. The lead, which is already in a volatilising state, will by this artifice be driven out in form of a subtile smoke; and by thus continuing by turns to melt the mass, and then to blow off the lead, as has been said, until no smoke is any longer perceived, the silver will at last be obtained pure. The same observation holds good here also which was made about the gold, that, as none but very little bits of the ores can be employed in these experiments, it will be difficult to extract the silver out of a pure ore; for some part of it will fly off with the lead, and what might be left is too little to be discerned by the eye. The silver which by this means is obtained is easily distinguished from lead by the following external marks, viz. that it must be red-hot before it can be melted: it cools sooner than lead: it has a silver colour; that is to say, brighter and whiter than lead: and is harder to beat with the hammer.

46 The *mineræ cupri calciformes*, (at least some of them) when mixed with too much stone or earth, are easily reduced to copper with any flux: if the copper is found not to have its natural bright colour, it must be melted with a little borax, which purifies it. Some of these ores do not at all discover their metal, if not immediately melted with borax; the heterogenea contained in them hindering the fusion, before these are scorified by the flux.

47 The grey copper ores, which only consist of copper and sulphur, are tried almost in the same manner as the preceding. Being exposed to the flame by themselves, they will be found instantly to melt, and part of their sulphur to go off. The copper may afterwards be obtained in two ways: the one, by keeping the proof in fusion for about a minute, and then suffering it to cool; when it will be found to have a dark and uneven appearance externally, but which, after being broke, discovers the metallic copper of a globular form in its centre, surrrounded with a regule, which still contains some sulphur and a portion of the metal: the other, by being melted with borax, which last way sometimes makes the metal appear sooner.

The *mineræ cupri pyritaceæ*, containing copper, sulphur, and iron, may be tried with the blow-pipe, if they are not too poor: in these experiments the ore ought to be calcined, and after that the iron scorified. For this purpose a bit of the ore must be exposed to a slow flame, that as much of the sulphur as possible may part from it before it is melted; because the ore commonly melts very soon, and then the sulphur is more difficult to drive off. After being melted, it must be kept in fusion with a strong fire, for about a minute, that a great part of the iron may be calcined: and, after that, some borax must be added, which scorifies the iron, and turns with it to a black slag. If the ore is very rich, a metallic copper will be had in the slag, after the scorification: if the ore is of a moderate richness, the copper will still retain a little sulphur, and sometimes iron: the product will therefore be brittle, and must with great caution be separated from the slag, that it may not break into pieces; and if this product is afterwards treated in the same manner as before said, in speaking of the grey copper ores, the metal will soon be produced. But, if the ore is poor, the product after the first scorification must be brought into fusion, and afterwards melted with some fresh borax, in order to calcine and scorify the remaining portion of iron; after which it may be treated as mentioned n° 47. The copper will, in this last case, be found in a very small globule. 48

The copper is not very easily scorified with this apparatus, when it is melted together with borax; unless it has first been exposed to the fire by itself for a while, in order to be calcined. When only a little of this metal is dissolved, it instantly tinges the slag of a reddish-brown colour, and mostly opaque; but as soon as this slag is kept in fusion for a little while, it becomes quite green and transparent: and thus the presence of the copper may be discovered by the colour, when it is concealed in heterogeneous bodies, so as not to be discovered by any other experiment. 49

If metallic copper is melted with borax by a slow fire, and only for a very little time, the glass, or slag, becomes of a fine transparent blue or violet colour, inclining more or less to the green: but this colour is not properly owing to the copper, but it may rather be to its phlogiston; because the same colour is to be had in the same manner from iron: and these glasses which are coloured with either of these two metals, soon lose their colour if exposed to a strong fire, in which they are made quite clear and colourless. Besides, if this glass, tinged blue with the copper, is again melted with more of this metal, it becomes of a good green colour, which for a long time keeps unchanged in the fire. 50

The iron ores, when pure, can never be melted by themselves, through the means of the blow-pipe alone; 51
nor

nor do they yield their metal, when melted with fluxes, because they require too strong a heat to be brought into fusion; and, as both the ore and the metal itself very soon lose their phlogiston in the fire, and cannot be supplied with a sufficient quantity from the charcoal, so likewise they are very soon calcined in the fire. This easy calcination is also the reason why the fluxes, for instance borax, readily scorify this ore, and even the metal itself. The iron loses its phlogiston in the fire sooner than the copper, it is therefore easier scorified; and this is the principle on which the experiment mentioned n° 48. is founded.

52 The iron is, however, discovered without much difficulty, although it be mixed but in a very small quantity with heterogeneous bodies. The ore, or those bodies which contain any large quantity of the metal, are all attracted by the loadstone, some without any previous calcination, and others not till after having being roasted. When a clay is mixed with a little iron, it commonly melts by itself in the fire; but, if this metal is contained in a limestone, it does not promote the fusion, but gives the stone a dark, and sometimes a deep black colour, which always is the character of iron. A *minera ferri calciformis pura crystallisata*, is commonly of a red colour: this being exposed to the flame, becomes quite black; and is then readily attracted by the loadstone, which it was not before. Besides these signs, the iron discovers itself, by tinging the slag of a green transparent colour, inclining to brown, when only a little of the metal is scorified; but as soon as any large quantity thereof is dissolved in the slag, this becomes first a blackish brown, and afterwards quite black and opaque.

Bismuth is known by its communicating a yellowish-
53 brown colour to borax; and arsenic by its volatility, and garlick smell. Antimony, both in form of regulus and ore, is wholly volatile in the fire, when it is not mixed with any other metal (except arsenic), and is known by its particular smell; easier to be distinguished, when once known, than described. When the ore of antimony is melted upon the charcoal, it bubbles constantly during its volatilising.

54 Zinc ores are not easily tried upon the coal (n° 39.) But the regulus of zinc, exposed to the fire upon the charcoal, burns with a beautiful blue flame, and forms itself almost instantly into white flowers, which are the common flowers of zinc.

55 Cobalt is particularly remarkable for giving to the glass a blue colour, which is the zaffre or smalt. To produce this, a piece of cobalt ore must be calcined in the fire (36, 37.) and afterwards melted with borax. As soon as the glass, during the fusion, from being clear, seems to grow opaque it is a sign that it is already tinged a little; the fire is then to be discontinued, and the operator must take hold, with the nippers, of a little of the glass whilst yet hot, and draw it out slowly in the beginning, but afterwards very quick, before it cools, whereby a thread of the coloured glass is procured, more or less thick, on which the colour may easier be seen against the day or candle light than if it were left in a globular form. The thread melts easily if only put in the flame of the candle, without the help of the blow-pipe.

If this glass is melted again with more of the cobalt, and kept in fusion for a while, the colour becomes very deep; and thus the colour may be altered, according to pleasure.

When the cobalt ore is pure, or at least contains
but little iron, a cobalt regulus is almost instantly 56
produced in the borax, during the fusion: but when it is mixed with a quantity of iron, this last metal ought first to be separated, which is easily performed, since it scorifies sooner than the cobalt; therefore, as long as the slag retains any brown or black colour (55.) it must be separated, and melted again with fresh borax, until it shew the colour.

Nickel is very seldom to be had, as its ores are 57
seldom free from mixtures of other metals. It is very difficultly tried with the blow-pipe. However, when this semi-metal is mixed with iron and cobalt, it is easily freed from these heterogeneous metals, and reduced to a pure nickel regulus, by means of scorification with borax, in the same manner as is mentioned (46.), because both the iron and cobalt sooner scorify than the nickel. The regulus of nickel itself is of a green colour, when calcined: it requires a pretty strong fire before its melts, and tinges the borax with a jacinth colour. Manganese gives the same colour to borax; but its other qualities are quite different, so as not to be confounded with the nickel.

Thus we have briefly described the use of the blow- 58
pipe, and the method of employing it in the study of mineralogy. Any gentleman who is a lover of this science, will, by attending to the rules here laid down, be able in an easy manner to amuse himself in discovering the properties of those works of nature which the mineral kingdom furnishes us with. The husbandman may by its help find out what sorts of stones earths, ores, &c. there are on his estate, and to what œconomical uses they may be employed. The scientific mineralist may, by examining into the properties and effects of the mineral bodies, discover the natural relation these bodies stand in to each other, and thereby furnish himself with materials for establishing a mineral system, founded on such principles as nature herself has laid down in them; and this in his own study, without being forced to have recourse to large laboratories, crucibles, furnaces, &c. which is attended with a great deal of trouble, and is the reason why so few can have an opportunity of gratifying their desire of knowledge in this part of natural history. It is to be hoped, that the more general its use becomes, the more and sooner will its imperfections be removed, and such additions made as may be found necessary and convenient. We shall now add some hints towards these improvements, leaving to the judicious practitioner the manner of completing them.

A greater number of fluxes might perhaps be found
out, whose effects on mineral bodies might be different 59
from these already in use, whereby more distinct characters of those mineral bodies might be discovered, which now either shew ambiguous ones, or which are almost impossible to be exactly tried by the blow-pipe. Instead of the sal sodæ, some other salts might be found out, more fit for these experiments. But it is very necessary not to make use of any other fluxes than such as have no attraction to the charcoal: if they at the same time are clear and transparent when melted, as the borax and *sal fusibile microcosmicum*, it is still bet-

Of Experiments.

ter: however, the tranfparency or opacity are of no great confequence, if a fubftance is effayed only in order to difcover its fufibility, without any attention to its colour: in which cafe, fome metallic flag perhaps might be ufeful.

60 When fuch ores are to be reduced whofe metals are very apt to calcine, fuch as tin, zinc, &c. it might perhaps be of fervice to add fome phlogifton, fince the charcoal cannot afford enough of it in the open fire of thefe effays: fuch a phlogifton might be the hard refin, or fome fuch body. The manner of melting the volatile metals out of their ores *per defcenfum* might alfo perhaps be imitated: for inftance, a hole might be made in the charcoal, wide above, and very narrow at the bottom; a little piece of ore being then laid at the upper end of the hole, and covered with fome very fmall pieces of the charcoal, the flame muft be directed on the top: the metal might, perhaps, by this method gather in the hole below, removed from the violence of the fire, particularly if the ore is very fufible, &c.

61 The ufe of the pocket laboratory, as here defcribed, is chiefly calculated for a travelling mineralift. But a perfon who is always refiding at one and the fame place, may by fome fmall alteration make it more commodious to himfelf, and avoid the trouble of blowing with the mouth. For this purpofe he may have the blow-pipe go through a hole in a table, and fixed underneath to a fmall pair of bellows with double bottoms, fuch as fome of the glafs-blowers ufe, and then nothing more is required than to move the bellows with the feet during the experiment; but in this cafe a lamp may be ufed inftead of a candle. This method would be attended with a ftill greater advantage, if there were many fuch parts as fig. 2. n° 2. (Plate LV. Vol. II.) the openings of which were of different dimenfions: thefe parts might by means of a fcrew be faftened to the main body of the blow-pipe, and taken away at pleafure. The benefit of having thefe nozzles of different capacities at their ends, would be that of exciting a ftronger or weaker heat as occafion might reqnire. It would only be neceffary to obferve, that in proportion as the opening of the pipe (nozzle) is enlarged, the quantity of the flame muft be augmented by a thicker wick in the lamp, and the force of blowing increafed by means of weights laid on the bellows. A much more intenfe heat would thus be procured by a pipe of a confiderable opening at the end, by which the experiments might undoubtedly be carried farther than with the common blow-pipe.

62 A traveller, who has feldom an opportunity of carrying many things along with him, may very well be contented with this pocket laboratory, and its apparatus, which is fufficient for moft part of fuch experiments as can be made on a journey. There are, however, other things very ufeful to have at hand on a journey, which ought to make a fecond part of the pocket-laboratory, if the manner of travelling does not oppofe it: this confifts of a little box including the different acids, and one or two matraffes, in order to try the mineral bodies in liquid menftrua, if required.

63 Thefe acids are, the acid of nitre, of vitriol, and of common falt. Moft of the ftones and earths are attacked, at leaft in fome degree, by the acids; but the calcareous are the eafieft of all to be diffolved by them, which is accounted for by their calcareous properties. The acid of nitre is that which is moft ufed in thefe experiments; it diffolves the limeftone, when pure, perfectly, with a violent effervefcence, and the folution becomes clear: when the limeftone enters into fome other body, it is neverthelefs difcovered by this acid, through a greater or leffer effervefcence in proportion to the quantity of the calcareous particles, unlefs thefe are fo few as to be almoft concealed from the acid by the heterogeneous ones. In this manner, a calcareous body, which fometimes nearly refembles a filiceous or argillaceous one, may be known from thefe latter, without the help of the blow-pipe, only by pouring one or two drops of this acid upon the fubject, which is very convenient when there is no opportunity nor time for ufing this inftrument.

The gypfa, which confift of lime and the vitriolic acid, are not in the leaft attacked by the acid of nitre, 64
if they contain a fufficient quantity of their own acid, becaufe the vitriolic acid has a ftronger attraction to the lime than the acid of nitre: but if the calcareous fubftance is not perfectly faturated with the acid of vitriol, then an effervefcence arifes with the acid of nitre, more or lefs in proportion to the want of the vitriolic acid. Thefe circumftances are often very effential in diftinguifhing the calcarei and gypfa from one another.

The acid of nitre is likewife neceffary in trying the 65
zeolites, of which fome fpecies have the fingular effect to diffolve with effervefcence in the abovementioned acid; and within a quarter of an hour, or even fometimes not until feveral hours after, to change the whole folution into a clear jelly, of fo firm a confiftence, that the glafs, wherein it is contained, may be reverfed, without its falling out.

If any mineral body is tried in this menftruum, and 66
only a fmall quantity is fufpected to be diffolved, tho' it was impoffible to diftinguifh it with the eye during the folution, it can eafily be difcovered by adding to it *ad faturitatem* a clear folution of an alkali, when the diffolved part will be precipitated, and fall to the bottom. For this purpofe the fal fodæ may be very ufeful.

The acid of nitre will fuffice for making experi- 67
ments upon ftones and earths; but if the experiments are to be extended to the metals, the other two acids are alfo neceffary. As the acids are very corrofive, they muft not be kept in the ordinary pocket-laboratory, already defcribed, for fear of fpoiling the other apparatus, if the ftoppers fhould happen not to fit exactly to the necks of the bottles, and fome of the acid fhould be fpilt.

For thefe acids a feparate box muft be made, which 68
is eight inches and three quarters long, four inches broad, and five inches high (A). In this box are three long and narrow bottles, containing the acids, placed upright at one end of it, two glafs matraffes laid horizontally in the upper part, and a little drawer underneath, made on purpofe to fill the empty room below the matraffes, and to give the box a regular form; and as charcoal is not every where to be met with in travelling, a piece ought always to be kept in this drawer for the ufe of the blow-pipe.

In

(A) But thefe dimenfions, originally directed, have been fince reduced, as mentioned under n° 3. par. *penult.*

69 In order to keep the acids more cloſe in the bottles, ſince the glaſs-ſtopper is not always ſufficient, there is a glaſs-cover beſides, made ſo as to ſcrew round the neck of the bottle; and if this is nicely made, nothing can come through, though the box be inclined, or even reverſed, which ſometimes may happen. The form of the glaſs matraſſes is ſeen fig. 4. They ought to be very thin at the bottom, that they may not crack by being ſuddenly put over the fire or taken off it. In theſe matraſſes ſolutions may very eaſily be made over the flame of a candle: every mine- ral body capable of being affected by the acids in this degree of heat, may here be diſſolved, and particularly the metals.

Plate CLXXXI.

70 Another inſtrument is likewiſe neceſſary to a complete pocket-laboratory, *viz.* a waſhing-trough; in which the mineral bodies, and particularly the ores, may be ſeparated from each other, and from the adherent rock, by means of water.

This trough is very common in the laboratories, and is uſed of different ſizes; but here only one is required of a moderate ſize, ſuch as twelve inches and a half long, three inches broad at the one end, and one inch and a half at the other end (B), ſloping down from the ſides and the broad end to the bottom, where it is three quarters of an inch deep: we have given a figure of it in fig. 5. It is commonly made of wood, which ought to be choſen ſmooth, hard, and compact, wherein are no pores in which the minute grains of the pounded matter may conceal themſelves.

It is to be obſerved, that if any matter is to be waſhed which is ſuſpected to contain ſome native metal, as ſilver or gold; a trough ſhould be procured for this purpoſe, of a very ſhallow ſlope, becauſe the minute particles of the native metal have then more power to aſſemble together at the broad end, ſeparate from the other matter.

The magnagement of this trough, or the manner of waſhing, conſiſts chiefly in this: that when the matter is mixed with about three or four times its quantity of water in the trough, this is kept very looſe between two fingers of the left hand, and ſome light ſtrokes given on its broad end with the right, that it may move backwards and forwards, by which means the heavieſt particles aſſemble at the broad and upper end, from which the lighter ones are to be ſeparated by inclining the trough and pouring a little water on them. By repeating this proceſs, all ſuch particles as are of the ſame gravity may be collected together, ſeparate from thoſe of a different gravity, provided they all were before equally pounded; though ſuch as are of a clayiſh nature, are often very difficult to ſeparate from the reſt, which, however, is of no great conſequence to a ſkilful and experienced waſher. The waſhing proceſs is very neceſſary, as there are often rich ores, and even native metals, found concealed in earths and ſand in ſo minute particles, as not to be diſcovered by any other means.

ARRANGEMENT *of Mineral Bodies.*

71 THE bodies belonging to the mineral kingdom are divided into four different claſſes, viz.

1. *Earths*, or thoſe ſubſtances which are not ductile, are moſtly indiſſoluble in water or oil, and preſerve their conſtitution in a ſtrong heat (C).
2. *Salts:* theſe diſſolve in water, and give it a taſte; and when the quantity of water required to keep them in diſſolution is evaporated, they concrete again into ſolid and angular bodies.
3. *Inflammables*, which can be diſſolved in oils, but not in water, and are inflammable.
4. *Metals*, the heavieſt of all bodies; ſome of which are malleable, and ſome can be decompounded.

Here, however, it muſt be obſerved, that theſe claſſes are blended one with another; and therefore ſome exceptions muſt be allowed in every one of them: for inſtance, in the firſt claſs, the calcareous earth is in ſome meaſure diſſoluble in water, and pipe-clay with ſome others diminiſh ſomewhat in their bulk when kept for a long time in a calcining heat. In the third claſs, the calx of arſenic has nearly the ſame properties as ſalts; and there is no poſſible definition of ſalt, that can exclude the arſenic, though at the ſame time it is impoſſible to arrange it elſewhere than among the ſemi-metals. In the fourth claſs it is to be obſerved, that the metals and ſemi-metals, perfect or imperfect, have not the ſame qualities common to them all; becauſe ſome of them may be calcined, or deprived of their phlogiſton, in the ſame degree of fire in which others are not in the leaſt changed, unleſs particular artifices or proceſſes are made uſe of: ſome of them alſo may be made malleable, while others are by no means to be rendered ſo. That the convex ſurface metals take after being melted, is a quality not particularly belonging to them, becauſe every thing that is perfectly fluid in the fire, and has no attraction to the veſſel in which it is kept, or to any added matter, takes the ſame figure; as we find borax, *ſal fuſibile microcoſmicum*, and others do, when melted upon a piece of charcoal: therefore, with regard to all that has been ſaid, it is hardly worth while to invent ſuch definitions as ſhall include ſeveral ſpecies at once; we ought rather to be content with perfectly knowing them ſeparately.

The FIRST CLASS.

EARTHS, are thoſe mineral bodies, not ductile, for the moſt part not diſſoluble in water or oils, and that preſerve their conſtitution in a ſtrong heat. 72

Theſe earths are here arranged according to their conſtituent parts, ſo far as hitherto diſcovered, and are divided into nine orders.

The FIRST ORDER.

The *Calcareous* kinds. Theſe, when pure, and free from heterogeneous matters, have the following qualities common to them all: 73

1. That they become friable when burnt in the fire, and afterwards fall into a white powder.
2. That their falling into powder is promoted, if, after being burnt, they are thrown into water, whereby a ſtrong heat ariſes, and a partial ſolution.
3. They cannot be melted by themſelves into glaſs in the ſtrongeſt fire.
4. When burnt, they augment the cauſticity of the lixivium of potaſhes.

5. They

(B) Reduced dimenſions are mentioned under n° 3. par *ult*.

(C) By *earths*, the author (Mr Cronſtedt) does not mean (ſtrictly ſpeaking) only earths, but includes all the kinds of ſtones or foſſils not inflammable, ſaline, or metallic.

5. They are diffolved in acids with effervefcence, in the following manner:

a. The acid of vitriol partly unites with them, and forms a precipitate, which is a gypfeous earth; and partly fhoots into felenitical cryftals with that which is kept diffolved, after a due evaporation.

b. With the acid of common falt they make a fal ammoniacum fixum, which alfo partly precipitates itfelf.

c. The acid of nitre diffolves them perfectly, and does not part with them again, unlefs fome alkaline falt is added.

6. They melt eafily with borax into a glafs, which fuffers impreffions in a degree of heat below ignition.

7. They likewife fufe into a glafs with *fal fufibile microcofmicum* with an effervefcence (D)

8. They melt the readieft of all kinds of ftones, with the calces, into a corrofive glafs or flag.

9. They have alfo fome power of reducing certain metallic earths or calces; for inftance, thofe of lead and of bifmuth, and likewife, tho' in a lefs degree, thofe of copper and of iron: thus,

10. Do they, in this laft-mentioned article (9.), as well as in other circumftances, refemble a fixed alkaline falt; from whence alfo this whole kind is very often, and properly, called *alkaline earths*.

The calcareous earth is found,

74 I. Pure,

1. In form of powder. *Agaricus mineralis*, or *lac lunæ*.

a. White, is found in moors, and at the bottom of lakes.

b. Red.

c. Yellow.—This kind of earth feems to be an impalpable powder of mouldered limeftones abraded and collected by the waters, and is therefore common in the neighbourhoods where limeftones are found: and tho' the ftone be at fome diftance, which is fometimes the cafe, ftill nothing contradictory appears in this opinion of the origin of this fpecies; fince in that cafe it has only been carried farther by the greater rapidity of a ftronger current of water. When this earth is found in the clefts of rocks, it receives more pompous names; fuch as *gur*, *lac lunæ*, &c. It burns readily into lime, if it is previoufly ftamped, that it may better cohere: it is then, or in its native ftate, ufed for white-wafhing, but eafily rubs off by the leaft touch. At certain places in the province of Smoland in Sweden, there is found in the moors a white earth, which, by its external appearance, refembles the fpecies here defcribed; but it does not fhow any marks of effervefcence with acids, nor does it burn into lime. It were to be wifhed, that thofe who have an opportunity of getting any quantity of this latter earth, would undertake to examine it better.

75 2. Friable and compact. Chalk, *creta*.

a. White, *creta alba*, is found in England, France, and in the province of Skone in Sweden, in which laft place it is only found adherent to flint. In the two firft kingdoms there are large ftrata of this fubftance, in which flint is imbedded. This feems to indicate, that the loofe flints, or thofe difperfed on the furface of the earth, have been by fome caufes carried from their native beds; but, as yet, no one can prove, that chalk and flint are of the fame conftituent parts.—Chalk is, however a vague name, alfo applied to other earths; whence we hear of chalks of various colours; but there are none which are known to be of a calcareous nature, except this kind here defcribed, and of which there are no other varieties, otherwife than in regard to the loofenefs of the texture, or the finenefs of the particles.

3. Indurated, or hard; *Terra calcarea indurata*. Limeftone; *Lapis calcareus*. 76

A. Solid, of no vifible particles, or not granulated.

This kind varies in regard to hardnefs and colour; for inftance,

a. White.

b. Whitifh yellow.

c. Flefh-coloured, found in loofe maffes.

d. Reddifh brown.

e. Grey.

f. Variegated with many colours, and particularly called *marble*.

g. Black.

B. Grained or granulated limeftone; *Lapis calcareus particulis granulatis*. 77

1. Coarfe-grained and of a loofe texture, called *falt-flag* in Swedifh, from its refemblance to lumps of falt.

a. Reddifh yellow. *b.* White.

The grained flux fpar is alfo fometimes called *falt-flag*.

2. Fine-grained.

a. White. *b.* Semi-tranfparent, from Solfatara in Italy, in which native brimftone is found.

3. Very fine grained.

a. White and green.

b. White and black.—This fpecies has often as beautiful colours as thofe commonly called *marbles*; but the texture and coherency of its particles will not admit of a good polifh.

C. Scaly limeftone; *Lapis calcareus particulis fquamofis five fpatofis*. 78

1. With coarfe or large fcales.

a. White.

Some kinds of this lofe in a calcining heat 40 *per cent.* of their weight; and, expofed to the air, get a brownifh efflorefcence, a fign that they contain fome iron, and are a medium between a limeftone and the white iron ore called *ftahlfteine*; nor do they excite any effervefcence with acids in their crude ftate.

b. Reddifh yellow.

2. With fmall fcales.

a. White.

3. Fine glittering or fparkling.

a. White.

(D) This effervefcence is alfo made with the borax, as well as with this *fal fufibile microcofmicum*; and it is alfo to be obferved, that the glaffes made with thefe falts are quite colourlefs and tranfparent.

Calcareous Earths.

a. White.

b. Of many colours. This variety conſtitutes a great number of the foreign marbles.

This ſpecies of limeſtone takes a good poliſh, and is therefore uſed as marble whenever it is found of a fine colour. It is beſides to be remarked, that the grained and ſcaly limeſtones are found either in veins, or form whole mountains, that ſhew no ſtrata, nor ſigns of petrifactions.

79 *D.* Lime or calcareous ſpars.

(1.) Of a rhomboidal figure.

a. Tranſparent or diaphanous.

1. Refracting ſpar; *Spatum iſlandicum.*

This repreſents the objects ſeen through it double.

2. Common ſpar, which ſhews the object ſingle.

1. White, or colourleſs.

2. Yellowiſh and phoſphoreſcent.

b. Opaque; *Spatum rhomboidale opacum.*

1. White, is found in many places, moſtly in clefts, and among cryſtalliſations.

2. Black.

3. Browniſh yellow.

(2.) Foliated or plated ſpar.

This has no rhomboidal figure, but breaks into thin plates, ſo placed as to be not unlike ſheets of thin paper, laid over each other.

a. Opaque white.

80 *E.* Cryſtalliſed calcareous ſpars. *Spar Druſen* (E).

It is compoſed of the laſt-mentioned ſpar that has formed itſelf exteriorly into ſeveral planes or ſides, wherefrom many different figures ariſe, the varieties of which have not yet been fully obſerved, nor can they be exactly deſcribed. The following are therefore mentioned, only as inſtances of the moſt regular and common kinds, viz.

(1.) Tranſparent; *Spatum druſicum diaphanum.*

a. Hexagonal truncated, *Cryſtalli ſpatoſi hexagonii truncati.*

b. Pyramidal.

1. Dog's teeth; *Pyramidales diſtincti.* Found at Salberg, and in the iron mines at Dannemera in the province of Upland.

2. Balls of cryſtalliſed ſpar, *Pyramidales concreti.*

Theſe are balls which have druſen, pyramidal, octaedral, ſpars accreted in their hollows or centres: they are found at Rettwin in the province of Dalarne, and other places (F).

F. Stalactitical ſpar; *Stalactites calcareus.* Stalactites, Stone-icicle, or Drop-ſtone. 81

This is formed from water ſaturated with lime, which, while running or dropping, depoſits by degrees the calcareous earth which it has carried along with it from clefts of rocks, or from out of the earth. It is therefore commonly of a ſcaly, though ſometimes of a ſolid and ſparry texture. Its external figure depends on the place where it is formed, or the quantity of the matter contained in the water, and other like circumſtances.

(1.) Scaled ſtalactites of very fine particles.

a. Of a globular form.

1. White, the pea-ſtone.

2. Grey, *piſolithus, oolithus.* Alſo the hammites, from its reſemblance to the roes or ſpawn of fiſh. It has been exhibited by authors as petrified roes. The Ketton free-ſtone, of Rutlandſhire, is a remarkable ſtone of this ſort.

b. Hollow, in the form of a cone.

1. White, is found every-where in vaults made with mortar, and through which water has had an opportunity to penetrate; and alſo in grottos dug in rocks of limeſtone.

c. Of an indeterminate figure. *Sinter.*

d. Of coherent hollow cones.

Of this kind is a ſtalactitical cruſt, which has formed a ſtratum, or rather filled a fiſſure between the ſtrata of the earth, at Helſingborg in the province of Skone; it is of a very ſingular figure, reſembling conical caps of paper placed and fixed one in the other, diminiſhing by degrees both in height and the other dimenſions.

2. Solid

(E) The tranſlator of Mr Cronſtedt's treatiſe has adopted this German term *druſen* into the Engliſh language, for a cluſter of regular-figured bodies, as a groupe conveys the idea of a cluſter only, whether regular or of indeterminate figures.

(F) The name *ſpar* is very well known, and only uſed to determine a certain figure, viz. when a ſtone breaks into a rhomboidal, cubical, or a plated form, with ſmooth and poliſhed ſurfaces, it is called *ſpar:* and as it is thus applied to ſtones of different kinds, without any regard to their principles, one ought neceſſarily to add ſome term to expreſs the conſtituent parts at the ſame time that the figure is mentioned; for inſtance, calcareous ſpar, gypſeous ſpar, flux ſpar, ſhorl or cockle ſpar, &c. This term, however, is applied only to earths, and ſuch ores as are of the ſame figure as the lead ſpar, &c.

All cryſtalliſed ſpars, when broken, ſhow the ſparry figure in their particles, and the cryſtalliſation is to be aſcribed to the empty ſpace left by the contraction of the ſparry principle: ſuch holes filled with druſen of ſpars, are in Swediſh called *drake*, or *druſe-hol.*

The figure of the cryſtals varies more in this genus than in any other, for which no reaſon can be aſſigned; it ought not to be aſcribed to ſalts, as long as the preſence of any ſuch cannot be proved: but there are ſtrong indications to ſuſpect, that other ſubſtances may likewiſe have received the ſame property to aſſume an angular ſurface on certain occaſions. See Mr Cronſtedt's Introductory Speech at the Royal Academy of Sciences at Stockholm.

Beſides, the conſideration of thoſe figures is a thing of more curioſity than of real uſe, becauſe no miner has yet been able to make any concluſion relative to the quantity or quality of the ores, from the difference of the figures of ſpars found along with them; and the grotto-makers never take any notice of the angles or ſides, but think it ſufficient for their purpoſe if they make a fine or glittering appearance at a diſtance.

It would, nevertheleſs, be well if any one would take upon himſelf the trouble to obſerve whether each ſpecies of ſpar has not a certain determinate number of figures or ſides, within which it is confined, in its accretions. This it has hitherto been impoſſible to do, becauſe all ſpecies of ſpars have been confounded together, without regard to their different principles.

Calcareous Earths.

(2.) Solid ftalactites of a fparry texture.

a. Hollow, and in form of a cone.

1. White, and femitranfparent.

In making lime-water, one may obferve how the lime gathers firft like a pellicle on the furface of the water, and afterwards, when this breaks, falls down to the bottom in form of a fcaly fediment, which is called *cremor calcis:* after that a new pellicle is formed, which likewife falls down; and in this manner it continues for a long while, although the lime-water had before been paffed through a filtre. This we may alfo imagine to be the way in which the works of nature are performed: whence the ftalactites commonly is of a fcaly texture, or at leaft difcovers fome tendency towards it. But a ftalactites of a fparry texture, fuch as above-mentioned from Rouen, may be fuppofed to be owing to a more copious principle concurring at once: and in the fame manner the fparry limeftone and its cryftallifations feem likewife to have been produced; fince they, as far as we know, are only found in clefts, which, when they have been filled up with a ftony matter, the Swedifh miners call *klyfter*, and *gangar*, or *veins*. In regard to this, the ftalactites, the fparry limeftone, and alfo its cryftallifations, might all be ranked under the fame title in a fyftematical defcription, as very little different from one another, if it were not neceffary, in defcribing mines and other works, to give them their feparate names; becaufe it is certain, that a piece which is broken from large fpar-cryftals, or from fparry ftalactites, may in a cabinet pafs extremely well for a common fparry limeftone, without leaving any fufpicion of its former figure before it was broke.

82 II. Satiated or united with the acid of vitriol. Gypfum, Plafter-ftone, or Parget.

This is,

1. Loofer and more friable than a pure calcareous earth.
2. Either crude or burnt, it does not excite any effervefcence with acids; or, at moft, it effervefces but in a very flight degree, and then only in proportion as it wants fome of the vitriolic acid to complete the faturation.
3. It readily falls into a powder in the fire.
4. If burnt, without being red-hot, its powder readily concretes with water into a mafs, which foon hardens; and then,
5. No heat is perceived in the operation.
6. It is nearly as difficult to be melted by itfelf as the limeftone, and fhews moftly the fame effects with other bodies as the lime-ftone: the acid of vitriol feems, however, to promote its vitrification.
7. When melted in the fire with borax, it puffs and bubbles very much, and for a long while, during the fufion, owing to the nature of both the falts.
8. When a fmall quantity of any gypfum is melted together with borax, the glafs becomes colourlefs and tranfparent; but fome forts of alabafter and fparry gypfa, when melted in fome quantity with borax, yield a fine yellow tranfparent colour, refembling that of the beft topazes. This phænomenon might probably happen with every one of the gypfeous kind. But it is to be obferved, that if too much of fuch gypfum is ufed in proportion to the borax, the glafs becomes opaque, juft as it happens with the pure limeftone.
9. Burnt with a phlogifton, it fmells of fulphur, and may as well by that means, as by both the alkaline falts, be decompounded; but for this purpofe there ought to be five or fix times as much weight of falt as of gypfum.
10. Being thus decompounded, the calx or earth which is left fhows commonly fome marks of iron.

The gypfeous earth is found, 83

(1.) Loofe and friable; *Terra gypfea pulverulenta.* Gypfeous earth, properly fo called; *Guhr.*

a. White.

(2.) Indurated,

A. Solid, or of no vifible particles, Alabafter. 84

This ftone is very eafy to faw and cut, and takes a dull polifh. It is not always found fatiated with the acid of vitriol.

a, White, alabafter.

1. Clear and tranfparent.
2. Opaque.

b. Yellow.

1. Tranfparent, from the Eaftern countries.
2. Opaque.

B. Gypfum of a fcaled or granulated ftructure. 85
This is the common plafter-ftone.

1. With coarfe fcales.
   a. White.
2. With fmall fcales. *a.* Yellowifh. *b.* Greyifh.

C. Fibrous gypfum, or plafter-ftone, improperly 86
(though commonly) called *Englifh talc* by our druggifts.

1. With the fibres coarfe.
   a. White, from Livonia.
2. With fine fibres.
   a. White.

D. Spar-like gypfum. Selenites. This by fome is 87
alfo called *glacies mariæ;* and is confounded with the clear and tranfparent mica.

1. Pure felenites.
   A. Tranfparent.
   a. Colourlefs.
   b. Yellowifh.
2. Spar-like gypfum; *Marmor metallicum.*

This ftone, on account of its heavinefs, which comes near to that of tin or iron, is fufpected to contain fomething metallic; but, as far as is hitherto known, no one has yet been able to extract any metal from it, except fome traces of iron, which is no more than what all other gypfa contain.

A. Semitranfparent; *fpatum Bononienfe*, the Bononian ftone, or phofphorus. Its fpecific gravity is 4,5000 : 1000.

B. Opaque.
a. White.

3. Liverftone, fo called by the Swedes and Germans.

E. Chry-

88 *E.* Cryftallifed gypfum. Gypfeous drufen; *drufeæ gypfeæ*.

(1.) Drufen of cryftals of pure fparry gypfum.

A. Wedge-formed, are compofed of a pure fpar-like gypfum.

1. Clear and colourlefs. 2. Whitifh yellow.

B. Capillary. *a.* Opaque, whitifh yellow.

C. Of ponderous fpar-like gypfum; *Marmor metallicum drufìcum.*

1. Jagged or like cocks combs, *criftati.* Thefe refemble cocks combs, and are found in clefts or fiffures accreted on the furfaces of balls of the fame fubftance. 2. White. 3. Reddifh.

89 *F.* Stalactitical gypfum. *Gips finter.*

This perhaps may be found of as many different figures as the calcareous ftalactites, or finters.

Mr Cronftedt has only feen the following, *viz.*

1. Of no vifible particles; in French, *grignard.*

A. Of an irregular figure.

a. Yellow.

b. White.

This is ufed in feveral works as alabafter, efpecially when it is found in large pieces; and then it commonly varies in colour between white and yellow, as alfo in tranfparency and opacity.

2. Of a fpar-like texture.

A. In form of a cone.

a. White and yellow.

B. Of an irregular figure.

a. White.

Gypfeous foffils abound in England. Plafter-ftone, granulated and folid, fome fo very fine as to be alabafter, that is, take a furface and politure, are plenty in Derbyfhire and Nottinghamfhire, where are large pits of it, and alfo in moft of the cliffs of the Severn, efpecially at the Old Paffage in Somerfetfhire. A very fine femipellucid folid alabafter is found in Derbyfhire. Fibrous talcs, very fine, are found in the fame pits of plafter-ftone above-mentioned, and many other places. Selenites of many kinds abound in England in clays, infomuch that it is needlefs to enumerate the places. Very fine gypfeous drufen are found in Sheppy-ifle; and fome, perfectly pellucid as cryftal, and large, have been dug from the falt-rocks at Nantwich in Chefhire. The *felenites rhomboidalis*, a rare foffil in other countries, is frequently found in England; but Shotover-hill, in Oxfordfhire, is famous for it. The ifle of Sheppy affords a kind peculiar to that fmall fpot of ground, and not found any where elfe in the world, fibrous, and always accreting in radiations like a ftar on the feptaria, thence called *ftella feptarii.*

90 III. Calcareous earth fatiated with the acid of common falt. *Sal ammoniacum fixum naturale.*

This is found,

1. In fea-water.

2. In falt-pits.

It is formed in great quantities at the bottoms of the falt-pans of the falt-works. It attracts the moifture of the air.

IV. Calcareous earth united with the inflammable fubftance.

These have a very offenfive fmell, at leaft when they are rubbed, and receive their colour from the phlogifton, being dark or black in proportion as it predominates. 91

(1.) Calcareous earth mixed with phlogifton alone; *Lapis fuillus*, fetid ftone and fpar, or fwine-ftone and fpar. Perhaps the fmell of this ftone may not be fo difagreeable to every one: it goes foon off in the fire. Its varieties, in regard to the texture, are as follow: 92

A. Solid, or of no vifible or diftinct particles.

a. Black.

B. Grained.

a. Blackifh brown.

C. Scaly, *particulis micaceis.*

1. With coarfe fcales.

a. Black.

2. With fine glittering or fparkling fcales.

a. Brown.

D. Sparry.

a. Black.

b. Light brown.

c. Whitifh yellow.

E. Cryftallifed.

1. In a globular form.

(2.) Calcareous earth united with phlogifton and the vitriolic acid. *Leberftein* of the Germans and Swedes. *Lapis hepaticus.* 93

This ftone fometimes readily, at other times only when rubbed, fmells like the *hepar fulphuris*, or gun-powder. It excites no effervefcence with acids, and is a medium between the gypfum and the fœtid ftones (93), to which it has, however, generally been referred, although no lime can be made from it; whereas they are the fitteft of all the different limeftones to be burnt into lime. It is found,

A. Scaly. 94

1. With coarfe fcales.

a. Whitifh yellow.

2. With fine glittering or fparkling fcales.

a. Black.

The method that nature takes in combining thofe matters which compofe the liver-ftone, may perhaps be the fame as when a limeftone is laid in a heap of mundic while it is roafting; becaufe there the fulphur unites itfelf with the limeftone, whereby the limeftone acquires that fmell common to liver of fulphur, inftead of which the vitriolic acid alone enters into the formation of gypfum. How the fulphur combines itfelf may likewife be obferved in the flate-balls or kernels from Andrarum alum-mines, where it fometimes combines itfelf with a martial earth, with which this flate abounds, and forms therewith pyrites within the very flate-balls. The fetid or fwine ftones, and the liver-ftone, are, in regard to the ftructure of their parts, fubject to the fame varieties as the other fpecies of limeftone: and it is to be obferved, that a volatile alkali is commonly fuppofed to have entered into the compofition of the fetid ftones, though it has never yet been difcovered by any experiment.

95 V. Calcareous earths blended with an argillaceous earth. Marle, *Marga*.

1. When crude, it makes an effervescence with acids; but,
2. Not after having been burnt; by which operation it is observed to harden, in proportion as the clay exceeds the calcareous substance.
3. It easily melts by itself into a glass, and even when it is mixed with the most refractory clay.
4. It is of great use in promoting the growth of vegetables, since the clay tempers the drying quality of the calcareous earth.
5. When burnt in a calcining heat, it readily attracts water: and, exposed to the air, in time it falls into a powder.

The varieties of this kind worthy to be taken notice of, depend on the different quantities of each of their component parts, and on the quality of the clay. We shall specify the following examples.

96 *A*. Loose and compact, *Marga friabilis*. This dissolves in water like common clay.

a. Rdedish brown.

b. Pale red. This, when burnt, is of a yellowish colour, and used for making earthen-ware in some places.

97 *B*. Semi-indurated, *Marga indurata aëre fatescens*.

It is nearly as hard as stone when first dug up, but moulders in the open air. It is mostly slatty, and is not uncommon in the slate-rocks of Sweden, where it lies between the thick beds of slatty limestone, and is also found by itself forming very thick strata. It does not dissolve in water, till by a considerable length of time it has mouldered to a powder.

a. Grey.

b. Red.

98 *C*. Indurated or stone marle.

A. In loose pieces, *Marga indurata amorpha*; by the Germans called *duckstein*, or *tophstein*.

a. White.

b. Grey.

It is formed from a sediment which the water carries along with it.

B. In continued strata. Hard slatty marle.

99 VI. Calcareous earth united with a metallic calx.

Here, as well as in the others, such a mixture or combination is to be understood, as cannot be discovered by the eye alone, without the help of some other means.

The subjects belonging to this division lose the property of raising an effervescence with acids, when they are rich in metal, or contain any vitriolic acid. However, there have been found some that contained 20 or 30 *per cent*. of metal, and yet have shewn their calcareous nature by the nitrous acid.

There are no more than three metals hitherto known to be united in this manner with the calcareous earth, *viz*.

100 (1.) Calcareous earth united with iron. White sparlike iron ore, *Minera ferri alba*. The *stahlstein* or *weises eisenerz* of the Germans.

1. This ore, however, is not always white, but commonly gives a white powder when rubbed.
2. It becomes black in the open air, as likewise in a calcining heat.
3. In this last circumstance it loses 30 or 40 *per cent*. of its weight, which by distillation has been found owing to the water that evaporates; and it is possible that some small quantity of vitriolic acid may, at the same time, evaporate with the water.
4. It is of all the iron ores the most easy to melt, and is very corrosive when melted.

This kind is found,

A. Loose; the mouldered part of the indurated sort.

a. Black, like soot.

b. Dark brown, somewhat resembling umbre.

B. Indurated.

1. Solid, of no distinct particles.

a. Red. Looks like red ochre, or the red hæmatites, but dissolves in the acid of nitre with a great effervescence.

2. Scaly, *particulis micaceis*.

a. White. *b*. Blackish grey.

3. Spar-like.

a. Light brown.

4. Drusen.

a. Blackish brown. *b*. White.

1. Porous. This is often called *eisenblute*, or *flos ferri*.
2. Cellular.

(2.) Calcareous earth united with copper. 101

A. Loose and friable. Mountain blue. Germanicè, *Bergblau*.

This dissolves in aquafortis with effervescence.

B. Indurated.

1. Pure calcareous earth mixed with calx of copper. Armenian stone, *lapis Armenus*. Such, according to the description of authors, ought the nature of the stone called *lapis Armenus* to be, though the druggists substitute in its stead a pale blue lapis lazuli, free from marcasite. 102
2. Gypseous earth united with calx of copper. Is of a green colour; and might perhaps be called *turquoise ore*, or *malachites*; though we do not know if all sorts of turquoise ore are of this nature. 103

a. Semi-transparent, is found at Ardal in Norway. By chemistry we know, that alkaline salts produce a blue colour with copper, which is changed into green as soon as any acid is added; and from thence the reason is obvious why a green colour may be found among calcareous copper ores, *viz*. when the vitriolic acid is in the neighbourhood of it.

(3.) Calcareous earth united with the calx of lead, 104

This is a lead ochre, or a spar-like lead ore, which, in its formation, has been mixed with a calcareous earth, and for that reason effervesces with acids.

A. Loose and friable.

a. White, from Kristersberget at Nya Kopparberget in Westmanland.

B. Indurated.

1. Scaly.

Siliceous Earths.

a. Yellowish.

Both these varieties contain a considerable quantity of lead, viz. 40 *per cent.* more or less; and the calcareous earth is as equally and intimately mixed with it, as in the white iron ore. Thus may these be distinguished from other lead-ochres and spar-like lead ores, which are much richer in lead, and never effervesce with acids. These last mentioned also seem to be produced by nature, nearly as the spar-like lead ores, and as the *flores saturni* are formed in calcining a regule of lead.

The Second Order.

105 The *Siliceous* kind.

This siliceous earth is, of all others, the most difficult to describe and to distinguish perfectly: however, it may be known by the following characters, which are common to all bodies belonging to this order.

1. In its indurated state it is hard, if not in regard to the whole, yet at least in regard to each particle of it, in a degree sufficient to strike fire with steel, and to scratch it, when rubbed against it, though the steel be ever so well tempered.
2. When pure, and free from heterogeneous particles, it does not melt by itself, neither in a reverberatory, nor in a blast furnace.
3. After being burnt, it does not fall to a powder, neither in the open air, nor in water, as the calcareous order does, but becomes only a little looser and more cracked by the fire, unless it has been very slowly and by degrees heated.
4. It excites no effervescence with acids.
5. In the fire it melts easiest of all to a glass with the fixed alkaline salt; and hence it has got the name of *vitrescent*, though this name is, properly speaking, less applicable to this order than to a great many other earths.

The mineral bodies that are comprehended in this order, are, indeed, somewhat different from one another. This difference, however, on first sight may be discerned: but, in regard to their effects in the fire, and other chemical experiments, it cannot be esteemed of any great consequence, at least while we are no farther advanced in the art of decompounding these hard bodies, and as long as no one has thought it worth the trouble and expence to use those means which are already discovered for this purpose; namely, the burning-glass or concave mirror; and to continue such experiments which Mr Pott has ingeniously begun as a basis for his *Lithogeognosia*. For want of this, there is no other way left, than to consider these bodies as simple substances, (how much soever compounded they may be), in the following manner.

106 I. Diamond. *Adamas gemma.*

Which,

1. Of all stones, is the hardest.
2. Is commonly clear, or transparent; which quality, however, may, perhaps, only belong to its crystals, but not to the rock itself from which they have their origin.
2. Its specific gravity is nearest 3,500. When brought to Europe in its rough state, it is in form either of round pebbles with shining surfaces, or of crystals of an octoëdral form.

a. Colourless, or diaphanous, or the diamond properly so called.

But it also retains this name when it is tinged somewhat red or yellow. Being rubbed, it discovers some electrical qualities, and attracts the mastic.

b. Red; Ruby. *Adamas ruber; Rubinus.*— 107
Which, by lapidaries and jewellers, is, in regard to the colour, divided into,

1. The ruby of a deep red colour inclining a little to purple.
2. Spinell, of a dark colour.
3. The balass, pale red, inclining to violet. This is supposed to be the mother of the rubies.
4. The rubicell, reddish yellow.

However, all authors do not agree in the characters of these stones.

II. Sapphire. *Sapphyrus gemma.* 108

It is transparent, of a blue colour; and is said to be in hardness next to the ruby, or diamond.

Sapphires are said to be found in Alsatia, at St Amarin: but accounts of this kind are in general not to be depended upon, as the fluors are frequently met with in collections and the druggists shops under the name of *saphires*, when they are of a deep blue colour; not to mention that the quartz is always termed a precious stone, whenever it is found clear and of a fine colour. The sapphire is said to lose its blue colour in the fire. Those which are but a little tinged are called *white sapphires*. The sapphire is seldom found of a very deep blue colour, and free from parallel flaws which run through it.

III. Topaz. *Topazius gemma.* 109

This is a precious stone which, when rough and perfect, is sold in a crystallised form. At Schneckenstein in Saxony, these crystals are found of a prismatical octoëdral form, with no points, but flat, and with some facets at the top; however, without doubt the oriental topazes have another figure.

Experiments by fire have been made on the Schneckenstein topazes by Mr Pott, as may be seen in his Lithogeognosia.

To this kind may be referred,

a. The pale yellow topaz; which is nearly uncoloured, and is found at Schneckenstein.
b. The yellow topaz, from Schneckenstein.
c. Deep yellow, or gold-coloured topaz, or oriental topaz.
d. Orange-coloured topaz.
e. The yellowish green topaz, or *chrysolite*.

It is of a grass-green colour, and may perhaps belong to some other species, which might be discovered, if it could be obtained rough, or in its matrix, and large enough or in such quantity as is necessary for experiments to be made.

f. The yellowish green and cloudy topaz, the *chrysoprase*.

This is perhaps the substance which serves as a matrix to the chrysolite: for those which have been seen of this kind are like the clear-veined, called

called in Swedifh *milk-cryftal*, and *quartz*, which is of the firft degree of cryftallifation.

g. Bluifh green topaz, or the beryl.

This varies in its colours; and is called, when,

1. Of a fea-green colour, the *aqua-marine*;
2. When more green, the *beryl*.

They are found in the ftream-works in Saxony and Bohemia, in form of pebbles, or round pieces.

110 IV. Emerald. *Smaragdus gemma.*

Its chief colour is green, and is tranfparent. It is the fofteft of precious ftones, and when heated it is phofphorefcent like the fluors. What in fome cabinets is given out for its matrix, and faid to come from Egypt, is nothing elfe than a deep green cockle-fpar; of which colour we likewife find cockle, or fhirl, in the ifland of Uto near Stockholm, and at Norbery in the province of Weftmanland in Sweden.

Mr Maillet informs us, that in former times the beft emeralds were found in Egypt.

111 To the precious ftones belong alfo the jacinths, or hyacinths; which are cryftals harder than quartz cryftals, tranfparent, of a fine reddifh-yellow colour when in their full luftre, and formed in prifms pointed at both ends: thefe points are always regular, in regard to the number of the facets, being four on each point; but the facets feldom tally: the fides alfo which form the main body, or column, are very uncertain in regard both to their number and fhape; for they are found of four, five, fix, feven, and fometimes of eight, fides: further, the column or prifm is in fome alfo fo compreffed, as almoft to refemble the face of a fpherical facetted garnet. Thefe cryftals lofe their colour, become white, and do not melt in the fire; by which qualities chiefly they may be diftinguifhed from garnets, which are likewife fometimes found of a colour not inferior to the true jacinths. The author had not, at the time when he wrote this effay, feen the true jacinths; but fays that the reddifh yellow garnets from Greenland are fold by the jewellers for jacinths; fo are likewife the Eaft Indian garnets of the fame colour; and, what is ftill more, there are fome jewellers that do not know the true diftinctions between a jacinth and a garnet at all, but buy and fell the garnets for jacinths, when they are of a fine reddifh yellow colour; this muft in particular be owing to the fcarcity of the true jacinth.

Mr Cronftedt fays he lately got fome jacinths of a quadrangular figure, which did not melt in the fire, but only became colourlefs.

112 V. Quartz. *Quartzum.*

This ftone is very common in Europe, and eafier to be known than defcribed. It is diftinguifhed from the other kinds of the filiceous order, by the following qualities.

1. That it is moft generally cracked throughout, even in the rock itfelf; whereby,
2. As well as by its nature, it breaks irregularly, and into fharp fragments.
3. That it cannot eafily be made red-hot, without cracking ftill more.
4. It never decays in the air.
5. Melted with pot-afhes, it gives a more folid and fixed glafs than any other of the filiceous order.
6. When there has been no interruption in its natural accretion, its fubftance always cryftallifes into hexagonal prifms pointed at one or both ends.
7. It occurs in clefts, fiffures, and fmall veins in rocks. It very feldom forms large veins, and ftill feldomer whole mountains, without being mixed with heterogeneous fubftances.

The quartz is found,

(1.) Pure.

A. Solid, of no vifible particles with a gloffy furface. Fat quartz.

a. Uncoloured and clear, *diaphanum*. This has no cryftallifed form, but is neverthelefs as clear as quartz cryftals of the beft water.
b. White, the common fat quartz.
c. Blue.
d. Violet.

B. Grained.

a. White.
b. Pale green.

C. Sparry quartz.

This is the fcarceft; and ought not to be confounded with the white felt-fpat, being of a fmoother appearance, and breaking into larger and more irregular planes.

a. Whitifh yellow. *b.* White.

D. Cryftallifed quartz. Rock cryftal. Quartz cryftal.

Its figure is already defcribed; and, in regard to the colours, the following varieties occur.

1. Opaque, or femi-tranfparent.
   a. White, or of a milk colour.
   b. Red, or of a carnelian colour.
   c. Black.
2. Clear.
   a. Blackifh brown, fmoky topaz, or *raunch topas* of the Germans.
   b. Yellow; found in Bohemia, and fold inftead of topazes.
   c. Violet; the amethyft.
   d. Uncoloured; rock-cryftal, properly fo called. When thefe coloured cryftals are not clear, they are called *flufs;* for inftance, *topaz-flufs*, *amethyft-flus*, &c.

(2.) Impure quartz.

A. Mixed with iron, in form of a black calx. This is of a gloffy texture, and contains a great quantity of iron.

B. Mixed with copper in form of a red calx.
a. Red.

VI. The flint. *Silex pyromachus*, *Lapis corneus*, or *hornftein* of the Germans. 113

This is equally common with the quartz, and it is full as difficult to defcribe it; efpecially as it forms a kind of intermediate fubftance between quartz and jafper, both which it fo nearly refembles, that it is not eafy to point out fuch characters as fhall readily diftinguifh it from them. The beft way, perhaps, will be to fpeak of its properties

perties comparatively; and then we may ſay, that,

1. It is more uniformly ſolid, and not ſo much cracked in the maſs as the quartz; and,
2. It is more pellucid than the jaſper.
3. It bears being expoſed to the air, without decaying, better than the jaſper, but not ſo well as the quartz.
4. It is better for making of glaſs than the jaſper, but is not quite ſo good as quartz for that purpoſe.
5. Whenever there has been an opportunity in this matter of its ſhooting into cryſtals, quartz cryſtals are always found in it; juſt as if the quartz had made one of its conſtituent parts, and had on certain circumſtances been ſqueezed out of it; this is to be ſeen in every hollow flint, and its clefts, which are always filled up with quartz.
6. It often ſhows moſt evident marks of having been originally in a ſoft and ſlimy ſtate.

The ſeveral varieties of this ſpecies have obtained diſtinct names, more with reſpect to their colours than from any real difference in their ſubſtance; but theſe are ſtill neceſſary to be retained, as the only names uſed by jewellers and others, who know how to value them accordingly.

114 (1.) The opal. *Opalus pæderota.*

It is the moſt beautiful of all the flint kind, owing to the changeable appearance of its colours by reflection and refraction, and muſt therefore be deſcribed under both theſe circumſtances.

a. The opal of Nonnius, the ſangenon of the Indians.

This appears olive-coloured by reflection, and ſeems then to be opaque; but when held againſt the light, is found tranſparent, and of a fine ruby red.

That opal is ſuppoſed to have been of this kind, which Pliny mentions in his Natural Hiſtory, chap. 307. ſect. 21. and which he ſays was in the ſenator Nonius's poſſeſſion, who rather ſuffered baniſhment than part with it to Antony.

This ſtone was at that time valued in Rome at 20,000 ſeſterces. But the ſtone here particularly deſcribed, was found in the ruins of Alexandria; it is about the ſize of a hazle-nut, and was bought for a trifle of a French druggiſt, named *Roboly*, and preſented to the French general conſul Lironcourt, who afterwards offered it to ſale in ſeveral places for the ſum of 40,000 rixdollars. See Haſſelquiſt's Travel's to the Eaſt, under the article of OPAL.

This very ſtone was in the year 1763 in the poſſeſſion of his excellency the duke de Nivernois, then ambaſſador to the Britiſh court.

There is, however, another of the ſame kind in Sweden, which by reflection appears rather brown; but by refraction is red, with violet veins.

b. The white opal. Its ground is white, of a glaſs-like complexion, from whence are thrown out green, yellow, and bluiſh rays; but it is of a reddiſh or rather flame colour, when held againſt the light.

1. Of many colours. The oriental opal.
2. Of a milky colour.
3. Bluiſh, and ſemi-tranſparent. This is not ſo much valued as thoſe which are more opaque, becauſe it is eaſier to be imitated by art.

(2.) The cat's eye. *Pſeudopalus.* 115

This ſtone is opaque, and reflects green and yellowiſh rays from its ſurface, and is found in Siberia.

(3.) The onyx. *Onyx camehuja.* Memphites. 116

This ſtone is the hardeſt of the flinty tribe; and conſiſts of differently coloured veins, which run parallel to one another, ſometimes in ſtraight, ſometimes in curved lines. It is found of two ſorts.

a. Nail-coloured onyx, having pale fleſh-coloured and white lines. From the river Tomm in Siberia.

b. With black and white lines. The oriental onyx.

The old Romans were accuſtomed to cut figures in relief on the ſtraight-lined onyxes, which they called *camehuja;* theſe are ſtill counterfeited, and called *camayeu*. Thoſe which conſiſt of concentric circles were called *memphites;* and we have now of this kind cut to be ſet in rings, under the name of *occhi di gatti*, which, however, ought not to be confounded with the pſeudopal, or cat's eye.

(4.) The chalcedony, or white agate. 117

Is a flint of a white colour, like milk diluted with water, more or leſs opaque: it has veins, circles, and round ſpots. It is ſaid to be ſofter than the onyx, but much harder than thoſe agates which are ſometimes found of the ſame colour.

a. The white opaque chalcedony, or *cacholong*, from the Buckhariſh Calmucks. This was firſt made known by one Renez, a Swediſh officer, who for ſeveral years had been in that country. The inhabitants find this flint on the banks of their rivers, and work idols and domeſtic veſſels out of it.

b. Of white and ſemi-tranſparent ſtrata; from Ceylon.

c. Bluiſh grey; from Ceylon and Siberia.

(5.) The carnelian. *Carniolus.* 118

Is of a browniſh red colour, and often entirely brown. Its name is originally derived from its reſemblance to fleſh, or to water mixed with blood.

a. Red.

b. Yellowiſh brown, looks like yellow amber, from the river Tomm in Siberia. It is ſaid not to be ſo hard as the chalcedony.

(6.) The ſardonyx. 119

Is a mixture of the chalcedony and carnelian, ſometimes ſtratum-wiſe, and ſometimes confuſedly blended and mixed together.

a. Striped with white and red ſtrata: this ſerves as well cut in cameo as the onyx.

b. White, with red dendritical figures. This very much reſembles that agate which is called the *mocha ſtone*, but with this difference, that the figures are of a red colour in this, inſtead of black, as in that agate.

Between the onyx, carnelian, chalcedony, ſardonyx, and agate, there ſeems to be no real difference,

difference, except fome inexplicable degrees of hardnefs.

120 (7.) The agate; *Achates*.

This name is given to flints that are variegated with different colours, promifcuoufly blended together; and they are efteemed in proportion to their mixture of colours, their beauty, and elegance. Hence alfo they have obtained variety of names, moftly Greek, as if the bufinefs of the lapidary in cutting of them, and admiring their feveral beauties and figures, had been derived from that nation alone.

a. Brown opaque agate, with black veins, and dendritical figures; the Egyptian pebble.
b. Of a chalcedony colour, *achates chalcedonifans*.
c. Semi-tranfparent, with lines of a blackifh brown colour, and dendritical figures; the mocha ftone. This is much efteemed, and makes a valuable part of fome collections, where it has a place chiefly for the fake of its figures, refembling vegetables, animals, &c. which however are often improved by art.
d. Semi-tranfparent, with red dots; *Gemma divi Stephani*. When the points are very minute, fo as to give the ftone a red appearance, it is by fome called *Sardea*.
e. Semi-tranfparent, with clouds of an orange colour.
f. Deep red or violet, and femi-tranfparent.
g. Of many colours, or variegated.
h. Black.

121 VII. Jafper. *Jafpis*.

All the opaque flints are called by this name, whofe texture refembles dry clay, and which have no other known quality, whereby they may be diftinguifhed from other flints, except that they may be more eafily melted in the fire; and this quality perhaps may proceed from fome heterogeneous mixture, probably of iron.

(1.) Pure jafper; which by no means yet known can be decompounded.
a. Green with red fpecks or dots; the *heliotrope*, or blood-ftone. *b.* Green. *c.* Red. *d.* Yellow. *e.* Red with yellow fpots and veins. *f.* Black.

(2.) Jafper containing iron; *Jafpis martialis, Sinople*.
A. Coarfe-grained.
a. Red and reddifh brown; *finople*.
B. Steel-grained, or fine-grained.
a. Reddifh brown: looks like the red ochre or chalk ufed for drawing; and has partition veins, which are unctuous to the touch, like a fine clay, and other like kinds.
C. Of a folid and fhining texture, like a flag.
a. Liver-coloured; and, *b.* Deep red. *c.* Yellow. This laft mentioned, when calcined, is attracted by the loadftone; and being effayed, yields 12 to 15 *per cent.* of iron.

122 VIII. Rhombic quartz; *Spatum fcintillans*, *Feltfpatum*.

This has its name from its figure, but feems to be of the fame fubftance as the jafper. We have not, however, ranked them together, for want of true marks to diftinguifh the different forts of the flinty tribe from one another.

This kind is found,

1. Sparry.
a. White.
b. Reddifh brown.
c. Pale yellow.
d. Greenifh.
This laft mentioned refembles very much the fchorl or cockle-fpar; but is neither fo eafy to melt in the fire, nor of fo exact a figure.
2. Chryftallifed.
a. In feparate or diftinct rhomboidal cryftals.

The THIRD ORDER.

THE *Garnet* kind. *Terræ granateæ*. 123

The matter compofing the fubftance of garnet, and fchorl or cockle, except that fmall portion which is metallic, does in its indurated ftate refemble the filiceous tribe, fo far as relates to external appearance and hardnefs; and therefore we would willingly have followed the opinion commonly received, of confidering thefe two fubftances as arifing from one another, if we had not been perfuaded to the contrary by the following qualities of the garnet.

1. It is more fufible, in proportion as it contains lefs metallic matter, and is more tranfparent or glaffy in its texture; which is quite contrary to the filiceous kind.
2. This is the reafon, perhaps, why the garnet, mixed with the falt of kelp, may on a piece of charcoal be converted to a glafs by the blowpipe, which cannot be done with the flints: and,
3. Why the moft tranfparent garnet may, without any addition, be brought to a black opaque flag by the fame means.
4. It is never, fo far as is hitherto known, found pure, or without fome mixture of metal; and efpecially iron, which may be extracted by the common methods.
5. The garnet matter, during the cryftallifation, has either been formed in fmall detached quantities, or elfe has had the power of fhooting into cryftals, though clofely confined in different fubftances: fince garnets are generally found difperfed in other folid ftones, and oftentimes in the harder ones, fuch as quartz and chert.

I. Garnet; *Granatus*. Which is a heavy and hard kind of ftone, cryftallifing in form of polygonal balls, and is moftly of a red, or reddifh brown colour. 124

A. garnet mixed with iron; *Granatus martialis*.
1. Coarfe-grained garnet-ftones, without any particular figure; in Swedifh called *Granatberg*; in German, *Granatftein*. *a.* Reddifh-brown garnet. *b.* Whitifh-yellow. *c.* Pale yellow.
2. Cryftallifed garnet.
a. Black. *b.* Red: femi-tranfparent, and cracked; tranfparent. *c.* Reddifh yellow tranfparent; the jacinth, or hyacinth. *d.* Reddifh brown. *e.* Green. *f.* Yellowifh green.

B. Garnet mixed with iron and tin.
1. Coarfe grained, without any particular figure.
a. Blackifh-brown.

2. Chryftal-

2. Cryftallifed.

a. Blackifh-brown.

b. Light-green or white.

The *bergs-radets*, or mine-mafters, Mr Brandt and Mr Rinman, have publifhed fome experiments on this kind of garnet, in the Memoirs of the Royal Academy of Sciences at Stockholm.

C. Garnet mixed with iron and lead.

1. Cryftallifed.

a. A reddifh-brown, difcovered and accurately examined by the bergs-radet Mr Von Swab (G).

125 II. Cockle, or fhirl. *Bafaltes; Corneus cryftallifatus Wallerii; Stannum cryftallis columnaribus nigris Linnæi.*—Is a heavy and hard kind of ftone, which fhoots into cryftals of a prifmatical figure, and whofe chief colours are black or green. Its fpecific gravity is the fame as the garnets, viz. between 3000 and 3400, though always proportionable to their different folidity.

126 *A.* Cockle, or fhirl, mixed with iron.

1. Coarfe, without any determined figure.

a. Green, found in moft of the Swedifh iron mines.

127 2. Sparry.

a. Deep green, (the mother of the emeralds), from Egypt.

b. Pale green.

c. White.

This occurs very frequently in the fcaly limeftones; and its colour changes from deep green to white, in proportion as it contains more or lefs of iron.

128 3. Fibrous, ftriated cockle, or fhirl: it looks like fibres or threads made of glafs.

A. Of parallel fibres.

a. Black.

b. Green.

c. White.

B. Of concentrated fibres. The ftarred cockle, or fhirl, from its fibres being laid ftellarwife.

a. Blackifh green, from Salberg, in Weftmanland; where, being found together with a fteel-grained lead ore, the whole is called *grau-ris-malm*, or pine-ore, from its refemblance to the branches of that tree. This kind of cockle is alfo found at Uto in Malaren.

b. Light green.

c. White.

129 4. Cryftallifed cockle, or fhirl.

a. Black.

To this fpecies of cockle, or fhirl, belong moft of thofe fubftances called *imperfect afbefti*; and as the cockle perfectly refembles a flag from an iron furnace, both in regard to its metallic contents and its glaffy texture, it is no wonder that it is not foft enough to be taken for an afbeftus. It has, however, only for the fake of its ftructure, been ranked among the afbefti. The ftriated cockle, or fhirl, compared to the afbefti, is of a fhining and angular furface (though this fometimes requires the aid of the magnifying-glafs to be difcovered), always fomewhat tranfparent, and is pretty eafily brought to a glafs with the blow-pipe, without being confumed as the pure afbefti feem to be.

b. Deep green, from Salberg in Weftmanland.

c. Light green, from Enighets-grufvan at Norberg in Weftmanland.

d. Reddifh brown; from Sorwik at Grengie in Weftmanland, and Glanfhammar in the province of Nerike.

The tauffstein, from Bafil, is of this colour, and confifts of two hexagonal cryftals of cockle grown together in form of a crofs: this the Roman Catholics wear as an amulet, and is called in Latin *lapis crucifer*, or the crofs-ftone.

It is not impoffible that there may be fome kinds of cockles, or fhirls, which, befides iron, alfo contain tin or lead, as the garnets: it has been faid, that lead has been melted out of a cockle, from Rodbeck's Eng at Umea in Lapland; and it feems likewife very probable that the cockles which are found in the Englifh tin-mines may contain fome tin. There are fome cryftals of cockle found which are fufible to a greater degree than any fort of ftone whatfoever: thefe are always of a glaffy texture, and femi-tranfparent.

The figure of the cockle cryftals is uncertain, but always prifmatical: the cockle from Yxfio at Nya Kopparberg, is quadrangular: the French kind has nine fides, or planes; and the tauffstein is hexagonal.

The name *cockle* for thefe fubftances is an old Cornifh mineral name; but is alfo given fometimes to other very different matters.

We have not in England any great quantity of fpecies of cockles; the chief are found in the tin mines of Cornwall, and fome fine cryftallifed kinds have been brought from Scotland.

The Englifh mineral name of *call*, has been ufed by fome authors as fynonymous with *cockles*, and they are confounded together at the mines; but the call, definitely fpeaking, is the fubftance called *wolfram* by the Germans, &c.

Garnets, though fmall, are often found in micaceous ftones in England; but extreme good garnets are found in great plenty alfo in like ftones in Scotland. 130

The Fourth Order.

The *Argillaceous* kind.

The principal character whereby thofe may be diftinguifh from other earths is, that they harden in the fire, and are compounded of very minute particles, by which they acquire a dead or dull appearance when broken.

I. Porcelain

(G) When any of the garnet kind is to be tried for its containing metal, the iron ought to be melted out of it by the common procefs; and if the garnet, at the fame time, contains both tin and lead, thefe two metals are likewife included in the iron: however, they may be extracted out of the iron, by expofing it to a heat augmented by degrees; becaufe then the tin and lead fweat out in form of drops, almoft pure, though always fomewhat mixed with iron.

Argillaceous Earths.

I. Porcelain clay; *Terra porcellanea*, vulgò *Argilla apyra*.

131 This is very refractory in the fire, and cannot in any common ftrong fire be brought into fufion any farther than to acquire a tenacious foftnefs, without lofing its form: it becomes then of a dim fhining appearance and folid texture, when it is broke; ftrikes fire with fteel; and has confequently the beft qualities required as a fubftance whereof veffels capable of refifting a melting and boiling heat, and of holding falts and acids, can be made. It is found,

132 (1.) Pure, *Pura*.

A Diffufible in water.

1. Coherent and dry.

a White. Mr Cronftedt affirms that he has feen a root of a tree changed into this clay.

2. Friable and dry.

a. White.

Thefe may be called *pure*, fince, after being burnt, they are quite white, though they have been expofed to a quick melting heat; and it may be queried, if all fuch clays muft not be fomewhat harfh, or at leaft not unctuous to the touch.

133 (2.) Mixed with phlogifton, and a very fmall quantity of infeparable heterogeneous fubftances. Of thefe are,

A. Diffufible in water.

a. White and fat pipe-clay.

b. Of a pearl colour.

c. Bluifh grey.

d. Grey.

e. Black.

f. Violet.

Thefe contain a phlogifton which is difcovered by expofing them to quick and ftrong fire, in which they become quite black interiorly, affuming the appearance of the common flints, not only in regard to colour, but alfo in regard to hardnefs: but if heated by degrees, they are firft white, and afterwards of a pearl colour. The fatter they feem to be, which may be judged both by their feeling fmooth and unctuous, and by their fhining when fcraped with the nail, they contain a larger quantity of the inflammable principle. It is difficult to determine, whether this ftrongly inherent phlogifton be the caufe of the above-mentioned pearl colour, or prevents them from being burnt white in a ftrong fire: yet no heterogeneous fubftance can be extracted from them, except fand, which may be feparated from fome by means of water, but which fand does not form any of the conftituent parts of the clays. If they be boiled in aqua regis in order to extract any iron, they are found to lofe their vifcofity.

134 *B*. Indurated.

Is commonly unctuous to the touch, and more or lefs difficult to be cut or turned in proportion to its different degrees of hardnefs; is not diffufible in water; grows hard, and is very refractory in the fire; pounded and mixed with water, it will not eafily cohere in a pafte: however, if it is managed with care, it may be baked in the fire to a mafs, which, being broke, fhews a dull and porous texture. It takes for the moft part, and without much labour, a fine polifh. It is found,

A. Compact and foft; *Smectis*, Briançon or French chalk. 135

a. White.

b. Yellow.

c. Red and white, and which looks like Caftile foap.

B. Solid and compact fteatites, and alfo foap-rock. 136

a. White or light green. *b*. Deep green *c*. Yellow.

It is a very difficult matter to fpecify all the varieties of the foap-ftones in regard to their hardnefs or foftnefs, fince they cannot be compared with any ftandard meafure. Thofe from Rifver, Sikfioberg, and China, are a great deal harder and more folid than the Englifh kind from the Land's End, which breaks between the fingers; but are foft in comparifon to that from Salberg, which is there called *ferpentine*, although both thefe varieties may indifcriminately be made ufe of for cutting and turning. The foft ones, however, are not fo apt to crack, when they are worked, as the harder. But none of thefe varieties is found in the rock, without being interfperfed with the unctuous clefts. When they are too many, too clofe to one another, and make the ftone unfit for ufe, they are in this cafe called by the Swedifh miners, *Skiolige;* and of this kind is a great quantity found at Salberg and Swartwik. Moft part of the foap-rock which is found in Sweden, is likewife mixed with glimmer or mica; and then it is called *telgften*, that is, *ollaris*.

C. Solid, and of vifible particles; ferpentine ftone. 137

1. Of fibrous and coherent particles. This is compofed, as it were, of fibres; and might therefore be confounded with the afbeftus, if its fibres did not cohere fo clofely with one another as not to be feen when the ftone is cut and polifhed. The fibres themfelves are large, and feem as if they were twifted.

a. Deep green. This is fold for the *lapis nephriticus*, and is dug at fome unknown place in Germany.

b. Light green from Skienfhyttan, in Weftmanland; in Sweden it is ufed by the plate-fmiths inftead of the French chalk.

2. Fine-grained ferpentine ftone: the Zoeblitz ferpentine. 138

a. Black. *b*. Deep green. *c*. Light green, *d*. Red. *e*. Bluifh grey. *f*. White. Thefe colours are all mixed together in the ferpentine ftone from Zoeblitz, but the green is the moft predominant colour.

(3.) Mixed with iron. This is, 148

A. Diffufible in water.

a. Red. Some of the bricks which are imported

ported from certain places in Germany, seem to be made of this kind.

B. Indurated.

1. Martial soap-earth; *Creta Brianzonica martialis.*
   a. Red, and mixed with some calcareous matter.
2. Martial soap-rock; *Steatites martialis.*
   a. Black. *b.* Red.

140 II. Stone-marrow; *Lithomarga.* *Keffekil* of the Tartars.

1. When dry, it is as fat and slippery as soap: but,
2. Is not wholly diffusible in water, in which it only falls to pieces, either in larger bits, or resembles a curd like mass.
3. In the fire it easily melts to a white or reddish frothy slag, consequently is of a larger volume than the clay was before being fused.
4. It breaks into irregular scaly pieces.

A. Of coarse particles: Coarse stone-marrow.

a. Grey, from Osmundsberget, in the parish of Rettwik, in Dalarne; and is there called *walklera*, that is, fuller's earth. It is mentioned in an account of Osmundsberget, published in the Transactions of the Academy of Sciences at Stockholm, in the year 1739, by the berg's-radet, or mine-master, Mr Tilas.

b. Whitish yellow, from the Crim Tartary, where it is called *keffekil*, and is said to be used for washing instead of soap.

B. Of very fine particles; fine stone-marrow.

a. Yellowish-brown; *Terra Lemnia.*—Is of a shining texture, falls to pieces in the water with a crackling noise; it is more indurated than the preceding, but has otherwise the same qualities.

141 III. Bole.

Is a fine and dense clay of various colours, containing a great quantity of iron, which makes it impossible to know the natural and specifical qualities of the bole itself, by any easy method hitherto in use. It is not easily softened in water, contrary to what the porcelain and the common clays are, (I. & V.); but either falls to pieces in form of small grains, or repels the water, and cannot be made ductile. In the fire it grows black, and is then attracted by the loadstone.

142 *A.* Loose and friable boles, or those which fall to a powder in water.

a. Flesh-coloured bole.

b. Red.

1. Fine; *Bolus Armenus.*
2. Coarse; *Bolus communis officinalis.*
3. Hard; *Terra rubrica.*

c. Green; *Terre verte.*

1. Fine.
2. Coarse.

d. Bluish-grey, is ductile as long as it is in the rock, but even then repels the water; it contains 40 per cent. of iron; which metal being melted out of it in a close vessel, the iron crystallises on its surface.

e. Grey.

1. Crystallised in a spherical polygonal figure.
2. Of an undeterminate figure.

At the time when the *terræ sigillatæ*, or sealed earths, were in general use, the druggists endeavoured to have them of all colours, and for that reason they took all sorts of clays, and sealed them: not only the natural ones, but likewise such as had been coloured by art, or had been mixed with *magnesia alba officinalis*, or other things, were afterwards vended for true boles; and for this reason the species of boles is still thought to comprehend so many varieties. Thus the Cologne clay is by the druggists ranked among the white sealed earths, and is called a *white bole:* and this same clay is by the Swedish potters called *Englesk jord*, or English earth; and by the tobacco-pipe makers *pip-lera*, or pipe-clay, &c.: which shews how great a confusion there must ensue, if the knowledge of these bodies was not founded upon a surer ground than the colour, figure, and names invented by common mechanics. Since the most part of these *terræ sigillatæ*, or sealed earths, are found to contain iron, we may conclude that the bole must be a martial clay; and, as such, it seems to be more fit for medical uses than other clays, if any dead earth must be used internally, when there is such an abundance of finer substances.

B. Indurated bole. 143

A. Of no visible particles.

This occurs very often in form of slate, or layers, in the earth; and then is made use of as an iron ore. However, it has usually been considered more in regard to its texture than to its constituent parts; and has been called *slate*, in common with several other earths which are found to have the same texture.

a. Reddish-brown; in most collieries, between the seams of coal.

b. Grey; from Coalbrookdale in Shropshire, and most collieries of England.

B. Of scaly particles.—The hornblende of the Swedes. 144

Is distinguished from the martial glimmer, or mica, by the scales being less shining, thicker, and rectangular.

a. Black.—This, when rubbed fine, gives a green powder.

b. Greenish.

Both these, particularly the black, are found every-where in Sweden among the iron-ores, and in the Grunsten. The hornblende grows hard in the fire, which is the reason why it is ranked here among the clays, though in all its other qualities it much resembles the cockle or shirl.

IV. Tripoli. *Terra Tripolitana.*

Is known by its quality of rubbing hard bodies, and making their surfaces to shine; the particles of the tripoli being so fine as to leave even no scratches on the surface. This effect 145

effect, which is called *polifhing*, may likewife be effected by other fine clays when they have been burnt a little. The tripoli grows fomewhat harder in the fire, and is very refractory: it is with difficulty diffolved by borax, and ftill with greater difficulty by the microcofmic falt. It becomes white when it is heated: when crude, it imbibes water, but is not diffufible in it: it taftes like common chalk, and is rough or fandy between the teeth, although no fand can by any means be feparated from it. It has no quality common with any other kind of earth, by which it might be confidered as a variety of any other. That which is here defcribed is of a yellow colour, and is fold by druggifts. This kind of tripoli has been lately difcovered in Scotland. But the *rotten-ftone*, fo called, is another fort found in England, viz. in Derbyfhire. It is in common ufe in England among workmen for all forts of finer grinding and polifhing, and is alfo fometimes ufed by lapidaries for cutting of ftones, &c.

146 V. Common clay, or brick clay. *Argilla communis; vulgaris plaftica.*

This kind may be diftinguifhed from the other clays, by the following qualities.

1. In the fire it acquires a red colour, more or lefs deep.
2. It melts pretty eafily into a greenifh glafs.
3. It contains a fmall quantity of iron and of the vitriolic acid, by which the preceding effects are produced.

It is found,

A. Diffufible in water.

1. Pure.
   - *a.* Red clay.
   - *b.* Flefh-coloured, or pale-red.
   - *c.* Grey.
   - *d.* Blue.
   - *e.* White, is found in the woody parts of Sodermanland, Dalarne, and of other provinces. It is often found in a flaty form, with fine fand between its ftrata. It is not eafy to be baked in the fire: when it it burnt, it is of a pale-red colour, and is more fufible than the preceding ones.
   - *f.* Fermenting clay. *Argilla intumefcens.*

     This is very like the preceding, as to the external appearance and other qualities; but when they are both found in the fame place, which is not uncommon in feveral of our mine countries, they feem to be different in regard to the fermenting quality of this variety. This fermentation cannot be the effect of the fand mixed with it, becaufe fand is found in them both: and befides, this kind ferments in the fame manner when it is mixed with gravel or ftones; and then it ferments later in the fpring than the other, fince by the ftones, perhaps, the froft is longer retained in it.
2. Mixed with lime. See MARLE, n° 95.

B. Indurated.

1. Pure. 147
   - *a.* Grey flaty.
   - *b.* Red flaty, from Kinnekulle, in the province of Weftergottland.
2. Mixed with phlogifton, and a great deal of the vitriolic acid. See ALUM *Ores*, n° 173.
3. Mixed with lime; (n° 98).

The FIFTH ORDER.

THE *Micaceous* kinds. The glimmer, daze, or glift. 148

Thefe are known by the following characters.

1. Their texture and compofition confift of thin flexible particles, divifible into plates or leaves, having a fhining furface.
2. Thefe leaves, or fcales, expofed to the fire, lofe their flexibility, and become brittle, and then feparate into thinner leaves: but in a quick and ftrong fire, they curl or crumple, which is a mark of fufion; though it is very difficult to reduce them into a pure glafs by themfelves, or without addition.
3. They melt pretty eafily with borax, the microcofmic falt, and the alkaline falt; and may, by means of the blow-pipe, be brought to a clear glafs with the two former falts. The martial mica is, however, more fufible than the uncoloured ones.

There is not yet difcovered any loofe earth of this kind, but it is always found indurated.

A. Colourlefs or pure mica; daze, glimmer, or glift. 149

1. Of large parallel plates; Mufcovy glafs. Is tranfparent as glafs; found in Siberia, and Elfdalen in the province of Wermeland in Sweden. 2. Of fmall plates; from Silfverberget, at Runneby, in the province of Blekinge, in Sweden. 3. Of particles like chaff; chaffy mica. 4. of twifted plates; crumpled mica.

B. Coloured and martial glimmer.

1. Of large parallel plates; *Martialis.* 150
   - *a.* Brown femi-tranfparent.
2. Of fine and minute fcales.
   - *a.* Brown.
   - *b.* Deep green.
   - *c.* Light green; *Talcum officinale.*
   - *d.* Black, found in granites.
3. Twifted or crumpled glimmer.
   - *a.* Light green, in the olaris.
4. Chaffy glimmer.
   - *a.* Black, is found in the ftone called *hornberg*, which occurs in moft of the Swedifh coppermines.
5. Cryftallifed glimmer; *Mica drufica.*
   1. Of concentrated and erect fcales.
   2. Of hexagonal horizontal plates.

The SIXTH ORDER.

The fluors, *Fluores minerales.* Suec. *Fluff-arter.* Germ. *Fluff-arten.* 151

Thefe are commonly called *fluxing*, *vitrefcent*, or *glafs fpars*, becaufe moft part of them have a fparry from

EARTHS. Fluors. form and appearance: they are, however, often met with in an indeterminate figure.

These are only known in an indurated state; and distinguish themselves from the other earths by the following characters.

1. They are scarce harder than a calcareous spar, and consequently do not strike fire with steel.
2. They do not ferment with acids, neither before nor after calcination, notwithstanding a phlogiston or an alkali had been added in the calcination.
3. They do not melt by themselves, but only split to pieces when exposed to a strong fire. But,
4. In mixtures with all other earths, they are very fusible, and especially when they are blended with the calcareous earth, with which they melt to a corroding glass, which dissolves the strongest crucibles, unless some quartz or apyrus clay is added thereto.
5. When heated slowly, and by degrees, they give a phosphorescent light; but as soon as they are made red-hot, they lose this quality. The coloured ones, and especially the green, give the strongest light, but none of them any longer than whilst they are well warm.
6. They melt and dissolve very easily by the addition of borax, and next to that by the microcosmic salt, without ebullition.

152 *A.* Indurated fluor.

(1.) Solid, of an indeterminate figure. Is of a dull texture, semi-transparent, and full of cracks in the rock.
 a. White.

(2.) Sparry fluor has nearly the figure of spar, though, on close observation, it is found not to be so regular, nothing but the glossy surface of this stone giving it the resemblance of spar.
 a. White. *b.* Blue. *c.* Violet. *d.* Deep green. *e.* Pale green. *f.* Yellow, from Gislof in Skone.

153 (3.) Crystallised fluor, when in single crystals; but fluor druse, when many crystals are heaped together.
 1. Of an irregular figure.
  a. White. *b.* Blue. *c.* Red.
 2. Of a cubical figure.
  a. Yellow. *b.* Violet.
 3. Of a polygonal spherical figure.
  a. White. *b.* Blue.
 4. Of an octoëdral figure.
  a. Clear and colourless.

The Seventh Order.

154 The *Asbestus* kind; *Asbestinæ*.

These are only yet discovered in an indurated state: their characters are as follow,

1. When pure they are very refractory in the fire. 2. In large pieces they are flexible. 3. They have dull or uneven surfaces. 4. In the fire they become more brittle. 5. They do not strike fire with the steel. 6. They are not attacked by acids. 7. They are easily brought into fusion by borax.

2

EARTHS. Asbestus, Zeolites. In this order are included both those varieties which by fossilogists have been mentioned under the names *amianti* and *asbesti*, and have often been confounded together.

I. Asbestus which is compounded of soft and thin membranes; *Amiantus Wallerii*. 155
 A. Of parallel membranes; *Corium*, sive *caro montana*, mountain-leather.
  1. Pure.
   a. White.
  2. Martial.
   a. Yellowish brown, from Storrginningen, at Dannemora, in the province of Upland. This melts pretty easily in the fire to a black slag, or glass.
 B. Of twisted soft membranes, mountain-cork. 156
  1. Pure.
   a. White.
  2. Martial.
   a. Yellowish brown. This has the same quality in the fire as the martial mountain-leather.

II. Of fine and flexible fibres; *Asbestus*, or earth-flax; *Asbestus Wallerii*. 157
 A. With parallel fibres; *Byssus*.
  1. Pure and soft.
   a. Light green.
   b. White.
  2. A little martial, and more brittle.
   a. Greenish; from Bastnas Grufva, at Ryddarhyttan in Westmanland in Sweden. There it forms the greatest part of the vein out of which the copper ore is dug; a great part of it is consequently melted together with the ore, and is then brought to a pure semi-transparent martial slag or glass.
 B. Of broken and recombined fibres. 158
  1. Martial.
   a. Light green.

The Eighth Order.

Zeolites.

This is described in its indurated state, in the Transactions of the Academy of Sciences at Stockholm for the year 1756; and there methodised as a stone *sui generis*, in regard to the following qualities: 159

1. It is a little harder than the fluors, and the calcareous kind: it receives however scratches from the steel, but does not strike fire with it.
2. It melts easily by itself in the fire, with a like ebullition as borax does, into a white frothy slag, which not without great difficulty can be brought to a solidity and transparency.
3. It is easier dissolved in the fire by the mineral alkali *(sal sodæ)*, than by the borax and microcosmic salt.
4. It does not ferment with this last salt, as the lime does; nor with the borax, as those of the gypseous kind.
5. It dissolves very slowly, and without any effervescence, in acids, as in oil of vitriol and spirit of nitre. If concentrated oil of vitriol is poured on pounded zeolites, a heat arises, and the

EARTHS. *Zeolites.*

powder unites into a mafs (1).

6. In the very moment of fufion it gives a phofphorus or light.

160 The zeolites is found in an indurated ftate.

(1.) Solid, or of no vifible particles.

A. Pure; *Zeolites durus.*

a. White, from Iceland.

B. Mixed with filver and iron.

a. Blue; *Lapus lazuli,* from the Buckarian Calmucks. This, by experiments made with it, has difcovered the following properties:

1. It retains for a long time its blue in a calcining heat, but is at laft changed into a brown colour.

2. It melts eafily in the fire to a white frothy flag; which, when expofed to the flame of a blow-pipe, is greatly puffed up, but in a covered veffel, and with a ftronger heat, becomes clear and folid, with blue clouds in it.

3. It does not ferment with acids: but,

4. Boiled in oil of vitriol, it diffolves flowly, and lofes its blue colour.

When a fixed alkali is added to this folution, a white earth is precipitated, which being fcorified with borax, yields a filver regulus, that varies in bignefs according to the various famples of the ftone.

5. By fcorification with lead, there has been extracted two ounces of filver out of 100 pounds weight of the ftone.

6. The prefence of filver is not difcovered with the fame certainty by the fpirit of nitre as by oil of vitriol.

7. When the fpirit of fal ammoniac is added to any folution, made either of crude or of a perfectly calcined lapis lazuli, there is no blue colour produced; which proves that this colour is not owing to copper, as fome have pretended: and this is farther confirmed by the fixity of the blue colour in the fire (1, 2.), and by the colour of the flag or glafs (2).

8. It is a little harder than the other kinds of zeolites; but does not, however, in hardnefs approach to the quartz, or to other ftones of the filiceous kind in general; becaufe the pureft and fineft blue lapis lazuli may be rubbed with the fteel to a white powder, although it takes a polifh like marble.

9. The lapis lazuli, when perfectly calcined, is a little attracted by the loadftone; and fcorified with lead, the flag becomes of a greenifh colour, not fuch a colour as copper gives, but fuch as is always produced by iron mixed with a calcareous fubftance.

161 (2.) Sparry zeolites.

This refembles a calcareous fpar; though it is of a more irregular figure, and is more brittle.

a. Light red, or orange-coloured; from Nya Krongrufvan, one of the gold-mines at Adelfors, in the province of Smoland.

EARTHS. *Magnefiæ.*

162 (3.) Cryftallifed zeolites is more common than the two preceding kinds; and is found,

A. In groups of cryftals in form of balls, and with concentrical points.

a. Yellow.

b. White.

B. Prifmatical and truncated cryftals.

a. White.

C. Capillary cryftals are partly united in groups, and partly feparate. In this latter accretion they refemble the capillary or feather filver ore; and is perhaps fometimes called *flos ferri,* at places where the nature of that kind of ftone is not yet fully known.

Thefe cryftals are found,

a. White.

The Ninth Order.

The *Manganefe* kind; *Magnefiæ.*

The ftones belonging to this order are in Swedifh called *brunften,* in Latin *fyderea,* or *magnefiæ nigræ;* in order to diftinguifh them from the *magnefia alba officinalis,* and in French *mangonefe,* &c. They are by fome lithographifts entirely omitted, and by others ranked among the iron ores. 163

1. The manganefes confift of a fubftance which gives a colour both to flags and to the folutions of falts, or, which is the fame thing, both to dry and to liquid menftrua, *viz.*

a. Borax, which has diffolved manganefe in the fire, becomes tranfparent, of a reddifh brown or jacinth colour. *b.* The microcofmic falt becomes tranfparent with it, of a crimfon colour, and moulders in the air. *c.* With the fixed alkali, in compofitions of glafs, it becomes violet; but if a great quantity of manganefe is added, the glafs is in thick lumps, and looks black. *d.* Scorified with lead, the glafs gets a reddifh brown colour. *e.* The lixivium of a deflagrated manganefe is of a deep red colour.

2. It deflagrates with nitre, which is a proof that it contains fome phlogifton.

3. When reckoned to be light, it weighs as much as an iron ore of the fame texture.

4. Being melted together with glafs-compofitions, it ferments during the folution: but it ferments in a ftill greater degree when it is melted with the microcofmic falt.

5. It does not excite any effervefcence with the fpirit of nitre: aqua regia, however, extracts the colour out of the black, and diffolves likewife a great deal of it, which, by means of an alkali, is precipitated to a white powder.

6. Such colours as are communicated to glaffes by manganefe, are eafily deftroyed by the calx of arfenic or tin: they alfo vanifh of themfelves in the fire.

7. It is commonly of a loofe texture, fo as to colour the fingers like foot, although it is of a metallic appearance when broke.

Manganefe

(1) Other varieties of the zeolites have been difcovered, particularly at Adelfors's gold-mines in Smoland in Sweden; of which fome forts do not melt by themfelves in the fire, but diffolve readily in the acid of nitre, and are turned by it into a firm jelly.

Manganese is found,

A. Loose and friable,

164 *a.* Black, seems to be decayed particles of the indurated kind.

165 *B.* Indurated.

1. Pure, in form of balls, whose texture consists of concentric fibres.

a. White, *Magnesia alba strictè sic dicta*, is very scarce. Mr Cronstedt saw a specimen of this kind in a collection from an unknown place in Norway; and by examining a piece of it, he found that it differed from the common manganese, by giving to the borax a deep red colour in the fire: this sort acquires a reddish brown colour when it is calcined.

b. Red manganese is said to be found in Piedmont. This Mr Cronstedt has never seen; but has been told that this variety is free from iron, and gives to glass rather a red than a violet colour.

166 2. Mixed with a small quantity of iron.

a. Black manganese, with a metallic brightness. This is the most common kind, and is employed at the glass-houses and by the potters. It is found,

1. Solid, of a flaggy texture; *Magnesia textura vitrea.*
2. Steel-grained.
3. Radiated.
4. Crystallised.

a. In form of coherent hemispheres.

167 3. Blended with a small quantity of iron and tin; *Spuma lupi*, or *Wolfram.*

Wolfram is a name which is also sometimes given to mock lead, and sometimes to cockle or shirl, as also to other minerals; however, it is chiefly given to this species of manganese, when it occurs in the tin mines.

1. With coarse fibres.

a. Of an iron colour. This gives to the glass compositions, and also to borax and the microcosmic salt, an opaque whitish yellow colour, which at last vanishes.

SECOND CLASS.

168 The SALTS. By this name those mineral bodies are called which can be dissolved in water, and give it a taste; and which have the power, at least when they are mixed with one another, to form new bodies of a solid and angular shape, when the water in which they are dissolved is diminished to a less quantity than is required to keep them in solution; which quality is called *crystallisation.*

No other salts ought to be considered and ranked in a mineral system but those which are found natural in the earth; and for this reason a great number of salts will be in vain looked for here, viz. all such as are either natural or prepared by art in the other two kingdoms of nature, and from substances belonging to them. Amongst these is nitre itself and its acid, and the vegetable acid, since these are never had from true mineral bodies; nor is it demonstrated that they have their origin from the true mineral vitriolic and muriatic acids. There have, indeed, been many attempts made to reduce most of them to a vitriolic acid, which by many is called the *universal acid:* but experiments will not agree with it; at least nobody has yet been able, by uniting a phlogiston with any other acid than the true vitriolic, to produce a substance in every particular resembling the true brimstone, or sulphur.

In regard to the known principal circumstances or qualities of the mineral salts, they are divided into

1. Acid salts, or mineral acids.
2. Alkaline salts, or mineral alkalis.

The First Order.

Acid salts; the characters of which are, that they 169

1. Have a sour taste.
2. Are corrosive; that is to say, have a power of dissolving a great number of bodies.
3. They have a strong attraction to the alkaline salts and earths, whence they always unite with them with an effervescence, and sometimes with a strong heat: by this mixture bodies are produced, which are employed in common life under the names of *vitriols*, *neutral salts*, *gypsum*, &c.
4. They change most of the expressed blue juices of vegetables into red.
5. They separate the alkali from the fat, when they have been united in soap; which effect is called *curdling* or *coagulation.*
6. They are volatile and subtile, so as never to be observable by the naked eye, unless they are mixed with heterogeneous bodies; and therefore the figure of the pure mineral acids cannot be defined but by guess.

A. The vitriolic acid; *Acidum vitrioli, aluminis, et sulphuris.* 170

I. The pure vitriolic acid is, in abstract, considered as possible to occur in nature: its qualities, when mixed with water, in which it is caught by distillation, are as follows:

1. When mixed with the least possible quantity of water, it is of an unctuous appearance, and is for that reason improperly called *oil of vitriol.*
2. It has in that state a considerable heaviness, viz. in comparison to water, as 1700 to 1000.
3. It dissolves silver, tin, the regulus of antimony, and quicksilver; but,
4. When mixed with more water, it dissolves zinc, iron, and copper.
5. It dissolves likewise the calcareous earth, and precipitates with it in form of a gypsum, of which a part shoots into gypseous drusen, *selenites et crystalli gypsei.*
6. It unites with the earth of quartz, when it has been previously dissolved in the *liquor silicum;* and with a pure argillaceous earth, dissolving it without any fermentation: with both these earths it makes alum.
7. It has a stronger attraction to the inflammable substance than to the alkaline salt, and forms with it a body which properly may be called the *mineral sulphur.*
8. When it is perfectly united with phlogistic substances belonging to the vegetable kingdom,

dom, and the water has been completely separated, this mixture catches flame in the open air, and is consumed; as may be seen by the powder called *pyrophorus*.

9. It attracts water strongly, and the aqueous vapours out of the air; and if a great quantity of water is added to it at once, a strong heat arises.

10. It unites readily and easily with the alkalis, whereby, according to their nature, different compounds are produced, which have obtained the names of *tartarus vitriolatus*, *sal mirabile*, and *sal ammoniacum fixum*.

171 II. The vitriolic acid mixed or saturated.

A. With metals; *Vitriola*, vitriols.

a. Simple vitriols.

1. Martial vitriol; green vitriol, or copperas.

This is the common green vitriol, which naturally is found dissolved in water, and is produced in abundance by decayed or calcined marcasites.

2. Copper vitriol; blue vitriol. This is of a deep blue colour, and is found in all ziment waters, as they are called; for instance, at Neusohl in Hungary, in St Johan's mine at Fahlune in the province of Dalarne, at Nya Kopparberget in Westmanland, and the copper-mines at Wicklow in Ireland, &c. It is, however, seldom perfectly free from an admixture of iron and zinc.

3. Zinc vitriol, is white and clear as alum, and is found at the Ramelsberg in the Hartz, as also in the rubbish at Stollgrufvan in Westmanland in Sweden, where the mock lead has decayed either spontaneously, or after having been burnt.

172 *b*. Compound vitriols.

1. Vitriol of iron and copper, is of a bluish green colour.

2. Vitriol of iron, zinc, and copper. This verges more to the blue than to the green colour. It is made at Fahlune in Dalarne, from the water which is pumped out of the copper mines: in this water large crystals of vitriol are often ready formed. If this vitriol is dipped in water, and afterwards rubbed on clean iron, the copper does not precipitate from it.

3. Vitriol of zinc and iron. This is the green vitriol from Goslar in the Hartz.

4. Vitriol of zinc and copper. This is the blue vitriol from Goslar.

5. Vitriol of nickel and iron, is of a deep green colour, and is contained in the ochre or decayed parts of the nickell, at the cobalt-mines at Los, in the province of Helsingland.

Most part of the vitriols owe their formation to art: because when such ores as contain sulphur are dug out of the mines by means of fire, the phlogiston of the sulphur is by the heat expelled, leaving the acid behind; which, being let loose or freed, is thereby enabled to attract and unite with watery vapours, dissolving at the same time the metals; and it is thus the vitriols are formed. Every sort of ore does not commonly decay or weather in a natural manner, without being promoted by art; and this decaying or weathering is mostly performed in the open air: for which reason no very great quantity of vitriol can be expected in that way; for when any ore thus weathers or decays, the dissolved particles are by degrees carried off by the rain, and are at last found in a dissolved state in certain springs or mineral waters. All such ores may therefore be called *true vitriol ores*, as contain iron, copper, zinc, and nickel mineralised with sulphur. The acid in the vitriols, however, is not dulcified by the metals, as it is by the alkali in the true neutral salts.

B. The acid of vitriol mixed or saturated with earths. 173

1. With a calcareous earth. Gypsum.

2. With an argillaceous earth. The alum kind.

a. With a small quantity of clay. Native or plumose alum.

Is found on decayed alum ores in very small quantities.

The gypsa and asbesti, but more especially the latter, have been used through ignorance in most countries for plumose native alum, on account of the similarity of structure.

b. With a greater quantity of pure clay. White alum ore.

1. Indurated pale red alum ore. Is employed at Lumini, not far from Civita Vecchia in Italy, to make the pale red alum called *roche-alum*. This is, of all alum ores, the most free from iron; and the reddish earth which can be precipitated from it does not show the least marks of any metallic substance.

c. With a very large quantity of martial clay, which likewise contains an inflammable substance. Common alum ore.

Is commonly indurated and slaty, and is therefore generally called *alum slate*.

It is found,

1. Of parallel plates, with a dull surface; from Andrarum in the province of Skone, Hunneberg and Billingen in the province of Westergottland, Rodoen in the province of Jemtland, and the island of Oeland, &c.

2. Undulated and wedge-like, with a shining surface. This at first sight resembles pit-coal: it is found in great abundance in the parish of Nas in Jemtland.

C. Vitriolic acid united with phlogiston. The sulphur kind. 174

D. Vi-

D. Vitriolic acid ſaturated with alkaline ſalt.

a. With the alkali of the common ſalt or ſea-ſalt.

175 This is a neutral ſalt, prepared by natute as well as by art, containing more or leſs of iron, or of a calcareous earth, from which ariſes alſo ſome difference in its effects when internally uſed. It ſhoots eaſily into priſmatical cryſtals, which become larger in proportion to the quantity of water evaporated before the cryſtalliſation. When laid on a piece of burning charcoal, or elſe burnt with a phlogiſton, the vitriolic acid diſcovers itſelf by the ſmell like to the *hepar ſulphuris*.

It is found in a diſſolved ſtate in ſprings and wells, and in a dry form on walls, in ſuch places where aphronitrum has effloreſced through them, and the vitriolic acid has happened to be preſent; for inſtance, where marcaſites are roaſted in the open air. This ſalt is often confounded with the aphronitrum, or a pure mineral alkali; and a learned diſpute once aroſe, which of theſe ſalts ought with the greateſt propriety to be called *natron*, *Baurach veterum*, *ſal mirabile*, or *Epſom ſalt*; whereas it might eaſily have been decided by chemical experiments, if their qualities had been regarded in preference to their figures or their native places.

This may be called *Engliſh* or *Epſom ſalt*, when it has naturally as equal a copious portion of the calcareous earth as of the artificial one; but in regard to its effects, for which it has been moſt valued by Glauber, Mr Cronſtedt has ranked all the leſs conſiderable varieties of this neutral ſalt, when natural, under the name of *ſal mirabile*.

176 *B*. Acid of common or ſea-ſalt. This acid, conſidered in that ſtate in which it can be had, viz. in mixture with water, has the following qualities:

1. It does not alter the fluidity of water, nor conſiderably augment its heavineſs, as the vitriolic acid does.
2. It is ſomewhat leſs corroſive and ſour than the ſaid vitriolic acid.
3. It ſtrongly attracts the alkaline ſalts; but, however, is forced to quit them to the vitriolic acid, when that is added.
4. It diſſolves the calcareous earth, and makes with it a ſubſtance called *ſal ammoniacum fixum*.
5. When expoſed to the fire, combined with a phlogiſton, it burns with a yellowiſh green flame.
6. When highly concentrated and pure, as when it is diſtilled from common ſalt mixed with pipe-clay, it diſſolves tin and lead: but leſs pure, it diſſolves copper, iron, zinc, and the regulus of antimony: the copper is, however, more eaſily diſſolved when it is in form of a calx, as the calces of quickſilver and cobalt likewiſe are.
7. It unites with ſilver diſſolved in aquafortis, and with lead diſſolved in aqua-regia, falling with them to the bottom in form of a white ſpongy maſs. This precipitation, expoſed to the fire, ſtill retains the acid, and melts with it into a glaſſy ſubſtance, which does not diſſolve in water.
8. It is apt to attract the humidity of the air, and to promote the decaying of thoſe dry ſubſtances with which it has been united.
9. Mixed with the ſpirit of nitre, it makes the ſolution called *aqua-regia*, which is the true liquid menſtruum for gold.

This acid ſeems alſo, on certain occaſions, to have got looſe from thoſe ſubſtances with which it had been originally united in the earth: the *ſal ammoniacum naturale* at Solfatara in Italy, and the horn ſilver ore, appear to be proofs of this, as they ſeem to be the products of time.

I. Mixed or ſatiated acid of ſea-ſalt.

A. With earths. 177

1. With a calcareous earth; *ſal ammoniacum fixum*.

This ſomewhat decays, or attracts the humidity of the air: it is found in abundance in the ſea-water. See the calcareous kind, (91, &c.)

B. With alkaline ſalts. 178

(1.) With the fixed mineral alkali, or ſea alkali; common ſalt, or ſea-ſalt.

This ſhoots into cubical cryſtals during the evaporation; it crackles in the fire, and attracts the humidity of the air.

α. Rock ſalt, foſſil ſalt.

Occurs in form of ſolid ſtrata in the earth.

1. With ſcaly and irregular particles.
   - *a*. Grey, and
   - *b*. White. Theſe are the moſt common, but the following are ſcarcer:
   - *c*. Red,
   - *d*. Blue, and
   - *e*. Yellow, from Cracow in Poland, England, Salzberg, and Tirol.
2. Cryſtalliſed rock-ſalt.
   - *a*. Tranſparent, from Cracow in Poland, &c.

β. Sea-ſalt.

Is produced from ſea-water, or from the water of ſalt lakes, by evaporation in the ſun, or by boiling.

The ſeas contain this ſalt, though more or leſs in different parts. In Siberia and Tartary, there are lakes that contain great quantities of ſalt.

γ. Spring-ſalt.

(2.) Saturated with a volatile alkali. Native ſal. ammoniac.

This is of a yellowiſh colour, and is ſublimed from the flaming vents or crevices at the Solfatara near Naples.

C. United with phlogiſton; amber, *ſuccinum*. 179

D. United with metals. 180

1. With ſilver; *Minera argenti cornea*, horn ſilver ore. The *hornertz* of the Germans.

The SECOND ORDER.

ALKALINE mineral ſalts.

Theſe are known by their action on the above-mentioned acids when they are joined together, whereby 181

whereby a fermentation arifes, and a precipitation enfues of fuch bodies as either of them had before kept in diffolution, uniting at the fame time together; by which new compofitions are made, that are called *neutral falts*, or *falia neutra*.

Thefe alkaline falts are,

182 I. Fixed in the fire.

A. Alkali of the fea, or of common falt.

(1.) Pure.

This has nearly the fame qualities with the lixivious falt which is prepared from the afhes of burnt vegetables; it is the fame with the *fal fodæ*, or kelp, becaufe the kelp is nothing elfe than the afhes remaining after the burning of certain herbs that abound with common falt; but which common falt, during the burning of thofe vegetables, has quitted its acid.

This,

1. Ferments with acids, and unites with them.
2. Turns the fyrup of violets to a green colour.
3. Precipitates fublimate mercury in an orange-coloured powder.
4. Unites with fat fubftances to make foap.
5. Diffolves the filiceous earth in the fire, and makes glafs with it, &c. It diftinguifhes itfelf from the falt of the pot-afhes, by the following properties: that,
6. It fhoots eafily into prifmatical cryftals; which
7. Fall to powder in the air, in confequence of their eafily lofing their humidity.
8. Mixed with the vitriolic acid, it makes the *fal mirabile*.
9. It melts eafier; and perhaps it is alfo more conveniently applied in the preparation of feveral medicines.
10. It is fomewhat volatile in the fire.

183 (2.) Mixed with a fmall quantity of the calcareous earth.

This is fo ftrongly united with the calcareous earth, that the latter enters with it into the very cryftals of the falt: though, by repeated folutions, the earth is by degrees feparated from it, and falls to the bottom after every folution. It grows in form of white froft on walls, and under vaults, and in places where it cannot be wafhed away by the rain. When it contains any confiderable quantity of the calcareous earth, its cryftals become rhomboidal, a figure which the calcareous earth often affumes in fhooting into cryftals; but when it is purer, the cryftals fhoot into a prifmatical figure. This is a circumftance which neceffarily muft confufe thofe who know the falts only by their figure, and fhews at the fame time how little certainty fuch external marks afford in a true diftinction of things. This falt is therefore very often confounded with the *fal mirabile*.

184 (3.) Saturated with mineral acids. Neutral falts.

a. With the acid of fea-falt; common falt, fea-falt.

b. With the vitriolic acid; *fal mirabile*.

B. Borax. 185

Many experiments have been made with this falt, in order to difcover its origin and conftituent parts, the moft remarkable of which are mentioned under the article CHEMISTRY n° 170, and its following qualities are to be obferved.

1. It fwells and froths in the fire, as long as any humidity remains in it; but melts afterwards very eafily to a tranfparent glafs, which, as it has no attraction to the phlogifton, keeps itfelf in the form of a pearl on the charcoal when melted with the blow-pipe.
2. It changes the fyrup of violets into green; and precipitates the folution of alum, and that of metals made with acids.
3. It unites with mineral acids to a neutral falt, which fhoots into very fine and fubtile hair-like cryftals, and is called *fal fedativum*. In a certain compofition it is volatile; and mixed with *litmus*, or *fuccus heliotropii*, and the fyrup of violets, it difcovers marks both of an alkali and an acid.
4. When it has been united with the vitriolic acid and a phlogifton, no *hepar fulphuris* is produced.
5. After being refined, it fhoots into irregular figures: but the cryftals, which form themfelves after the firft operation, and are called *tincal*, confift of octagonal prifms, flat at the extremities, and with their angles cut off or truncated.

II. Volatile. This perfectly refembles that falt which is extracted from animals and vegetables, under the name of *alkali volatile*, or *fal urinofum*, and is commonly confidered as not belonging to the mineral kingdom; but fince it is difcovered not only in moft part of the clays, but likewife in the fublimations at Solfatara near Naples, it cannot poffibly be quite excluded from the mineral kingdom. 186

Its principal qualities are, That,

a. In the fire it rifes in a dry form, and volatilifes in the air in form of corrofive vapours, which are offenfive to the eyes and nofe.

b. It precipitates the folution of the mercurial fublimate into a white powder.

c. It alfo precipitates gold out of *aqua regia*, and detonates with it.

d. It has a reaction in regard to the acids, tho' not fo ftrongly as other alkalies.

e. It tinges the folution of copper blue, and diffolves this metal afrefh, if a great quantity is added.

f. It deflagrates with nitre, which proves that it contains a phlogifton.

It is never found pure; but,

A. Mixed, 187

1. With falts.

a. With the acid of common falt. Native fal ammoniac.

2. With earths.

a. Clay.

INFLAMMABLES. Ambergrife, Amber.

a. Clay. The greateft part of the clays contain a volatile alkali, which difcovers itfelf in the diftillation of the fpirit of fea-falt, &c.

THIRD CLASS.

188 Mineral INFLAMMABLE SUBSTANCES.

To this clafs belong all thofe fubterraneous bodies that are diffoluble in oils, but not in water, which they repel; catch flame in the fire; and are electrical.

It is difficult to determine what conftitutes the difference between the purer forts of this clafs, fince they all muft be tried by fire, in which they all yield the fame product; but thofe which in the fire fhew their differences by containing different fubftances, are here confidered as being mixed with heterogeneous bodies: that fmall quantity of earthy fubftance, which all phlogifta leave behind in the fire, is, however, not attended to.

189 I. Ambergrife, is commonly reckoned to belong to the mineral kingdom, although it is faid to have doubtful marks of its origin.

a. It has an agreeable fmell, chiefly when burnt.

b. It is confumed in an open fire.

c. It foftens in a gentle degree of heat, fo as to ftick to the teeth like pitch.

d. It is of a black or grey colour, and of a dull and fine-grained texture. The grey is reckoned the beft, and is fold very dear.

190 II. Amber. *Ambra flava; fuccinum; electrum.* There are often found fifh, infects, and vegetables included in it, which teftify its once having been liquid. It is more tranfparent than moft part of the other bitumens, and is doubtlefs that fubftance which firft gave rife to electrical experiments.

Its varieties are reckoned from the colour and tranfparency: it is found,

A. Opake.

a. Brown. *b.* White. *c.* Blackifh.

B. Tranfparent.

a. Colourlefs.

b. Yellow. The greateft quantity of European amber is found in Pruffia; but it is, befides, collected on the fea-coaft of the province of Skone, and at Biorko, in the Lake Malaren, in the province of Upland; as alfo in France and in Siberia. It is chiefly employed in medicines, and for making varnifhes.

191 III. Rock-oil; *Petroleum.* It is an inflammable mineral, of a light-brown colour, which cannot be decompounded, but is often rendered impure by heterogeneous admixtures. In length of time, it hardens in the open air, like a vegetable refin; and then becomes of a black colour, whether it is pure, or mixed with other bodies. It is likewife found in the earth.

A. Liquid.

1. Naphtha. This is faid to be of a very fragrant fmell, tranfparent, extremely inflammable, and attracts gold. It is gathered from the furface of the water in fome wells in Perfia.

INFLAMMABLES. Rock-oil. Sulphur.

2. Rock-oil; *Petroleum*, properly fo called. This fmells like the oil of amber, though more agreeable, and is likewife very ready to take fire. It is collected in the fame manner as the naphtha, from fome wells in Italy, 192
and in a deferted mine at Ofmundfberget in the province of Dalarne in Sweden: at this laft-mentioned place it is found in fmall hollows in the limeftone, as refin is in the wood of the pines.

B. Thick and pitchy rock-oil, or Barbadoes tar; 193
Petroleum tenax, maltha. Refembles foft pitch.

C. Hardened rock-oil; *Petroleum induratum.* 194
Foffil pitch; *Pix montana.*

1. Pure; *Afphaltum.* This leaves no afh or earthy fubftance when it is is burnt. From this or the preceding fubftance, it is probable the afphaltum was prepared that the Egyptians ufed in embalming their dead bodies, and which is now called *mummia.*

2. Impure; *Pix montana impura.* This contains a great quantity of earthy matter, which is left in the retort after diftillation, or upon the piece of charcoal if burnt in an open fire; it coheres like a flag, and is of the colour of black lead: but in a calcining heat this earth quickly volatilifes; fo that the nature of it is not yet known. The fubftance which rifes, and then falls into the receiver during the diftillation of this foffil pitch, is entirely the fame as the common natural liquid rock-oil.

IV. Mineral phlogifton, or bitumen, united with 195
the vitriolic acid. Sulphur, or brimftone. This is very common in the earth, and difcovers itfelf in many and various forms. It is found,

A. Native fulphur. In this the two conftituent parts are mixed in due proportion in regard to each other, according to the rules of that attraction which is between them; it is eafily known,

1. By its inflammability, and by its flame.

2. By its fmell when burnt; and,

3. By its producing a liver of fulphur, when mixed with a fixed alkali, like that made from artificial fulphur.

It is found,

a. Pellucid, of a deep yellow colour.

b. Opake, white, and greyifh. It is often found on limeftone, which the vitriolic acid has left untouched, having a ftronger attraction to the phlogifton, and therefore wholly uniting with that.

B. Sulphur that has diffolved or is faturated with 196
metals.

1. With iron. Pyrites, or copperas-ftone; *Pyrites.* This is the fubftance from which moft fulphur is prepared, and is therefore ranked here with all its varieties. It is hard, and of a metallic fhining colour.

A. Pale yellow pyrites; *Pyrites fubflavus.* Marcafite. This is very common, and contains a proportionable quantity of fulphur with refpect to the iron; when once thoroughly inflamed, it burns by itfelf.

 a. Of

a. Of a compact texture; *Polita piedra del ynca, Hifpanorum.*
b. Steel-grained.
c. Coarfe-grained.
d. Cryftallifed. It fhoots moftly into cubical and octoëdral figures, tho' it alfo cryftallifes into innumerable other forms.

197 B. Liver-coloured marcafite. Its colour cannot be defcribed, being betwixt that of the preceding marcafite, and the azure copper ore. The iron prevails in this kind; it is therefore lefs fit to have fulphur extracted from it, and alfo for the fmelting of copper ores. It is found,
a. Of a compact texture.
b. Steel-grained.
c. Coarfe-grained.

198 2. Iron and tin. Black-lead, or wadd; *Molybdæna.* If by fuch a mixture as this the iron and tin be not rendered too volatile, it muft be fuppofed that the great lofs the black lead fuftains in the calcining heat is occafioned from the fulphur, and that the fulphur confequently makes out the greateft part of the black lead. It is found,
a. Lamellar and fhining, of the fame colour as the potters lead ore.
b. Of a fteel-grained and dull texture. It is naturally black, but when rubbed it gives a dark lead colour.
c. Of a fine fcaly and coarfe-grained texture; coarfe black lead. It has at the fame time a fcaly and a granulated appearance. From Gran in the province of Upland, and from Tavaftehuflan in Finland. Profeffor Pott has examined the black lead in covered veffels, and Mr Quift in an open fire; from which difference in the method of treating it, different notions have arifen: becaufe the black lead is nearly unalterable when expofed to the fire in covered veffels, or when immediately put into a ftrong charcoal fire, but it is almoft wholly volatile in a calcining heat. This is the cafe with feveral others of the mineral phlogiftons; and from this we may in general learn, how neceffary it is to examine the mineral bodies by many and different methods, and to endeavour to multiply the experiments more than what has been hitherto done.

199 3. Sulphur with iron and copper; yellow or marcafitical copper ore.
4. Sulphur with iron and lead; potters lead-ore.
5. Sulphur with iron and zinc; mock lead, black jack, or blende.
6. Sulphur with iron and arfenic; arfenical pyrites.
7. Sulphur with iron and cobalt.
8. Sulphur with iron and bifmuth.
9. Sulphur with iron and nickel.
10. Sulphur with iron and gold; pyritical gold ore.
11. Sulphur with filver; glafs filver ore.
12. Sulphur with copper; grey or vitreous copper ore.

13. Sulphur with lead; potters lead ore.
14. Sulphur with bifmuth.
15. Sulphur with quickfilver; cinnabar.
16. Sulphur with arfenic, orpiment, *realgar.*

V. Mineral phlogifton united with earths. 200
A. With a calcareous earth.
1. With pure calcareous earth; the fetid or fwine fpar.
2. With the calcareous earth and vitriolic acid; the *leberftein* or *liverftone* of the Swedes.

B. With an argillaceous earth.
1. With a fmall quantity of argillaceous earth and vitriolic acid: Coal; *Lithantrax.* It is of a black colour, and of a fhining texture; it burns, and is moftly confumed, in the fire; but leaves, however, a fmall quantity of afhes.
a. Solid coal. b. Slatty coal.
2. With a greater quantity of argillaceous earth and vitriolic acid; the *kolm* of the Swedes. This is of the fame appearance with the former, though of a more dull texture; it burns with a flame, and yet is not confumed, but leaves behind a flag of the fame bulk or volume as the coal was.
3. With abundance of argillaceous earth; ftone coal. It burns with a flame by itfelf, otherwife it looks like other flates.

VI. Mineral phlogifton mixed with metallic earths. 201

This is not found in any great quantity: in regard to its external appearance, it refembles pit-coal; and the fat fubftance contained in it, at times, partly burns to coal, and partly volatilifes in a calcining heat.

The only known varieties of this kind are,

A. Minera cupri phlogiftica.

When it has been inflamed, it retains the fire, and at laft burns to afhes, out of which pure copper can be fmelted.

B. Minera ferri phlogiftica.

This is not very different in its appearance from the pit-coal or foffil pitch, but it is fomewhat harder to the touch. There are two varieties of this fpecies:

1. Fixt in the fire; *Minera ferri phlogiftica fixa.*
Expofed to a calcining heat, it burns with a very languid though quick flame; it preferves its bulk, and lofes only a little of its weight. It yields above 30 per cent. of iron.
a. Solid, refembles black fealing-wax.—— It is found in the liver-coloured marcafite in Wafkberget, at Norrberke in Weftmanland.
b. Cracked, and friable.
2. Volatile in the fire.
This is unalterable in an open fire, either of charcoal, or even upon a piece of charcoal before the flame of the blow-pipe; but under a muffle the greateft part of it volatilifes, fo that only a fmall quantity of calx of iron remains. It is found,
a. Solid.
b. Cracked.

This laft kind leaves more afhes: thefe afhes,

aſhes, when farther expoſed to the fire, become firſt yellowiſh-green, and afterwards reddiſh-brown, when, beſides iron, they then alſo diſcover ſome marks of copper; it has, however, not been poſſible to extract any metallic ſubſtance from them, the effects of the loadſtone, and the colour communicated to the glaſs of borax, having only given occaſion to this ſuſpicion.

FOURTH CLASS.

METALS.

202 Are thoſe mineral bodies which, with reſpect to their volume, are the heavieſt of all hitherto-known bodies; they are not only malleable, but they may alſo be decompounded, and in a melting heat be brought again to their former ſtate, by the addition of the phlogiſton they had loſt in their decompoſition.

Thoſe metals which in a calcining heat loſe their phlogiſton, and conſequently with that the former coherency of their particles, are called *imperfect;* as tin, lead, copper, and iron, and all the ſemi-metals (of which more hereafter): notwithſtanding which, they may be malleable. But thoſe which cannot be deſtroyed in the fire alone are called *perfect;* as gold, ſilver, and platina del pinto. Neverthelefs, the metals have commonly been conſidered more with regard to their malleability than to their fixity in the fire; and are therefore divided into,

A. Malleable, which are called *metals;* and,

B. Brittle, which are called *ſemi-metals.*

The zinc is, however, as a medium between theſe two diviſions, juſt as the quickſilver is between the perfect and imperfect metals; becauſe the quickſilver may indeed be ſo far deſtroyed in the fire, that its particles are ſeparated during their volatiliſation; but every one of them, even the minuteſt, retains, however, the phlogiſton united with it.

The First Order. *True Metals.*

203 I. Gold; *Aurum, ſol chymicorum.*

This is by mankind eſteemed as the principal and firſt among the metals; and that partly for its ſcarcity, but chiefly for the following qualities:

1. It is of a yellow ſhining colour.
2. It is the heavieſt of all known bodies, its ſpecific gravity to water being as 19,640 to 1000.
3. It is the moſt tough and ductile of all metals; becauſe one grain of it may be ſtretched out ſo as to cover a ſilverwire of the length of 98 yards, by which means $\frac{1}{105000}$ grain becomes viſible to the naked eye.
4. Its ſoftneſs comes neareſt to that of lead, and conſequently it is but very little elaſtic.
5. It is fixed and unalterable in air, water, and fire, becauſe it does not eaſily quit its phlogiſton; its liquid menſtruum being only made by art.

It has, however, according to Homberg's experiments, when expoſed to Tſchirnhauſen's burning-glaſs, been found partly to volatiliſe in form of ſmoke, and partly to ſcorify: but this wants to be farther examined. It is alſo ſaid, that gold, in certain circumſtances, and by means of certain artifices in electrical experiments, may be forced into glaſs; and that on this occaſion it becomes white, leaving a black duſt behind it; which, if ſo, confirms certain other chemical experiments, viz. That gold can, together with its colour, loſe ſomething of its phlogiſton, and yet retain its heavineſs, ductility, &c.

6. When melted, it reflects a bluiſh-green colour from its ſurface.
7. It diſſolves in aqua regia, which is compoſed of the acids of ſea-ſalt and nitre; but not in either alone, nor in any other ſolution of ſalt or acid whatſoever.
8. When mixed with a volatile alkali and a little of the acid of nitre, by means of precipitation out of aqua regia, it burns off quickly, in the leaſt degree of heat, with a ſtrong fulmination.
9. It is diſſolved, *in forma ſicca*, by the liver of ſulphur, and alſo ſomewhat by the glaſs of biſmuth.
10. It is not carried away by the antimony during the volatiliſation of that ſemi-metal, and is therefore conveniently ſeparated from other metals by the help of crude antimony; in which proceſs the other metals are partly made volatile, and fly off with the antimony, and partly unite with the ſulphur, to which the gold has no attraction, unleſs by means of ſome uniting body, or by a long digeſtion.
11. The phoſphorus is ſaid to have ingreſs into gold.
12. If mixed with a leſs portion of ſilver, platina, copper, iron, and zinc, it preſerves tolerably well its ductility. But,
13. When mixed with tin, it becomes very brittle; and it attracts likewiſe the ſmoke of that metal ſo as to be ſpoiled, if melted in an hearth where tin has been lately melted: And this is perhaps the reaſon why gold becomes brittle, and of a paler colour, when melted in a new black lead crucible.
14. It requires a ſtrong heat before it melts, nearly as much, or a little more than copper.
15. It mixes or amalgamates readily with quickſilver.

A. Native gold is in its metallic form commonly pure: and in this ſtate moſt part of this metal 204
uſed in the world is found. With reſpect to either the figure or the quantity in which it is found in one place, it is by miners divided into,

1. Thin ſuperficial plated or leaved gold; which conſiſts of very thin plates or leaves, like paper.
2. Solid or maſſive, is found in form of thick pieces.
3. Cryſtalliſed, conſiſts of an angular or cryſtalline figure.
4. Waſh gold, or gold duſt, is waſhed out of ſands, wherein it lies in form of looſe grains

and lumps. The gold is in general more frequently imbedded and mixed with quartz than with any other kind of ftone; and the quartz in which the gold is found in the Hungarian gold mines is of a peculiar appearance. All other forts of ftones, however, are not to be excluded, fince gold is likewife found in fome of them; for inftance, in limeftone, in Adolph Fredrik's Grufva at Adelfors in the province of Smoland in Sweden; in Hornblende, in Baftnas Grufva at Riddarfhyttan in the province of Weftmanland; not to mention feveral other gold mines.

205 *B.* Mineralifed gold. This is an ore in which the gold is fo far mineralifed, or fo entangled in other bodies, as not to be diffolved by the aqua regia.

1. Mineralifed with fulphur.
   - *a.* Mineralifed by means of iron. Marcafitical gold ore; *Pyrites aureus.* It is found at Adelfors, in the province of Smoland; and contains an ounce of gold, or lefs, in 100 pounds.
   - *b.* Mineralifed by means of quickfilver. It is found in Hungary.
   - *c.* Mineralifed by means of zinc and iron; *Aurum fulphure mineralifatum mediante zinco & ferro, aut argento.* The Schemnitz blende. At Schemnitz in Hungary are found zinc ores, which contain a great deal of filver, and this filver is very rich in gold. Since gold and fulphur have no immifcible power or attraction to one another, many have infifted that gold never could be found in marcafite, or thofe ores which contain fulphur: but fince we know by experience that gold can be melted out of the above-mentioned ores, although they have been previoufly digefted in aqua-regia; and that gold likewife mixes and diffolves into a regulus; there is the greateft reafon to believe that a third fubftance, which here is a metal, muft neceffarily have by its admixture enabled the fulphur to unite with a certain quantity of gold. Scheffer has given upon this fubject fome very curious and ufeful obfervations, in his Hiftory of the Refining of Metals, inferted in the Tranfactions of the Academy of Sciences at Stockholm.

It is, however, by no means hereby intended to confirm the credulous in their opinion, that the marcafites in general contain more gold than what true metallurgifts have afferted; becaufe fraud might then perhaps become too common. It is only meant to indicate, that, as no gold is to be expected from marcafites, where no native gold is found in the neighbourhood, in the fame manner no marcafites ought to be defpifed which are found in tracks where gold ores are dug: but at the fame time care muft be taken not to be deluded by the mention of volatile gold, as it is a notion really contradictory and fufpicious; and then there can be no fear of being mifled.

II. Silver; *Argentum, luna.* Which is, 206

- *a.* Of a white fhining colour.
- *b.* Its fpecific gravity to water is 11,091 to 1000.
- *c.* It is very tough or ductile, fo that a grain of it may be ftretched out to three yards in length, and two inches in breadth.
- *d.* It is unalterable in air, water, and fire.
- *e.* It diffolves in the acid of nitre, and alfo by boiling in the acid of vitriol.
- *f.* If precipitated out of the acid of nitre with the common falt, or with its acid, it unites fo ftrongly with this laft acid, that it does not part from it, even in the fire itfelf, but melts with it into a mafs like glafs, which is called *luna cornea.*
- *g.* It does not unite with the femi-metal nickel, during the fufion.
- *h.* It amalgamates eafily with quickfilver.
- *i.* It is in the dry way diffolved by the nitre of fulphur.
- *k.* It has a ftrong attraction to fulphur, fo as readily to take a reddifh yellow or black colour, when it is expofed to fulphureous vapours.
- *l.* It has no attraction to arfenic; whence, when the red arfenical filver ore, or *rothgulden ertz* of the Germans, is put into the fire, the arfenic flies off, and leaves the fulphur (which in this compound was the *medium uniens*) behind, united with the filver in form of the glafs filver ore, or glafs ertz.
- *m.* It is not diffolved by the glafs of lead, and confequently it remains on the cupel.
- *n.* It is exhaled or carried off by volatile metals and acids, as by the vapours of antimony, zinc, and the acid of common falt.
- *o.* It melts eafier than copper.

Silver is found,

A. Native or pure. 207

Native filver moft generally is nearly of fixteen carats ftandard.

1. Thin fuperficial plated or leaved filver.
2. It is alfo found in form,
   - *a.* Of fnaggs, and coarfe fibres.
   - *b.* Of fine fibres. Capillary filver.
   - *c.* Arborefcent. From Potofi in America, and Kongfberg in Norway.
   - *d.* Cryftalline, or figured. This is very fcarce to be met with: it has diftinct figures, with fhining furfaces; it is, however, fometimes found at Kongfberg.

The filver from America is faid to be found for the moft part native; fo it is likewife at Kongfberg in Norway; but it is not commonly fo in the other European mines. In Sweden, it is found native in a very fmall quantity, in the mines of Salberg in Weftmanland, of Lofafen in Dalarne, of Hevaffwik and Sladkierr in the province of Dal, of Sunnerfkog in the province of Smoland, and in the ifland Utoen in the Lake Malaren. It was once found in pretty large lumps in a vein

vein of clay in one of the iron mines at Normark, in the province of Wermeland. It was there mixed with nickel, which was partly decayed or withered; and under this circumſtance it formed the compound ore called the *ſtercus anſerinum*, or *gooſe-dung ore*. At this place the argillaceous vein croſſes the veins of the iron ore, and will perhaps be found to have more of theſe riches, even in ſeveral other places, if well ſearched, as is done in other countries, oftentimes not on ſuch evident marks or ſigns.

208 *B.* Diſſolved and mineraliſed.

(1.) With ſulphur alone. Glaſs ſilver ore,

This is ductile, and of the ſame colour as lead; but, however, becomes blacker in the air. It has, therefore, very undeſervedly got the name of *glaſs-ore;* for that name rather belongs to the *minera argenti cornea*, or horn ſilver ore, if indeed any ſilver ore can be conſidered as glaſſy.

It is found in the ſame manner as native gold; *viz.*

1. In cruſts, plates, or leaves.
2. Grown into
   a. Snaggs, and
   b. Chryſtalline figures.

It is generally either of a lamellar or a grained texture, and is found at Kongſberg and in the Saxon mines.

The glaſs ſilver ore is the richeſt of all ſilver ores; ſince the ſulphur, which is united with the ſilver in this ore, makes out but a very ſmall quantity of its weight.

209 (2.) With ſulphur and arſenic. The red or ruby-like ſilver ore. The *rothgulden* of the Germans.

The colour of this ore varies as the proportion of each of theſe ingredients varies in the mixture; viz. from dark grey to deep red: but when it is rubbed or pounded, it always gives a red colour. When put in the fire, it crackles and breaks; and when the crackling ceaſes, it melts eaſily, the arſenic at the ſame time exhaling in ſmoke.

a. Grey arſenical ſilver ore: which is either,
   1. Plated, cruſted, or leaved; and,
   2. Solid.

b. The red arſenical ſilver ore:
   1. Plated, cruſted, or leaved;
   2. Solid or ſcaly; and,
   3. Cryſtalliſed.

In this laſt form it ſhows the moſt beautiful red colour, and is often ſemitranſparent. It contains about 60 *per cent.* in ſilver; and is found in the greateſt quantity at Andreaſberg in the Hartz.

210 (3.) With ſulphurated arſenic and copper. The *weiſſgulden* of the Germans.

This, in its ſolid form, is of a light grey colour, and of a dull and ſteel-grained texture. The more copper it contains, the darker is the colour. It often holds ſeven pounds of ſilver *per cent.* It is,

a. Friable, withered, or decayed, of a black or ſooty colour; and is therefore by the Germans called *ſilber-ſchwartz*, or *Ruſſigtes-ertz.*

b. Solid, of a light grey colour, and is that ſort properly called *weiſſgulden.*

It is found at St Mary of the Mines in Alſatia, the Saxon mines, and at St Andreaſberg in the Hartz.

(4.) With ſulphurated arſenic and iron. The *weiſertz*, or white ſilver ore, of the Germans. 211

This is an arſenical pyrites, which contains ſiver; it occurs in the Saxon mines, and ſo exactly reſembles the common arſenical pyrites as not to be diſtinguiſhed from it by ſight alone, or without other means. The ſilver it contains may perhaps conſiſt of very ſubtile capillary ſilver mixed in it.

(5.) With ſulphurated antimony. 212

a. Of a dark-grey and ſomewhat browniſh colour. The *lebererz*, from Braunſdorff in Saxony.

b. Of a blackiſh blue colour.
   1. In form of capillary cryſtals. *Federertz*, or plumoſe ſilver ore.

It is found in Saxony, and contains only two or four ounces of ſilver *per cent.* 213

(6.) With ſulphurated copper and antimony. The Dal *falertz.*

This reſembles, both in colour and texture, the dark-coloured weiſſgulden, or falertz. When rubbed, it gives a red powder.

a. Solid.

b. Cryſtalliſed, is found in the pariſh of Aminſkog in the province of Dal; and at that place has been for ſeveral years melted by a method invented for the different mixture of the ores; which proceſs muſt be very troubleſome to thoſe who are not perfectly well verſed in metallurgy.

It contains 13 ounces of ſilver, and 24 *per cent.* of copper.

(7.) With ſulphurated zinc. The *pechblende* of the Germans. 214

This is a zinc ore, mock lead, or blende, which contains ſilver, and is found among rich ſilver and gold ores; for inſtance, in the Hungarian and Saxon mines.

a. Of a metallic changeable colour.
   1. Solid, and with fine ſcales.
   2. In form of balls. The *kugel-ertz*, or ball ore.

It is found at Schemnitz, and contains alſo gold. Its yield of ſilver is 24 ounces *per cent.* and 30 *per cent.* of zinc.

b. Black mock lead, or blende, found in Saxony. This is alſo found,
   1. Solid, and with fine ſcales;
   2. And in form of balls.

(8.) With ſulphurated lead; potters ore. *Galena, bleyglanz.* 215

(9.) With

True METALS. *Platina.*

(9.) With fulphurated lead and antimony, called *ftriperz.*

216 (10.) With fulphurated iron. *Silberhaltiger kies;* marcafite holding filver.

At Kongfberg in Norway, it is faid, a liver-coloured marcafite is often found, particularly at the mine called *Fraulein Chriftiana,* &c. This marcafite contains of filver from three ounces to three and an half *per cent.*

217 (11.) With the acid of common falt. *Minera argenti cornea. Hornertz,* or horn-filver ore.

This is the fcarceft filver ore; it is of a white or pearl colour, changeable or varying on the furface, femi-tranfparent, and fomewhat ductile both when crude and when melted. It cannot be decompofed without fome admixture of fuch fubftances as attract the acid of the fea-falt. It is found in very thin wrought leaves or crufts, at Johan Georgenftadt, in Saxony.

218 III. Platina del Pinto; *Juan blanca.*

This metal is a recent difcovery of our times; and is defcribed with great accuracy by Scheffer, in the Acts of the Royal Academy of Sciences at Stockholm for the year 1752; as alfo by Dr Lewis, in the Philofophical Tranfactions for the year 1754, vol. xlviii. And though thefe two gentlemen agree in the principal circumftances relating to this metal, yet it is very plain by their defcriptions, that neither of them knew any thing of the other's experiments. By thefe defcriptions we are convinced of the refemblance this metal bears to gold; and therefore we muft allow it to be called *white gold,* though, both theoretically and practically, it may be diftinguifhed from gold by the following qualities.

1. It is of a white colour.
2. It is fo refractory in the fire, that there is no degree of heat yet found by which it can be brought into fufion by itfelf, the burning-glafs excepted, which has not yet been tried. But, when mixed with other metals and femi-metals, it melts very eafily, and efpecially with arfenic, both in its metallic form and in form of a calx or glafs.
3. It does not amalgamate with quickfilver by itfelf, but only by means of the acid of common falt after a long trituration. This metal is therefore really feparated from gold by amalgamation, at thofe places where it is found; and without this quality it would be very difficult to feparate it.
4. It is harder and lefs coherent than gold.
5. It is heavier than gold; and therefore the heavieft of all bodies hitherto difcovered: for though the fpecific gravity of platina, in the hydroftatical experiments made by Dr Lewis, is found to be to water only as 17,000 to 1000; yet, when melted with other certain metals, its fpecific gravity has, by an exact calculation, been found to be confiderably augmented, even fo much as to 22,000.
6. Diffolved in aqua regia, and precipitated with tin, or with a folution of that metal, it yields no *purpura mineralis.*

True METALS. *Tin.*

Except thefe, this metal has the fame qualities as gold: but it cannot, on account of its refractorinefs in the fire, be worked off pure on the cupel, nor can it be worked with antimony; becaufe, before it is rendered perfectly pure, it cools, grows hard, and retains always fome part of the added metals. It is brought to us only in its native ftate, in fmall, irregular, rugged grains; and it is yet uncertain whether it is found naturally mineralifed. The platina is brought to Europe from the Rio del Pinto, in the Spanifh Weft Indies.

IV. Tin; *Stannum, Jupiter.* 219

This is diftinguifhed from the other metals by the following characters and qualities.

a. A white colour, which verges more to the blue than that of filver.
b. It is the moft fufible of all metals; and,
c. The leaft ductile; that is, it cannot be extended or hammered out fo much as the others.
d. In breaking or bending it makes a crackling noife.
e. It has a fmell particular to itfelf, and which cannot be defcribed.
f. In the fire it is eafily calcined to white afhes, which are 25 *per cent.* heavier than the metal itfelf. During this operation, the phlogifton is feen to burn off in form of fmall fparkles among the afhes, or calx.
g. This calx is very refractory; but may, however, with a very ftrong degree of heat be brought to a glafs of the hard refin. But this calx is eafily mixed in glafs compofitions, and makes with them the white enamel.
h. It unites with all metals and femi-metals; but renders moft of them very brittle, except lead, bifmuth, and zinc.
i. It amalgamates eafily with quickfilver.
k. It diffolves in aqua-regia, the fpirit of fea-falt, and the vitriolic acid; but it is only corroded into a white powder by the fpirit of nitre.

The vegetable acid, foaps, and pure alkaline falts, alfo corrode this metal by degrees.

l. Its fpecific gravity to water is as 7400 to 1000, or as 7321 to 1000.
m. Diffolved in aqua-regia, which for this purpofe ought to confift of equal parts of the fpirit of nitre and fea-falt, it heightens the colour of the cochineal, and makes it deeper; for otherwife that dye would be violet.

Tin is not found naturally in the earth in any other ftate than, 220

(1.) In form of a calx.

A. Indurated, or vitrified.

1. Mixed with a little of the calx of arfenic.

A. Solid tin ore, without any determinate figure; tin-ftone.

It refembles a garnet of a blackifh-brown colour, but is a great deal heavier; and has been confidered, at the Englifh tin-mines, as a ftone containing no metal, until fome years ago it began to be fmelted to great advantage.

B. Cryftallifed; tin-grains.

Is like the garnets, of a fpherical polygonal

True METALS. Lead.

polygonal figure, but looks more unctuous on the surface.

1. In larger grains; and,
2. In smaller grains.

2. Mixed with the calx of iron.
3. Mixed with the manganese.
4. Mineralised with sulphur and iron; black lead.

221 V. Lead; *Plumbum*, *Saturnus*. It is,

a. Of a blueish-white colour when fresh broke, but soon dulls or sullies in the air.

b. Is very heavy; viz. to water as 11,325 to 1000.

c. Is softest next to gold; but has no great tenacity, and is not in the least sonorous.

d. It is easily calcined; and, by a certain art in managing the degrees of the fire, its calx becomes white, yellow, and red.

e. This calx melts easier than any other metallic calx to a glass, which becomes of a yellow colour, and semi-transparent. This glass brings other bodies, and the imperfect metals, into fusion with it.

f. It dissolves, 1st, In the spirit of nitre; 2dly, In a diluted oil of vitriol, by way of digestion; 3dly, In the vegetable acid; 4thly, In alkaline solutions; and 5thly, In expressed oils, both in the form of metal and of calx.

g It gives a sweet taste to all solutions.

h. It amalgamates with quicksilver.

i. With the spirit of sea-salt it has the same effect as silver, whereby is produced a *saturnus corneus*.

k. It does not unite with iron, when it is alone added to it in the fire.

l. It works on the cupel, which signifies that its glass enters into certain porous bodies, destitute of phlogiston and alkaline salts.

m. It melts in the fire before it is made red-hot, almost as easily as the tin.

n. Its calx or glass may be reduced to its metallic state by pot-ashes.

222 Lead is found,

A. In form of a calx.

(1.) Pure.

A. Friable; lead ochre; native cerufs. This is found at Kristiersberget in Westmanland in Sweden, on the surface of the potter's ore.

B. Indurated; lead spar, or spatose lead ore.

1. Radiated, or fibrous.
   a. White.
2. Crystallised into a prismatical figure.
   a. White.
   b. Yellowish green.

223 (2.) Mixed.

A. With the calx of arsenic; arsenic lead-spar.

1. Indurated.

a. White. Mr Cronstedt has tried such an ore from an unknown place in Germany, and found that no metallic lead could be melted from it by means of the blow-pipe, as can be done out of other lead spars; but it must be performed in a crucible, and then that part of the arsenic which did not fly off in smoke during the experiment was likewise reduced, and found in form of grains dispersed, and forced into the lead. Another ore of this kind, which likewise was not easily reduced by means of the blow-pipe, did always, after being melted, and during the cooling, hastily shoot into polygonal, but mostly hexagonal, crystals, with shining surfaces. Can this crystallisation be owing to salts, which are said not to act in this manner but when they are dissolved in water?

B. With a calcareous earth.

The above-mentioned lead ores are very rich in lead, and easy to be tried; because most of them, being slowly heated, may be reduced to lead by means of the blow-pipe on a piece of charcoal. The calx of the lead in these ores has, perhaps, first been dissolved by sulphur and arsenic; and has afterwards, when these two have weathered away or decayed, and parted from it, assumed this form, in the same manner as we see it really happens, during the calcination, with rich lead ores, or such regules as contain lead. The same, very likely, is the case with other metals; for which reason their ores, when they occur in form of a calx, often contain a little sulphur, and more especially arsenic.

B. Mineralised.

1. With sulphur alone: the *bley-schweiff*, or *bleyglanz*, of the Germans. 224

a. Steel-grained lead-ore; from the mines at Hellefors, in the province of Westmanland.

b. Radiated, or antimoniated lead-ore.

c. Tessellated, or potter's lead-ore.

At Villach in Austria there is said to be found a potter's lead-ore, which contains not the least portion of silver.

2. With sulphurated silver. *Galena*; also called *bleyglanz*, by the Germans. 225

a. Steel-grained.

b. With small scales; is found at Selberg, and is there particularly called *blyschweif*.

c. Fine-grained.

d. Of a fine cubical texture; and,

e. Of coarse cubes. These two varieties are found in all the Swedish silver-mines.

f. Crystallised.

The steel-grained and scaly ores are of a dim and dull appearance when they are broke, and their particles have no determined angular figure: they are therefore in Swedish commonly called *blyschweif*; in opposition to the cubical ores, which are called *blyglanz*. The most part of the ores called *blyglanz* contain silver, even to 24 ounces *per cent*. of which we have instances in the mines of Salberg, where it has been observed, that the coarse cubical lead ores are generally the richest in silver, contrary to what

True METALS. Copper.

what is commonly taught in books; the reafon of which may perhaps be, that, in making the effays on thefe two ores, the coarfe cubical can be chofen purer or freer from the rock than the fine cubical ores.

226 3. With fulphurated iron and filver. This is found,

a. Fine-grained. *b.* Fine cubical. *c.* Coarfe cubical. When this ore is fcorified, it yields a black flag; whereas the preceding lead-ores yield a yellow one, becaufe they do not contain any iron.

227 4. With fulphurated antimony and filver; antimoniated or radiated lead-ore. This has the colour of a blyglanz, but is of a radiated texture.

It is found,

a. Of fine rays and fibres; and,

b. Of coarfe rays or fibres. The lead in this ore prevents any ufe being made of the antimony to advantage; and the antimony likewife in a great meafure hinders the extracting of the filver.

228 VI. Copper; *Cuprum, Venus, Æs.*

This metal is,

a. Of a red colour.

b. The fpecific gravity of the Japan copper is 9000, and of the Swedifh 8784 or 8843 to 1000.

c. It is pretty foft and tough.

d. The calx of copper being diffolved by acids becomes green, and by alkalies blue.

e. It is eafily calcined in the fire into a blackifh blue fubftance, which, when rubbed to a fine powder, is red; when melted together with glafs, it tinges it firft reddifh brown, and afterwards of a tranfparent green or fea-green colour.

f. It diffolves in all the acids; viz. the acids of vitriol, fea-falt, nitre, and the vegetable; and likewife in all alkaline folutions. That it becomes rufty, and tarnifhes in the air (a confequence of a former folution), depends very much on fome vitriolic acid which is left in the copper in the refining of it. This metal is eafier diffolved when in form of a calx than in a metallic ftate, efpecially by the acids of vitriol and fea-falt, and the vegetable acid.

g. Vitriol of copper is of a deep blue colour; but the vegetable acid produces with the copper a green falt, which is verdigrife.

h. It can be precipitated out of the folutions in a metallic ftate; and this is the origin of the precipitated copper of the mines, called *Ziment copper.*

i. It is not eafily amalgamated with quickfilver; but requires for this purpofe a very ftrong trituration, or the admixture of the acid of nitre.

k. It becomes yellow when mixed with zinc, which has a ftrong attraction to it, and makes brafs, pinchbeck, &c.

l. It is eafily diffolved by lead glafs, which laft is coloured green by it.

m. When this metal is expofed to the fire, it gives a green colour to the flame in the moment it begins to melt, and continues to do fo afterwards, without lofing any thing confiderable of its weight.

n. It requires a ftrong degree of heat before it melts, yet is it a leffer degree than for iron.

Copper is found in the earth, 229

A. Native, or in a metallic ftate; virgin or native copper.

1. Solid, is found in the iron mine of Hefslekulla in the province of Nerike, and at Sunnerfkog in the province of Smoland; alfo in the Ruffian Carelia, and in other foreign places.

2. Friable, in form of fmall, and fomewhat coherent grains. Precipitated or ziment copper. It is found at Riddarfhyttan in Weftmanland, at Fahlun in Dalarne, and in Hungary.

It has been obferved, that both copper and filver glafs ore, being precipitated from water, become friable and granulated, but that they in time grow folid and ductile: whence the difpute about the diftinction between native and precipitated copper may ceafe; the rather as native copper will fcarcely be found in other places, and in any other kinds of ftones, than thofe thro' which the ziment or vitriolic waters have circulated; although the fiffures through which it has run may afterwards be filled with a ftony fubftance.

B. In form of a calx. 230

(1.) Pure.

A. Loofe or friable; *Ochra veneris.*

1. Blue; *Cæruleum montanum.* Is very feldom found perfectly free from a calcareous fubftance.

2. Green; *Viride montanum.* Both thefe colours depend on menftrua, which often are edulcorated or wafhed away.

3. Red. This is an efflorefcence of the glafs copper ore. It is found in the province of Dal, and at Oftanberg in the province of Dalarne.

B. Indurated. Glafs copper ore. 231

a. Red. This is fometimes as red as fealing wax, and fometimes of a more liver-brown colour. It is found in Sandbacken, at Norberg in Weftmanland, at Ordal in Norway, in Siberia, and in Suabia in Germany.

This ore is always found along with native copper, and feems to have loft its phlogifton by way of efflorefcence, and to be changed into this form. It is likewife found along with the fulphurated copper; and is commonly, though very improperly, called *glafs copper ore.*

(2.) Mixed. 232

A. Loofe or friable; *Ochra veneris friabilis impura.*

1. Mixed with a calcareous fubftance; *Cæruleum montanum.* In this ftate copper blue is moftly found. It ferments during the folution in aquafortis.

2. Mixed with iron. Black. It is the decom-

decompofition of the Fahlun copper ore.

B. Indurated.

1. Mixed with gypfum, or plafter. Green. Is found at Ordal in Norway, and there called *malachites*.

2. Mixed with quartz. Red. From Sunnerfkog in the province of Smoland.

3. Mixed with lime. Blue. This is the *lapis armenus*, according to the accounts given of it by authors.

C. Diffolved and mineralifed; *Cuprum mineralifatum*.

233 (1.) With fulphur alone. Grey copper ore. Is improperly alfo called *glafs copper ore*.

a. Solid, without any certain texture. This is very foft, fo that it can be cut with a knife, almoft as eafily as black lead.

b. Fine-cubical; *Minera cupri fulphurata teffilis conftans minoribus*. Both thefe varieties are found at Sunnerfkog in Smoland; where the laft is fometimes found decompofed or weathered, and changed into a deep mountain blue.

234 (2.) With fulphurated iron. *Minera cupri pyritacea*; yellow copper ore. Marcafitical copper ore; *Pyrites cupri*. This is various both in regard to colour, and in regard to the different proportion of each of the contained metals; for inftance,

a. Blackifh grey, inclining a little to yellow; *Pyrites cupri grifeus*. When decayed or weathered, it is of a black colour; is the richeft of all the varieties of this kind of copper ore, yielding between 50 and 60 *per cent.* and is found in Spain and Germany.

b. Reddifh yellow, or liver brown, with a blue coat on the furface; *Minera cupri lazurea*. This ore yields between 40 and 50 *per cent.* of copper, and is commonly faid to be blue, though it is as red, when frefh broke, as a red copper regulus.

c. Yellowifh green; *Pyrites cupri flavo viridefcens*. This is the moft common in the north part of Europe; and is, in regard to its texture, found,

1. Solid, and of a fhining texture, from Oftanberg in the province of Dalarne.

2. Steel-grained, of a dim texture, from the fame place, and Falun in Dalarne.

3. Coarfe-grained, is of an uneven and fhining texture. It occurs in moft of the Swedifh and Norwegian copper mines.

4. Cryftallifed marcafitical copper ore.

a. Of long octoëdrical cryftals. This is found at Hevaffwik in the province of Dal, and in Lovifagrufva in Weftmanland; notwithftanding its exiftence is denied by Henckel and his followers.

d. Pale-yellow. This cannot be defcribed but as a marcafite, though an experienced eye will eafily difcover fome difference between them. It yields 22 *per cent.* of copper.

e. Liver-coloured. This is found at Falun, in Darlarne in Sweden, where it contains copper; though at moft other places where it occurs, it does not contain any copper, but is only a martial marcafite.

(3.) With fulphurated arfenic and iron. White copper ore. It is faid to be found in the Hartz in Germany, and to refemble an arfenical pyrites; but moft of the pyritical copper ores, as well as the marcafites, contain a little arfenic, though it is in too fmall a quantity to be obfervable. 235

(4.) Diffolved by the vitriolic acid; *Vitriolum veneris*. 236

(5.) With phlogifton. Copper coal-ore.

VII. Iron; *Ferrum, Mars*. It is, 237

a. Of a blackifh blue fhining colour.

b. It becomes ductile by repeated heating between coals, and hammering.

c. It is attracted by the loadftone, which is an iron ore; and the metal itfelf may alfo be rendered magnetical.

d. Its fpecific gravity to water is as 7,645, or 8000 : : 1000.

e. It calcines eafily to a black fcaly calx, which, when pounded, is of a deep red colour.

f. When this calx is melted in great quantity with glafs compofitions, it gives a blackifh brown colour to the glafs; but in a fmall quantity a greenifh colour, which at laft vanifhes, if forced by a ftrong degree of heat.

g. It is diffolved by all falts, by water, and likewife by their vapours. The calx of iron is diffolved by the fpirit of fea-falt, and by aqua regia.

h. The calx of the diffolved metal becomes yellow, or yellowifh brown; and in a certain degree of heat, it turns red.

i. The fame calx, when precipitated from acids by means of the fixed alkali, is of a greenifh colour; but it becomes blue, when precipitated by means of an alkali united with phlogifton; in which laft circumftance the phlogifton unites with the iron: thefe two precipitates lofe their colour in the fire, and turn brown.

k. The vitriol of iron is brown.

l. It is the moft common metal in nature, and at the fame time the moft ufeful in common life; notwithftanding which, its qualities are perhaps very little known.

Iron is found, 238

A. In form of calx.

[1.] Pure.

A. Loofe and friable. Martial ochre; *Minera ochracea*.

1. Powdery; *Ochra ferri*. This is commonly yellow or red, and is iron which has been diffolved by the vitriolic acid.

2. Concreted. Bog-ore.

a. In form of round porous balls.

b. More folid balls.

c. In fmall flat pieces, like cakes, or pieces of money.

d. In fmall grains.
e. In lumps of an indeterminate figure. All thefe are of a blackifh brown, or a light brown colour.

239 B. Indurated. The bloodftone; *Hæmatites.*

(1.) Of an iron colour; *Hæmatites cœrulefcens.* This is of a blueifh grey colour; it is not attracted by the loadftone, yields a red powder when rubbed, and is hard.
a. Solid, and of a dim appearance when broken.
b. Cubical, and of a fhining appearance when broken.
c. Fibrous, is the moft common *torrften* of Sweden.
d. Scaly; the *eifenman* of the Germans.
1. Black; from Gellebeck, in Norway.
2. Blueifh grey; from Reka Klitt. When this is found along with marcafite, as at Sandfwar in Norway, it is not only attracted by the loadftone, but is of itfelf really a loadftone.
e. Cryftallifed.
1. In octoëdrical cryftals.
2. In polyëdrical cryftals.
3. In a cellular form. Thefe varieties are the moft common in Sweden, and are very feldom blended with marcafite, or any other heterogeneous fubftance, except their different beds. It is remarkable, that, when thefe ores are found along with marcafite, thofe particles which have lain neareft to the marcafite are attracted by the loadftone, although they yield a red, or reddifh brown powder, like thofe which are not attracted by the loadftone: it is likewife worth obfervation, that they generally contain a little fulphur, if they are imbedded in a lime-ftone rock, which, however, very feldom happens in Sweden; but there is one fuch inftance at Billfia in Soderberke, in the province of Dalarne.

240 (2.) Blackifh brown bloodftone; *Hæmatites nigrefcens.* Kidney ore. This yields a red or brown powder when it is rubbed; it is very hard, and is attracted by the loadftone.
a. Solid, with a glaffy texture.
b. Radiated.
c. Cryftallifed.
1. In form of cones, from Siberia.
2. In form of concentric balls, with a facetted furface. Thefe are very common in Germany, but very fcarce in Sweden.

241 (3.) Red bloodftone; *Hæmatites ruber.* Red kidney ore.
a. Solid, and dim in its texture.
b. Scaly. The *eifenman* of the Germans. This is commonly found along with the iron-coloured iron glimmer, and fmears the hands.
c. Cryftallifed, in concentric balls, with a flat or facetted furface.

(4.) Yellow bloodftone; *Hæmatites flavus.*
a. Solid. 242
b. Fibrous, from Lamerhof in Bohemia. The varieties of the colours in the bloodftone are the fame with thofe produced in the calces of iron, made by dry or liquid menftrua, and afterwards expofed to different degrees of heat.

[2.] Iron in form of calx, mixed with heterogeneous fubftances. 243
A. With a calcareous earth. White fpathofe iron ore. The *ftablftein* of the Germans.
B. With a filiceous earth. The martial jafper of Sinople.
C. With a garnet earth. Garnet and cockle or fhirl.
D. With an argillaceous earth. The bole.
E. With a micaceous earth. Mica.
F. With manganefe.
G. With an alkali and phlogifton. Blue martial earth. Native Pruffian-like blue. 244
1. Loofe or powdery: found among the turf in the levels of the province of Skone; alfo in Sax Weiffenfels, and at Norvlanden in Norway, &c.
H. With an unknown earth, which hardens in water. Tarras; *Cementum.* 245
1. Loofe or granulated; *Terra Puzzolana:* from Naples and Civita Vecchia in Italy. This is of a reddifh brown colour, is rich in iron, and is pretty fufible.
2. Indurated; *Cementum induratum.* This is of a whitifh yellow colour, contains likewife a great deal of iron, and has the fame quality with the former, to harden foon in water, when mixed with mortar. This quality cannot be owing to the iron alone, but rather to fome particular modification of it occafioned by fome accidental caufes, becaufe thefe varieties rarely happen at any other places except where volcanos have been, or are yet in the neighbourhood. 246
I. Calx of iron, united with another unknown earth. The *tungften* of the Swedes. This is alfo, though improperly, called *white tin-grains.* This refembles the garnet-ftone, and the tin-grains; is nearly as heavy as pure tin; very refractory in the fire, and exceffively difficult to reduce to metal. Iron has, however, been melted out of it to more than 30 *per cent.* It is very difficultly diffolved by borax and alkaline falts, but melts very eafily with the microcofmic falt; giving a black flag: and for this reafon, this laft mentioned falt muft be 247

be employed in the experiments on this ſtone. It is found,

1. Solid and fine-grained.
   - *a.* Reddiſh or fleſh-coloured.
   - *b.* Yellow.
2. Spathoſe, and with an unctuous ſurface.
   - *a.* White.
   - *b.* Pearl-coloured. This kind of ſtone is very ſeldom met with, but in ſuch places where black-lead is common in the neighbourhood; and the hiſtory of the black lead, inſerted in the Memoirs of the Swediſh Academy of Sciences, gives reaſon to believe, that this may contain ſome tin; which merits further examination. Mr Cronſtedt has in the ſaid Memoirs communicated his experiments upon this kind of ſtone from Riddarſhyttan, and Biſpberget in Weſtmanland; as has alſo Mr Rinman, on a great number of other martial earths. See the Memoirs for the years 1751 and 1754.

248 *B.* Diſſolved or mineraliſed iron.

[1.] With ſulphur alone.

A. Perfectly ſaturated with ſulphur; *Ferrum ſulphure ſaturatum.* Marcaſite.

B. With very little ſulphur. Black iron ore. Iron ſtone.

This is either attracted by the loadſtone, or is a loadſtone itſelf attracting iron; it reſembles iron, and yields a black powder when rubbed.

(1.) Magnetic iron ore. The loadſtone, *Magnes.*
- *a.* Steel-grained, of a dim texture, from Hogberget in the pariſh of Gagnœf in Dalarne: it is found at that place almoſt to the day, and is of as great ſtrength as any natural loadſtones were ever commonly found.
- *b.* Fine grained, from Saxony.
- *c.* Coarſe-grained, from Spetalſgrufvan at Norberg, and Kierrgrufvan, both in the province of Weſtmanland. This loſes very ſoon its magnetical virtue.
- *d.* With coarſe ſcales, found at Sandſwœr in Norway. This yields a red powder when rubbed.

249 (2.) Refractory iron ore. This in its crude ſtate is attracted by the loadſtone.
- *a.* Giving a black powder when rubbed; *Tritura atra.* Of this kind are,
  1. Steel-grained.
  2. Fine-grained.
  3. Coarſe-grained. This kind is found in great quantities in all the Swediſh iron mines; and of this moſt part of the fuſible ores conſiſt, becauſe it is commonly found in ſuch kinds of rocks as are very fuſible: and it is as ſeldom met with in quartz as the hæmatites is met with in limeſtone.
- *b.* Rubbing into a red powder. Theſe are real hæmatites, that are ſo far modified by ſulphur or lime as to be attracted by the loadſtone.
  1. Steel-grained.
  2. Fine-grained. Emery. This is imported from the Levant: it is mixed with mica, is ſtrongly attracted by the loadſtone, and ſmells of ſulphur when put to the fire.
  3. Of large ſhining cubes.
  4. Coarſe, ſcaly. The *eiſenglimmer* or *eiſenman*, from Gellebeck in Norway.

     Theſe are very ſcarce in Sweden, moſt part of the Swediſh bloodſtones being pure, as has already been ſaid, and form that very profitable ore in Swediſh called *torrſten.*

[2.] With arſenic; *Ferrum arſenico mineraliſatum.* Called *miſpickel* by the Germans, and *plate mundic* in Cornwall. 250

[3.] With ſulphurated arſenic. Arſenical pyrites.

[4.] With vitriolic acid. Martial vitriol.

[5.] With phlogiſton. Martial coal ore.

[6.] With other ſulphurated and arſenicated metals. See theſe in their reſpective arrangements.

SECOND ORDER. *Semi-metals.*

There are but ſeven ſemi-metals yet diſcovered, viz.

I. Quickſilver, mercury; *Argentum vivum, mercurius, hydrargyrum.* 251

This diſtinguiſhes itſelf from all metals, by the following qualities:

- *a.* Its colour is white and ſhining, a little darker than that of ſilver.
- *b.* It is fluid in the cold, and diviſible by the leaſt force; but as it only ſticks to a few bodies, to which it has an attraction, it is ſaid that it does not wet.
- *c.* It is volatile in the fire.
- *d.* Its weight is next to that of the gold, viz. to water, as 13,593 : : 1000.
- *e.* It attracts the other ſemi-metals and metals, and unites with them all, except cobalt and nickel, with which it cannot by any means yet known be made to mix. This union is called an *amalgamation.* This amalgamation, or mixtion of metallic bodies, according to the readineſs with which they unite or mix, is in the following progreſſion, viz. gold, ſilver, lead, tin, zinc, biſmuth, copper, iron, and the regulus of antimony: but the three latter, however, do not very readily amalgamate. The iron requires a ſolution of the vitriol of iron, as a medium to promote the union.
- *f.* It diſſolves in the ſpirit of nitre, out of which it is precipitated by a volatile alkali, and the common ſalt, in form of a white powder; but

if a fixed alkali is ufed, into a yellow powder or calx.

g. It diffolves in the oil of vitriol by a ftrong boiling.

h. It is not affected by the acid of common falt, unlefs it be previoufly diffolved by other acids; in which cafe only they unite with one another, and may be fublimed together, which fublimation is a ftrong poifon.

i. It unites with fulphur by grinding; and then produces a black powder called *æthiops mineralis*, which fublimes into a red ftriated body called *factitious cinnabar*.

k. The fulphur is again feparated from the quickfilver, by adding iron or lime, to which the fulphur attaches itfelf, leaving the quickfilver to be diftilled over in a metallic form; but if a fixed alkali is added to it, fome part of the quickfilver will remain in the refiduum, and in that cafe makes a liver of fulphur.

252 Quickfilver is found,

A. Native, or in a metallic ftate. This is found in the quickfilver mines at Idria in Friuli, or the Lower Auftria, in clay, or in a black flaty lapis ollaris, out of which it runs, either fpontaneoufly or by being warmed even in the hands. It has feveral times been found at Herr Sten's Bottn, in the mines of Salberg in Weftmanland, and fometimes alfo amalgamated with native filver.

253 *B.* Mineralifed,

(1.) With fulphur. Cinnabar; *Cinnabaris nativa.* This is of a red colour, and its fpecific gravity to water is as 7500 to 1000.

a. Loofe or friable cinnabar; looks like red ochre.

b. Indurated. Solid cinnabar. Is of a deep red colour; and, with refpect to its texture, is either,

1. Steel-grained:
2. Radiated:
3. Compofed of fmall cubes, or fcaly:
4. Chryftallifed,

a. In a cubical form; it is tranfparent, and deep red as a ruby.

254 (2.) With fulphur and copper; *Mercurius cupro fulphurato mineralifatus.* This is blackifh grey, of a glaffy texture, and brittle; crackles and fplits exceffively in the fire; and when the quickfilver and fulphur are evaporated, the copper is difcovered by its common opaque red colour in the glafs of borax, which, when farther forced in the fire, or diluted, becomes green and tranfparent.

255 II. Bifmuth; tin-glafs. *Vifmutum, bifmutum, marcafita officinalis.* It is,

a. Of a whitifh yellow colour.

b. Of a laminated texture, foft under the hammer, and neverthelefs very brittle.

c. Its fpecific gravity to water is, as 9,700 : : 1000.

d. It is very fufible; calcines and fcorifies like lead, if not rather eafier; and therefore it works on the cuppel. It is pretty volatile in the fire.

e. Its glafs or flag becomes yellowifh brown, and has the quality of retaining fome part of the gold, if that metal has been melted, calcined, and vitrified with it.

f. It may be mixed with the other metals, except cobalt and zinc, making them white and brittle.

g. It diffolves in aquafortis, without imparting to it any colour; but to the aqua-regia it gives a red colour, and may be precipitated out of both thefe folutions with pure water, into a white powder, which is called *Spanifh white.* It is alfo precipitated by the acid of fea-falt; which laft unites with it, and makes the *vifmutum corneum.*

h. It amalgamates eafily with quickfilver. Other metals are fo far attenuated by the bifmuth, when mixed with it, as to be ftrained or forced along with the quickfilver through fkins or leather.

Bifmuth is found in the earth. 256

A. Native. This refembles a regulus of bifmuth, but confifts of fmaller fcales or plates.

1. Superficial, or in crufts.
2. Solid, and compofed of fmall cubes. This is found in and with the cobalt ore, at Schneeberg in Saxony, and other foreign places: likewife along with the copper ore, at Nyberget, in the parifh of Stora Skedwi, in the province of Dalarne.

B. In form of calx. 257

1. Powdery or friable; *Ochra vifmuti.* This is of a whitifh yellow colour; it is found in form of an efflorefcence, to the day, at Los in the province of Helfingland.

It has been cuftomary to give the name of *flowers of bifmuth* to the pale red calx of cobalt, but it is wrong; becaufe neither the calx of bifmuth, nor its folutions, become red, this being a quality belonging to the cobalt.

C. Mineralifed bifmuth. This is, with refpect to colour and appearance, like the coarfe teffelated potter's lead ore; but it confifts of very thin fquare plates or flakes, from which it receives a radiated appearance when broken croffwife. 258

1. With fulphur.

a. With large plates or flakes, from Baftnas at Riddarfhyttan, Bafringe and Stripas in Weftmanland.

b. With fine or fmall fcales, from Jacobsgrufvan at Riddarfhyttan, and the mines at Los in the parifh of Farila in Helfingland.

2. With fulphurated iron.

a. Of coarfe, wedge-like fcales, from Kongruben, at Gellebeck in Norway.

This mineralifed bifmuth ore yields a fine radiated regulus; for which reafon it has been ranked among the antimonial ores, by thofe who have not taken proper care to melt a pure regulus or deftitute of fulphur from it; while others, who make no difference between regules and pure metals, have ftill more pofitively afferted it to be only an antimonial ore.

III. Zinc; fpeltre. *Zincum.* 259

a. Its colour comes neareft to that of lead, but it does not fo eafily tarnifh.

b. It fhows a texture, when it is broken, as if it were compounded of flat pyramids.

c. Its

Semi-Metals. *Zinc.*

c. Its specific gravity to water is, as 6,900 or 7000 to 1000.

d. It melts in the fire before it has acquired a glowing heat; but when it has gained that degree of heat, it burns with a flame of a changeable colour, between blue and yellow; and if in an open fire, the calx rises in form of soft white flowers; but if in a covered vessel, with the addition of some inflammable, it is distilled in a metallic form; in which operation, however, part of it is sometimes found vitrified.

e. It unites with all the metals, except bismuth, and makes them volatile. It is, however, not easy to unite it with iron without the addition of sulphur. It has the strongest attraction to gold and copper, and this last metal acquires a yellow colour by it; which has occasioned many experiments to be made to produce new metallic compositions.

f. It is dissolved by all the acids: of these the vitriolic acid has the strongest attraction to it; yet it does not dissolve it, if it is not previously diluted with much water. The abundance of phlogiston in this semi-metal is perhaps the reason of its strong attraction to the vitriolic acid.

g. Quicksilver amalgamates easier with zinc than with copper, by which means it is separated from compositions made with copper.

h. It seems to become electrical by friction, and then its smaller particles are attracted by the loadstone; which effects are not yet perfectly investigated; but they may excite philosophers to make farther experiments, in order to discover whether the electrical power shews itself in the metals by being attracted by the loadstone, or whether the magnetic power can be exerted on other metals than iron.

260 Zinc is found,

A. In form of calx.

(1.) Pure.

a. Indurated.

1. Solid.

2. Crystallised.

This is of a whitish grey colour, and its external appearance is like that of a lead spar; it cannot be described, but is easily known by an experienced eye. It looks very like an artificial glass of zinc; and is found among other calamines at Namur, and in England.

(2.) Mixed.

A. With a martial ochre; *Ochra sive calx zinci martialis.*

1. Half indurated. Calamine; *Lapis calaminaris.*

a. Whitish yellow,

b. Reddish brown.

This seems to be a mouldered or weathered blende.

B. With a martial clay or bole.

C. With a lead ochre and iron.

261 *B.* Mineralised zinc.

(1.) With sulphurated iron. Blende, mock-lead, black-jack, mock-ore; *pseudogalena* and *blende* of the Germans.

A. Mineralised zinc in a metallic form. Zinc ore.

This is of a metallic blueish grey colour, neither perfectly clear as a potter's ore, nor so dark as the Swedish iron ores.

1. Of a fine cubical or scaly texture.

2. Steel-grained.

B. In form of calx. Blende. Mock-lead; *Sterile nigrum. Pseudogalena.* This is found, 262

1. With course scales,

a. Yellow; semi-transparent.

b. Greenish.

c. Black; *pechbende* or *pitch blende* of the Germans.

d. Blackish brown.

2. With fine scales,

a. White.

b. Whitish yellow.

c. Reddish brown.

3. Fine and sparkling; at Goslar called *braun bleyertz.*

a. Dark brown.

The zinc, in these last kinds of blendes, is as it were in form of a calx or glass, so that they are often transparent: on the contrary, in the zinc ore, (n° 261.) it seems rather to be in a metallic form, or, like most other metals, mineralised with sulphur. The sulphur, nevertheless, exists in the different kinds of blende, equally as in the zinc ore; and this remarkable difference in their appearance must be accounted for from another principle than the quantity of the zinc which they contain; because the yellow and white blendes are often found richer than the zinc ores; but the zinc ores are, however, more easy to melt, and consequently more profitable. Perhaps it is because the blende does not contain a sufficient quantity of the phlogiston of the sulphur, to prevent the calcination of the zinc.

It is no matter whether a calcined blende is called *calamine* or not, provided it has such properties that it may be employed to the same purposes, and with the same advantage, as that calamine which nature has freed from its sulphur by its weathering or decaying. This may be done with some kinds of blende; and Mr Von Swab has given evident and excellent proofs of it in Sweden; insomuch that it would demonstrate a want of experience to insist that sulphur cannot be expelled by calcination, without destroying the zinc itself, and that flowers of zinc may be produced from zinc ores in a calcining heat, without addition of any phlogiston.

Mr

Mr Jufti however avers, that he has found an ore of this quality, which in his Mineralogy he calls *Zinkfpat:* but there is great reafon to doubt if it really contains any zinc, until it is proved whether the author added any phlogifton during the calcination, or reduced the zinc out of it; becaufe, although the flowers of zink may not always be perfectly well calcined, yet there is no inftance of a natural zinc ore being difcovered, which by itfelf yields thofe flowers during the calcination: and it requires, befides, a ftrong heat to produce thefe flowers from a perfect calx or glafs of this femi-metal, either natural or artificial, though mixed with a phlogifton; for it could not have been a native zinc, fince it refembled a fpar, and fuch a one very likely is not to be found in nature.

263 IV. Antimony; *Antimonium Stibium.* This femimetal is,

a. Of a white colour almoft like filver.

b. Brittle; and in regard to its texture, it confifts of fhining planes, of greater length than breadth.

c. In the fire it is volatile, and volatilifes part of the other metals along with it, except gold and platina. It may, however, in a moderate fire, be calcined into a light grey calx, which is pretty refractory in the fire, but melts at laft to a glafs of a reddifh brown colour.

d. It diffolves in fpirit of fea-falt and aqua regia, but is only corroded by the fpirit of nitre into a white calx; it is precipitated out of the aqua regia by water.

e. It has an emetic quality when its calx, glafs, or metal, is diffolved in an acid, except when in the fpirit of nitre, which has not this effect.

f. It amalgamates with quickfilver, if the regulus, when fufed, is put to it; but the quickfilver ought for this purpofe to be covered with warm water: it amalgamates with it likewife, if the regulus of antimony be previoufly melted with an addition of lime.

264 Antimony is found in the earth.

A. Native.

This is of a filver colour, and its texture is compofed of pretty large fhining planes.

This kind was found in Carls Ort, in the mine of Salberg, about the end of the laft century; and fpecimens thereof have been preferved in collections under the name of an arfenical pyrites, until the mine-mafter Mr Von Swab difcovered its real nature, in a treatife he communicated to the Royal Academy of Sciences at Stockholm in the year 1748. Among other remarkable obfervations in this treatife, it is faid, firft, That this native antimony eafily amalgamated with quickfilver; doubtlefs, becaufe it was imbedded in a limeftone; fince, according to Mr Pott's experiments, an artificial regulus of antimony may, by means of lime, be difpofed to an amalgamation: Secondly, That when brought in form of a calx, it fhot into cryftals during the cooling.

B. Mineralifed antimony. 265

(1.) With fulphur.

This is commonly of a radiated texture, compofed of long wedge-like flakes or plates; it is nearly of a lead colour, and rough to the touch.

a. Of coarfe fibres.

b. Of fmall fibres.

c. Steel-grained, from Saxony and Hungary.

d. Cryftallifed, from Hungary.

1. Of a prifmatical, or of a pointed pyramidal figure, in which laft circumftance the points are concentrical.

Mr Cronftedt mentions a fpecimen of this, in which the cryftals were covered with very minute cryftals of quartz, except at the extremities, where there was always a little hole: this fpecimen was given for a *flos ferri* fpar.

(2.) With fulphur and arfenic. Red antimony ore; *Antimonium folare.* 266

This is of a red colour, and has the fame texture with the preceding, though its fibres are not fo coarfe.

a. With fmall fibres.

b. With abrupt broken fibres, from Braunfdorff in Saxony, and from Hungary.

All antimonial ores are fomewhat arfenical, but this is more fo than the preceding kinds.

(3.) With fulphurated filver. Plumofe filver-ore.

(4.) With fulphurated filver, copper, and arfenic.

(5.) With fulphurated lead.

V. Arfenic. This is, 267

a. In its metallic form, nearly of the fame colour as lead, but brittle, and changes fooner its fhining colour in the air, firft to yellow, and afterwards to black.

b. It appears laminated in its fractures, or where broken.

c. Is very volatile in the fire, burns with a fmall flame, and gives a very difagreeable fmell like garlic.

d. It is, by reafon of its volatility, very difficult to be reduced, unlefs it is mixed with other metals: However, a regulus may be got from the white arfenic, if it is quickly melted with equal parts of pot-afhes and foap; but this regulus contains generally fome cobalt, moft of the white arfenic being produced from the cobalt ores during their calcination. The white arfenic, mixed with a phlogifton, fublimes likewife into octoëdral cryftals of a metallic appearance, whofe fpecific gravity is 8,308.

e. The calx of arfenic, which always, on account of

Semi-Metals. *Arsenic.*

of its volatility, muſt be got as a ſublimation, is white, and eaſily melts to a glaſs, whoſe ſpecific gravity is 5,000. When ſulphur is blended in this calx, it becomes of a yellow, orange, or red colour; and according to the degrees of colour is called *orpiment* or yellow arſenic; *ſandarach, realgar*, or red arſenic; and alſo *rubinus arſenici*.

f. This calx and glaſs are diſſoluble in water, and in all liquids; though not in all with the ſame facility. In this circumſtance arſenic reſembles the ſalts; for which reaſon it alſo might be ranked in that claſs.

g. The regulus of arſenic diſſolves in ſpirit of nitre; but as it is very difficult to have it perfectly free from other metals, it is yet very little examined in various menſtrua.

h. It is poiſonous, eſpecially in form of a pure calx or glaſs: But probably it is leſs dangerous when mixed with ſulphur, ſince it is proved by experience, that the men at mineral works are not ſo much affected by the ſmoke of this mixture as by the ſmoke of lead; and that ſome certain nations make uſe of the red arſenic in ſmall doſes as a medicine.

i. It unites with all metals, and is likewiſe much uſed by nature itſelf to diſſolve, or, as we term it, to *mineraliſe*, the metals, to which its volatility and diſſolubility in water muſt greatly contribute. It is likewiſe moſt generally mixed with ſulphur.

k. It abſorbs or expels the phlogiſton, which has coloured glaſſes, if mixed with them in the fire.

Arſenic is found,

268 [1.] Native; called *Scherbencobolt* and *Fliegenſtein* by the Germans.

It is of a lead colour when freſh broken, and may be cut with a knife, like black lead, but ſoon blackens in the air. It burns with a ſmall flame, and goes off in ſmoke.

A. Solid and teſtaceous.

This is found in the mines of Saxony, the Hartz, and Hungary.

B. Scaly, at Kongſberg in Norway.

C. Friable and porous; *Fliegenſtein*.

(1.) With ſhining fiſſures.

This is by ſome called *Spigel cobolt, (minera cobalti ſpecularis)*, according to their notions of the affinity of theſe metals to one another. However, there always remains after the volatiliſation of the ſcherbencobolt, ſome calx, either of cobalt or biſmuth, and ſome ſilver, though in too ſmall a quantity to deſerve any notice.

(2.) In form of a calx.

A. Pure, or free from heterogeneous ſubſtances.

1. Looſe or powdery.
2. Indurated, or hardened. This is found in form of white ſemi-tranſparent cryſtals.

B. Mixed with ſulphur.

1. Hardened.

a. Yellow. Orpiment; *Auripigmentum*.

b. Red. Native realgar, or ſandarach.

The orpiment may perhaps be found naturally in looſe ſcaly powder, as it is ſometimes met with in the ſhops: however, the hardened ſort is ſeldom found but in collections.

Semi-Metals. *Cobalt.*

C. Mixed with the calx of tin, in the tin-grains.

D. With ſulphur and ſilver, in the rothgulden, or red ſilver ore.

E. With calx of lead, in the lead-ſpar.

F. With calx of cobalt, in the effloreſcence of cobalt.

[2.] Mineraliſed.

A. With ſulphur and iron. Arſenical pyrites or marcaſite. Theſe kinds in Cornwall are called *ſilvery* or *white mundics*, and *plate mundics*. 269

This alone produces red arſenic, when calcined, and is found in great quantities in the mines of Loras in the province of Dalarne: It is if a deeper colour than the following.

B. With iron only. This differs with regard to its particles, being,

1. Steel-grained;
2. Coarſe-grained, from Weſterſilſverberget;
3. Cryſtalliſed.

a. In an octoëdral figure. This is the moſt common kind.

b. Priſmatical. The ſulphureous marcaſite is added to this kind, when red arſenic is to be made; but in Sweden it is ſcarcer than the ſulphureous arſenical pyrites.

C. With cobalt, almoſt in all cobalt ores.

D. With ſilver.

E. With copper.

F. With antimony.

VI. Cobalt. 270

This ſemi-metal is,

a. Of a whitiſh grey colour, nearly as fine-tempered ſteel.

b. Is hard and brittle, and of a fine-grained texture; hence it is of a duſky, or not ſhining appearance.

c. Its ſpecific gravity to water is 6000 to 1000.

d. It is fixt in the fire, and becomes black by calcination; it then gives to glaſſes a blue colour, inclining a little to violet, which colour, of all others, is the moſt fixed in fire.

e. The concentrated oil of vitriol, aquafortis, and aqua-regia, diſſolve it; and the ſolutions become red. The cobalt calx is likewiſe diſſolved by the ſame menſtrua, and alſo by the volatile alkali and the ſpirit of ſea-ſalt.

f. When united with the calx of arſenic in a ſlow (not a briſk) calcining heat, it aſſumes a red colour: the ſame colour is naturally produced by way of efflorеſcence, and is then called the *bloom*, or *flowers of cobalt*. When cobalt and arſenic are melted together in an open fire, they produce a blue flame.

g. It does not amalgamate with quickſilver by any means hitherto known.

h. Nor does it mix with biſmuth, when melted with it, without addition of ſome medium to promote their union.

The cobalt is moſt commonly found in the earth mixed with iron.

A. In form of a calx.

(1.) With iron without arfenic.

a. Loofe or friable. Cobalt ochre. It is black, and like the artificial zaffre.

271 *b*. Indurated; the *fchlacken* or flag cobalt. This is likewife of a black colour, but of a glaffy texture; and feems to have loft that fubftance which mineralifed it, by being decayed or weathered. It is often confounded with the fcherbencobolt, for it is feldom quite free from arfenic; and there may perhaps exift a progreffive feries from the fchlacken kind to the fcherbencobolt kind.

272 (2.) With the calx of arfenic. Cobalt-blut; *Ochra cobalti rubra*; bloom, flowers, or efflorefcence, of cobalt.

a. Loofe or friable. This is often found of a red colour like other earths, fpread very thin on the cobalt ores, and is, when of a pale colour, erroneoufly called *flowers of bifmuth*.

b. Indurated. Hardened flowers of cobalt. This is commonly cryftallifed in form of deep red femi-tranfparent rays or radiations.

A white cobalt-earth, or ochre, is faid to have been found. It has been feen and examined by a celebrated mineralift, who has found it in every refpect, except the colour, to refemble the cobalt flowers; and it is very poffible that thofe cobalt flowers might in length of time have loft their red colour, and become white.

273 *B*. Mineralifed.

(1.) With arfenic and iron in a metallic form. This is of a dim colour when broken, and not unlike fteel. It is found,

a. Steel-grained.

b. Fine-grained,

c. Coarfe-grained.

d. Cryftallifed.

1. In a dendritical or arborefcent form.

2. Polyëdral, with fhining furfaces; the *glanzkobolt* of the Germans.

3. In radiated nodules.

274 (2.) With fulphurated iron. This is of a lighter colour than the preceding, nearly like to tin or filver. It is found,

A. Cryftallifed.

1. In a polygonal form.

a. Of a flaggy texture.

b. Coarfe-grained. This kind difcovers not the leaft mark of arfenic. The coarfe-grained becomes flimy in the fire, and fticks to the ftirring hook during the calcination, in the fame manner as many regules do; and is a kind of regule prepared by nature.

That fort of a flaggy texture is very martial, and is defcribed by the mine-mafter Mr Brandt, in the Acts of the Swedifh Academy of Sciences for the year 1746. Both thefe give a beautiful colour.

275 (3.) With fulphur, arfenic, and iron. This refembles the arfenicated cobalt ore, being only rather of a whiter or lighter colour. It is found,

a. Coarfe-grained.

b. Cryftallifed,

1. In a polygonal figure, with fhining furfaces, or *glanzkobolt*. It is partly of a white or light colour, and partly of a fomewhat reddifh yellow.

(4.) With fulphurated and arfenicated nickel and iron; fee n° 279. 276

VII. Nickel; *Niccolum*. This is the lateft difcovered femi-metal. It was firft defcribed by its 277 difcoverer Mr Cronftedt, in the Acts of the Royal Academy of Sciences at Stockholm for the years 1751 and 1754, where it is faid to have the following qualities: That,

1. It is of a white colour, which, however, inclines fomewhat to red.
2. Of a folid texture, and fhining in its fractures.
3. Its fpecific gravity to water is as 8,500 to 1000.
4. It is pretty fixt in the fire; but, together with the fulphur and arfenic, with which its ore abounds, it is fo far volatile as to rife in form of hairs and branches, if in the calcination it is left without being ftirred.
5. It calcines to a green calx.
6. This calx is not very fufible, but, however, tinges glafs of a tranfparent reddifh-brown or jacinth colour.
7. It diffolves in aquafortis, aqua regia, and the fpirit of fea-falt, but more difficultly in the vitriolic acid, tinging all thefe folutions of a deep green colour. Its vitriol is of the fame colour; but the colcothar of this vitriol, as well as the precipitates from the folutions, become by calcination of a light green colour.
8. Thefe precipitates are diffolved by the fpirit of fal ammoniac, and the folution has a blue colour; but being evaporated, and the fediment reduced, there is no copper, but a nickel regulus is produced.
9. It has a ftrong attraction to fulphur; fo that when its calx is mixed with it, and put on a fcorifying teft under the muffel, it forms with the fulphur a regule: this regule refembles the yellow fteel-grained copper-ores, and is hard and fhining on its convex furface.
10. It unites with all the metals, except quickfilver and filver. When the nickel regulus is melted with the latter, it only adheres clofe to it, both the metals lying near one another on the fame plane; but they are eafily feparated with a hammer. Cobalt has the ftrongeft attraction to nickel, after that to iron, and then to arfenic. The two former cannot be feparated from one another but by their fcorification; which is eafily done, fince
11. This femi-metal retains its phlogifton a long time in the fire, and its calx is reduced by the help of a very fmall portion of inflammable matter: it requires, however, a red heat before it can be brought into fufion, and melts a little fooner, or almoft as foon as copper or gold, confequently fooner than iron.

The

The nickel is found.

A. In form of a calx. Nickel ochre.

278 1. Mixed with the calx of iron. This is green, and is found in form of flowers on Kupfer-nickel.

279 *B.* Mineralised nickel.

1. With sulphurated and arsenicated iron and cobalt. *Kupfernickel.* This is of a reddish yellow colour; and is found,

a. Of a flaggy texture, in Saxony.

b. Fine-grained; and

c. Scaly, in Loos cobalt-mines in the province of Helsingeland, at which place it is of a lighter colour than the foreign ones. These two are often from their colour confounded with the liver-coloured marcasite.

280 2. With the acid of vitriol. This is of a beautiful green colour, and may be extracted out of the nickel ochre, or efflorescence of the Kupfernickel.

Of Saxa and Petrifactions.

281 Though the *Saxa*, and fossils commonly called *petrifactions*, cannot be ranked in a mineral system, as consisting of principles already taken notice of; yet as these bodies, especially the latter, occupy so considerable a place in most mineral collections, and the former must necessarily be taken notice of by the miners in the observations they make in the subterranean geography, it appeared proper to subjoin them in such an order as may answer the purpose for which they are regarded by miners and mineralogists.

FIRST ORDER.

Saxa. *Petræ.*

282 These may be divided into two kinds.

1. Compound saxa, are stones whose particles, consisting of different substances, are so exactly fitted and joined together, that no empty space, or even cement, can be perceived between them; which seems to indicate, that some, if not all, of these substances have been soft at the instant of their union.

2. Conglutinated stones, are stones whose particles have been united by some cementitious substance, which, however, is seldom perceivable, and which often has not been sufficient to fill every space between the particles: in this case the particles seem to have been hard, worn off, and in loose, single, unfigured pieces, before they were united.

283 I. Compound saxa.

A. Ophites. Scaly limestone with kernels or bits of serpentine stone in it.

1. *Kolmord's marble.* It is white and green.

2. *Serpentino antico,* is white, with round pieces of black steatites in it. This must not be confounded with the *serpentino verde antico.*

3. The *Haraldsio marble.* White, with quadrangular pieces of a black steatites.

4. The *marmor pozzevera di Genoua.* Dark green marble, with white veins. This kind receives its fine polish and appearance from the serpentine stone.

284 *B. Stellsten* or *gestellstein; Saxum compositum particulis quartzosis & micaceis.*

1. Of distinct particles. In some of these the quartzose particles predominate, and in others the micaceous: in the last case it is commonly slaty, and easy to split.

2. Of particles which are wrapt up in one another.

a. Whitish grey.

b. Greenish.

c. Reddish. Both these kinds of stellsten are, for their resistance to the fire, employed in building furnaces; but the latter is the best, because it seems at the same time to contain a little of a refractory clayish substance: it, however, cracks very soon, if the flat side of the stratum, instead of the extremity, is turned towards the fire. It is also of great use in mills. It is lucky for œconomical purposes, that the plates of these stones are so thick, although thereby they are not so easily split.

C. Norrka. Murksten of the Swedes. *Saxum compositum micâ, quartzo, et granato.* 285

1. With distinct garnets or shirl.

a. Light grey.

b. Dark grey.

c. Dark grey, with prismatical, radiated, or fibrous cockle or shirl.

2. With kernels of garnet-stone.

a. Of pale red garnet-stone. The first of this kind, whose slaty strata makes it commonly easy to be split, is employed for mill-stones, which without difficulty distinguish themselves for that purpose, if sand is first ground with them, because the sand wears away the micaceous particles on the surfaces, and leaves the garnets prominent, which renders the stone fitter for grinding the corn.

D. The whetstone, *Cos. Saxum compositum micâ, quartzo, et forsan argillâ martiali in nonnullis speciebus.* 286

1. Of coarse particles.

a. White.

b. Light grey.

2. Of fine particles.

a. Liver-brown colour.

b. Blackish grey.

c. Light grey.

d. Black. The table-slate, or that kind used for large tables and for school-slates.

The naked eye, and the magnifying glass, much better discovers the micaceous particles in this kind to be as it were twisted in one another; some clay seems likewise to enter into the composition: however, it cannot yet be certainly asserted that it is real mica which has that appearance in this kind.

3. Of very minute and closely combined particles. The Turkey stone. This is of an olive colour, and seems to be the finest mixture of the first species of this genus. It is found in loose stones at Biorkskoginas in the parish of Hellefors in Westmanland, though not

not perfectly free from croſs veins of quartz, which always are in the ſurface of the rock, and ſpoil the whetſtones. It is alſo ſaid to be found in Tellemarken in Norway. The beſt of this ſort come from the Levant, and are pretty dear. The whetſtone kinds, when they ſplit eaſily, and in thin plates, are very fit to cover houſes with, tho' moſt of them are not uſed for that purpoſe.

E. The *telgſten* of the Swedes. *Lapis allaris. Saxum compoſitum ſteatite et micâ.*
- *a.* Light grey.
- *b.* Whitiſh yellow.
- *c.* Dark grey.
- *d.* Dark green. This is employed with great advantage to build fire-places and furnaces, &c. and when it is ſlaty, the extremities of the ſtrata muſt be turned towards the fire.

287 *F.* Porphyry; *Porphyrites.* Italorum *porfido. Saxum compoſitum jaſpide et feltſpato, interdum micâ et baſalte.*
- *a.* Its colour is green, with light green feltſpat, *Serpentino verde antico.* It is ſaid to have been brought from Egypt to Rome, from which latter place the ſpecimens of it now come.
- *b.* Deep red, with white feltſpat.
- *c.* Black, with white and red feltſpat.
- *d.* Reddiſh brown, with light-red and white feltſpat.
- *e.* Dark grey, with white grains of feltſpat alſo. Many varieties of this kind in regard to colour are found in form of nodules or looſe ſtones in Sweden; but we have only mentioned the hardeſt and fineſt of thoſe which are found in the rocks; becauſe, beſides theſe, there are coarſe porphyries found, which ſcarce admit of any poliſh. The dark red porphyry has been moſt employed for ornaments in building: yet it is not the only one known by the name of *porfido*, the Italians applying the ſame name alſo to the black kind.

288 *G.* The *trapp* of the Swedes. *Saxum compoſitum jaſpide martiali molli, ſeu argillâ martiali induratâ, et - - - -*

This kind of ſtone ſometimes conſtitutes or forms whole mountains; as, for example, the mountain called *Hunneberg* in the province of Weſtergottland, and at Drammen in Norway; but it is oftener found in form of veins in mountains of another kind, running commonly in a ſerpentine manner, contrary or acroſs to the direction of the rock itſelf. It is not homogeneous, as may be plainly ſeen at thoſe places where it is not preſſed cloſe together; but where it is preſſed cloſe, it ſeems to be perfectly free from heterogeneous ſubſtances. When this kind is very coarſe, it is interſperſed with feltſpat; but it is not known if the finer ſorts likewiſe contain any of it. Beſides this, there are alſo ſome fibrous particles in it, and ſomething that reſembles a calcareous ſpar: this, however, does not ferment with acids, but melts as eaſy as the ſtone itſelf, which becomes a black ſolid glaſs in the fire. By calcination it becomes red, and yields in eſſays 12 or more *per cent.* of iron. No other ſort of ore is to be found in it, unleſs now and then ſomewhat merely ſuperficial lies in its fiſſures; for this ſtone is commonly, even to a great depth in the rock, cracked in acute angles, or in form of large rhomboidal dice. It is employed at the glaſs-houſes, and added to the compoſition of which bottles are made. By the Germans it is called *ſchwach* or *ſchwartsſtein;* at the Swediſh glaſs-works, *trappſkiol, tegelſkiol,* or *ſwartſkiol;* and at Jarlſberg in Norway, *blabeſt.* In the air it decays a little, leaving a powder of a brown colour; it cracks commonly in the fire, and becomes reddiſh brown if made red-hot. It is found,

1. Of coarſe chaffy particles.
   - *a.* Dark grey.
   - *b.* Black.
2. Coarſe-grained.
   - *a.* Dark grey.
   - *b.* Reddiſh.
   - *c.* Deep brown.
3. Of fine imperceptible particles.
   - *a.* Black. The touchſtone; *Lapis lydius.*
   - *b.* Blueiſh.
   - *c.* Grey.
   - *d.* Reddiſh.

The black variety (3. *a.*) is ſometimes found ſo compact and hard, as to take a poliſh like the black agate: it melts, however, in the fire to a black glaſs; and is, when calcined, attracted by the loadſtone.

H. Amygdaloides. Saxum baſi jaſpideâ martiali, cum fragmentis ſpati calcarei et ſerpentini, figurâ ellipticâ. The carpolithi or fruit-ſtone rocks of the Germans. It is a martial jaſper, in which elliptical kernels of calcareous ſpar and ſerpentine ſtone are included. 289
- *a.* Red, with kernels of white limeſtone, and of a green ſteatites. This is of a particular appearance, and when calcined is attracted by the loadſtone; it decays pretty much in the air, and has ſome affinity with the trapp, and alſo with the porphyry. There are ſometimes found pieces of native copper in this ſtone.

I. The *gronſten* of the Swedes. *Saxum compoſitum micâ et hornblende.* Its baſis is hornblende, interſperſed with mica. It is of a dark green colour, and is dug in ſeveral places in Smoland, where it is employed in the iron furnaces as a flux to the bog ore. 290

K. The granites. *Saxum compoſitum feltſpata, micâ et quartzo, quibus accidentaliter interdum hornblende, ſteatites, granatus et baſaltes immixti ſunt.* Its principal conſtituent parts are feltſpat, or rhombic quartz, mica, and quartz. It is found, 291

(1.) Looſe or friable. This is uſed at the Swediſh braſs-works to caſt the braſs in, and comes from France.

(2.) Hard and compact.

a. Red.

a. Red.

1. Fine-grained.
2. Coarfe-grained.

b. Grey, with many and various colours. The granites are feldom flaty or laminated, when their texture is clofe, and the harder particles, as the felt-fpat or rhombic quartz, the quartz, and the fhirl, predominate in it. They admit of a good polifh; for which reafon the Egyptians in former times, and the Italians now, work them into large pieces of ornamental architecture; for which purpofe they are extremely fit, as they do not decay in the air.

292 II. Conglutinated faxa.

A. Of larger or broken pieces of ftones of the fame kinds conglutinated together. *Breccia.*

1. Of limeftone cemented by lime.

a. The calcareous breccia; *Breccia calcarea:* the *marmi brecciati* of the Italians.

When thefe kinds have fine colours, they are polifhed and employed for ornaments in architecture, and other œconomical ufes: they come from Italy.

b. The *lumachella* of the Italians, or fhell-marbles. Thefe are a compound of fhells and corals, which are petrified or changed into lime, and conglutinated with a calcareous fubftance. When they have many colours, they are called *marbles,* and employed for the fame purpofes as the preceding.

293 2. Of kernels of jafper cemented by a jafpery fubftance. *Breccia jafpidea. Diafpro brecciato* of the Italians. Of this kind fpecimens from Italy are feen in collections. A coarfe jafper breccia is faid to be found not far from Frejus in Provence in France.

294 3. Of filiceous pebbles, cemented by a jafpery fubftance, or fomething like it. The plum-pudding ftone of the Englifh. *Breccia filicea.* Its bafis, which at the fame time is the cement, is yellow, wherein are contained fingle flinty or agaty pebbles, of a grey colour or variegated. This is of a very elegant appearance when cut and polifhed; it is found in England.

295 4. Of quartzofe kernels combined with an unknown cement. *Breccia quartzofa.*

296 5. Of kernels of feveral different kinds of ftones. *Breccia faxofa.*

a. Of kernels of porphyry, cemented by a porphyry or coarfe jafpery fubftance; *Breccia porphyrea.*

b. Of kernels of feveral faxa; *Breccia indeterminata.* Is found in loofe ftones in Dalarne, and are originally broken from the Fiell tracts in Serna, which confift of nothing elfe but conglutinated ftones.

c. Of conglutinated kernels of fandftone; *Breccia arenacea.* This kind confifts of fandftone kernels, which have been combined a fecond time together.

The above-mentioned brecciæ of themfelves muft demand the diftinctions here made between, but which perhaps may feem to be carried too far, fince their particles are fo big and plain as to be eafily known from one another. Thefe ftones are a proof both of the fubverfions which the mountains in many centuries have undergone, and of fome of hidden means which nature makes ufe of in thus cementing different kinds of ftones together. Any certain bignefs for the kernels or lumps in fuch compounds, before they deferve the name of *breccia,* cannot be determined, becaufe that depends on a comparifon which every one is at liberty to imagine. At one place in the mountain called *Hykieberget,* the kernels of porphyry have a diameter of fix feet, while in other places they are no bigger than walnuts. At Maffewala, the kernels have a progreffive fize down to that of a fine fandftone. Moft of this kind of ftone is fit for ornaments, though the workmanfhip is very difficult and coftly.

B. Conglutinated ftones of granules or fands of different kinds. Sandftone; *Lapis arenaceus.* 297

In this divifion are reckoned thofe which confift of fuch minute particles, that all of them cannot eafily be difcovered by the naked eye. The greateft part, however, confift of quartz and mica; which fubftances are the moft fit to be granulated, without being brought to a powder.

1. Cemented by clay.

a. With an apyrous or refractory clay; is of a loofe texture, but hardens, and is very refractory in the fire.

b. With common clay; from Burfwick in the ifland of Gottland.

2. With lime; refembles mortar made with coarfe fand.

a. Confifting of tranfparent and greenifh grains of quartz and white limeftone.

b. Of no vifible particles. This is of a loofe texture, and hardens in the air.

3. With an unknown cement.

a. Loofe.
b. Harder.
c. Compact.
d. Very hard.

4. Cemented by the ruft or ochre of iron. Is found in form of loofe ftones at feveral places, and ought perhaps to be reckoned among the *mineræ arenaceæ* or fand-ores; at leaft when the martial ochre makes any confiderable portion of the whole.

C. Stones and ores cemented together; *Mineræ arenaceæ.* 298

1. Of larger fragments.

a. Mountain green, or *viride montanum cupni,* and pebbles cemented together, from Siberia.

b. Potters lead-ore, with limeftone.

c. Yellow or marcafitical copper ore, with fmall pebbles.

2. Of fmaller pieces. 299

Earthy changes, &c.

a. Potters lead-ore with a quartzose sand.
b. Mountain green with sand from Siberia.
c. Cobalt ore with sand.
d. Martial ochre with sand.

300 SECOND ORDER.

MINERAL CHANGES, or the PETRIFACTIONS.

Mineralia-Larvata, vulgò *Petrifacta*,

ARE mineral bodies in the form of animals or vegetables, and for this reason no others belong to this order than such as have been really changed from the subjects of the other two kingdoms of nature. There is more difficulty to determine the first point, viz. from when these bodies are to be styled petrifactions, than from when they cease to be such.

301 I. Earthy changes; *Terræ larvatæ. Terrificata.*
A. Extraneous bodies changed into a lime substance, or calcareous changes; *Larvæ calcareæ.*
(1.) Loose or friable. Chalky changes; *Cretæ larvatæ.*
a. In form of vegetables.
b. In form of animals.
1. Calcined or mouldered shells; *Humus conchaceus.*
(2.) Indurated; *Petrifacta calcarea.*
a. Changed and filled with solid lime-stone.
1. In form of animals.
2. In form of vegetables.
b. Changed into a calcareous spar; *Petrifacta calcarea spatosa.*
1. In form of animals.
2. In form of vegetables.

302 *B* Extraneous bodies changed into a flinty substance. Siliceous changes; *Larvæ siliceæ.* These are, like the flint,
(1.) Indurated.
a. Changed into flints.
1. Carnelians in form of shells, from the river Tomm in Siberia.
2. Agat in form of wood. Such a piece is said to be in the collection of Count Tessin.
3. Coralloids of white flint, *(Millepora).*
4. Wood of yellow flint.

303 *C* Extraneous bodies changed into clay. Argillaceous changes; *Larvæ argillaceæ.*
A. Loose and friable.
1. Of porcelane clay.
a. In form of vegetables.
A piece of white porcelane clay from Japan, with all the marks of the root of a tree, has been observed in a certain collection.
2. Indurated.
1. In an unknown clay.
a. In form of vegetables. *Osteocolla.* It is said to be changed roots of the poplar tree, and not to consist of any calcareous substance.
A sort of fossil ivory is said to be found, which has the properties of a clay; but it is doubtful if it is rightly examined.

304 II. Saline extraneous bodies, or such as are penetrated by mineral salts. *Corpora peregrina insalita. Larvæ insalitæ.*

Metallic changes, &c.

A. With the vitriol of iron.
1. Animals.
a. Human bodies have been twice found in the mine at Falun in Dalarne; the last was kept a good many years in a glass-case, but began at last to moulder and fall to pieces.
2. Vegetables.
a. Turf, and
b. Roots of trees.
These are found in water strongly impregnated with vitriol. They do not burn with a flame, but only like a coal in a strong fire; neither do they decay in the air.

III. Extraneous bodies penetrated by mineral inflammable substances, or mineral phlogiston. 305
A. Penetrated by the substance of pit-coals.
1. Vegetables, which commonly have been woods, or appertaining to them.
a. Fully saturated. *Gagas.* Jet.
The jet is of a solid shining texture.
b. Not perfectly saturated; *Mumia vegetabilis.* Is loose; resembles umbre, and may be used as such.
B. Penetrated by rock-oil or asphaltum. 306
1. Vegetables.
a. Turf.
The Egyptian mummies cannot have any place here, since art alone is the occasion that those human bodies have in length of time been penetrated by the asphaltum, in the same manner as has happened naturally to the wood in pit-coal strata.
C. Penetrated by sulphur which has dissolved iron, or by marcasite and pyrites; *Pyrite impregnata. Petrifacta pyritacea.* 307
1. Human.
a. Bivalves,
b. Univalves,
c. Insects.

IV. Metals in form of extraneous bodies; *Larvæ metalliferæ.* 308
A. Silver; *Larvæ argentiferæ.*
(1.) Native.
a. On the surfaces of shells.
(2.) Mineralised with copper and sulphur.
a. Fahlertz, or grey silver ore in form of ears of corn, &c. and supposed to be vegetables, are found in argillaceous slate at Frankenberg and Tahlitteren in Hesse.
B. Copper; *Larvæ cupriferæ.*
(1.) Copper in form of calx. 309
a. In form of animals, or of parts belonging to them.
1. Ivory, and other bones of the elephant. The Turcois or Turkey stone. It is of a blueish green colour, and much valued in the east.
At Simore in Languedoc bones of animals are dug, which during the calcination assume a blue colour; but it is not

Changes from Decompofition.

not probable that the blue colour is owing to copper.

310 (2.) Mineralifed copper, which impregnates extraneous bodies; *Cuprum mineralifatum corpora peregrina ingreffum.*

A. With fulphur and iron. The yellow or marcafitical copper-ore that impregnates,

1. Animals.

a. Shells.

b. In form of fifh.

B. With fulphur and filver. Grey filver-ore or fahlerts, like ears of corn, from the flate-quarries in Heffe.

311 *C.* Changes into iron; *Larvæ ferriferæ.*

(1.) Iron in form of calx, which has affumed the place or the fhape of extraneous bodies; *Ferrum calciforme corpora peregrina ingreffum.*

a. Loofe; *Larvæ ochraceæ.*

1. Of vegetables.

Roots of trees, from the lake Langelma in Finland. See the acts of the Swedifh Academy of Sciences for the year 1742.

b. Indurated; *Larvæ hæmatiticæ.*

1. Of vegetables.

312 (2.) Iron mineralifed, affuming the fhape of extraneous bodies.

a. Mineralifed with fulphur. Marcafite. *Larvæ pyritaceæ.*

313 V. Extraneous bodies decompofing, or in a way of deftruction; *Corpora peregrina in gradibus deftructionis confiderata.* Mould; *Humus.* Turf; *Turba.*

A. From animals. Animal-mould; *Humus animalis.*

1. Shells. *Humus conchaceus.*

2. Mould of other animals; *Humus diverforum animalium.*

B. Vegetable mould; *Humus vegetabilis.*

1. Turf; *Turba.*

a. Solid, and hardening in the air; *Turba folida aëre indurefcens.*—Is the beft of this kind to be ufed for fuel, and comes neareft to the pit-coals. It often contains a little of the vitriolic acid.

b. Lamellated turba; *Turba foliata.* This is in the firft degree of deftruction.

2. Mould of lakes; *Humus lacuftris.* This is a black mould which is edulcorated by water.

3. Black mould; *Humus ater.*

This is univerfally known, and covers the furface of that loofe earth in which vegetables thrive beft.

314 THIRD ORDER. NATURAL SLAGS. *Scoriæ Vulcanorum.*

Slags.

SLAGS are found in great abundance in many places in the world, not only where volcanoes yet exift, but likewife where no fubterraneous fire is now known: Yet, in Mr Cronftedt's opinion, they cannot be produced but by means of fire. Thefe are not properly to be called *natural*, fince they have marks of violence, and of the laft change that mineral bodies can fuffer without the deftruction of the world; nor are they *artificial*, according to the univerfally-received meaning of this word. When we, perhaps, in future times, by new-difcovered means, may be able to find out of what fort of earth ftones are compounded, we fhall ftill be forced to ftop at the furface of them, and be contented with knowing that they contain a little iron.

A. Iceland agate; *Achates iflandicus niger.* 315

It is black, folid, and of a glaffy texture; but in thin pieces it is greenifh and femi-tranfparent like glafs-bottles, which contain much iron. The moft remarkable is, that fuch large folid maffes are found of it, that there is no poffibility of producing the like in any glafs-houfe.

It is found in Iceland, and in the ifland of Afcenfion: The jewellers employ it as an agate, though it is too foft to refift wear.

B. Rhenifh millftone; *Lapis molaris Rhenanus.* 316

Is blackifh-grey, porous, and perfectly refembles a fort of flag produced by mount Vefuvius.

C. Pumice-ftone; *Pumex.* 317

Is very porous and bliftered, in confequence of which it is fpecifically very light. It refembles that frothy flag which is produced in our iron furnaces.

1. White.

2. Black.

The colour of the firft is perhaps faded or bleached, becaufe the fecond kind comes in that ftate from the laboratory itfelf, viz. the volcanoes.

D. Pearl flag; *Scoriæ conftantes globulis vitreis conglomeratis.* 318

Is compounded of white and greenifh glafs particles, which feem to have been conglutinated while yet foft, or in fufion. Found on the ifle of Afcenfion.

E. Slag-fand or afhes; *Scoriæ pulverulentæ cineres vulcanorum.* 319

This is thrown out from volcanoes in form of larger or fmaller grains. It may perhaps be the principle of the Terra Puzzolana, becaufe fuch an earth is faid at this time to cover the ruins of Herculaneum near Naples, which hiftory informs us was deftroyed by a volcano during an earthquake.

MINERVA, or PALLAS, in Pagan worfhip, the goddefs of fciences and of wifdom, fprung completely armed from Jupiter's brain; and on the day of her nativity it rained gold at Rhodes. She difputed with Neptune the honour of giving a name to the city of Athens; when they agreed that whofoever of them fhould produce what was moft ufeful to mankind, fhould have that advantage. Neptune, with a ftroke of his trident, formed a horfe; and Minerva caufed an olive to fpring from the ground, which was judged to be moft ufeful, from its being the fymbol of peace. Minerva changed Arachne into a fpider, for pretending

to

to excel her in making tapeſtry. She fought the giants; favoured Cadmus, Ulyſſes, and other heroes; and refuſed to marry Vulcan, chooſing rather to live in a ſtate of celibacy. She alſo deprived Tireſias of ſight, turned Meduſa's locks into ſnakes, and performed ſeveral other exploits.

Minerva is uſually repreſented by the poets, painters, and ſculptors, completely armed, with a compoſed but agreeable countenance, bearing a golden breaſt-plate, a ſpear in her right-hand, and her ægis or ſhield in the left, on which is repreſented Meduſa's head encircled with ſnakes, and her helmet was uſually entwined with olives.

Minerva had ſeveral temples both in Greece and Italy. The uſual victim offered her was a white heifer, never yoked. The animals ſacred to her were the cock, the owl, and the baſiliſk.

MINERVÆ *Caſtrum*, *Arx Minervæ*, *Minervium*, or *Templum Minervæ*, (anc. geogr.), a citadel, temple, and town on the Ionian ſea, beyond Hydrus; ſeen a great way out at ſea. Now *Caſtro*, a town of Otranto in Naples. E. Long. 19. 25. N. Lat. 46. 8.

MINERVÆ *Promontorium* (anc. geogr.), the ſeat of the Sirens, a promontory in the Sinus Paeſtanus, the ſouth boundary of Campania on the Tuſcan coaſt; ſo called from a temple of Minerva on it: ſituate to the ſouth of Surrentum, and therefore called *Surrentinum*. Now *Capo della Minerva*, on the weſt coaſt of Naples, over-againſt the iſland Capri.

MINERVALIA, in Roman antiquity, feſtivals celebrated in honour of Minerva, in the month of March; at which time the ſcholars had a vacation, and uſually made a preſent to their maſters, called from this feſtival *minerval*.

MINGRELIA, anciently COLCHIS, a part of Weſtern Georgia, in Aſia; bounded on the eaſt by Iberia, or *Georgia* properly ſo called; on the weſt, by the Euxine Sea; on the ſouth, by Armenia, and part of Pontus; and on the north, by Mount Caucaſus.

Colchis, or Mingrelia, is watered by a great many rivers; as the Corax, the Hippus, the Cyaneus, the Chariſtus, the Phaſis, where the Argonauts landed, the Abſarus, the Ciſſa, and the Ophis, all emptying themſelves into the Euxine Sea. The Phaſis does not ſpring from the mountains in Armenia, near the ſources of the Euphrates, the Araxes, and the Tigris, as Strabo, Pliny, Ptolemy, Dionyſius, and after them Arrian, Reland, Calmet, and Sanſon, have falſely aſſerted; but riſes on Mount Caucaſus; and flows not from ſouth to north, but from north to ſouth, as appears from the map of Colchis or Mingrelia in Thevenot's collection, and the account which Sir John Chardin gives of that country. This river forms in its courſe a ſmall iſland, called alſo *Phaſis;* whence the pheaſants, if Iſidorus is to be credited, were firſt brought to Europe, and thence called by the Greeks *Phaſiani*. The other rivers of Colchis are not conſiderable.

The whole kingdom of Colchis was in ancient times very pleaſant and fruitful, as it is ſtill where duly cultivated; abounded in all the neceſſaries of life; and was enriched with many mines of gold, which gave occaſion to the fable of the Golden Fleece and the Argonautic expedition ſo much celebrated by the ancients.

The lateſt account we have of this country is from Sir John Chardin, who tells us, that its length is above 100 miles, and its breadth 60; being not near ſo extenſive as the ancient Colchis, which reached from the frontiers of Iberia or Georgia Proper, weſtward to the Palus Mæotis: that it is beautifully diverſified with hills, mountains, valleys, woods, and plains, but badly cultivated: that there are all the kinds of fruits which are found in England, growing wild, but taſteleſs and inſipid for want of culture: that, if the natives underſtood the art of making wines, thoſe of this country would be the fineſt in the world: that there are many rivers which have their ſource in Mount Caucaſus, particularly the Phaſis, now called the *Rione:* that the country abounds in beeves, hogs, wild boars, ſtags, and other veniſon; and in partridges, pheaſants, and quails: that falcons, eagles, pelicans, lions, leopards, tigers, wolves, and jackals, breed on Mount Caucaſus, and ſometimes greatly annoy the country: that the people are generally handſome, the men ſtrong and well made, and the women very beautiful; but both ſexes very vicious and debauched: that they marry their nieces, aunts, or other relations, indifferently; and take two or three wives if they pleaſe, and as many concubines as they will: that they not only make a common practice of ſelling their children, but even murder them, or bury them alive, when they find it difficult to bring them up: that the common people uſe a ſort of paſte, made of a plant called *gom*, inſtead of bread; but that that of the better ſort conſiſts of wheat, barley, or rice: that the gentry have an abſolute power over their vaſſals, which extends to life, liberty, and eſtate: that their arms are the bow and arrow, the lance, the ſabre or broad-ſword, and the buckler: that they are very naſty; and eat ſitting croſs-legged upon a carpet, like the Perſians; but the poorer ſort upon a mat or bench, in the ſame poſture: that the country is very thin of inhabitants, no leſs than 12,000 being ſuppoſed to be ſold yearly to the Turks and Perſians: that the principal commodities exported from it are, honey, wax, hides, caſtor, martinſkins, flax-ſeed, thread, ſilk, and linen-cloth; but that there are no gold or ſilver mines now, and very little money: that the revenue of the prince or viceroy, amounts to about 20,000 crowns *per annum:* that the inhabitants call themſelves *Chriſtians;* but that both they and their prieſts are altogether illiterate, and ignorant of the doctrines and precepts of Chriſtianity: that there biſhops are rich, have a great number of vaſſals, and are cloathed in ſcarlet and velvet: and that their ſervice is according to the rites of the Greek church, with a mixture of Judaiſm and Paganiſm.

The cities of moſt note in this country in ancient times were Pityus; Dioſcurias, or Dioſcorias, which was ſo called from Caſtor and Pollux, two of the Argonauts, by whom it is ſuppoſed to have been founded, and who in Greek are ſtyled *Dioſcuroi*, at preſent known by the name of *Savatapoli;* Aea on the Phaſis, ſuppoſed to be the ſame as Hupolis; *Phaſis*, ſo called from the river on which it ſtood; Cyta, at the mouth of the river Cyaneus, the birth-place of the famous Medea, called from thence, by the poets, *Cytæis;* Saraceæ, Zadris, Surium, Madia, and Zoliſſa. As for modern cities, it does not appear that there are any here

here confiderable enough to merit a defcription; or, if there are, they feem to be little, if at all, known to Europeans.

MINHO, a great river in Spain, which taking its rife in Galicia, divides that province from Portugal, and falls into the Atlantic at Caminha.

MINIATURE, in a general fenfe, fignifies reprefentation in a fmall compafs, or lefs than the reality.

MINIATURE-PAINTING;

A DELICATE kind of painting, diftinguifhed from every other fpecies of that art by the following particulars. 1. It is more delicate. 2. It requires a nearer view. 3. It is not eafily done but in little. 4. It is wrought only upon vellum, paper, or ivory; and the colours are diluted only with gum-water.

SECT. I. *Of Drawing and Defigning.*

To fucceed in this art, a man fhould be perfectly fkilled in the art of defigning or drawing: but as moft people who affect the one, know little or nothing of the other, and would have the pleafure of painting, without giving themfelves the trouble of learning to defign, (which is indeed an art that is not acquired without a great deal of time, and continual application), inventions have been found out to fupply the place of it; by means of which a man defigns or draws, without knowing how to defign.

The firft is chalking: that is, if you have a mind to do a print or defign in miniature, the back-fide of it, or another paper, muft be blackened with fmall-coal, and then rubbed very hard with the finger wrapped in a linen cloth: afterwards the cloth muft be lightly drawn over the fide fo blackened that no black grains may remain upon it to foil the vellum you would paint upon; and the print or draught muft be faftened upon the vellum with four pins, to keep it from fhifting. And if it be another paper that is blackened, it muft be put between the velom and the print, or draught, with the blackened fide upon the vellum. Then, with a blunted pin or needle, you muft pafs over the principal lines or ftrokes of the print, or draught, the contours, the plaits of the drapery, and over every thing elfe that muft be diftinguifhed; preffing fo hard, that the ftrokes may be fairly marked upon the velom underneath.

Copying by fquares is another convenient method for fuch as are but little fkilled in the art of defigning, and would copy pictures, or other things, that cannot be chalked. The method is this: The piece muft be divided into many equal parts by little fquares, marked out with charcoal, if the piece be clear and whitifh, and the black can be fairly feen upon it; or with white chalk, if it be too brown and dufky. After which, as many fquares of equal dimenfions muft be made on white paper, upon which the piece muft be defigned; becaufe, if this be done immediately upon velom, (as one is apt to mifcarry in the firft attempt), the vellum may be foiled with falfe touches. But when it is neatly done upon paper, it muft be chalked upon the vellum in the manner before defcribed. When the original and the paper are thus ordered, obferve what is in each fquare of the piece to be defigned; as a head, an arm, a hand, and fo forth; and place it in the correfponding part of the paper. And thus finding where to place all the parts of the piece, you have nothing to do but to form them well, and to join them together. By this method you may reduce or enlarge a piece to what compafs you pleafe, making the fquares of your paper greater or leffer than thofe of the original; but they muft always be of an equal number.

To copy a picture, or other thing, in the fame fize and proportion, another method is, to make ufe of varnifhed paper, or of the fkin of a hog's bladder, very tranfparent, fuch as is to be had at the gold-beaters. Talc or ifinglafs will likewife do as well. Lay any one of thofe things upon your piece; through it you will fee all the ftrokes and touches; which are to be drawn upon it with a crayon or pencil. Then take it off; and faftening it under paper or velom, fet up both againft the light in the manner of a window; and with a crayon, or a filver needle, mark out upon the paper or vellum you have put uppermoft, all the lines and touches you fhall fee drawn upon the varnifhed paper, bladder, talc, or ifinglafs, you have made ufe of, and which will plainly appear through this window.

After this manner, making ufe of the window, or of glafs expofed to the light, you may copy all forts of prints, defigns, and other pieces, on paper or velom; laying and faftening them under the paper or velom upon which you would draw them. And it is a very good and a very eafy contrivance for doing pieces of the fame fize and proportion.

If you have a mind to make pieces look another way, there is nothing to be done but to turn them; laying the printed or drawn fide upon the glafs, and faftening the paper or velom upon the back of it; remembering to let your lights fall on the left fide.

A good method likewife to take a true copy of a picture in oil, is to give a touch of the pencil upon all the principal ftrokes, with lake tempered with oil; and to clap upon the whole a paper of the fame fize: then paffing the hand over it, the touches of the lake will ftick and leave the defign of your piece expreffed upon the paper, which may be chalked like other things. But you muft remember to take off with the crumb of bread what remains of the lake upon the picture before it be dry.

You muft likewife make ufe of pounce, made of powdered charcoal put in a linen-rag; with which the piece you would copy muft be rubbed, after you have pricked all the principal ftrokes or touches, and faftened white paper or vellum underneath.

But a furer and eafier help than all thefe for one who knows nothing of defigning, is a mathematical compafs; it is generally made of ten pieces of wood, in form of rulers, half a quarter of an inch thick, half an inch broad, and a foot long, or more, according as you have a mind to draw pieces of a greater or leffer fize. To facilitate the conftruction of this inftrument, a figure is given, with an explanation of the manner in which it is to be ufed. See Plate CLXXXIII. fig. 4.

The little board A is to be of fir, and covered with linen,

Of Colours.

linen, or any other cloth; becaufe the piece you copy, and the vellum or paper you copy upon, muft be fixed upon it. Upon this board muft the compafs alfo be fixed with a pin, by the end of the firft foot B, deep enough to keep it clofe, but not fo deep as to hinder it from turning eafily. When you have a mind to reduce things, place your original on the fide of the foot C, and the vellum or paper you would draw upon on the fide of the foot B; removing the vellum or drawing it nearer, according as you intend to reduce or enlarge.

In order to enlarge a piece, you have nothing to do but to change the places of your original and your copy; placing the laft towards C, and the other on the fide of B.

And in both one and the other method, a crayon or leaden needle muft be put in the foot under which the vellum lies; and a pin, a little blunted, in that over the original, with which all the traces are to be followed; conducting the pin with one hand, and with the other preffing gently upon the crayon or needle that marks the vellum. When the crayon or needle bears fufficiently upon the vellum, you have no occafion to touch it

By this inftrument you may alfo drawn in equal dimenfions: but in order to this, the compafs muft be fixed in another manner upon the board; for if it is to be faftened upon it by the middle at D, and your original and your copy muft be fixed on each fide of this middle foot, at the equal diftances, or from corner to corner; that is, from C to E, when the pieces are large. One may likewife draw feveral copies at once of equal and different dimenfions.

When your piece is marked out upon the vellum, you muft pafs with a pencil of very clear carmine over all the traces, to the end they may not be effaced as you work: then clean your vellum with the crumb of bread, that no black may remain upon it.

Your vellum muft be pafted upon a little plate of brafs or wood, of the fize you would make your piece, to keep it firm and tight: but this pafting muft be on the edges of your vellum only, and behind the plate; for which purpofe your vellum muft exceed your plate above an inch on every fide: for the part you paint upon muft never be pafted; becaufe it would not only give it an ill look, but you could not take it off if you would. Cut off the little fhags and locks of the velom; and wetting the fair fide with a linen-cloth, dipped in water, clap the other upon the plate with a clean paper between them: fo much as hangs over muft be pafted upon the back of the plate, drawing it equally on all fides, and hard enough to ftretch it well.

Sect. II. *Of Materials.*

The chief colours made ufe of for painting in miniature, are

Carmine.
Venice and Florence lake.
Rofe pink.
Vermilion.
Red-lead.
Brown red.
Red orpiment.
Ultramarine.
Verditer.
Indigo.
Gall-ftone.
Yellow-ochre.
Dutch pink.
Gamboge.
Naples yellow.
Pale mafticot.
Deep yellow mafticot.
Ivory-black.
Lamp-black.
True Indian ink.
Biftre, or wood-foot.
Raw umber.
Burnt umber.
Sap-green.
Verdigrife.
Flake-white.
Crayons of all colours.
Gold and filver fhells.
Leaf-gold and leaf-filver.

The feven tranfparent colours, which are ufed where writing is feen through the colour.

Liquid { Lake. Blue. Yellow. Grafs-green. Dark-green. Purple-colour. Brown.

Moft of thefe colours neceffary for miniature-painting may eafily be prepared by attending to the directions given under the article Colour-*Making*.

As colours taken from earth and other heavy matter are always too coarfe, be they never fo well ground, efpecially for delicate work, becaufe of a certain fand remaining in them; the fineft parts may be drawn out by diluting them with the finger in a cup of water. When they are well fteeped, let them fettle a while: then pour out the cleareft, which will be at top, into another veffel. This will be the fineft, and muft be let dry; and when it is ufed, muft be diluted with gum-water.

If you mix a little of the gall of an ox, a carp, or an eel, particularly of the laft, in green, black, grey, yellow, and brown, colours, it will not only take away their greafy nature, but alfo give them a luftre and brightnefs they have not of themfelves. The gall of eels muft be taken out when they are fkinned, and hung upon a nail to dry; and when you would ufe it, it muft be diluted with brandy; add a little of it mixed with the colour you have diluted already. This likewife makes the colour ftick better to the velom, which it hardly does when it is greafy: moreover, this gall hinders it from fcaling,

Some colours are made clearer by fire, as yellow ochre, brown red, ultramarine, and umber: all others are darkened by it. But if you heat the faid colours with a fharp fire, they change; for the brown red becomes yellow; yellow ochre becomes red; umber reddens alfo. Cerufs by fire takes the colour of citron, and is often called *mafticot*. Obferve, that yellow ochre heated, becomes more tender than it was, and fofter than brown red. Likewife brown red heated becomes fofter than fine yellow ochre. Both are very proper. The fineft and trueft ultramarine, heated upon a redhot

Colours, &c.

hot iron, becomes more glittering; but it waftes, and is coarfer and harder to work with in miniature.

All thefe colours are diluted in little cups of ivory, made on purpofe, or in fea fhells, with water in which gum-arabic and fugar-candy are put. For inftance, in a glafs of water put a piece of gum as big as a walnut, and half that quantity of fugar-candy. This laft hinders the colours from fcaling when they are laid on, which they generally do when they want it, or the vellum is greafy.

This gum-water muft be kept in a neat bottle corked; and you never muft take any out of it with a pencil that has colour upon it, but with a quill or fome fuch thing.

Some of this water is put in the fhell with the colour you would temper, and diluted with the finger till it be very fine. If it be too hard, you muft let it foften in the fhell with the faid water before you dilute it. Afterwards let it dry: and do thus with every colour, except lily-green, fap-green, and gamboge, which muft be tempered with fair water only. But ultramarine, lake, and biftre, are to be more gummed than other colours.

If you make ufe of fea-fhells, you muft let them fteep two or three days beforehand in water: then cleanfe them in boiling-hot water, mixed with vinegar, in order to carry off a certain falt, which otherwife fticks to them, and fpoils the colours that are put to them.

To know whether colours are fufficiently gummed, you have nothing to do but to give a ftroke of the pencil upon your hand when they are diluted, which dries immediately: if they chap and fcale, there is too much gum; if they rub out by paffing the finger over them, there is too little. It may be feen likewife when the colours are laid on the vellum, by paffing the finger over them. If they ftick to it like a powder, it is a fign there is not gum enough, and more muft be put to the water with which you temper them: but take care you do not put too much; for that makes the colour extremely hard and dry. It may be known likewife by their glueinefs and brightnefs: fo the more they are gummed, the darker they paint; and when you have a mind to give a greater ftrength to a colour than it has of itfelf, you have nothing to do but to give it a great deal of gum.

Provide yourfelf with an ivory pallet, very fmooth, as big as your hand; on one fide of which the colours for the carnation, or naked parts of a picture, are to ranged in the following manner. In the middle put a great deal of white, pretty largely fpread; becaufe it is the colour moft made ufe of: and upon the edge, from the left to the right, place the following colours at a little diftance from the white.

- Mafticot.
- Dutch pink.
- Orpiment.
- Yellow-ochre.
- Green; compofed of verditer, Dutch pink, and white, in equal quantities.
- Blue; made of ultramarine, Indigo, and white, to a great degree of palenefs.
- Vermilion.
- Carmine.
- Biftre, and
- Black.

On the other fide of the pallet, fpread fome white in the fame manner as for the carnation. And when you have a mind to paint draperies, or other things, place near the white the colour you would make them of, in order to work as fhall be fhewn hereafter.

The ufe of good pencils is a great matter. In order to make a good choice, wet them a little; and if the hairs keep clofe together as you turn them upon the finger, and make but one point, they are good: but if they clofe not together, but make feveral points, and fome are longer than others, they are good for nothing. When they are too fharp-pointed, with only four or five hairs longer than the reft, yet clofing all together, they are, notwithftanding, good; but they muft be blunted with a pair of fciffars, taking care at the fame time you do not clip away too much. It is proper to have two or three forts of them; the largeft for laying the grounds and dead-colouring, and the fmalleft for finifhing.

To bring the hairs of your pencil to join clofe together and make a good point, you muft often put the pencil juft between your lips when you are at work; moiftening and preffing it clofe with the tongue, even when there is colour upon it; for if there be too much, fome of it is taken off by this means, and enough left for giving fine and equal touches. You need not apprehend this will do you any harm. None of the colours for miniature, except orpiment, when they are prepared, have either ill tafte or ill quality. This expedient muft efpecially be ufed for dotting, and for finifhing, particularly the naked parts of a picture, that the touches may be neat and fair, and not too much charged with colour. As for draperies and other things, as well in dead-colouring as in finifhing, it is fufficient, in order to make the hairs of your pencil join well, and to unload it when it has too much colour, to draw it upon the edge of the fhell, or upon the paper you muft put upon your work to reft your hand on, giving fome ftrokes upon it before you work upon your piece.

To work well in miniature, you muft do it in a room that has but one window, and fix yourfelf very near it, with a table and defk almoft as high as the window; placing yourfelf in fuch a manner, that the light may always come in on the left fide, and never forward or on the right.

When you would lay a colour on all parts equally ftrong, as for a ground, you muft make your mixtures in fhells, and put in enough for the thing you defign to paint; for if there be not enough, it is a great chance but the colour you mix afterwards is too dark or too light.

Sect. III. *Of Working.*

After having fpoke of vellum, pencils, and colours, let us now fhew how they are to be employed. In the firft place, then, when you would paint a piece, be it carnation, drapery, or any thing elfe, you muft begin by dead-colouring; that is to fay, by laying your colours on with liberal ftrokes of the pencil, in the fmootheft manner you can, as the painters do in oil; not giving it all the force it is to have for a finifhing: that

Of Working.

that is, make the lights a little brighter, and the ſhades leſs dark, than they ought to be; becauſe in dotting upon them, as you muſt do after dead-colouring, the colour is always fortified, and would at laſt be too dark.

There are ſeveral ways of dotting; and every painter has his own. Some make their dots perfectly round. Others make them a little longiſh. Others hatch by little ſtrokes that croſs each other every way, till the work appears as if it had been wrought with dots. This laſt method is the beſt, the boldeſt, and the ſooneſt done. Wherefore ſuch as would paint in miniature ought to uſe it, and to inure themſelves from the firſt to dot in the plump and the ſoft way; that is to ſay, where the dots are loſt, in a manner, in the ground upon which you work, and only ſo much appears as is ſufficient to make the work ſeem dotted. The hard and the dry way is quite the reverſe, and always to be avoided. This is done by dotting with a colour much darker than your ground, and when the pencil is not moiſtened enough with the colour, which makes the work ſeem rough and uneven.

Study likewiſe carefully to loſe and drown your colours one in another, ſo that it may not appear where they disjoin; and to this end, ſoften or allay your touches with colours that partake of both, in ſuch ſort that it may not appear to be your touches which cut and disjoin them. By the word *cut*, we are to underſtand what manifeſtly ſeparates and divides, and does not run in and blend itſelf with the neighbouring colours; which is rarely practiſed but upon the borders of drapery.

When your pieces are finiſhed, to heighten them a little, gives them a fine air; that is to ſay, give, upon the extremity of the lights, ſmall touches with a colour yet lighter, which muſt be loſt and drowned with the reſt.

When the colours are dry upon your pallet or in your ſhells, in order to uſe them, they muſt be diluted with water. And when you perceive they want gum, which is ſeen when they eaſily rub off the hand or the vellum if you give a touch with them upon either, they muſt be tempered with gum-water inſtead of pure water, till they are in condition.

There are ſeveral ſorts of grounds for pictures and and portraitures. Some are wholly dark, compoſed of biſtre, umber, and Cologn earth, with a little black and white; others more yellow, in which is mixed a great deal of ochre; others greyer, which partake of indigo. In order to paint a ground, make a waſh of the colour or mixture you would have it, or according to that of the picture or portraiture you would copy; that is to ſay, a very light lay, in which there is hardly any thing but water, in order to ſoak the vellum. Then paſs another lay over that, ſomewhat thicker, and ſtrike it on very ſmoothly with large ſtrokes as quick as you can, not touching twice in the ſame place before it be dry; becauſe the ſecond ſtroke carries off what has been laid on at the firſt, eſpecially when you lean a little too hard upon the pencil.

Other dark grounds are likewiſe made of a colour a little greeniſh: and thoſe are moſt in uſe, and the propereſt to lay under all ſorts of figures and portraitures; becauſe they make the carnation, or naked parts of a picture, appear very fine; are laid on very eaſily, and there is no occaſion to dot them, as one is often obliged to do the others, which are rarely made ſmooth, and even at the firſt; whereas in theſe one ſeldom fails of ſucceſs at the firſt bout. To make them, you muſt mix black, Dutch pink, and white, all together; more or leſs of each colour, according as you would have them darker or lighter. You are to make one lay very light, and then a thicker, as of the firſt grounds. You may alſo make them of other colours, if you pleaſe; but theſe are the moſt common.

When you paint a holy perſon upon one of theſe grounds, and would paint a ſmall glory round the head of your figure, you muſt not lay the colour too thick in that part, or you may even lay none at all, eſpecially where this glory is to be very bright: but lay for the firſt time with white and a little ochre mixed together, of a ſufficient thickneſs; and in proportion as you go from the place of the head, put a little more ochre; and to make it loſe itſelf, and die away with the colour of the ground, hatch with a free ſtroke of the pencil, following the round of the glory, ſometimes with the colour of which it is made, and ſometimes with that of the ground, mixing a little white or ochre with the laſt when it paints too dark to work with: and do this till one be inſenſibly loſt in another, and nothing can be ſeen to disjoin them.

To fill an entire ground with a glory, the brighteſt part is laid on with a little ochre and white, adding more of the firſt in proportion as you come nearer the edges of the picture: and when the ochre is not ſtrong enough (for you muſt always paint darker and darker), add gall-ſtone, afterwards a little carmine, and laſtly biſtre. This firſt laying, or dead-colouring, is to be made as ſoft as poſſible; that is to ſay, let theſe ſhadowings loſe themſelves in one another without gap or interſection. Then the way is to dot upon them with the ſame colours, in order to drown the whole together; which is pretty tedious, and a little difficult, eſpecially when there are clouds of glory on the ground. Their lights muſt be fortified in proportion as you remove from the figure, and finiſhed as the reſt, by dotting and rounding the clouds; the bright and obſcure parts of which muſt run inſenſibly into one another.

For a day-ſky, take ultramarine and a good deal of white, and mix them together. With this make a lay, as ſmooth as you can, with a large pencil and liberal ſtrokes, as for grounds; applying it paler and paler as you deſcend towards the horizon; which muſt be done with vermilion or red lead, and with white of the ſame ſtrength with that where the ſky ends, or ſomething leſs; making this blue loſe itſelf in the red, which you bring down to the ſkirts of the earth, or tops of houſes; mixing towards the end gall-ſtone and a good deal of white, in ſuch a manner that the mixture be ſtill paler than the former, without any viſible interſection or parting between all theſe colours of the ſky.

When there are clouds in the ſky, you may ſpare the places where they are to be; that is to ſay, you need not lay on any blue there, but form them, if they are reddiſh, with vermilion, gall-ſtone, and white, with a little Indigo; and if they are more upon the black, put in a good deal of the laſt; painting the lights of one and the other with maſticot, vermilion, and white, more or leſs of any of theſe colours, according to

Of Draperies.

to the ſtrength you would give them, or according to that of the original you copy; rounding the whole as you dot; for it is a difficult matter to lay them very ſmooth at the firſt painting: and if the ſky is not even enough, you muſt dot it alſo.

It is at your pleaſure to exempt the places of the clouds, for you may lay them upon the ground of the ſky; heightening the bright parts by putting a good deal of white, and fortifying the ſhadows by uſing leſs. This is the ſhorteſt way.

A night or ſtormy ſky is done with indigo, black, and white, mixed together; which is laid as for a day-ſky. To this mixture muſt be added ochre, vermilion, or brown-red, for the clouds; the lights of which are to be of maſticot, or red-lead, and a little white; now redder, now yellower, at diſcretion. And when it is a tempeſtuous ſky, and lightning appears in ſome places, be it blue or red, it is to be done as in a day-ſky, drowning and loſing the whole together at the firſt forming or dead-colouring, and at the finiſhing.

Sect. IV. *Of Draperies.*

To paint a blue drapery, put ultramine near the white upon your pallet; and mix a part of the one with the other, till it makes a fine pale, and has a body. With this mixture you muſt form the brighteſt parts; and then adding more ultramarine, form ſuch as are darker; and go on after this manner till you come to the deepeſt plaits and the thickeſt ſhades, where you muſt lay pure ultramine: and all this muſt be done as for a firſt-forming or dead-colouring; that is to ſay, laying the colour on with free ſtrokes of the pencil, yet as ſmooth as you can; loſing the lights of the ſhadows with a colour neither ſo pale as the lights, nor ſo dark as the ſhades. Then dot with the ſame colour as in the firſt-forming, but a ſmall matter deeper; that the dots may be fairly ſeen. All the parts muſt be drowned one in another, and the plaits appear without interſection. When the ultramarine is not dark enough to make the deeper ſhadows, how well ſoever it be gummed, mix a little Indigo with it to finiſh them. And when the extremities of the lights are not bright enough, heighten them with white and a very little ultramarine.

A drapery of carmine is done in the ſame manner as the blue; except that in the darkeſt places there is to be a lay of pure vermilion, before you dead-colour with carmine, which muſt be applied at top; and in the ſtrongeſt ſhades, it muſt be gummed very much. To deepen it the more, mix a little biſtre with it.

There is likewiſe made another red drapery, which is firſt drawn with vermilion, mixing white with it to dead-colour the bright places; laying it pure and unmixed for thoſe that are darker, and adding carmine for the grand ſhades. It is finiſhed afterwards, like other draperies, with the ſame colours. And when the carmine with the vermilion do not darken enough, work with the firſt alone, but only in the deepeſt of the ſhades.

A drapery of lake is made in the ſame manner with that of carmine; mixing a good deal of white with it for the bright places, and very little for thoſe that are dark. It is finiſhed likewiſe with dotting; but you have nothing to do with vermilion in it.

Violet-draperies are likewiſe done after this manner; after making a mixture of carmine and ultramarine, putting always white for the bright parts. If you would have your violet be columbine or dove-colour, there muſt be more carmine than ultramarine: but if you would have it bluer and deeper, put more ultramarine than carmine.

A drapery is made of a fleſh-colour, beginning with a lay made of white, vermilion, and very pale lake; and making the ſhades with the ſame colours, uſing leſs white in them. This drapery muſt be very pale and tender, becauſe the ſtuff of this colour is thin and light; and even the ſhades of it ought not to be deep.

To make a yellow drapery, put a lay of maſticot over all; then one of gamboge upon that, excepting the brighteſt places, where the maſticot muſt be left entire; the dead-colour with ochre, mixed with a little gamboge and maſticot, putting more or leſs of the laſt according to the ſtrength of the ſhades. And when theſe colours do not darken enough, add gall-ſtone. And gall-ſtone pure and unmixed is uſed for the thickeſt ſhades; mixing a little biſtre with it, if there be occaſion to make them ſtill darker. You finiſh by dotting with the ſame colours you dead-coloured with, and loſing the lights and the ſhades in one another.

If you put Naples-yellow, or Dutch-pink, in lieu of maſticot and gamboge, you will make another ſort of yellow.

The green drapery is made by a general lay of verditer; with which, if you find it too blue, mix maſticot for the lights, and gamboge for the ſhades. Afterwards add to this mixture lily-green or ſap-green, to ſhadow with; and as the ſhades are thicker, put more of theſe laſt greens, and even work with them pure and unmixed where they are to be extremely dark. You finiſh with the ſame colours, a little darker.

By putting more yellow, or more blue, in theſe colours, you may make different ſorts of greens as you pleaſe.

To make a black drapery, you dead-colour with black and white, and finiſh with the ſame colour, putting more black, as the ſhades are thicker; and for the darkeſt, mix indigo with it, eſpecially when you would have the drapery appear like velvet. You may always give ſome touches with a brighter colour, to heighten the lights of any drapery whatſoever.

A white woolen drapery is made by a lay of white, in which there muſt be a very ſmall matter of ochre, orpiment, or gall-ſtone, that it may look a little yellowiſh. Then dead-colour, and finiſh the ſhades with blue, a little black, white, and biſtre; putting a great deal of the laſt in the darkeſt.

The light-grey is begun with black and white, and finiſhed with the ſame colour deeper.

For a brown drapery, make a lay of biſtre, white and a little brown-red; and ſhadow with this mixture, made a little darker.

There are other draperies, called *variable*, becauſe the lights are of a different colour from the ſhades. Theſe are moſtly uſed for the veſtments of angels, for young and gay people, for ſcarfs and other airy attire, admitting of a great many folds, and flowing at the

Of Draperies.

pleasure of the wind. The most common are the violets: of which they make two sorts; one, where the lights are blue; and the other, where they are yellow.

For the first, put a lay of ultramarine and very pale white upon the lights; and shadow with carmine, ultramarine, and white, as for a drapery wholly violet; so that only the grand lights appear blue. Yet they must be dotted with violet, in which there is a great deal of white, and lost insensibly in the shades.

The other is done by putting upon the lights only, instead of blue, a lay of masticot; working the rest as in the drapery all violet, excepting that it must be dotted, and the light parts blended with the shadowy, that is, the yellow with the violet, with a little gamboge.

The carmine-red is done like the last; that is, let the lights be done with masticot, and the shades with carmine; and to lose the one in the other, make use of gamboge.

The lake-red is done like that of carmine.

The green is done as the lake; always mixing verditer with lily or sap-green, to make the shades; which are not very dark.

Several other sorts of draperies may be made at discretion, always taking care to preserve the union of the colours, not only in one sort of cloth or so, but also in a group of several figures; avoiding, as much as the subject will allow, the putting of blue near the colour of fire, of green against black; and so of other colours which cut and disjoin, and whose union is not kind enough.

Several other draperies are made of foul colours, as brown-red, bistre, indigo, &c. and all in the same manner. Likewise of other colours, simple and compound; the agreement between which is always to be minded, that the mixture may produce nothing harsh and disagreable to the eye. No certain rule can be laid down for this. The force and effect of your colours are only to be known from use and experience, and you most work according to that knowledge.

Linen-cloths are done thus: After drawing the plaits or folds, as is done in a drapery, put a lay of white over all; then dead-colour, and finish the shades with a mixture of ultramarine, black, and white, using more or less of the last, according to their strength or tenderness; and in the greatest deepenings put bistre, mixed with a little white; giving only some touches of this mixture, and even of pure bistre, upon the extremities of the greatest shadows, where the folds must be drawn, and lost with the rest.

They may be done in another manner, by making a general lay of this mixture of ultramarine, black and very pale white; and dead-colour (as has been said before) with the same colour, but a little deeper. And when the shades are dotted and finished, heighten the lights with pure white, and lose them with the deepenings of the linen. But of whateve sort you make them, when they are finished, you must give a yellowish teint of orpiment and white to certain places; laying it lightly on, and as it were in water; so that what is underneath may, notwithstanding, plainly appear, as well the shadows as the dotting.

Yellow linen-cloth is done by putting a lay of white, mixed with a little ochre. Then form and finish the shades with bistre, mixed with white and ochre; and in the thickest shades use pure bistre: and before you finish, give some teints here and there of ochre and white, and others of white and ultramarine, as well upon the shades as the lights; but let them be very bright; and drown the whole together in dotting, and it will look finely. As you finish, heighten the extremities of the lights with masticot and white. You may add to this sort of linen, as well as to the white, certain bars from space to space, as in Turkey-mantuas; that is, small stripes blue and red with ultramarine and carmine; one of red between two of blue, very bright and clear upon the lights, and deeper upon the shades. Virgins are pretty often dressed with veils of this sort (by Popish painters), and scarfs of this kind are put about necks that are bare; because they become the teint mighty well.

If you would have both these sorts of linen transparent, and the stuff or other thing that is beneath appear through them, make the first lay for them very light and clear, and mix in the colour to shadow with, a little of that which is underneath, especially towards the end of the shades; and only do the extremities of the lights, for the yellow, with masticot and white; and for the white, with pure white.

They may be done in another manner, especially when you would have them altogether as clear as muslin, lawn, or gauze. To this end form and finish what is to be beneath, as if nothing was to be put over it. Then mark out the light and clear folds with white or masticot; and a shadowy with bistre and white, or with black, blue, and white, according to the colour you would make them of; making the rest somewhat fainter: yet this is not necessary but for the parts that are not to be so clear.

Crape is done the same way; excepting that the folds of the shades and the lights, and the borders too, are to be marked out with little filaments of black upon what is underneath; which is likewise to be finished beforehand.

When you would make a stuff like a watered tabby, make the waves upon it with a colour a little lighter, or a little darker, in the lights and the shades.

There is a manner of touching draperies which distinguishes the silken from the woolen. The last are more terrestrial and sensible; the others more light and fading. But it must be observed, that this is an effect which depends partly upon the stuff and partly upon the colour; and for the employing these in a manner suitable to the subjects and the deepenings of painting, we shall here touch upon their different qualities.

We have no colour which partakes more of light, nor which comes nearer the air, than white; which shews it to be fickle and fleeting. It may, nevertheless, be held and brought to by some neighbouring colour, more heavy and sensible, or by mixing them together.

Blue is a most fleeting colour: and so we see, that the sky and the remotest views of a picture are of this colour; but it will become lighter and fickler, in proportion as it is mixed with white.

Pure black is the heaviest and most terrestrial of all co-

Of Draperies.

colours; and the more of it you mix with others, the nearer you bring them to the eye.

Neverthelefs, the different difpofitions of black and white make alfo their effects different: for white often makes black difappear, and black brings white more into view; as in the reflection of globes, or other figures to be made round, where there are always parts that fly as it were from the eye, and deceive it by the craft of art: and under the white are here comprehended all the light colours; as under the black, all the heavy colours.

Ultramarine is, then, foft and light.

Ochre is not fo much fo.

Mafticot is very light; and fo is verditer.

Vermilion and carmine come near this quality.

Orpiment and gamboge not fo near.

Lake holds a certain mean, rather foft than rough.

Dutch pink is an indifferent colour, eafily taking the quality of others. So it is made terreftrial by mixing it with colours that are fo; and, on the contrary, the moft light and fleeting by joining it with white or blue.

Brown-red, umber, dark greens, and biftre, are the heavieft and moft terreftrial, next to black.

Skilful painters, who underftand perfpective, and the harmony of colours, always obferve to place the dark and fenfible colours on the fore-parts of their pictures; and the moft light and fleeting they ufe for the diftances and remote views. And as for the union of colours, the different mixtures that may be made of them will learn you the friendfhip or antipathy they have to one another. And upon this you muft take your meafures for placing them with fuch agreement as fhall pleafe the eye.

For the doing of lace, French-points, or other things of that nature, put over all a lay of blue, black, and white, as for linen: then heighten the flower-work with pure white: afterwards make the fhades above with the firft colour, and finifh them with the fame. When they are upon the carnation or naked parts of a picture, or upon any thing elfe that you would fhow through another, finifh what is beneath, as if nothing was to be put over it: and at top, make the points or lace with pure white, fhadowing and finifhing them with the other mixture.

If you would paint a fur, you muft begin with a kind of drapery, done, if it be dark, with biftre and white, making the fhadowings of the fame colour, with lefs white. If the fur be white, do it with blue, white, and a little biftre. And when this beginning, or firft-forming, is done, inftead of dotting, draw fmall ftrokes, turning, now in one manner, now in another, according to the courfe and flatting of the hair. Heighten the lights of dark furs with ochre and white, and of the other with white and a little blue.

For doing a building, if it be of ftone, take indigo, biftre, and white, with which make the beginning or firft form of it; and for fhadowing it, put lefs of this laft; and more biftre than indigo, according to the colour of the ftone you would paint. To thefe you may likewife add a little ochre, both for the forming and the finifhing. But to make it finer, you muft give, here and there, efpecially for old fabrics, blue and yellow teints, fome with ochre, others with ultramarine, mixing always white with them, whether before the firft-forming, provided they appear through the draught, or whether upon it, lofing or drowning them with the reft when you finifh.

When the building is of wood, as there are many forts, it is done at difcretion; but the moft ordinary way is to begin or firft-form with ochre, biftre, and white, and finifh without white, or with very little; and if the fhades are deep, with pure biftre. In the other they add fometimes vermilion, fometimes green or black; in a word, juft according to the colour they would give it; and they finifh with dotting, as in draperies and every thing elfe.

Of Carnations.

Sect. V. *Of Carnations, or the naked parts of Painting.*

There are in carnation fo many different colourings, that it would be a difficult thing to give general rules upon fo variable a fubject. Nor are they minded, when one has got, by cuftom and practice, fome habit of working eafily: and fuch as are arrived to this degree, employ themfelves in copying their originals, or elfe they work upon their ideas, without knowing how: infomuch, that the moft fkilful, who do it with lefs reflection and pains than others, would likewife be more put to it to give an account of their maxims and knowledge in the matter of painting, if they were to be afked what colours they made ufe of for fuch and fuch a colouring, a teint here, and another there.

Neverthelefs, as beginners want fome inftruction at the firft, we will fhow in general, after what manner feveral carnations are to be done.

In the firft place, after having drawn your figure with carmine, and ordered your piece, apply, for women and children, and generally for all tender colourings, a lay of white, mixed with a very little of the blue made for faces, of which we have told the compofition; but let it hardly be feen.

And for men, inftead of blue, they put in this firft lay a little vermilion; and when they are old, a little ochre is mixed with it.

Afterwards follow all the traces with vermilion, carmine, and white, mixed together; and begin all the fhades with this mixture, adding white in proportion as they are weaker; and putting but little in the darkeft, and none, in a manner, in certain places where ftrong touches are to be given: for inftance, in the corner of the eye; under the nofe; at the ears; under the chin; in the feparations of the fingers; in all joints; at the corners of the nails; and generally in every part where you would mark out feparations in fhades that are obfcure. Neither need you fear to give to thofe places all the force and ftrength they ought to have as foon as you begin or firft-form them, becaufe in working at top with green, the red you have put there is always weakened.

After having begun, or firft-formed, or dead-coloured, with red, make blue teints with ultramarine and a great deal of white, upon the parts which fly from the eye; that is to fay, upon the temples; under and in the corners of the eyes; on both fides the mouth, above and below; a little upon the middle of the forehead; between the nofe and the eyes; on the fide of the cheeks; on the neck and other places where

Of Carnations.

where the flesh assumes a bluish cast. Yellowish teints are likewise made with ochre or orpiment, and a little vermilion mixed with white, under the eye-brows, on the sides of the nose towards the bottom, a little underneath the cheeks, and upon the other parts which rise and come nearer the eye. It is especially from these teints that the natural complexion is to be observed, in order to catch it; for painting being an imitation of nature, the perfection of the art consists in the justness and simplicity of the representation, especially in face-painting.

When, therefore, you have done your first lay, your dead colouring, and your teints, you must work upon the shades, dotting with green for the carnations or naked parts; mixing, according to the rule we have given for the teints, a little blue for the parts which fly from the eye; and, on the other hand, making it a little yellower for those that are more sensible; that is to say, which rise, and come nearer the eye: and at the end of the shades, on the side of the light, you must blend and lose your colour insensibly in the ground of the carnation with blue, and then with red, according to the places where you paint. If this mixture of green does not work dark enough at first, pass over the shades several times, now with red, and now with green; always dotting: and this do till they are as they should be.

And if you cannot with these colours give the shades all the force they ought to have, finish, in the darkest, with bistre mixed with orpiment, ochre, or vermilion, and sometimes with pure bistre, according to the colouring you would make, but lightly, laying on your colour very clear.

You must dot upon the clear and bright places with a little vermilion or carmine, mixed with much white, and a very small matter of ochre, in order to lose them with the shadowy, and to make the teints die away insensibly into one another; taking care, as you dot, or hatch, to make your strokes follow the turnings and windings of the fleshy parts. For though the rule be to cross always, this dotting or hatching ought to appear a little more here, because it rounds the parts. And as this mixture might make a colouring too red, if it was always to be used, they work likewise in every part, to blend the teints and the shades, with blue and a little green, and much white, so mixed as to be very pale; excepting, nevertheless, that this colour must not be put upon the cheeks, nor upon the extremities of the clear parts, no more than the other mixture upon these last, which must be left with all their light; as certain places of the chin, of the nose, and of the forehead, and upon the cheeks; which, and the cheeks, ought nevertheless to be redder than the rest, as well as the feet, the hollows of the hands, and the fingers of both.

Observe, that these two last mixtures ought to be so pale, that the work shall hardly be visible; for they serve only to soften it; to unite the teints with one another, and the shades with the lights, and to drown the traces. Care must likewise be taken that you work not too much with the red mixture upon the blue teints, nor with the blue upon the others; but change the colour from time to time, when you perceive it works too blue or too red, till the work be finished.

The white of the eyes must be shadowed with this same blue, and a little flesh-colour; and the corners, on the side of the nose, with vermilion and white; giving them a little touch of carmine. The whole is softened with this mixture of vermilion, carmine, white, and a very small matter of ochre.

The apples or balls of the eyes are done with the mixture of ultramarine and white; the last prevailing a little; adding a little bistre, if they are yellowish; or a little black, if they are grey. Make the little black circle in the middle, called the *crystal of the eye;* and shadow the balls with indigo, bistre, or black, according to the colour they are of; giving to each a small touch of pure vermilion round the crystal; which must be lost with the rest at the finishing. This gives vivacity to the eye.

The round or circumference of the eye is done with bistre and carmine; that is to say, the slits or partings, and the eye-lids, when they are large and bold; especially the upper ones; which must afterwards be softened with the red or blue mixtures we have mentioned before, to the end they may be lost in one another, and nothing seem interfected. When this is done, give a little touch of pure white upon the crystal, on the side of the lights. This makes the eye shine, and gives life to it.

The mouth is dead-coloured with vermilion, mixed with white; and finished with carmine, which is softened as the rest. And when the carmine does not work dark enough, mix a little bistre with it. This is to be understood of the corners in the separation in the lips; and particularly, of certain mouths half open.

The hands, and all the other parts of carnation, are done in the same manner as the faces; observing, that the ends of the fingers be a little redder than the rest. When your whole work is formed and dotted, mark the separations of all the parts with little touches of carmine and orpiment mixed together, as well in the shadowy as the light places; but a little deeper and stronger in the first; and lose them in the rest of the carnation.

The eye-brows and the beard are dead-coloured, as are the shades of carnations; and finished with bistre, ochre, or black, according to the colour they are of, drawing them by little strokes the way they ought to go; that is to say, give them all the nature of hair. The lights of them must be heightened with ochre and bistre, a little vermilion, and much white.

For the hair of the head, make a lay of bistre, ochre, and white, and a little vermilion. When it is very dark-coloured, use black instead of ochre. Afterwards form the shadowy parts with the same colours, putting less white in them; and finish with pure bistre, or mixed with ochre or black, by small strokes very fine, and close to each other, waving and buckling them according to the curling of the hair. The light parts must also be heightened by little strokes with ochre or orpiment, white, and a little vermilion. After which, lose the lights and the shades in each other, by working sometimes with a dark, and sometimes with a pale colour.

And for the hair about the forehead, thro' which the skin is seen, it must be first formed with the colour thereof, and that of the carnation, working and shadowing with one and the other, as if you designed

to

Of Carnations.

to paint none. Then form it, and finish with bistre. The lights are to be heightened as the other. Grey hair is dead-coloured with white, black, and bistre, and finished with the same colour, but deeper; heightening the bright and clear parts of the hair, as well as those of the eye-brows and the beard, with white and very pale blue, after having formed them as the others, with the colour of the flesh or skin; and finish with bistre.

But the most important thing is to soften one's work; to blend the teints in one another, as well as the beard and the hair about the forehead, with the other hair and the carnation; taking especial care not to work rough and dry; and that the traces, turnings and windings of the carnation, or naked parts, be not interfected. You must likewise accustom yourself to put white in your colours only in proportion as you work lighter or darker: for the colour you use the second time must be always a little stronger and deeper than the first, unless it be for softening.

Different colourings are easily made, by putting more or less of red, or blue, or yellow, or bistre, whether for the dead-colouring, or for the finishing. That for women ought to be bluish; that for children a little red; and both fresh and florid. That for men ought to be yellower; especially when they are old.

To make a colouring of death, there must be a first lay of white and orpiment, or a very pale ochre: dead-colour with vermilion, and lake, instead of carmine, and a good deal of white; and afterwards work over it with a green mixture, in which there is more blue than any other colour, to the end the flesh may be livid and of a purple colour. The teints are done the same way as in another colouring; but there must be a great many more blue than yellow ones, especially upon the parts which fly from the sight, and about the eyes; and the last are only to be upon the parts which rise, and come nearer the eye. They are made to die away in one another, according to the ordinary manner; sometimes with very pale blue, and sometimes with ochre and white, and a little vermilion; softening the whole together. The parts and contours must be rounded with the same colours. The mouth is to be, in a manner, of a quite violet. It is dead-coloured, however, with a little vermilion, ochre, and white; but finished with lake and blue: and to give it the deep strokes, they take bistre and lake; with which they likewise do the same to the eyes, the nose, and the ears. If it is a crucifix, or some martyr, upon whom blood is to be seen, after the finishing the carnation, form it with vermilion, and finish it with carmine, making in the drops of blood a little bright reflecting spark, to round them. For the crown of thorns, make a lay of sea-green and masticot; shadow it with bistre and green; and heighten the clear and light parts with masticot.

Iron is formed, or first laid, with indigo, a little black and white; and finished with pure indigo, heightening it with white.

For painting fire and flames, the lights are done with masticot and orpiment; and for the shades, they mix vermilion and carmine.

A smoke is done with black, indigo and white, and sometimes with bistre: one may likewise add vermilion or ochre, according to the colour it is to be of.

Pearls are painted by putting a lay of white, and a little blue: they are shadowed and rounded with the same colour, deeper: a small white dot is made almost in the middle, on the side of the light; and on the other side, between the shadow and the edge of the pearl, they give a touch with masticot, to make the reflection; and under the pearls is made a little shadow of the colour of the ground they are upon.

Diamonds are done with pure black; then they heighten them with little touches of white on the side of the light. It is the same thing for any other jewels you have a mind to paint: there is nothing to be done but to change the colour.

For making a figure of gold, put a lay of shell-gold, and shadow it with gall-stone. Silver is done the same way; excepting that it must be shadowed with indigo.

One great means to acquire a perfection in the art, is to copy excellent originals. We enjoy with pleasure and tranquillity the labour and pains of others. But a man must copy a great number before he is able to produce as fine effects; and it is better to be a good copier than a bad author.

Of Landscapes.

Sect. VI. *Of Landscapes.*

In the first first place, after having ordered the œconomy of your landscape as of your other pieces, you must form the nearest grounds or lands, when they are to appear dark, with sap or lily-green, bistre, and a little verditer, to give a body to your colour; then dot with this mixture, but a little darker, adding sometimes a little black to it.

For such pieces of ground as the light falls upon, and which are therefore clear and bright, make a lay of ochre and white: then shadow and finish with bistre. In some they mix a little green, particularly for shadowing and finishing.

There are sometimes upon the fore-part certain reddish lands; which are dead-coloured with brown-red, white, and a little green; and finished with the same, putting a little more green in them.

For the making of grass and leaves upon the fore-ground, you must, when that is finished, form with sea-green, or verditer, and a little white; and for those that are yellowish, mix masticot. Afterwards shadow them with lily-green, or bistre and gall-stone, if you would have them appear withered.

The grounds or lands at a little distance, are formed with verditer, and shadowed and finished with sap-green, adding bistre for some of the touches here and there.

Such as are at a greater distance, are done with sea-green and a little blue; and shadowed with verditer.

In a word, the farther they go, the more blueish they are to be made; and the farthest distances ought to be of ultramarine and white; mixing in some places small touches of vermilion.

Water is painted with indigo and white, and shadowed with the same colour, but deeper: and to finish it, instead of dotting, they do nothing but make strokes and traces without crossing; giving them the same turn with the waves, when there are any. Sometimes a little green must be mixed in certain places, and

Of Landscapes.

and the light and clear parts heightened with pure white, particularly where the water foams.

Rocks are dead-coloured like buildings of ftone; excepting that a little green is mixed for forming and fhadowing them. Blue and yellow teints are made upon them, and loft with the reft in finifhing. And when there are fmall branches, with leaves, mofs, or grafs, when all is finifhed, they are to be raifed at top with green and mafticot. They may be made yellow, green, and reddifh, for appearing dry, in the fame manner as on the ground. Rocks are dotted as the reft; and the farther they are off, the more greyifh they are made.

Caftles, old houfes, and other buildings of ftone and wood, are done in the manner abovementioned; fpeaking of thofe things, when they are upon the firft lines. But when you would have them appear at a diftance, you muft mix brown-red and vermilion, with much white; and fhadow very tenderly with this mixture; and the farther they are off, the weaker are the ftrokes to be for the feparations. If they are covered with flate, it is to be made bluer than the reft.

Trees are not done till the fky be finifhed; one may, neverthelefs, fpare the places of them when they contain a good number: and however it be, fuch as come near the eye, are to be dead-coloured with verditer, mixing fometimes ochre; and fhadowed with the fame colours, adding, lily-green. Afterwards you muft work leaves upon them by dotting without croffing: for this muft be done with fmall longifh dots, of a darker colour, and pretty full of it, which muft be conducted on the fide the branches go, by little tufts of a little darker colour. Then heighten the lights with verditer or fea-green, and mafticot, making leaves in the fame manner: and when there are dry branches or leaves, they are dead-coloured with brown-red or gall-ftone, with white; and finifhed with gall-ftone, without white, or with biftre.

The trunks of trees are to be dead-coloured with ochre, white, and a little green, for the light and clear parts; and for the dark, they mix black, adding biftre and green for fhadowing one and the other. Blue and yellow teints are likewife made upon them, and little touches given here and there with white and mafticot; fuch as you ordinarily fee upon the bark of trees.

The branches which appear among the leaves are done with ochre, verditer, and white; or with biftre and white, according to the light they are placed in. They muft be fhadowed with biftre and lily-green.

Trees, which are at a little diftance, are dead-coloured with verditer and fea-green; and are fhadowed and finifhed with the fame colours, mixed with lily-green. When there are fome which appear yellowifh, lay with ochre and white, and finifh with gall-ftone.

For fuch as are in the diftances and remote views, you muft dead-colour with fea-green; with which, for finifhing, you muft mix ultramarine. Heighten the lights of one and the other with mafticot, by fmall disjoined leaves.

It is the moft difficult part of landfcape, in manner of miniature, to leaf a tree well. To learn, and break one's hand to it a little, the way is to copy good ones; for the manner of touching them is fingular, and cannot be acquired but by working upon trees themfelves; about which you muft obferve to make little boughs, which muft be leafed, efpecially fuch as are below and towards the fky.

And generally, let your landfcapes be coloured in a handfome manner, and full of nature and truth; for it is that which gives them all their beauty.

Of Flowers.

Sect. VII. *Of Flowers.*

It is an agreeable thing to paint flowers, not only on account of the fplendour of their different colours, but alfo by reafon of the little time and pains that are beftowed in trimming them. There is nothing but delight in it; and, in a manner, no application. You maim and bungle a face, if you make one eye higher than another; a fmall nofe with a large mouth; and fo of other parts. But the fears of thefe difproportions conftrain not the mind at all in flower-painting; for unlefs they be very remarkable, they fpoil nothing. For this reafon moft perfons of quality, who divert themfelves with painting, keep to flowers. Neverthelefs, you muft apply yourfelf to copy juftly: and for this part of miniature, as for the reft, we refer you to nature, for fhe is your beft model. Work, then, after natural flowers; and look for the teints and different colours of them upon your pallet: a little ufe will make you find them eafily; and to facilitate this to you at the firft, we fhall, in the continuance of our defign, fhew the manner of painting fome; for natural flowers are not always to be had; and one is often obliged to work after prints, where nothing is feen but graving.

It is a general rule, that flowers are defigned and laid like other figures; but the manner of forming and finifhing them is different: for they are firft formed only by large ftrokes and traces, which you muft turn at the firft the way the fmall ones are to go, with which you finifh; this turning aiding much thereto. And for finifhing them, inftead of hatching or dotting, you draw fmall ftrokes very fine, and very clofe to one another, without croffing; repaffing feveral times, till your dark and your clear parts have all the force you would give them.

Of Roses.—After making your firft fketch, draw with carmine the red rofe, and apply a very pale lay of carmine and white. Then form the fhades with the fame colour, putting lefs white in it: and laftly, with pure carmine, but very bright and clear at the firft; fortifying it more and more as you proceed in your work, and according to the darknefs of the fhades. This is done by large ftrokes. Then finifh; working upon it with the fame colour by little ftrokes, which you muft make go the fame way with thofe of the graving, if it be a print you copy; or the way the leaves of the rofe turn, if you copy after a painting, or after nature; lofing the dark in the clear parts, and heightening the greateft lights, and the brighteft or moft lightfome leaves, with white and a little carmine. You muft always make the hearts of rofes, and the fide of the fhadow darker than the reft; and mix a little indigo for fhadowing the firft leaves, particularly when the rofes are blown, to make them feem faded. The feed is dead-coloured with gamboge; with which a little fap-green is mixed for fhadowing. Rofes ftreaked with feveral colours, ought to be paler than

Of Flowers.

than others, that the mixture of colours may be better feen; which are done with carmine; a little darker in the fhades, and very clear in the lights; always hatching by ftrokes. For white rofes you muft put a lay of white, and form and finifh them as the red; but with black, white, and a little biftre; and make the feed a little yellower. Yellow rofes are done by putting in every part a lay of mafticot, and fhadowing them with gamboge, gall-ftone, and biftre; heightening the clear and light places with mafticot and white.

The ftiles, the leaves, and the buds of all forts of rofes are formed with verditer, with which is mixed a little mafticot and gamboge; and for fhadowing them, they add fap-green, putting lefs of the other colours when the fhades are deep. The outfide of the leaves ought to be bluer than the infide: wherefore it muft be dead-coloured with fea-green, and fap-green mixed with that for fhadowing, making the veins or fibres on this fide clearer than the ground, and thofe on the other fide darker. The prickles which are upon the ftiles and buds of rofes, are done with little touches of carmine, which are made to go every way; and for thofe that are upon the ftalks, they are formed with verditer and carmine, and fhadowed with carmine and biftre; making the bottom of the ftalks more reddifh than the top; *i. e.* you muft mix with the green, carmine and pure biftre.

Of Tulips.—As there is an infinity of tulips, different from one another, one cannot pretend to mention the colours with which they are all done. We will only touch upon the handfomeft, called *ftreaked:* and thefe ftreaks are dead-coloured, with very clear carmine in fome places, and with darker in others; finifhing with the fame colour by little ftrokes, which muft be carried the fame way with the ftreaks. And in others is put firft a lay of vermilion. Then they form them by mixing carmine, and finifh them with pure carmine. In fome they put Florence-lake over the vermilion inftead of carmine. Some are done with lake and carmine mixed together, and with lake alone, or with white and lake for the firft forming; whether it be rofe-pink or Florence-lake. There are fome of a purple colour, which are formed with ultramarine, carmine, or lake, fometimes bluer and fometimes redder. The manner of doing both one and the other is the fame: there is no difference but in the colours. You muft, in certain places, as between the ftreaks of vermilion, carmine, or lake, fometimes put blue made of ultramarine and white, and fometimes a very bright purple, which is finifhed by ftrokes as the reft, and loft with the ftreaks. There are fome likewife that have fallow teints, that are made with lake, biftre, and ochre, according as they are: but this is only in fine and rare tulips, and not in the common ones. For fhadowing the bottom of them, they ordinarily take indigo and white for fuch whofe ftreaks are of carmine. For fuch as are of lake, they take black and white; with which, in fome, biftre is mixed, and in others green. Some are likewife to be fhadowed with gamboge and umber, and always by ftrokes and traces, that turn as the leaves turn. Other tulips are likewife done, called *bordered;* that is to fay, the tulip is not ftreaked but on the edges of the leaves, where there is a border. It is white in the purple; red in the yellow; yellow in the red; and red in the white. The purple is laid with ultramarine, carmine, and white; fhadowing and finifhing it with this mixture. The border is fpared; that is to fay, let only a light lay of white be put there, and let it be fhadowed with very bright indigo. The yellow is formed with gamboge, and fhadowed with the fame colour, mixing ochre and umber or biftre with it. The border is laid with vermilion, and finifhed with a very fmall matter of carmine. The red is formed with vermilion, and finifhed with the fame colour, mixing carmine or lake with it. The bottom and the border are done with gamboge; and for finifhing, they add gall-ftone and umber, or biftre. The white is fhadowed with black, blue, and white. Indian ink is very proper for this. The fhadowings of it are very tender. It produces alone the effect of blue and white, mixed with the other black. The border of this white tulip is done with carmine. In all thefe forts of tulips, they leave a nerve or finew in the middle of the leaves that are brighter than the reft: and the borders are drowned at the bottom by fmall traces, turning croffwife; for they muft not appear cut and feparated, as the ftreaked or party-coloured. They make them likewife of feveral other colours.—When they happen to be fuch whofe bottoms on the infide are black, as it were, they form and finifh them with indigo, as alfo the feed about the nozzle or ftalk. And if the bottom is yellow, it is formed with gamboge, and finifhed by adding umbre or biftre. The leaves and the ftalks of tulips are ordinarily formed with fea-green, and fhadowed and finifhed with lily-green, by large traces all along the leaves. Some may likewife be done with verditer, mixing mafticot with it, and fhadowed with fap-green, that the green of the fhades may be yellower.

The Anemony, or *Wind-flower.*—There are feveral forts of them, as well double as fingle. The laft are ordinarily without ftreaks. Some are made of a purple colour, with purple and white, fhadowing them with the fame colour; fome redder, others bluer; fometimes very pale, and fometimes very dark. Others are formed with lake and white, and finifhed with the fame, putting lefs white; fome without any white at all. Others are formed with vermilion, and fhadowed with the fame colour, adding carmine. We fee likewife white ones, and fome of a citron colour. The laft are laid with mafticot; and one and the other fhadowed and finifhed fometimes with vermilion, and fometimes with very brown lake, efpecially near the feed, at the bottom; which is often likewife of a blackifh colour, that is done with indigo, or black and blue, mixing for fome a little biftre; and always working by very fine ftrokes and traces, and lofing the lights in the fhades. There are others that are brighter and clearer at the bottom than any where elfe; and fometimes they are perfectly white there, though the reft of the flower be dark. The feed of all thefe anemonies is done with indigo and black, with a very little white, and fhadowed with indigo; and in fome it is raifed with mafticot. The double anemonies are of feveral colours. The handfomeft have their large leaves ftreaked. Some are done, that is, the ftreaked or party-coloured, with vermilion, to which carmine is added for the finifhing; fhadowing the reft of the leaves with indigo; and for the fmall leaves

Of Flowers.

leaves within, a lay is put of vermilion and white, and they are ſhadowed with vermilion mixed with carmine, mixing here and there ſome ſtronger touches, eſpecially in the heart of the flower, next the great leaves on the ſide of the ſhadow. They finiſh with carmine, by little ſtrokes and traces, turning the ſame way with the mixed or party-colours, and the leaves. They form and finiſh the ſtreaks or party-colours of ſome others, as well as the ſmall leaves, with pure carmine; leaving, nevertheleſs, in the middle of the laſt, a little circle, in which is laid dark purple, which is loſt with the reſt. And when all is finiſhed, they give ſome touches with this ſame colour round about the ſmall leaves, eſpecially on the ſide of the ſhadow; drowning them with the large ones, the remainder of which is ſhadowed either with indigo or black. In ſome, the ſmall leaves are done with lake or purple, though the party-colours of the large ones be done with carmine. There are others, whoſe mixed colours are done with carmine, in the middle of moſt of the large leaves; putting in ſome places vermilion underneath, and loſing theſe colours with the ſhadows of the bottom; which are done with indigo and white. The ſmall leaves are laid with maſticot, and ſhadowed with very dark carmine on the ſide of the ſhade, and with very clear on the ſide of the light, leaving there in a manner pure maſticot, and giving only ſome little touches with orpiment and carmine, to ſeparate the leaves, which may be ſhadowed ſometimes with a very little pale-green. There are double anemonies painted all red, and all purple. The firſt are formed with vermilion and carmine, in a manner without white, and ſhadowed with pure carmine, well gummed, that they may be very dark. Purple anemonies are laid with purple and white, and finiſhed with white. In a word, there are double anemonies, as there are ſingle ones, of all colours; and they are done in the ſame manner. The green of one and the other is verditer; with which maſticot is mixed for forming. It is ſhadowed and finiſhed with ſap-green. The ſtiles of them are a little reddiſh; wherefore they are ſhadowed with carmine mixed with biſtre, and ſometimes with green, after having laid them with maſticot.

The Carnation and the Pink.—It is with pinks and carnations as with anemonies and tulips; that is, there are ſome mixt-coloured, and others of one ſingle colour. The firſt are ſtreaked and diverſified ſometimes with vermilion and carmine, ſometimes with pure lake, or with white; ſome ſtreaks very dark, and others very pale; ſometimes by little ſtreaks and diverſifications, and ſometimes by large ones. Their bottoms are ordinarily ſhadowed with indigo and white. There are pinks of a very pale fleſh-colour, and ſtreaked and diverſified with another, a little deeper, made with vermilion and lake. Others, which are of lake and white, are ſhadowed and ſtreaked without white. Others all red, which are done with vermilion and carmine, as dark as poſſible. Others all of lake. And laſtly, there are others, wherein nature or fancy is the rule. The green of one and the other is ſea-green, ſhadowed with lily-green or ſap-green.

The Red-lily.—It is laid with red-lead, formed with vermilion, and in the deepeſt of the ſhades with carmine; and finiſhed with the ſame colour by ſtrokes and traces, turning as the leaves turn. The clear and light parts are heightened with red-lead and white. The ſeed is done with vermilion and carmine. The green parts are done with verditer, ſhadowed with lily or ſap-green.

The Day-lily.—There are three ſorts of them:

1. The gridelin, a little red;
2. The gridelin, very pale; and,
3. The white.

For the firſt they put a lay of lake and white, and ſhadow and finiſh with the ſame colour deeper; mixing a little black to deaden it, eſpecially in the darkeſt places.

The ſecond are laid with white, mixed with a very little lake and vermilion, in ſuch a manner that theſe two laſt colours are hardly ſeen. Afterwards they ſhadow with black and a little lake, working redder in the middle of the leaves, next the ſtalks; which ought to be, as alſo the ſeed, of the ſame colour, particularly towards the top; and at the bottom a little greener.

The ſtile of the ſeed is laid with maſticot, and ſhadowed with ſap-green.

The other day-lilies are done by putting a lay of pure white, and ſhadowing and finiſhing with black and white.

The ſtalks of theſe laſt, and the greens of them all, are done with ſea-green, and ſhadowed with ſap-green.

The Hyacinth, or *Purple-flower*.—There are four ſorts of them.

The blue, a little dark;
Others paler;
The gridelin;
And the white.

The firſt are laid with ultramarine and white; and ſhadowed and finiſhed with leſs white. Others are laid and ſhadowed with pale blue. The gridelines are formed with lake and white, and a very ſmall matter of ultramarine; and finiſhed with the ſame colour a little deeper. For the laſt they put a lay of white; then they ſhadow them with black, with a little white; and finiſh them all by ſtrokes and traces, following the turnings and windings of the leaves. The green and the ſtalks of ſuch as are blue, are done with ſea and lily-green very dark: and in the ſtalks of the firſt may be mixed a little carmine, to make them reddiſh. The ſtalks of the two others, as alſo the green, are formed with verditer and maſticot, and ſhadowed with ſap-green.

The Piony.—A lay of Venice-lake and white muſt be put on all parts, pretty ſtrong: then ſhadow with leſs white, and with none at all in the darkeſt places: after which finiſh with the ſame colour by traces, turning them as for the roſe; gumming it very much in the deepeſt of the ſhades; and raiſing the lights and the edges of the moſt lightſome leaves with white and a little lake. Little veins are likewiſe made, which go like the ſtrokes in hatching, but are more viſible. The green of this flower is done with ſea-green, and ſhadowed with ſap-green.

Cowslips.—They are of four or five colours. There are ſome of a very pale purple.

The gridelin. The white and the yellow.

The purple is done with ultramarine, carmine, and white;

Of Flowers.

white; putting lefs white for fhadowing. The gridelin is laid with Venice-lake, and a very fmall matter of ultramarine, with much white; and fhadowed with the fame colour deeper. For the white, a lay of white muft be put; and they muft be fhadowed with black and white; and finifhed, as the others, by traces, or ftrokes. The heart of thefe cowflips is done with mafticot in the fhape of a ftar, which is fhadowed with gamboge, making a little circle in the middle with fap-green. The yellow are laid with mafticot, and fhadowed with gamboge and umber. The ftiles, the leaves, and the buds, are formed with verditer, mixed with a little mafticot, and finifhed with fap-green; making the fibres or veins, which appear upon the leaves, with this fame colour; and heightening the lights of the largeft with mafticot.

The Ranunculus, or *Crow-foot*.—There are feveral forts of them: the fineft are the orange-coloured. For the firft, they put a lay of vermilion, with a very fmall matter of gamboge; and add carmine for fhadowing; finifhing it with this laft colour, and a little gall-ftone. In the others may be put Venice-lake, inftead of carmine, efpecially in the heart of the flower. The orange-coloured are laid with gamboge, and finifhed with gall-ftone, vermilion, and a little carmine; leaving fome little yellow ftreaks. The green of the ftalks is done with verditer and very pale mafticot; mixing lily-green to fhadow them. That of the leaves is a little darker.

The Crocus.—Thefe are of two colours.

Yellow and purple. The yellow are formed with mafticot and gall-ftone, and fhadowed with gamboge and gall-ftone: after which, upon each leaf, on the outfide, are made three ftreaks, feparate from one another, with biftre and pure lake; which are loft, by little traces, in the bottom. The outfide of the leaves is left all yellow.—The purple are laid with carmine, mixed with a little ultramarine, and very pale white. They are formed and finifbed with lefs white; making likewife, in fome, purple ftripes or ftreaks, very dark, as in the yellow; and in others, only fmall veins. The feed of both is yellow; and is done with orpiment and gall-ftone. For the ftiles, they put a lay of white, and fhadow with black, mixed with a little green. The green of this flower is formed with very pale verditer, and fhadowed with fap-green.

The Iris.—The Perfian iris is done by putting, for the infide-leaves, a lay of white, and fhadowing them with indigo and green together, leaving a little white feparation in the middle of each leaf; and for thofe on the outfide, they put in the fame place a lay of mafticot, which is fhadowed with gall-ftone and orpiment; making little dark and longifh dots over all the leaf, at a fmall diftance from one another. And at the end of each are made large ftrains, with biftre and lake in fome, and in others with pure indigo, but very black. The reft, and the outfide of the leaves, are fhadowed with black. The green is formed with fea-green, and very pale mafticot, and fhadowed with fap-green. The Sufian iris is laid with purple and white, putting a little more carmine than ultramarine; and for the fhades, efpecially in the middle leaves, they put lefs white; and, on the contrary, more ultramarine than carmine; making the veins of this very colour, and leaving in the middle of the infide leaves a little yellow finew. There are others which have this very finew in the firft leaves; the end of which only is bluer than the reft. Others are fhadowed and finifhed with the fame purple, redder: They have alfo the middle finew on the outfide-leaves; but white and fhadowed with indigo. There are likewife yellow ones; which are done by putting a lay of mafticot and orpiment; fhadowing them with gall-ftone, and making the veins upon the leaves with biftre. The green of one and the other is done with fea-green, mixing a little mafticot for the ftiles. They are fhadowed with fap-green.

The Jasmin.—It is done with a lay of white, and fhadowed with black and white; and for the outfide of the leaves, they mix a little biftre; making the half of each, on this fide, a little reddifh with carmine.

The Tuberose.—For the doing of this, they make a lay of white, and fhadow with black, with a little biftre in fome places; and for the outfide of the leaves, they mix a little carmine, to give them a reddifh teint, particularly upon the extremities. The feed is done with mafticot, and fhadowed with fap-green. The green of it is laid with verditer, and fhadowed with fap-green.

The Hellebore.—The flower of hellebore is done almoft in the fame manner; that is, let it be laid with white, and fhadowed with black and biftre, making the outfide of the leaves a little reddifh here and there. The feed is laid with dark green, and raifed with mafticot. The green of it is foul and rufty, and is formed with verditer, mafticot, and biftre; and finifhed with fap-green and biftre.

The White lily.—It is laid with white, and fhadowed with black and white. The feed is done with orpiment and gall-ftone. And the green is done as in the tuberofe.

The Snow-drop.—It is formed and finifhed as the white lily. The feed is laid with mafticot, and fhadowed with gall-ftone. And the green is done with fea and fap-green.

The Jonquil.—It is laid with mafticot and gall-ftone, and finifhed with gamboge and gall-ftone. The green is formed with fea-green, and fhadowed with fap-green.

The Daffodil.—All daffodils, the yellow, the double, and the fingle, are done by putting a lay of mafticot: they are formed with gamboge, and finifhed by adding umber and biftre; excepting the bell in the middle, which is done with orpiment and gall-ftone, bordered or edged with vermilion and carmine. The white are laid with white, and fhadowed with black and white; excepting the cup or bell, which is done with mafticot and gamboge. The green is fea-green, fhadowed with fap-green.

The Marigold.—It is done by putting a lay of mafticot, and then one of gamboge; fhadowing it with this very colour, after vermilion is mixed with it: and for finifhing, they add gall-ftone and a little carmine. The green is done with verditer, fhadowed with fap-green.

The Austrian Rose.—For making the Indian rofe, they put a lay of mafticot, and another of gamboge. Then they form it, mixing gall-ftone; and finifh it with the laft colour, adding biftre and a very fmall

Of Flowers.

small matter of carmine in the deepest shades.

The Indian Pink, or *French Marigold*.—It is done by putting a lay of gamboge; shadowing it with this colour, after you have mixed a good deal of carmine and gall-stone with it; and leaving about the leaves a little yellow border of gamboge, very clear in the lights, and darker in the shades. The seed is shadowed with bistre. The green as well of the rose as the pink, is formed with verditer, and finished with sap-green.

The Sun-flower.—It is formed with masticot and gamboge, and finished with gall-stone and bistre. The green is laid with verditer and masticot, and shadowed with sap-green.

The Passion-flower.—It is done as the rose, and the green of the leaves likewise; but the veins are done with a darker green.

Poetical pinks and Sweet-williams—They are done by putting a lay of lake and white; shadowing them with pure lake, with a little carmine for the last; which are afterwards dotted on all parts with little round dots, separate from one another; and the threads in the middle are raised with white. The green of them are sea-green, which is finished with sap-green.

The Scabious.—There are two sorts of scabious, the red and the purple. The leaves of the first are laid with Florence-lake, in which there is a little white; and shadowed without white: and for the middle, which is a great boss or husk in which the seed lies, it is formed and finished with pure lake, with a little ultramarine or indigo to make it darker. Then they make little white longish dots over it, at a pretty distance from one another, clearer in the light than in the shade, making them go every way. The other is done by putting a lay of very pale purple, as well upon the leaves as the boss in the middle; shadowing both with the same colour, a little deeper: and instead of little white touches from the seed, they make them purple; and about each grain they make out a little circle, and this over the whole boss or husk in the middle. The green is formed with verditer and masticot, and shadowed with sap-green.

The Sword or *Day-lily*.—It is laid with Florence-lake and very pale white; formed and finished with pure lake, very clear and bright in some places, and very dark in others; mixing even bistre in the thickest of the shades. The green is verditer, shadowed with sap-green.

Hepatica, or *Liverwort*.—There is red and blue. The last is done by putting on all parts a lay of ultramarine, white, and a little carmine or lake; shadowing the inside of the leaves with this mixture, but deeper; excepting those of the first rank; for which, and for the outside of every one of them, they add indigo and white, that the colour may be paler, and not so fine. The red is laid with lake-columbine and very pale white; and finished with less white. The green is done with verditer, masticot, and a little bistre; and shadowed with sap-green, and a little bistre, especially on the outside of the leaves.

The Pomegranate.—The flower of the pomegranate is laid with red-lead; shadowed with vermilion and carmine; and finished with this last colour. The green is laid with verditer and masticot, and shadowed with sap-green.

The Flower of the Indian Bean.—It is done with a lay of Levant-lake and white; shadowing the middle leaves with pure lake; and adding a little ultramarine for the others. The green is verditer, shadowed with sap-green.

The Columbine.—There are columbines of several colours: the most common are the purple, the gridelin, and the red. For the purple, they lay with ultramarine, carmine, and white; and shadow with this mixture, deeper. The gridelin are done the same way, putting a great deal less ultramarine than carmine. The red are done with lake and white, finishing with less white. There are some mixed flowers of this kind, of several colours; which must be formed and finished as the others, but paler, making the mixtures of a little darker colour.

The Lark's Heel.—There are of different colours, and of mixed colours: the most common are the purple, the gridelin, and the red; which are done as the columbines.

Violets and Pansies.—Violets and pansies are done the same way; excepting that in the last the two middle leaves are bluer than the others, that is, the borders or edges; for the inside of them is yellow; and there little black veins are made, which take their beginning from the heart of the flower, and die away towards the middle.

The Muscipula, or *Catch-fly*.—There are two sorts of it, the white and the red; the last is laid with lake and white, with a little vermilion, and finished with pure lake. As for the knot or nozzle of the leaves, it is formed with white and a very small matter of vermilion, mixing bistre, or gall-stone, to finish it. The leaves of the white are laid with white; adding bistre and masticot upon the knots, which are shadowed with pure bistre, and the leaves with black and white. The green of all these flowers is done with verditer and masticot, and shadowed with sap-green.

The Crown Imperial.—There are of two colours, the yellow and the red. The first is done by putting a lay of orpiment, and shadowing it with gall-stone and orpiment, with a little vermilion. The other is laid with orpiment and vermilion, and shadowed with gall-stone and vermilion; making the beginning of the leaves next the stile, with lake and bistre, very dark; and veins with this mixture, both in one and the other, all along the leaves. The green is done with verditer and masticot, shadowed with sap-green and gamboge.

The Cyclamen, or *Sow-bread*.—The red is laid with carmine, a little ultramarine, and much white; and finished with the same colour, deeper; putting, in a manner, only carmine in the middle of the leaves, next the heart, and in the rest add a little more ultramarine. The other is laid with white, and shadowed with black. The stalks of one and the other ought to be a little reddish; and the green, verditer and sap-green.

The Gilliflower.—There are several sorts of gilliflowers; the white, the yellow, the purple, the red, and the mixed, of various colours. The white are laid with white, and shadowed with black, and with a little indigo in the heart of the leaves. The yellow, with masticot, gamboge, and gall-stone. The purple are formed with purple and white; and finished with less white;

Of Fruits, &c.

white; making the colour brighter in the heart, and even a little yellowish. The red with lake and white; finishing them with white. The mixed-coloured are laid with white, and the mixtures are sometimes made with purple, in which there is much ultramarine; others again, in which there is more carmine. Sometimes they are of lake, and sometimes of carmine. Some are done with white, and others without white; shadowing the rest of the leaves with indigo. The seed of all is formed with verditer and masticot, and finished with sap-green. The leaves and stiles are laid with the same green, mixing sap-green to finish them.

Fruits, fishes, serpents, and all sorts of reptiles, are to be touched in the same manner as the figures of men are; that is, hatched or dotted.

Birds and all other animals are done like flowers, by strokes, or traces.

Never make use, for any of these things, of white-lead. It is only proper in oil. It blackens like ink, when only tempered with gum; especially if you set your work in a moist place, or where perfumes are. Cerus of Venice is as fine, and of as pure a white. Be not sparing in the use of this, especially in forming or dead-colouring; and let it enter into all your mixtures, in order to give them a certain body, which will render your work glueish, and make it appear soft, plump, and strong.

The taste of painters is, nevertheless, different in this point. Some use a little of it, and others none at all. But the manner of the last is meagre and dry. Others use a great deal; and doubtless it is the best method and most followed among skilful persons: for besides that it is speedy, one may by the use of it copy all sorts of pictures; which would be almost impossible otherwise; notwithstanding the contrary opinion of some, who say, that in miniature we cannot give the force and all the different teints we see in pieces in oil. But this is not true, at least of good painters; and effects prove it pretty plainly: for we see figures, landscapes, pictures, and every thing else in miniature, touched in as grand, as true, and as noble a manner, (though more tender and delicate), as they are in oil.

Properties of Miniature.

However, painting in oil has its advantages; were they only these, that it exhibits more work, and takes up less time. It is better defended likewise against the injuries of time; and the right of birth must be granted it, and the glory of antiquity.

But miniature likewise has its advantages; and without repeating such as have been mentioned already, it is neater and more commodious. You may easily carry all your implements in your pockets, and work when and wherever you please, without such a number of preparations. You may quit and resume it when and as often as you will; which is not done in the other; in which one is rarely to work dry.

To conclude: In the art of painting, excellence does not depend upon the greatness of the subject, but upon the manner in which it is handled. Some catch the airs of a face well; others succeed better in landscapes: some work in little, who cannot do it in large: some are skilled in colours, who know little of design: others, lastly, have only a genius for flowers: and even the Bassans got themselves a fame for animals; which they touched in a very fine manner, and better than any thing else.

Minim ‖ Minium.

MINIM, in music, a note equal to two crotchets, or half a semibreve. See Music.

MINIMS, a religious order in the church of Rome, founded by St Francis de Paula, towards the end of the 15th century. Their habit is a coarse black woollen stuff, with a woollen girdle, of the same colours, tied in five knots. They are not permitted to quit their habit and girdle night nor day. Formerly they went bare-footed, but are now allowed the use of shoes.

MINIMUM, in the higher geometry, the least quantity attainable in a given case.

MINISTER, a person who preaches, performs religious worship in public, administers the sacraments, &c.

Minister *of State*, a person to whom the prince intrusts the administration of government. See Counsel.

Foreign Minister, is a person sent into a foreign country, to manage the affairs of his province, or of the state to which he belongs. Of these there are two kinds: those of the first rank are ambassadors, and envoys extraordinary, who represent the persons of their sovereigns; the ministers of the second rank are the ordinary residents.

MINIUM, or Red-lead. See Chemistry, n° 402.

The general method of preparing that colour is there described; but the following more accurate and particular one hath appeared in the last edition of the Chemical Dictionary. "The furnace in which minium is made is of the reverberatory kind, with two fire-places at the ends; each fire-place being separated from the area, or body of the furnace, by a wall 12 inches high. The fire-places are 15 inches broad, and their length is equal to the breadth of the whole furnace, which is about eight or nine feet. The length of the area from one fire-place to the other is 9 or 10 feet. The quantity of lead used in one operation is about 1500 pounds, of which nine parts are lead obtained from furnaces where the ore is smelted, and one part is lead extracted from the scoria which is formed in smelting the ore. This latter kind is said to be necessary, as the former could not alone be reduced into powder. All the lead is at once put into the area, the bottom of which is level. The calx, as fast as it is formed, is drawn to one side by means of a rake suspended by a chain before the mouth of the furnace. In four or five hours the whole quantity of the lead is calcined, or, if any pieces remain uncalcined, they are separated, and kept for the next operation. The heat employed is that of a cherry-red; and the fire-places and mouth are kept open, that the air may accelerate the calcination. The powder or calx is to be frequently stirred to prevent its concreting; and when this operation has been continued about 24 hours, the matter is taken out of the furnace, and laid on a flat pavement. The cold water is thrown on it, to give it weight, as the workmen say; but rather, as some think, to make it friable. It is then to be ground in a mill, and the finer

finer part is feparated by wafhing, while the coarfer part, referved for fome following operation, is to be placed at the mouth of the furnace in order to retain the melted lead. The fine powder, which is now of a yellow colour, is again put into the fame or a fimilar furnace, and expofed to a very moderote fire from 36 to 48 hours; during which time it is ftirred frequently to prevent its concreting; and the powder gradually acquires its proper red colour. The minium is then to be taken out of the furnace, cooled, and fifted thro' an iron fieve placed in a cafk."

MINOR, in law. See Law, n° clxi.

Minor, in logic, the fecond propofition of a regular fyllogifm. See Logic.

MINORCA, an ifland of the Mediterranean, fituated between 39 and 40 degrees of North Latitude, and near four degrees of Eaft Longitude. It is about 33 miles in length from north-weft to fouth-eaft, in breadth from eight to twelve, but in general about ten miles; fo that in fize it may nearly equal the county of Huntingdon or Bedfordfhire. The form is very irregular; and the coafts are much indented by the fea, which forms a great number of little creeks and inlets, fome of which might be very advantageous.

This ifland is one of thofe called by the ancient Romans *Baleares*, which arofe from the dexterity of the inhabitants in ufing the fling. It fell under the power of the Romans, afterwards of the northern barbarians, who deftroyed that empire. From them it was taken by the Arabs, who were fubdued by the king of Majorca, and he by the king of Spain. The Englifh fubdued it in 1708, and the French in the late war; but it was reftored to Britain by the treaty of Paris in 1763.

The air of this ifland is much more clear and pure than in Britain; being feldom darkened with thick fogs: yet the low valleys are not free from mifts and unwholefome vapours; and in windy weather the fpray of the fea is driven over the whole ifland. Hence it happens that utenfils of brafs or iron are extremely fufceptible of ruft, in fpite of all endeavours to preferve them; and houfehold furniture becomes mouldy. The fummers are dry, clear, calm, and exceffively hot; the autumns moift, warm, and unequal; at one time perfectly ferene, at another cloudy and tempeftuous. During the winter there are fometimes violent ftorms, though neither frequent nor of long continuance; and whenever they ceafe, the weather returns to its ufual ferenity. The fpring is always variable, but refembles the winter more than the fummer. The changes of heat and cold are neither fo great nor fo fudden in this climate as in many others. In the compafs of a year, the thermometer feldom rifes much above the 80th, or falls below the 48th degree. In fummer there is fcarcely ever a difference of four or five degrees between the heat of the air at noon and at night; and in winter the variation is ftill lefs confiderable. But this muft be underftood of a thermometer fhaded from the influence of the folar beams; for if expofed to them it will often rife 12, 14, or 16 degrees higher than what we have mentioned; and in other feafons the difference between the heat of the air in the fun and in the fhade is much greater. Yet, even in the dog-days, the heat of the atmofphere, at leaft in open places, feldom furpaffes that of human blood. The winds are very boifterous about the equinoxes, and fometimes during during the winter. At other times they are generally moderate, and, according to the obfervations of feamen, they rarely blow in the fame direction near the iflands adjacent to the gulph of Lyons as in the open fea. During the fummer there is commonly a perfect calm in the mornings and evenings: but the middle of the day is cooled by refrefhing breezes which come from the eaft, and, following the courfe of the fun, increafe gradually till two or three in the afternoon; after which they infenfibly die away, as night approaches. This renders the heat of the fun lefs dangerous and inconvenient; and if thefe breezes intermit for a day or two, the natives grow languid and inactive from the heat. The northerly winds in general are clear and healthy, difpel the mifts, and make a clear blue fky; whilft thofe which blow from the oppofite quarter, render the air warm, moift, and unhealthy. The north wind is fuperior in power to all the reft; which appears from hence, that the tops of all the trees incline to the fouth, and the branches on the north fide are bare and blafted. The next to it in force is the north-weft. Both are frequent towards the clofe of winter, and in the fpring; and, being dry and cold, they fhrivel up the leaves of the vegetables, deftroy their tender fhoots, and are often exceffively detrimental to the vineyards and rifing corn. The piercing blafts at that feafon from the north-eaft, as they are more moift, and more frequently attended with rain, are lefs prejudicial. The fouth and fouth-eaft winds are by much the moft unhealthy. In whatever feafons they blow, the air is foggy, and affects the breathing; but in the fummer feafon they are fultry and fuffocating. An exceffive dejection of fpirits is then a univerfal complaint; and on expofing the thermometer to the rays of the fun, the mercury has frequently rifen above the 100th degree. The weft wind is ufually drier than the fouth: the eaft is cold and bluftering in the fpring, and fultry in the fummer.

The weather in Minorca is generally fair and dry; but when it rains, the fhowers are heavy, though of fhort continuance, and they fall moft commonly in the night. The fky in fummer is clear, and of a beautiful azure, without clouds or rain; but moderate dews defcend regularly after funfet. In autumn the weather becomes lefs ferene; whirlwinds and thunder become frequent; and in the night-time lightning, and thofe meteors called *falling ftars*, are very common. Water-fpouts alfo are often feen at that feafon, and frequently break upon the fhore. A fudden alteration in the weather takes place about the autumnal equinox; the fkies are darkened with clouds, and the rains fall in fuch quantities, that the torrents thereby occafioned, pouring down from the hills, tear up trees by the root, carry away cattle, break down fences, and do confiderable mifchief to the gardens and vineyards. But thefe anniverfary rains are much more violent than lafting; always falling in fudden and heavy fhowers, with intervals of fair weather. They are accompanied with thunder, lightning, and fqualls of wind, moft commonly from the north. Hail and fnow are often intermixed with the rains which fall in winter and in fpring; but the fnow, for the moft part, diffolves immediately; and ice is here an uncom-

 mon appearance.

The whole coast of Minorca lies low; and there are only a few hills near the centre, of which the most considerable, named *Toro* by the inhabitants, may be seen at the distance of 12 or 14 leagues from the land. The surface of the island is rough and unequal; and in many places divided by long narrow vales of a considerable depth, called *barrancoes* by the natives. They begin towards the middle of the island, and after several windings terminate at the sea. The south-west side is more plain and regular towards the north-east; where the hills are higher, with low, marshy valleys betwixt them, the soil less fruitful, and the whole tract unhealthy to man and beast. Near the towns and villages the fields are well cultivated, and inclosed with stone-walls; but the rest, for the most part, are rocky, or covered with woods and thickets. There are some pools of standing water, but very few rivulets; which is the greatest defect about the island, as the inhabitants have scarcely any wholesome water excepting what is saved from the clouds.

The soil is light, thin, and very stony, with a good deal of sea-salt, and, in some places, of calcareous nitre intermixed. In most places there is so little earth, that the island appears to be but one large irregular rock covered here and there with mould, and an infinite variety of stones. Notwithstanding this, however, it is not only extremely proper for vineyards, but produces more wheat and barley than could at first sight be imagined; and, if the peasants may be credited, it would always yield a quantity of corn and wine sufficient for the natives, did not the violence of the winds, and the excessive drought of the weather, frequently spoil their crops. The fields commonly lie fallow for two years, and are sown the third. About the latter end of winter, or the beginning of spring, they are first broke up; and next autumn, as soon as the rains fall, they are again ploughed and prepared for receiving the proper seeds. The tillage is very easily performed; for a plough so light as to be transported from place to place on the ploughman's shoulder, and to be drawn by an heifer, or an ass sometimes assisted by an hog, is sufficient for opening so thin a soil. The later the harvest happens, the more plentiful it proves. The barley is usually cut down about the 20th of May N. S. and the wheat is reaped in June; so that the whole harvest is commonly got in by midsummer-day. The grain is not threshed with flails as in this country, but trodden out on a smooth piece of rock by oxen and asses, according to the custom of the eastern nations.

The natives of Minorca are commonly lean, thin, and well-built, of a middle stature, and olive complexion; but their character is by no means agreeable. Such is the natural impetuosity of their temper, that the slightest cause provokes them to anger; and they seem to be incapable of forgiving or forgetting an injury. Hence quarrels break out daily, even among neighbours and relations; and family-disputes are transmitted from father to son; and thus, though lawyers and pettifoggers are very numerous in this country, there are still too few for the clients. Both sexes are, by constitution, extremely amorous: they are often betrothed to each other while children, and marry at the age of 14. The women have easy labours, and commonly return in a few days to their usual domestic business; but, lest the family should become too numerous for their income, it is a practice among the poorer sort to keep their children at the breast for two or three years, that by this means the mothers may be hindered from breeding.

Bread of the finest wheat-flour, well fermented and well baked, is more than half the diet of people of all ranks. Rice, pulse, vermicelli, herbs and roots from the garden, summer-fruits, pickled olives, and pods of the Guinea pepper, make up almost all the other half; so that scarce a fifth of their whole food is furnished from the animal-kingdom, and of this fish makes by much the most considerable portion. On Fridays, and other fast-days, they abstain entirely from flesh; and during Lent they live altogether on vegetables and fish, excepting Sundays, when they are permitted the use of eggs, cheese, and milk. Most of their dishes are high-seasoned with pepper, cloves, cinnamon, and other spices; and garlic, onions, or leeks, are almost constant ingredients. They eat a great deal of oil, and that none of the sweetest or best flavoured; using it not only with sallads, but also with boiled and fried fish, greens, pulse, &c. instead of butter. A slice of bread soaked in boiled water, with a little oil and salt, is the common breakfast of the peasants, well known by the name of *oleagua*. Their ordinary meals are very frugal, and consist of very little variety; but on festivals and other solemn occasions, their entertainments are to the last degree profuse and extravagant, insomuch that the bill of fare of a country farmer's wedding-dinner would scarce be credited.

With regard to other matters, the Minorquins are accused of prodigious indolence in the way of business, and neglect of the natural advantages they possess. In the bowels of the earth are iron, copper, and lead-ores, of none of which any use hath been made except the last. A lead-mine was worked to advantage some time ago, and the ore sent into France and Spain for the use of the potteries in those countries. The proprietor discontinued his work on some small discouragement; and indeed it is said, that these people are of all mankind the most easily put out of conceit with an undertaking that does not bring them in mountains of present gain, or that admits of the slightest probability of disappointing their most sanguine expectations: nor will their purse admit of many disappointments; and thus their poverty co-operating with their natural despondence and love of ease, is the principal cause of their backwardness to engage in projects, though ever so promising, for the improvement of their private fortune, and the advantage of the commerce of their country. This lead-ore went under the name of *vernis* among the natives, as it was wholly used by the potters in varnishing and glazing their earthen vessels.

There are few exports of any account, and they are obliged to their neighbours for near one-third of their corn, all their oil, and such a variety of articles of less consideration, that nothing could preserve them from a total bankruptcy, but the English money circulated by the troops, which is exchanged for the daily supplies of provisions, increased by the multiplication of vineyards, the breeding of poultry, and the production of vegetables, in a proportion of

at least five to one since the island has been in our possession. It will not require many words to enumerate their exports: they make a sort of cheese, little liked by the English, which sells in Italy at a very great price; this, perhaps, to the amount of 800 l. *per annum*. The wool they send abroad may produce 900 l. more. Some wine is exported; and, if we add to its value that of the home-consumption, which has every merit of an export, being nine parts in ten taken off by the troops for ready money, it may well be estimated at 16,000 l. a-year. In honey, wax, and salt, their yearly exports may be about 400 l. and this comes pretty near the sum of their exports, which we estimate together at 18,100 l. Sterling *per annum*.

A vast balance lies against them, if we consider the variety and importance of the articles they fetch from other countries, for which they must pay ready cash. Here it may be necessary to withdraw some things from the heap, such as their cattle, sheep, and fowls, on which they get a profit; for the country does not produce them in a sufficient abundance to supply them, especially when we have a fleet of men of war stationed there.

Their imports are, corn, cattle, sheep, fowls tobacco, oil, rice, sugar, spices, hard-ware, and tools of all kinds; gold and silver lace; chocolate, or cacoa to make it; tobacco, timber, plank, boards, mill-stones, tobacco-pipes, playing cards, turnery ware, seeds, soap, saddles; all manner of cabinet-makers work, iron spikes, nails, fine earthen-ware, glass, lamps, brasiery, paper, and other stationary wares; copperas, galls, dye-stuffs, painters brushes, and colours; musical instruments, music, and strings; watches, wine, fruit, all manner of fine and printed linens, muslins, cambrics, and laces; bottles, corks, starch, indigo, fans, trinkets, toys, ribbands, tape, needles, pins, silk, mohair, lanthorns, cordage, tar, pitch, rosin, drugs, gloves, fire-arms, gunpowder, shot, and lead; hats, caps, velvet, cotton stuffs, woollen cloths, stockings, capes, medals, vestments, lustres, pictures, images, agnus Dei's, books, pardons, bulls, relics, and indulgencies.

The island is divided into what they style *terminos*, of which there were anciently five, now reduced to four, and resemble our counties. The termino of Ciudadella, at the north-western extremity of the island, is so styled from this place, which was once a city, and the capital of Minorca. It makes a venerable and majestic figure, even in its present state of decay, having in it a large Gothic cathedral, some other churches and convents, the governor's palace, and an exchange, which is no contemptible pile. There are in it 600 houses, which, before the seat of government and the courts of justice were removed to Mahon, were fully inhabited; and there are still more gentlemens families here than in all the rest of the island. It hath a port commodious enough for the vessels employed in the trade of this country, which, though in the possession of a maritime power, is less than it formerly was. It is still, in the style of our officers, *the best quarters* (and there are none bad), in the country; and if there was a civil government, and the place made a free port, the best judges are of opinion it would very soon become a flourishing place again; and the fortifications, if it should be found necessary, might then also be easily restored and improved.

The termino of Fererias is the next, a narrow slip reaching cross from sea to sea, and the country little cultivated; it is therefore united to Mercandal. In this last termino stands Mont-toro in the very centre of the isle, and the highest ground, some say the only mountain in it; on the summit of which there is a convent, where, even in the hottest months, the monks enjoy a cool air, and at all times a most delightful prospect. About six miles north from Mont-toro stands the castle that covers Port Fornelles, which is a very spacious harbour on the east side of the island. There are in it shoals and foul ground, which, to those who are unacquainted with them, render it difficult and dangerous; yet the packets bound from Mahon to Marseilles frequently take shelter therein; and while the Spaniards were in possession of the isle, large ships and men of war frequented it. At a small distance from this lies another harbour called *Adaia*, which runs far into the land; but being reputed unsafe, and being so near Fornelles, is at present useless. The country about it is, however, said to be the pleasantest and wholesomest spot in the island, and almost the only one plentifully supplied with excellent spring-water, so that the gardens are well laid out, and the richest and finest fruits grow here in the highest perfection. Alaior is the next termino, in which there is nothing remarkable but the capital of the same name, well situated on an eminence, in a pleasant and tolerably cultivated country.

The termino of Mahon, at the south-east end of the island, is at present the most considerable of them all, containing about 60,000 English acres, and nearly one-half of the inhabitants in Minorca. The town of Mahon derives its name from the Carthaginian general Mago, who is universally allowed to be its founder. It stands on an eminence on the west side of the harbour, the ascent pretty steep. There are in it a large church, three convents, the governor's palace, and some other public edifices. It is large; but the streets are winding, narrow, and ill-paved. The fortress of St Philip stands near the entrance of the harbour, which it covers, is very spacious, of great strength, with subterranean works to protect the garrison from bombs, large magazines, and whatever else is necessary to render it a complete fortification, and hath a numerous and well-disposed artillery. Port Mahon is allowed to be the finest harbour in the Mediterranean, about 90 fathoms wide at its entrance, but within very large and safe, stretching a league or more into the land. Beneath the town of Mahon there is a very fine quay, one end of which is reserved for the ships of war, and furnished with all the accommodations necessary for careening and refitting them; the other serves for merchantmen. On the other side the harbour is Cape Mola, where it is generally agreed a fortress might be constructed which would be impregnable, as the castle of St Philip was esteemed before we took it, and bestowed so much money upon it, that, though some works were erected at Cape Mola, it was not judged proper to proceed in the fortifications there at a fresh expence; at least this is the only reason that hath been assigned.

MINOS, in fabulous history, king of Crete, was

the son of Jupiter and Europa. He is said to have built several cities in the island of Crete; to have given laws to the Cretans; and to have had a son, from whom sprung Minos II. king of Crete, Sarpedon, and Rhadamanthus, who distributed justice with such severity, that they were, according to the poets, constituted judges of hell, where the most difficult cases were referred to Minos, who was distinguished from the rest by his holding a sceptre of gold.

MINOTAUR, in antiquity, a fabulous monster much talked of by the poets, feigned to be half man and half bull.

The minotaur was brought forth by Pasiphäe, wife of Minos king of Crete. It was shut up in the labyrinth of that island, and at last killed by Theseus.

Servius gives the explanation of this fable: he says that a secretary of king Minos, named *Taurus*, "bull," having an intrigue with the queen (Pasiphäe) in the chamber of Dædalus, she was at length delivered of twins; one of whom resembled Minos, and the other Taurus. This occasioned the production to be reputed monstrous.

MINOW, a very small species of cyprinus, so well known that it needs no description.

MINSTREL, an ancient term for a singer and instrumental performer.

The word *minstrel* is derived from the French *menestrier*, and was not in use here before the Norman conquest. It is remarkable, that our old monkish historians do not use the worc *citharædus*, *cantator*, or the like, to express a *minstrel* in Latin; but either *mimus*, *histrio*, *joculator*, or some other word that implies *gesture*. Hence it should seem that the minstrels set off their singing by mimicry, or action; or, according to Dr Brown's hypothesis, united the powers of melody, poem, and dance.

The Saxons, as well as the ancient Danes, had been accustomed to hold men of this profession in the highest reverence. Their skill was considered as something divine, their persons were deemed sacred, their attendance was solicited by kings, and they were every-where loaded with honours and rewards. In short, poets and their art were held among them in that rude admiration which is ever shewn by an ignorant people to such as excel them in intellectual accomplishments. When the Saxons were converted to Christianity, in proportion as letters prevailed among them, this rude admiration began to abate, and poetry was no longer a peculiar profession. The poet and the minstrel became two persons. Poetry was cultivated by men of letters indiscriminately, and many of the most popular rhymes were composed amidst the leisure and retirement of monasteries. But the minstrels continued a distinct order of men, and got their livelihood by singing verses to the harp at the houses of the great. There they were still hospitably and respectfully received, and retained many of the honours shewn to their predecessors the Bards and Scalds. And indeed, though some of them only recited the compositions of others, many of them still composed songs themselves; and all of them could probably invent a few stanzas on occasion. There is no doubt but most of the old heroic ballads were produced by this order of men. For although some of the larger metrical romances might come from the pen of the monks or others, yet the smaller narratives were probably composed by the minstrels who sung them. From the amazing variations which occur in different copies of these old pieces, it is evident they made no scruple to alter each other's productions, and the reciter added or omitted whole stanzas, according to his own fancy or convenience.

In the early ages, as is hinted above, this profession was held in great reverence among the Saxon tribes, as well as among their Danish brethren. This appears from two remarkable facts in history, which shew that the same arts of music and song were equally admired among both nations, and that the privileges and honours conferred upon the professors of them were common to both; as it is well known their customs, manners, and even language, were not in those times very dissimilar.

When king Alfred the Great was desirous to learn the true situation of the Danish army, which had invaded his realm, he assumed the dress and character of a minstrel; and taking his harp, and only one attendant, (for in the earliest times it was not unusual for a minstrel to have a servant to carry his harp), he went with the utmost security into the Danish camp. And though he could not but be known to be a Saxon, the character he had assumed procured him a hospitable reception; he was admitted to entertain the king at table, and staid among them long enough to contrive that assault which afterwards destroyed them. This was in the year 878.

About 60 years after, a Danish king made use of the same disguise to explore the camp of king Athelstan. With his harp in his hand, and dressed like a minstrel, Anlaff king of the Danes went among the Saxon tents, and taking his stand near the king's pavilion, began to play, and was immediately admitted. There he entertained Athelstan and his lords with his singing and his music; and was at length dismissed with an honourable reward, though his songs must have discovered him to have been a Dane. Athelstan was saved from the consequences of this stratagem by a soldier, who had observed Anlaff bury the money which had been given him, from some scruple of honour, or motive of superstition. This occasioned a discovery.

From the uniform procedure of both these kings, it is plain that the same mode of entertainment prevailed among both people, and that the minstrel was a privileged character among both. Even as late as the reign of Edward II. the minstrels were easily admitted into the royal presence, as appears from a passage in Stow, which also shews the splendour of their appearance.

"In the year 1316, Edward the second did solemnize his feast of Pentecost at Westminster, in the great hall: where sitting royally at the table with his peers about him, there entered a woman adorned like a minstrel, sitting on a great horse trapped, as minstrels then used, who rode round about the tables, shewing pastime; and at length came up to the king's table, and laid before him a letter, and forthwith turning her horse, saluted every one, and departed."—The subject of this letter was a remonstrance to the king on the favours heaped by him on his minions, to the

Minstrel. the neglect of his knights and faithful servants

The messenger was sent in a minstrel's habit, as what would gain an easy admission; and was a woman concealed under that habit, probably to disarm the king's resentment: for we do not find that any of the real minstrels were of the female sex; and therefore conclude this was only an artful contrivance peculiar to that occasion.

In the 4th year of Richard II. John of Gaunt erected at Tetbury in Staffordshire a court of minstrels, with a full power to receive suit and service from the men of this profession within five neighbouring counties, to enact laws, and determine their controversies; and to apprehend and arrest such of them as should refuse to appear at the said court, annually held on the 16th of August. For this they had a charter, by which they were empowered to appoint a king of the minstrels, with four officers, to preside over them. These were every year elected with great ceremony; the whole form of which is described by Dr Plott: in whose time, however, they seem to have become mere musicians.

Even so late as the reign of king Henry VIII. the reciters of verses or moral speeches learnt by heart, intruded without ceremony into all companies; not only in taverns, but in the houses of the nobility themselves. This we learn from Erasmus, whose argument led him only to describe a species of these men who did not sing their compositions; but the others that did, enjoyed without doubt the same privileges.

We find that the minstrels continued down to the reign of Elizabeth; in whose time they had lost much of their dignity, and were sinking into contempt and neglect. Yet still they sustained a character far superior to any thing we can conceive at present of the singers of old ballads.

When queen Elizabeth was entertained at Killingworth castle by the earl of Leicester in 1575, among the many devices and pageants which were exhibited for her entertainment, one of the personages introduced was that of an ancient minstrel, whose appearance and dress are so minutely described by a writer there present, and gives us so distinct an idea of the character, that we shall quote the passage at large.

"A person very meet seemed he for the purpose, of a xlv. years old, apparelled partly as he would himself. His cap off: his head seemingly rounded tonsterwise: fair-kembed, that, with a sponge daintly dipt in a little capon's grease, was finely smoothed, to make it shine like a mallard's wing. His beard smugly shaven: and yet his shirt after the new trink, with ruffs fair starched, sleeked and glistering like a pair of new shoes, marshalled in good order with a setting stick, and strut, 'that' every ruff stood up like a wafer. A side [i. e. long] gown of Kendale green, after the freshness of the year now, gathered at the neck with a narrow gorget, fastened afore with a white clasp and a keeper close up to the chin; but easily, for heat, to undo when he list. Seemingly begirt in a red caddis girdle: from that a pair of capped Sheffield knives hanging a' two sides. Out of his bosom drawn from a lappet of his napkin edged with a blue lace, and marked with a D for Damian; for he was but a batchelor yet.

"His gown had side [i. e. long] sleeves down to mid-leg, slit from the shoulder to the hand, and lined with white cotton. His doublet-sleeves of black worsted: upon them a pair of points of tawny-chamlet laced along the wrist with blue threaden pointes. A wealt towards the hands of fustian-a-napes. A pair of red neather stocks. A pair of pumps on his feet, with a cross cut at his toes for corns; not new indeed, yet cleanly blackt with soot, and shining as a shoing horn. Minstrel, Mint.

"About his neck a red ribband suitable to his girdle. His harp in good grace dependent before him. His wrest tyed to a green lace and hanging by: under the gorget of his gown a fair flaggon chain, (pewter for) silver, as a squire Minstrel of Middlesex, that travelled the country this summer season, unto fair and worshipful mens houses. From his chain hung a scutcheon, with metal and colour, resplendent upon his breast, of the ancient arms of Islington."

—This minstrel is described as belonging to that village. We suppose such as were retained by noble families, wore their arms hanging down by a silver chain as a kind of badge. From the expression of Squire Minstrel above, we may conclude there were other inferior orders, as Yeomen Minstrels, or the like.

This minstrel, the author tells us a little below, "after three lowly courtesies, cleared his voice with a hem . . . and wiped his lips with the hollow of his hand for 'filing his napkin; tempered a string or two with his wrest; and, after a little warbling on his harp for a prelude, came forth with a solemn song, warranted for story out of king Arthur's acts, &c."

Towards the end of the 16th century, this class of men had lost all credit, and were sunk so low in the public opinion, that in the 39th year of Elizabeth a statute was passed by which "minstrels, wandering abroad" were included among "rogues, vagabonds, and sturdy beggars," and were adjudged to be punished as such. This act seems to have put an end to the profession, for after this time they are no longer mentioned.

MINT, the place in which the king's money is coined. See COINAGE.

There were anciently mints in almost every county in England; but the only mint at present in the British dominions is that in the tower of London. The officers of the mint are, 1. The warden of the mint, who is the chief; he oversees the other officers, and receives the bullion. 2. The master-worker, who receives the bullion from the warden, causes it to be melted, delivers it to the moneyers, and, when it is coined, receives it again. 3. The comptroller, who is the overseer of all the inferior officers, and sees that all the money is made to the just assize. 4. The assay-master, who weighs the gold and silver, and sees that it is according to the standard. 5. The auditor, who takes the accounts. 6. The surveyor of the melting; who, after the assay-master has made trial of the bullion, sees that it is cast out, and not altered after it is delivered to the melter. 7. The engraver; who engraves the stamps and dyes for the coinage of the money. 8. The clerk of the irons; who sees that the irons are clean and fit to work with. 9. The melter; who melts the bullion before it be coined. 10. The provost of the mint; who provides for and

oversees

overfees all the moneyers. 11. The blanchers, who anneal and cleanfe the money. 12. The moneyers; fome of whom forge the money, fome fhear it, fome round and mill it, and fome ftamp and coin it. 13. The porters, who keep the gate of the mint.

Mint-*Marks*. It hath been ufual, from old time, to oblige the mafters and workers of the mint, in the indentures made with them, "to make a privy mark in all the money that they made, as well of gold as of filver, fo that another time they might know, if need were, and witte which moneys of gold and filver among other of the fame moneys, were of their own making, and which not." And whereas, after every trial of the pix at Weftminfter, the mafters and workers of the mint, having there proved their moneys to be lawful and good, were immediately entitled to receive their *quietus* under the great feal, and to be difcharged from all fuits or actions concerning thofe moneys, it was then ufual for the faid mafters and workers to change the privy mark before ufed for another, that fo the moneys from which they were not yet difcharged might be diftinguifhed from thofe for which they had already received their *quietus;* which new mark they then continued to ftamp upon all their moneys, until another trial of the pix gave them alfo their *quietus* concerning thofe.

The pix is a ftrong box with three locks, whofe keys are refpectively kept by the warden, mafter, and comptroller of the mint; and in which are depofited, fealed up in feveral parcels, certain pieces taken at random out of every *journey*, as it is called; that is, out of every 15 pounds weight of gold, or 60 pounds weight of filver, before the fame is delivered to the proprietors. And this pix is, from time to time, by the king's command, opened at Weftminfter, in the prefence of the lord-chancellor, the lords of the council, the lords-commiffioners of the treafury, the juftices of the feveral benches, and the barons of the exchequer; before whom a trial is made, by a jury of goldfmiths impannelled and fworn for that purpofe, of the collective weights of certain parcels of the feveral pieces of gold and filver taken at random from thofe contained in the pix; after which thofe parcels being feverally melted, affays are then made of the bullion of gold and filver fo produced, by the melting certain fmall quantities of the fame againft equal weights taken from the refpective trial-pieces of gold and filver that are depofited and kept in the exchequer for that ufe. This is called the *trial of the pix;* the report made by the jury upon that trial is called the *verdict of the pix* for that time; and the indented trial-pieces juft above-mentioned, are certain plates of ftandard gold and ftandard filver, made with the greateft care, and delivered in upon oath, from time to time as there is occafion, by a jury of the moft able and experienced goldfmiths, fummoned by virtue of a warrant from the lords of the treafury to the wardens of the myftery of goldfmiths of the city of London for that purpofe; and which plates being fo delivered in, are divided each, at this time, into feven parts by indentures, one of which parts is kept in his majefty's court of exchequer at Weftminfter, another by the faid company of goldfmiths, and two more by the officers of his majefty's mint in the tower; the remaining three being for the ufe of the mint, &c. in Scotland. The pix has fometimes been tried every year, or even oftener, but fometimes not more than once in feveral years: and from hence is underftood how it comes to pafs, that, among the pieces that are dated as well as marked, three or more different dates are fometimes found upon pieces impreffed with the fame mark; and again, that different marks are found upon pieces bearing the fame date. Thefe marks are firft obfervable upon the coins of king Edward III.; the words above quoted concerning thofe marks are from the indentures made with the lord Haftings, mafter and worker to king Edward IV.; and the marks themfelves continued to be ftamped very confpicuoufly upon the moneys, till the coinage by the mill and fcrew was introduced and fettled after the Reftoration, in the year 1662: fince which time, the moneys being made with far greater regularity and exactnefs than before, thefe marks have either been totally laid afide, or fuch only have been ufed as are of a more fecret nature, and only known to the officers and engravers concerned in the coinage: and indeed the conftant practice that has ever fince prevailed, of dating all the feveral pieces, has rendered all fuch marks of much lefs confequence than before.

Mint, in botany. See Mentha.

MINUET, a very graceful kind of dance, confifting of a coupee, a high ftep, and a balance: it begins with a beat, and its motion is triple.

The invention of the minuet feems generally to be afcribed to the French, and particularly to the inhabitants of the province of Poictou. The word is faid by Menage and Furetiere to be derived from the French *menue* or *menu*, "fmall, or little;" and in ftrictnefs fignifies a fmall pace. The melody of this dance confifts of two ftrains, which, as being repeated, are called *reprifes*, each having eight or more bars, but never an odd number. The meafure is three crotchets in a bar, and is thus marked $\frac{3}{4}$, though it is commonly performed in the time $\frac{6}{8}$. Walther fpeaks of a minuet in Lully's opera of *Roland*, each ftrain of which contains ten bars, the fectional number being 5; which renders it very difficult to dance.

MINUTE, in geometry, the 60th part of a degree of a circle.

Minute *of Time*, the 60th part of an hour.

Minute, in architecture, ufually denotes the 60th, fometimes the 30th, part of a module. See Architecture.

Minute is alfo ufed for a fhort memoir, or fketch of a thing taken in writing.

MINUTIUS felix. See Felix.

MIQUELETS, a name given to the Spaniards who inhabit the Pyrenean mountains on the frontiers of Arragon and Catalonia, and live by robbing.

MIQUELON, a fmall defert ifland to the fouthweft of Cape May in Newfoundland, ceded to the French by the peace of 1763, for drying and curing their fifh. W. Long. 54. 30. N. Lat. 47. 22.

MIRABILIS, Marvel of Peru; a genus of the monogynia order, belonging to the pentandria clafs of plants.

The moft remarkable fpecies are,

1. The jalappa, or common marvel of Peru, hath a large, thick, flefhy root; an upright, thick, jointed ftalk, dividing and branching numeroufly, widely, and

Mirabilis. and erectly, a yard or more high; garnished with oblong, broad, opposite leaves; and all the branches and shoots terminated by numerous flowers in clusters, of different colours in the varieties. Of this there are varieties with white flowers—with yellow flowers—with purple flowers—with red flowers—with white and yellow flowers—white and purple flowers—purple and yellow flowers—red and yellow flowers. Several other varieties often rise from seed; and it is remarkable that although several of the above colours and variegations are sometimes common to the same plant, yet it is rare that a plant of this species produces flowers of one of those colours alone; sometimes, however, the same plant will exhibit only white and purple flowers separate, and sometimes both colours in the same flowers, intermixed with the plain ones: the same is also observable in the red and yellow; others have plain flowers of several different colours, and sometimes variegated flowers also on the same plants. The root of this species was supposed to be the true officinal jalap, but which is since discovered to be the root of a species of *convolvulus*.

2. The longiflora, or long-flowered mirabilis, hath a large, thick, fleshy root; a thick stalk, dividing low into many declinated spreading branches, extending two or three feet every way; large, heart-formed, hairy, viscous leaves, in opposite pairs; and all the branches and shoots terminated by white flowers in clusters, having very long tubes, nodding downward.

3. The dichotoma, dichotomous, or forked mirabilis; hath a thick fleshy root; an upright, thick, swollen, jointed stem, branching forkedly two or three feet high; oblong opposite leaves; and smallish red flowers at the axillas, singly and close-sitting.

All these plants flower in July, continuing in plentiful succession until October, very conspicuous and elegant. They have the singularity of being shut all day, and expanding towards the evening when the sun declines; hence the inhabitants of the Indies, where they grow naturally, called them *four o'clock flowers:* their time of opening here, however, depends on the weather; for if cloudy, or that the sun is not very vehement, they often open great part of the day.

They are naturally perennial in root, which, however, if not preserved here in winter, prove but of one year's duration; but if sheltered from frost and wet during the winter season, they will remain alive, and shoot out strongly again in spring: in this country, however, the plants are commonly considered as annuals; because they rise from seed in the spring, and the same year produce flowers and perfect seed; and if left to nature in the open air, totally perish in winter, at the first attack of frost or excessive wet; but, as aforesaid, if in autumn, when the stalks begin to assume a state of decay, the roots are taken up, and preserved in sand in a dry room all winter, and planted again in spring, they shoot out afresh stronger than at first, and sometimes obtain four or five feet stature, with very spreading heads; or if plants growing in pots, having the stems cut down in autumn, and the pots placed in a green-house, or garden-frames under glasses, the roots may also be preserved sound, and will shoot out again in spring as above.

The roots generally become large, tuberous, and fleshy, covered with a dark rind.

All the species are of a tender nature, scarcely able to endure the open air here fully day and night, until May or June; that is, they being raised from seed in spring, chiefly in hot-beds under glasses, continued and forwarded there until the beginning of June, then fully exposed in the borders or pots, they become large branchy plants in July and August, and continue flowering until October or November, till prevented by the cold.

They are all elegant furniture for the principal compartments of the pleasure-ground, they being both very ornamental in their large branchy growth, closely garnished with leaves; and, by flowering so numerously, seem as if entirely covered with flowers, in constant plentiful succession from July till the beginning of winter, as aforesaid.

The roots of all these plants is a strong purgative, and given in a double quantity operate equal to the true jalap.

The propagation of all the species is by seed in the spring, either in a warm border, or in a hot-bed; but the latter will forward the plants to considerably the earliest and greatest degree of perfection.

Miracle. MIRACLE, is defined by Dr Samuel Clarke, to be a work effected in a manner different from the common and regular method of providence, by the interposition either of God himself, or some intelligent agent superior to man.

It has been much controverted, whether true miracles can be worked by any less power than the immediate power of God; and whether to complete the evidence of a miracle, the nature of the doctrine pretended to be proved by it is necessary to be taken into the consideration. The above learned author undertakes to set this matter in a clear light, as follows.

In respect to the power of God, and the nature of the things themselves, all things that are possible at all, are equally easy to be done: it is at least as great an act of power to cause the sun to move at all, as to cause it at any time to stand still; yet this latter we call a *miracle*, the former not.

What degrees of power God may reasonably be supposed to have communicated to created beings or subordinate intelligences, is impossible for us to determine: therefore a miracle is not rightly defined to be such an effect as could not have been produced by any less power than the divine omnipotence. There is no instance of any miracle in scripture, which to an ordinary spectator would necessarily imply the immediate operation of original, absolute, and underived power.

All things that are done in the world, are done either immediately by God himself, or by created intelligent beings, matter not being at all capable of any laws or powers whatsoever; so that all those things which we say are the effects of the natural powers of matter and laws of motion, are properly the effects of God acting upon matter continually and every moment, either immediately by himself, or mediately by some created intelligent beings. Consequently it is no more against the course of nature for an angel to keep a man from sinking in the water, than for a man to hold a stone from falling in the air, by overpowering the law of gravitation; and yet the one is a miracle, the other not so.

The only possible ways by which a spectator may certainly

certainly and infallibly diftinguifh whether miracles be the works either immediately of God himfelf, or of fome good angel employed by him; or whether, on the contrary, they are the works of evil fpirits, are thefe: If the doctrine attefted by miracles, be in itfelf impious, or manifeftly tending to promote vice; then, without all queftion, the miracles, how great foever they may appear to us, are neither worked by God himfelf, nor by his commiffion. If the doctrine itfelf be indifferent, and at the fame time there be worked other miracles more and greater than the former, then that doctrine which is attefted by the fuperior power muft neceffarily be believed to be divine: this was the cafe of Mofes and the Egyptian magicians. If, in the laft place, the doctrine attefted by miracles tends to promote the honour of God, and the practice of righteoufnefs among men; and yet neverthelefs be not in itfelf demonftrable, nor could without a revelation be difcovered to be actually true, and there is no pretence of more and greater miracles to contradict it, which is the cafe of the doctrine and miracles of Chrift; then the miracles are unqueftionably divine, and the doctrine muft, without all controverfy, be acknowledged as an immediate and infallible revelation from God.

The Lord Bacon obferves, that a miracle was never wrought by God to convert an atheift, becaufe the light of nature might have led him to confefs a God: but miracles, fays he, are defigned to convert idolaters and the fuperftitious, who have acknowledged a deity, but erred in the manner of adoring him; becaufe no light of nature extends fo far as fully to declare the will and true worfhip of God.

Acofta inquiring into the caufe why miracles are not wrought by the prefent miffionaries for the converfion of heathen nations, as they were by the Chriftians of the primitive ages, gives this as one reafon: That the Chriftians at firft were ignorant men, and the Gentiles learned; but now, on the contrary, all the learning in the world is employed in the defence of the gofpel, and there is nothing but ignorance to oppofe it; and there can be no need of farther miracles in fo good a caufe, when it is in the hands of fuch able advocates againft fuch weak adverfaries. See the article Abridgment.

MIRANDA-de-Ebro, a town of Spain in Old Caftile, with a ftrong caftle; feated in a country that produces excellent wine. The town is divided into two parts by the river, over which there is a handfome bridge. W. Long. 3. 10. N. Lat. 42. 52.

MIRANDE, a town of Gafcony in France, capital of the county of Aftarac; feated on a mountain near the river Baufe. E. Long. 0. 21. N. Lat. 42. 53.

MIRANDO-de-Douro, or *Duero*, a ftrong town of Portugal, and capital of the province of Tra-los-Montes, with a bifhop's fee. It is well fortified, and feated on a rock near the confluence of the rivers Douro and Frefna. W. Long. 5. 40. N. Lat. 41. 30.

MIRANDOLA, a town of Italy, and capital of a duchy of the fame name, fituate between the duchies of Mantua and Modena. It is a pretty large place, well fortified, and has alfo a ftrong citadel and fort. It has been feveral times taken and retaken; the laft time by the king of Sardinia in 1742. E. Long. 11. 5. N. Lat. 44. 52.

MIRANDULA. See Picus.

MIRIAM, fifter of Aaron and Mofes, makes two or three remarkable appearances in fcripture. It was owing to her that her mother was employed by Pharaoh's daughter as nurfe to Mofes. She put herfelf at the head of the women of Ifrael after their paffage through the Red-Sea, in order to fing the fong which the men had fung before. She joined with her brother Aaron in murmuring againft Mofes, and was feverely chaftifed for that action; for fhe became leprous, and continued feparate from the reft without the camp for feven days. She died before her brothers, though in the fame year with them, and was buried at the public expence.

MIRROR, a name for a looking-glafs, or any polifhed body, whofe ufe is to form the images of diftant objects by reflexion of the rays of light. See Reflexion.

Mirrors are either plain, convex, or concave. The firft reflect the rays of light in a direction exactly fimilar to that in which they fall upon them, and therefore reprefent bodies of their natural magnitude. The convex ones make the rays diverge much more than before reflexion, and therefore greatly diminifh the images of thofe objects which they fhew: while the concave ones, by collecting the rays into a focus, not only magnify the objects they fhow, but will burn very fiercely when expofed to the rays of the fun; and hence they are commonly known by the name of *burning mirrors*. See Burning-*Mirrors*.

In ancient times the mirrors were made of fome kind of metal; and from a paffage in the Mofaic writings we learn that the mirrors ufed by the Jewifh women were made of brafs. The Jews certainly had been taught to ufe that kind of mirrors by the Egyptians; from whence it is probable, that brazen mirrors were the firft kind ufed in the world. Any kind of metal indeed, when well polifhed, will reflect very powerfully; but of all others filver reflects the moft, though it hath been in all countries too expenfive a material for common ufe. Gold alfo is very powerful; and metals, or even wood, gilded and polifhed, will act very powerfully as burning mirrors. Even polifhed ivory, or ftraw nicely plaited together, will form mirrors capable of burning, if on a large fcale.

Since the invention of glafs, and the application of quickfilver to it, became generally known, it hath been univerfally employed for thofe plain mirrors ufed as ornaments to houfes; but in making reflecting telefcopes, they have been found much inferior to metallic ones. It doth not appear that the fame fuperiority belongs to the metalline burning mirrors, confidered merely as burning-glaffes; fince the mirror with which Mr Macquer melted platina, though only 22 inches diameter, and which was made of quickfilvered glafs, produced much greater effects than M. Villette's metalline fpeculum, which confiderably exceeded it in fize. It is very probable, however, that this mirror of M. Villette's was by no means fo well polifhed as it ought to have been; as the art of preparing the metal for taking the fineft polifh hath but lately been difcovered and publifhed in the Philofophical Tranfactions by Mr Mudge. See Glass-*Grind-*

Grinding, and the *Mechanical Part* of OPTICS.

MIRE-CROW, SEA-CROW, or *Pewit*. See LARUS.

MISADVENTURE, in common language, signifies any unlucky accident which takes place without being forefeen.

MISADVENTURE, in law, has an efpecial fignification for the killing a man partly by negligence, and partly by chance. See HOMICIDE.

MISCHNAH, or MISNAH, the code or collection of the civil law of the Jews. The Jews pretend, that when God gave the written law to Mofes, he gave him alfo another which was not written; and which was preferved by tradition among the doctors of the fynagogue, till Rabbi Judah, furnamed the *Holy*, feeing the danger they were in, through their difperfion, of departing from the traditions of their fathers, judged it proper to reduce them to writing. The mifnah is divided in fix parts: the firft relates to the diftinction of feeds in a field, to trees, fruits, tythes, &c.; the fecond regulates the manner of obferving feftivals; the third treats of women, and matrimonial cafes; the fourth, of loffes in trade, &c.; the fifth is on obligations, facrifices, &c.; and the fixth treats of the feveral forts of purification.

MISDEMEANOUR, in law, fignifies a crime. Every crime is a mifdemeanour; yet the law has made a diftinction between crimes of an higher and a lower nature; the latter being denominated *mifdemeanours*, the former *felonies*, &c. For the underftanding of which diftinction, we fhall give the following definition from Blackftone's Commentaries, vol. iv. 5.

" A crime, or mifdemeanour, is an act *committed* or *omitted*, in violation of a public law, either forbidding or commanding it. This general definition comprehends both *crimes* and *mifdemefnours*; which, properly fpeaking, are mere fynonimous terms; tho' in common ufage, the word *crime* is made to denote fuch offences as are of a deeper and more atrocious dye; while fmaller faults, and omiffions of lefs confequence, are comprifed under the gentler name of *mifdemeanours* only.

MISE, in law-books, is ufed in various fenfes: thus it fometimes fignifies cofts or expences, in which fenfe it is commonly ufed in entering of judgments in actions perfonal. It is alfo ufed for the iffue to be tried on the grand affize; in which cafe, joining of the mife upon the mere right, is putting in iffue between the tenant and demandant, Who has the beft or cleareft right.

MISE alfo fignifies a tax or tallage, &c. An honorary gift, or cuftomary prefent from the people of Wales to every new king or prince of Wales, anciently given in cattle, wine, and corn, but now in money, being 5000 l. or more, is denominated a *mife*: fo was the ufual tribute or fine of 3000 merks paid by the inhabitants of the county palatine of Chefter, at the change of every owner of the faid earldoms, for enjoying their liberties. And at Chefter they have a mifebook, wherein every town and village in the county is rated what to pay towards the mife. The 27 Hen. VIII. c. 26. ordains that lords fhall have all fuch mifes and profits of their lands as they had in times paft, &c.

MISE, is fometimes alfo corruptly ufed for *meafe*, in law French *mees*, " a meffuage;" as a *mife place*, in fome manors, is fuch a meffuage or tenement as anfwers the lord a heriot at the death of its owner. 2. *Inft.* 528.

MISERICORDIA, in law, is an arbitrary fine impofed on any perfon for an offence: this is called *mifericordia*, becaufe the amercement ought to be but fmall, and lefs than that required by magna charta. If a perfon be outrageonfly amerced, in a court that is not of record, the writ called *moderata mifericordia* lies for moderating the amercement according to the nature of the fault.

MISFORTUNE. An unlucky accident.

MISFORTUNE, or chance, in law, a deficiency of the will; or committing of an unlawful act by misfortune or chance, and not by defign. In fuch cafe, the will obferves a total neutrality, and does not co-operate with the deed; which therefore wants one main ingredient of a crime. See CRIME.

Of this, when it affects the life of another, we have fpoken under the article HOMICIDE; and in this place have only occafion to obferve, that if any accidental mifchief happens to follow from the performance of a lawful act, the party ftands excufed from all guilt: but if a man be doing any thing unlawful, and a confequence enfues which he did not forefee or intend, as the death of a man or the like, his want of forefight fhall be no excufe; for, being guilty of one offence, in doing antecedently what is in itfelf unlawful, he is criminally guilty of whatever confequence may follow the firft mifbehaviour.

MISFEASANCE, in law-books, fignifies a trefpafs.

MISLETOE, in botany. See VISCUM.

MISNOMER, in law, a mifnaming or miftaking a perfon's name. The Chriftian name of a perfon fhould always be perfect; but the law is not fo ftrict in regard to furnames, a fmall miftake in which will be difpenfed with to make good a contract, and fupport the act of the party. See PLEA *to Indictment*.

MISO. See DOLICHOS.

MISPRISIONS, (a term derived from the old French, *mefpris*, a neglect or contempt), are, in the acceptation of our law, generally underftood to be all fuch high offences as are under the degree of capital, but nearly bordering thereon: and it is faid, that a mifprifion is contained in every treafon and felony whatfoever; and that, if the king fo pleafe, the offender may be proceeded againft for the mifprifion only. And upon the fame principle, while the jurifdiction of the ftar-chamber fubfifted, it was held that the king might remit a profecution for treafon, and caufe the delinquent to be cenfured in that court, merely for a high mifdemeanour: as happened in the cafe of Roger earl of Rutland, in 43 Eliz. who was concerned in the earl of Effex's rebellion. Mifprifions are generally divided into two forts; negative, which confift in the concealment of fomething which ought to be revealed; and pofitive, which confift in the commiffion of fomething which ought not to be done.

1. Of the firft, or negative kind, is what is called *mifprifion of treafon*; confifting in the bare knowledge and concealment of treafon, without any degree of affent thereto: for any affent makes the party a principal

pal traitor; as indeed the concealment, which was construed aiding and abetting, did at the common law; in like manner as the knowledge of a plot against the state, and not revealing it, was a capital crime at Florence, and other states of Italy. But it is now enacted by the statute 1 & 2 Ph. & Mar. c. 10. that a bare concealment of treason shall be only held a misprision. This concealment becomes criminal, if the party apprised of the treason does not, as soon as conveniently may be, reveal it to some judge of assize or justice of the peace. But if there be any probable circumstances of assent, as if one goes to a treasonable meeting, knowing beforehand that a conspiracy is intended against the king; or, being in such company once by accident, and having heard such treasonable conspiracy, meets the same company again, and hears more of it, but conceals it; this is an implied assent in law, and makes the concealer guilty of actual high-treason.

Misprision of felony is also the concealment of a felony which a man knows, but never assented to; for, if he assented, this makes him either principal or accessory. And the punishment of this, in a public officer, by the statute Westm. 1. 3 Edw. I. c. 9. is imprisonment for a year and a day; in a common person, imprisonment for a less discretionary time; and, in both, fine and ransom at the king's pleasure: which pleasure of the king must be observed, once for all, not to signify any extrajudicial will of the sovereign, but such as is declared by his representatives, the judges in his courts of justice; *voluntas regis in curia, non in camera.*

2. Misprisions, which are merely positive, are generally denominated *contempt* or *high misdemeanours;* of which the principal is the *mal-administration* of such high officers as are in public trust and employment. This is usually punished by the method of parliamentary impeachment: wherein such penalties, short of death, are inflicted, as to the wisdom of the house of peers shall seem proper; consisting usually of banishment, imprisonment, fines, or perpetual disability. Hither also may be referred the offence of *embezzling the public money,* called among the Romans *peculatus;* which the Julian law punished with death in a magistrate, and with deportation, or banishment, in a private person. With us it is not a capital crime, but subjects the committer of it to a discretionary fine and imprisonment.—Other misprisions are, in general, such contempts of the executive magistrate as demonstrate themselves by some arrogant and undutiful behaviour towards the king and government; for a detail of which, *vide* Blackstone's Comment. iv. 22.

MISSAL, the Romish mass-book, containing the several masses to be said on particular days. It is derived from the Latin word *missa,* which, in the ancient Christian church, signified every part of divine service.

MISSEL-BIRD, a species of TURDUS.

MISSIONARIES, such ecclesiastics as are sent by any Christian church into Pagan or Infidel countries, to convert the natives, and establish the Christian religion among them.

There are in France, and other Popish countries, several congregations of missionaries, whose principal end is to be employed on missions, and to inspire into the young clerks that spirit of piety and devotion which is necessary for the worthy discharge of their ministry. Such are the congregations of the priests of the mission, the Eudists, the missionaries of Lyons, and some others. The most remarkable of these congregations is that of the priests of the mission, which consists of secular clergy; who nevertheless make four simple vows, of poverty, chastity, obedience, and perseverance. Their habit is distinguished from that of other ecclesiastics only by a linen-collar four fingers broad, and by their wearing a little tuft of beard.

MISSISIPPI, also called the *river of St Louis,* is one of the largest in the world. Its source is unknown: for it has not been navigated higher than 300 miles below the fall or cataract of St Anthony; and there it is 30 fathoms deep, though at the distance of 2400 miles from its mouth. It discharges itself into the sea by three mouths; and, like the Nile, has periodical inundations, by the melting of snow in the north, so that in May it overflows the country on each side, from 60 to 90 miles, and the innundation continues till near the end of July. In the lowest parts of the country there are morasses, lakes, and canals, along the banks, which are generally covered with trees, and in some places the course of the river is confined between high precipices. Its inundations always leave a great quantity of mud upon the land, and sometimes carry down trees to the river's mouth, where they form new islands, and render the entrance difficult.

MISSON (Francis Maximilian), whose pleadings before the parliament of Paris in favour of the reformers bear genuine marks of eloquence and ability, retired into England after the revocation of the edict of Nantz, and became a strenuous assertor of the Protestant religion. In the years 1687 and 1688, he travelled to Italy as governor to an English nobleman: in consequence of which he published at the Hague, "A new voyage to Italy," 3 vols 12mo; which has been translated into English with many additions. He published also the "Sacred Theatre at Cevennes, or an account of Prophecies and Miracles performed in that part of Languedoc," London 1707. "Observations and remarks of a traveller," 12mo, Hague. He died at London in 1721.

MISTAKE, any wrong action committed, not through an evil design, but through an error of judgment.

MISTAKE, in law. See IGNORANCE.

MISUSER, in law, is an abuse of any liberty or benefit; as "He shall make fine for his MISUSER." Old. Nat. Br. 149. By *misuser* a charter of a corporation may be forfeited; so also an office, &c.

MISY, in natural history, a species of the chalcantha, a fossil very common in the Turkish dominions, and sometimes found in the mines of Cremnitz in Hungary. It is a considerably firm substance, of an irrelar texture, not compact; much resembling some of our more gaudy marcasites, but wanting in their hardness and weight. It is of no determinate shape or size; but is often found in small detached masses, which are usually broad, flat, and very rugged at the edges. As to its medical virtues, they are no other than those of the green vitriol.

MITE, a small coin formerly current, and equal to about one-third part of a farthing.

MITE, in zoology. See ACARUS.

MITELLA, BASTARD AMERICAN SANICLE; a genus of the digynia order, belonging to the decandria claſs of plants. There are two ſpecies, both natives of North America, riſing with annual herbaceous ſtalks from five or ſix to eight or nine inches in height, and producing ſpikes of ſmall whitiſh flowers, whoſe petals are fringed on their edges. They are eaſily propagated by parting their roots; and ſhould be planted in a ſhady ſituation, and in a ſoft loamy ſoil. The fruit of one of the ſpecies is the achiotte, or arnotto.

MITHRIDATE, in pharmacy; an antidote, or compoſition, in form of an electuary, ſuppoſed to ſerve either as a remedy or a preſervative againſt poiſons. See PHARMACY, n° 892.—894. It takes its name from the inventor, Mithridates king of Pontus; who is ſaid to have ſo fortified his body againſt poiſons with antidotes and preſervatives, that when he had a mind to diſpatch himſelf, he could not find any poiſon that would take effect. The receipt of it was found in his cabinet, written with his own hand, and was carried to Rome by Pompey. It was tranſlated into verſe by Damocrates, a famous phyſician; and was afterwards tranſlated by Galen, from whom we have it: though there is room to imagine it has undergone conſiderable alterations ſince the time of its royal preſcriber.

MITHRIDATES, king of Pontus, a renowned general, and at firſt ſucceſsful againſt the Romans: but being finally conquered by Pompey, and his ſon Pharnaces raiſed to the throne, who treated him with unnatural barbarity, he took poiſon; but this proving ineffectual, owing to a ſalutary medicine which he had almoſt conſtantly employed, he was ſlain at his own requeſt by one of his attendants, 63 B. C. aged 72. He was a prince of extraordinary courage, capable of forming and executing the greateſt deſigns. He had travelled a great deal, was learned, fond of men of letters, and ſpoke many languages. He compoſed a treatiſe *De Arcanis Morborum*; which Pompey cauſed to be carried to Rome, and which his freedman Læneus tranſlated into Latin. It was he who compoſed that counter-poiſon which from his name is ſtill called *mithridate*; but his ſanguinary temper darkened the luſtre of his moſt amiable perfections. See PONTUS.

MITRE, a ſacerdotal ornament worn on the head by biſhops and certain abbots on ſolemn occaſions; being a ſort of cap, pointed and cleft at top. The high-prieſt among the Jews wore a mitre or bonnet on his head. The inferior prieſts of the ſame nation had likewiſe their mitres; but in what reſpect they differed from that of the high prieſt, is uncertain. Some contend that the ancient biſhops wore mitres; but this is by no means certain.

MITTAU, the capital of the duchy of Courland. It is ſtrongly fortified; but was taken by the Swedes in 1701, and by the Muſcovites in 1706. E. Long. 23. 51. N. Lat. 56. 44.

MITTIMUS, as generally uſed, hath two ſignifications. 1. It ſignifies a writ for removing or transferring of records from one court to another. 2. It ſignifies a precept, or command in writing, under the hand and ſeal of a juſtice of the peace, directed to the gaoler or keeper of ſome priſon, for the receiving and ſafe keeping of an offender charged with any crime, until he be delivered by due courſe of law.

MITYLENE, (anc. geog.), a celebrated, powerful, and affluent city of Leſbos; nor was it leſs famous for the ſtudy of philoſophy and eloquence. It ſuffered much in the Peloponneſian war from the Athenians; and in the Mithridatic war from the Romans, being taken and deſtroyed: but it ſoon roſe again, having recovered its ancient liberty, by the favour of Pompey, (Velleius, Plutarch). It remained a free city and in power 1500 years. The country of Pittacus, one of the ſeven wiſe men of Greece; of Alcæus, and of Sappho. *Mytillenæi*, or *Mytilinenſes*, the people; who at ſtated times celebrated poetical conteſts, (Plutarch). Cicero calls it a city ennobled by nature and ſituation, eſpecially by the beauty of its edifices, and by its plains, which are pleaſant and fertile. It is ſometimes by the poets joined with Rhodes, (Horace, Martial). *Mitylenæus*, the epithet, (Lucan). It now gives name to the whole iſland, and this as early as the days of Euſtathius; and is itſelf called *Caſtro*.

MIXT, or MIXT BODY, in chemiſtry, that which is compounded of different elements or principles.

MIXTURE, a compound, or aſſemblage of ſeveral different bodies in the ſame maſs. Simple mixture, conſiſts only in the ſimple appoſition of parts of different bodies to each other. Thus, when powders of different kinds are rubbed together, the mixture is only ſimple, and each of the powders retains its particular characters. In like manner, when oil and water are mixed together, though the parts of both are confounded, ſo that the liquor may appear to be homogeneous, we cannot ſay that there is any more than a ſimple appoſition of the parts, as the oil and water may very eaſily be again ſeparated from each other. But the caſe is very different when bodies are *chemically* mixed; for then one or both bodies aſſume new properties, and can by no means be diſcovered in their proper form without a particular chemical proceſs adapted to this purpoſe. Hence chemical mixture is attended with many phenomena which are never obſerved in ſimple mixtures; ſuch as heat, effervеſcence, &c. To chemical mixture belongs the union of acids and alkalies, the amalgamation of metals, ſolution of gums, &c. and upon it depend many of the principal operations of chemiſtry. See that article *paſſim*.

MIZEN, in the ſea-language, is a particular maſt or ſail. The mizen-maſt ſtands in the ſternmoſt part of the ſhip. In ſome great ſhips there are two of theſe; when that next the main-maſt is called the *main-mizen*, and that next the poop the *bonaventure mizen*.

MIZRAIM, or MISRAIM, the dual name of Egypt, uſed in ſcripture to denote the Higher and Lower Egypt, which ſee. It ſometimes occurs ſingular, *Mazor:* 2 Kings xix. Iſaiah xix. Micah vii.

MNIUM, MARSHMOSS; a genus of the order of muſci, belonging to the cryptogamia claſs of plants. There are 18 ſpecies, of which ſeven are natives of Britain; but none have any remarkable property except the two following. 1. The fontanum is an elegant moſs, frequent in bogs, and on the borders of old ſprings. It is from two to four inches high: the ſtalks are ſimple at the baſe, and covered with a ruſty down; but higher up are red, and divided into ſeveral

veral round, ſingle, taper branches, which proceed nearly from the ſame point. The leaves are not more than $\frac{1}{12}$ of an inch long, lanceolate and acute, of a whitiſh green colour, and ſo thinly ſet, that the red ſtalk appears between them. This moſs, as it may be ſeen at a conſiderable diſtance, is a good mark to lead to the diſcovery of clear and cold ſprings. Linnæus informs us, that the Laplanders are well acquainted with this ſign. Mr Withering informs us, that wherever this moſs grows, a ſpring of freſh water may be found without much digging. 2. The hygrometricum grows in woods, heaths, garden-walks, walls, old trees, decayed wood, and where coals or cinders have been laid. It is ſtemleſs, hath tips inverſely egg-ſhaped, nodding, and bright yellow. If the fruit-ſtalk is moiſtened at the baſe with a little water or ſteam, the head makes three or four revolutions: if the head is moiſtened, it turns back again.

MOAB, (anc. geog.), a country of Arabia Petræa; ſo called from Moab the ſon of Lot, to whoſe poſterity this country was allotted by divine appointment, Deut. xi. 9. It was anciently occupied by the Emim, a race of giants extirpated by the Moabites, *ibid.* Moab anciently lay to the ſouth of Ammon, before Sihon the Amorite ſtripped both nations of a part of their territory, afterwards occupied by the Iſraelites, Numb. xxi.; and then Moab was bounded by the river Arnon to the north, the Lacus Aſphaltites to the weſt, the brook Zared to the ſouth, and the mountains Abarim to the eaſt.

MOAT, or Ditch, in fortification, a deep trench dug round the rampart of a fortified place, to prevent ſurpriſes.

The brink of the moat, next the rampart, is called the *ſcarpe;* and the oppoſite one, the *counterſcarpe.*

A dry moat round a large place, with a ſtrong garriſon, is preferable to one full of water; becauſe the paſſage may be diſputed inch by inch, and the beſiegers, when lodged in it, are continnally expoſed to the bombs, granades, and other fire-works, which are thrown inceſſantly from the rampart into their works. In the middle of dry moats, there is ſometimes another ſmall one, called *cunette;* which is generally dug ſo deep, till they find water to fill it.

The deepeſt and broadeſt moats are accounted the beſt; but a deep one is preferable to a broad one: the ordinary breadth is about 20 fathoms, and the depth about 16.

To drain a moat that is full of water, they dig a trench deeper than the level of the water, to let it run off; and then throw hurdles upon the mud and ſlime, covering them with earth or bundles of ruſhes, to make a ſure and firm paſſage.

MOCHO, Moco, or *Mokha;* by ſome ſuppoſed to be the Muſa or Muza of Ptolemy, is a port and town on the Red-Sea, of conſiderable trade; contains about 10,000 inhabitants, Jews, Armenians, and Mohammedans, is ſurrounded with walls after the ancient manner, and has four gates and four towers, the laſt mounted with cannon, but no ditch. It gives name to a kingdom extending along the moſt ſouthern coaſt of Arabia; of which that part which lies next the ſea is a dry barren deſart, in ſome places 10 or 12 leagues over; but bounded by mountains, which being well watered, enjoy an almoſt perpetual ſpring; and beſides coffee, the peculiar produce of this country, yields corn, grapes, myrrh, frankincenſe, caſſia, balm, gums of ſeveral ſorts, mangos, dates, pomegranates, &c. The weather here is ſo hot and ſultry in ſummer, eſpecially when the ſouth wind blows, that it would be unſupportable, if it was not mitigated by the cool breezes that generally blow from the mountains on the north, or the Red and Arabic Seas on the weſt and eaſt. The heat in winter is equal to that of our warmeſt ſummers; and it is very ſeldom that either clouds or rain are ſeen. The city of Mocho is now the emporium for the trade of all India to the Red-Sea. The trade was removed hither from Aden, in conſequence of the prophecy of a ſheik, much revered by the people, who foretold, that it would ſoon become a place of extenſive commerce, notwithſtanding its diſadvantageous ſituation. It ſtands cloſe to the ſea, in a large, dry, and ſandy plain, that affords no good water within 20 miles of the city; what they drink comes from Moſa, and coſts as dear as ſmall-beer in England. The water near the town, as it is thought, produces a worm, which the naturaliſts call the *dracunculus,* which is about two feet and a half long, very ſlender, and breeds in the fleſhy parts of the body: in extracting it great care muſt be uſed, the conſequence being dangerous if any part of it remains in the body. The buildings here are lofty, and tolerably regular, having a pleaſant aſpect from Mecca. The ſteeples of ſeveral moſques are very high, preſenting themſelves to view at a great diſtance. Their markets are well ſtored with beef, mutton, lamb, kid, camels, and antelopes fleſh, common fowls, Guinea hens, partridges, and pigeons. The ſea affords plenty of fiſh, but not ſavoury; which ſome think proceeds from the extreme ſaltneſs of the water, and the nature of their aliment. The markets are alſo ſtocked with fruit, ſuch as grapes, peaches, apricots, quinces, and nectarines; although neither ſhrub nor tree is to be ſeen near the town, except a few date-trees. Frequently no rain falls here in two or three years, and ſeldom more than a ſhower or two in a year; but in the mountains, at the diſtance of about 20 miles from Mokha, the earth is watered with a gentle ſhower every morning, which makes the vallies fertile in corn, and the fruits natural to the climate. The Arab inhabitants, though remarkably grave and ſuperſtitious, are ſaid to be extremely covetous and hypocritical; robbing, thieving, and committing piracy, without the leaſt ſcruple or remorſe. The Engliſh and Dutch companies have handſome houſes here, and carry on a great trade in coffee, olibanum, myrrh, aloes, liquid ſtorax, white and yellow arſenic, gum-arabic, mummy, balm of Gilead, and other drugs. One inconvenience, however, they ſuſtain from the violence and exactions of the Arabian princes; but the king's cuſtoms are eaſy, being fixed at *three per cent.* to Europeans. Of the coins at Mocha, the moſt current is the camaſſie, which riſes and falls in value at the banker's diſcretion: they are from 50 to 80 for a current dollar, which is but an imaginary ſpecies, being always reckoned one and a half *per cent.* lower than Spaniſh dollars. As to their weights, they are almoſt infinite,

infinite, according to the nature of the thing to be weighed: they have the banian weight; the magnet; the ambergriſe; the agala; the gold and ſilver weights, &c.

MOCKING-BIRD, in ornithology. See TURDUS.

MOCOCO. See LEMUR.

MODE, in metaphyſics, denotes the manner of a thing's exiſtence. See METAPHYSICS, n° 50. 51. 55.—86.

MODE, in muſic; a regular diſpoſition of the air and accompaniments relative to certain principal ſounds upon which a piece of muſic is formed, and which are called the *eſſential ſounds of the mode.*

There is this difference between the mode and the tone, that the latter only determines the principal ſound, and indicates the place which is moſt proper to be occupied by that ſyſtem which ought to conſtitute the baſs of the air; whereas the former regulates the thirds, and modifies the whole ſcale agreeably to its fundamental ſounds.

Our *modes* are not, like thoſe of the ancients, characterized by any ſentiment which they tend to excite, but reſult from our ſyſtem of harmony alone. The ſounds eſſential to the mode are in number three, and form together one perfect chord. 1. The tonic or key, which is the fundamental note both of the tone and of the mode. (See TONE and TONIC). 2. The dominant, which is a fifth from the tonic. (See DOMINANT). 3. The mediant, which properly conſtitutes the *mode*, and which is a third from the ſame tonic. As this third may be of two kinds, there are of conſequence two different modes. When the mediant forms a greater third with the tonic, the mode is major; when the third is leſſer, it is minor.

The major mode is immediately generated by the reſonance of ſounding bodies, which exhibit the third major of the fundamental ſound: but the minor mode is not the product of nature; it is only found by analogy and inverſion. This is equally true upon the ſyſtem of Sig. Tartini as upon that of M. Rameau.

This laſt author, in his various and ſucceſſive publications, has explained the origin of this minor mode in different ways, of which his interpreter M. D'Alembert was ſatisfied with none. It is for this reaſon that he has founded this origin on a different principle which cannot be better explained than in the words of that eminent geometrician. See MUSIC, Art. 28, 29, 30 and 31.

When the mode is once determined, every note in the ſcale aſſumes a name expreſſive of its relation to the fundamental ſound, and peculiar to the place which it occupies in that particular mode. We ſubjoin the names of all the notes ſignificant of their relative values and places in each particular *mode*, taking the octave of *ut* as an example of the major *mode*, and of *la* as an example of the minor.

Major,	*ut*	*re*	*mi*	*fa*	*ſol*	*la*	*ſi*	*ut*,
Minor,	*la*	*ſi*	*ut*	*re*	*mi*	*fa*	*ſol*	*la*.
	Tonic.	Second note.	Mediant.	Sub-dominant, or Fourth note,	Dominant.	Sub-dominant, or Sixth note,	Seventh note.	Octave.

It is neceſſary to remark, that when the ſeventh note is only a ſemitone diſtant from the higheſt in the octave, that is to ſay, when it forms a third major with the dominant, as *ſi* natural in the major *mode*, or *ſol* ſharp in the minor, that ſeventh ſound is then called a *ſenſible note*, becauſe it diſcovers the tonic and renders the tone apreciable.

Nor does each gradation only aſſume that name which is ſuitable to it; but the nature of each interval is determined according to its relation to the *mode.* The rules eſtabliſhed for this are as follow:

1. The ſecond note muſt form a ſecond major above the tonic, the fourth note and the dominant ſhould form a fourth and fifth exactly true; and this equally in both modes.

2. In the major mode, the mediant or third, the ſixth and the ſeventh from the tonic, ſhould always be major; for by this the mode is characterized. For the ſame reaſon theſe three intervals ought always to be minor in the minor mode: nevertheleſs, as it is neceſſary that the ſenſible note ſhould likewiſe there be perceived, which cannot be effectuated without a falſe relation whilſt the ſixth note ſtill remains minor; this occaſions exceptions, of which in the courſe of the air or harmony care muſt be taken. But it is always neceſſary that the cleff, with its tranſpoſitions, ſhould preſerve all the intervals, as determined with relation to the tonic, according to the ſpecies of the *mode.* For this a general rule will be found at the word *Cleff* in Rouſſeau's Muſical Dictionary.

As all the natural chords in the octave of *ut* give, with relation to that tonic, all the intervals preſcribed for the major *mode*, and as the caſe is the ſame with the octave of *la* for the minor mode, the preceding example, which was only given that we might have an opportunity of naming the notes, may likewiſe ſerve as a formula for the rule of the intervals in each *mode.*

This rule is not, as one might imagine, eſtabliſhed upon principles that are merely arbitrary: it has its ſource in the generation of harmony, at leaſt in a certain degree. If you give a perfect major chord to the tonic, to the dominant, and the ſub-dominant, you will have all the ſounds of the diatonic ſcale for the major *mode:* to obtain that of the minor, leaving ſtill its third major to the dominant, give a third minor to the two other chords. Such is the analogy of the mode.

As this mixture of major and minor chords introduces into the minor mode a falſe relation between the ſixth and the ſenſible note, to avoid this falſe relation, they ſometimes give the third major to the fourth note in aſcent, or the third minor to the dominant in deſcending, chiefly by inverting the chords; but theſe in this caſe are licences.

There are properly no more than two *modes*, as we have ſeen: but as there are twelve different ſounds in the octave which may be made fundamental ſounds, and of conſequence form as many keys or tones; and as each of theſe tones are ſuſceptible of the major or minor mode, muſic may be compoſed in twenty-four modes or manners. Nay, in the manner of writing muſic, there are even thirty-four paſſable modes: but in practice ten are excluded, which when thoroughly examined are nothing elſe but a repetition of the other ten, under relations much more difficult, in which all the

Mode.

the chords muſt change their names, and where it muſt coſt any one ſome trouble to know what he is about. Such is the major mode upon a note raiſed above its natural pitch by a ſemitone, and the minor mode upon a note depreſſed by a ſemitone. Thus, inſtead of compoſing upon *ſol* ſharp with a third major, it is much more eligible to operate upon *la* flat, which will give you an opportunity to employ the ſame tones; and inſtead of compoſing upon *re* flat with a third minor, you will find it more convenient to chooſe *ut* ſharp for the ſame reaſon; viz. on one hand to avoid a *fa* with a double ſharp, which would be equivalent to a *ſol* natural; and on the other hand a *ſi* with a double flat, which would become a *la* natural.

The compoſer does not always continue in the ſame *mode*, nor in the ſame *key*, in which he has begun an air; but, whether to alter the expreſſion or introduce variety, *modes* and *keys* are frequently changed, according to the analogy of harmony; yet always returning to thoſe which have been firſt heard: this is called *modulation*.

From thence ariſes a new diviſion of *modes* into ſuch as are *principal* and ſuch as are *relative:* the principal is that in which the piece begins and ends; the relative modes are ſuch as the compoſer interweaves with the principal in the flow of the harmony. (See Modulation).

Others have propoſed a third ſpecies, which they call a *mixed mode*, becauſe it participates the modulation of both the others, or rather becauſe it is compoſed of them; a mixture which they did not reckon an inconveniency, but rather an advantage, as it increaſes the variety, and gives the compoſer a greater latitude both in air and harmony.

This new mode, not being found by the analyſis of the three chords like the two former, is not determined, like them, by harmonics eſſential to the mode, but by an entire ſcale which is peculiar to itſelf, as well in riſing as deſcending; ſo that in the two modes above-mentioned the ſcale is inveſtigated by the chords, and in this mixed mode the chords are inveſtigated by the ſcale. The following notes exhibit the form of this ſcale in ſucceſſion, as well riſing as deſcending:

mi fa ſol la ſi ut re mi.

Of which the eſſential difference is, as to the *melody*, in the poſition of the two ſemitones; of which the firſt is found between the firſt and the ſecond note, and the laſt between the fifth and ſixth: and, with reſpect to the *harmony*, the difference conſiſts in this, that upon its tonic it carries a third minor in the beginning, and major in ending, in the accompaniment of this ſcale, as well in riſing as deſcending, ſuch as it has been given by thoſe who propoſed it, and executed at a ſpiritual concert, May 30. 1751.

They object to its inventor, That his mode has neither chords nor harmony eſſential to itſelf, nor cadences which are peculiar to it, and which ſufficiently diſtinguiſh it from the major or minor mode. He anſwers to this, That the diſtinction of his mode is leſs in harmony than in melody, and leſs even in the mode itſelf than in the modulation; that in its beginning it is diſtinguiſhed from the major mode by its third minor, and in its end from the minor mode by its plagal cadence. To which his opponents reply, That a modulation which is not excluſive cannot be ſufficient to eſtabliſh a mode; and that his muſt inevitably occur in the two other modes, and above all in the minor: and, as to his plagal cadence, that it neceſſarily takes place in the minor mode as often as tranſition is made from the chord of the tonic to that of the dominant, as has long been the caſe in practice, even upon final notes, in plagal modes, and in the tone proper to the fourth. From whence it is concluded, that his mixed mode is not ſo much a particular ſpecies, as a new denomination for the manner of interweaving and combining the major and minor modes, as ancient as harmony, practiſed at all periods: and this appears to be ſo true, that, even when he begins his ſcale, its author will neither venture to give the fifth nor the ſixth to his tonic, for fear leſt by the firſt the tonic ſhould be determined in the minor mode, or the mediant in the major mode by the ſecond. He leaves the harmony equivocal by not filling up his chord.

Mode || Modena.

But whatever objections may be made againſt the mixed mode, whoſe name is rather rejected than its practice, this will not prevent the author from appearing as a man of genius, and a muſician profoundly learned in the principles of his art, by the manner in which he treats it, and the arguments which he uſes to eſtabliſh it.

Mode *Major*. } See Interval.
Mode *Minor*. }

MODEL, in a general ſenſe, an original pattern, propoſed for any one to copy or imitate.

This word is particularly uſed, in building, for an artificial pattern made in wood, ſtone, plaſter, or other matter, with all its parts and proportions, in order for the better conducting and executing ſome great work, and to give an idea of the effect it will have in large. In all great buildings, it is much the ſureſt way to make a model in relievo, and not to truſt to a bare deſign or draught. There are alſo models for the building of ſhips, &c. and for extraordinary ſtaircaſes, &c.

They alſo uſe models in painting and ſculpture; whence, in the academies, they give the term *model* to a naked man or woman, diſpoſed in ſeveral poſtures, to give an opportunity to the ſcholars to deſign him in various views and attitudes.

MODENA, a duchy of Italy, bounded on the ſouth by Tuſcany and the republic of Lucca, on the north by the duchy of Mantua, on the eaſt by the Bologneſe and the territories of the church, and on the weſt by the duchy of Parma; extending in length from ſouth to north about 56 Engliſh miles, and in breadth between 24 and 36, and yielding plenty of corn, wine, and fruits, with mineral waters. In ſome places alſo petroleum is ſkimmed off the furface of the water of deep wells made on purpoſe; and in others is found a kind of earth or tophus, which, when pulveriſed, is ſaid to be an excellent remedy againſt poiſon, fevers, dyſenteries, and hypochondriac diſorders. The country of La Salſa affords ſeveral kinds of petrifactions. The principal rivers are the Croſtolo, Secchia, and Panaro. The family of Eſté, dukes of Modena, is very ancient. They had their name from Eſté, a ſmall city in the diſtrict of Padua. In

In 1753, the prefent duke was appointed imperial vicar-general, field-marfhal, and governor, of the Milanefe during the minority of the archduke Peter Leopold, who was declared governor-general of the Auftrian Lombardy. The duke, though a vaffal of the empire, hath an unlimited power within his own dominions.

MODENA, an ancient city, in Latin *Mutina*, which gives name to a duchy of Italy, and is its capital. It ftands 28 miles eaft of Parma, 44 almoft fouth of Mantua, and 20 weft of Bologna; and is a pretty large and populous, but not a handfome city. It is much celebrated by Roman authors for its grandeur and opulence; but was a great fufferer by the fiege it underwent during the troubles of the triumvirate. It hath long been the ufual refidence of the dukes; and is alfo the fee of a bifhop, who is fuffragan to the archbifhop of Bologna. Mr Keyfler fays, that when Decius Brutus was befieged here by Mark Antony, Hirtius the conful made ufe of carrier-pigeons; and that, even at this day, pigeons are trained up at Modena, to carry letters, and bring back anfwers. This city hath given birth to feveral celebrated perfons, particularly Taffo the poet, Correggio the great painter, Sigonius the civilian and hiftorian, da Vignola the architect, and Montccuculi the imperial general. The tutelary faint of it is named *Geminianus*. The ducal palace is a very noble edifice, in which, among the other fine pictures, the birth of Chrift by Correggio, called *la Notte Felice*, is much celebrated. The only manufacture for which this city is noted, is that of mafks, of which great numbers are exported. The churches of the Jefuits, of the Theatines, and of St Dominic, are well worth viewing. In the college of St Carlo Boromeo between 70 and 80 young noblemen are continually maintained, and inftructed both in the fciences and genteel exercifes. St Beatrix, who was of the family of Efté, is faid to knock always at the gate of the palace three days before any of the family dies. Before moft of the houfes are covered walks, or porticos, as at Bologna. The city is fortified, and on its fouth fide ftands the citadel.

MODERATOR, in the fchools, the perfon who prefides at a difpute, or in a public affembly: thus the prefident of the annual affembly of the church of Scotland is ftyled *moderator*.

MODERN, fomething new, or of our time; in oppofition to what is antique, or *ancient*.

MODERN *Authors*, according to Naude, are all thofe who have wrote fince Boëthius. The modern philofophy commences with Galileo; the modern aftronomy with Copernicus.

MODIFICATION, in philofophy, that which modifies a thing, or gives it this or that manner of being. Quantity and quality are accidents which modify all bodies.

Decree of MODIFICATION, in Scots law, a decree afcertaining the extent of a minifter's ftipend, without proportioning it among the perfons liable in payment.

MODILLIONS, in architecture, ornaments in the corniche of the Ionic, Corinthian, and Compofite columns.

MODIUS, in antiquity, a kind of dry meafure, in ufe among the Romans, for feveral forts of grain.

MODREVIUS (Andreas Frichius), fecretary to Sigifmund Auguftus king of Poland, acquired confiderable reputation by his learning and works. He broke off from the Romifh church, favoured the Lutherans and Anti-trinitarians, and took great pains in order to unite all Chriftian focieties under the fame communion. Grotius has placed him in the clafs of the reconcilers of the different fchemes of religion. His principal work is intitled, *De republica emendanda*.

MODULATION, the art of forming any thing to certain proportion.

MODULATION, in reading, or fpeaking. See READING.

MODULATION, in mufic, derived from the Latin *modulari*. This word in our language is fufceptible of feveral different fignifications. It frequently means no more than an air, or a number of mufical founds properly connected and arranged. Thus it anfwers to what Mr Malcolm underftands by the word *tune*, when he does not exprefsly treat concerning the tuning of inftruments. Thus likewife it expreffes the French word *chant*; for which reafon, in the article MUSIC, we have frequently expreffed the one word by the other. But the precife and technical acceptation to which it ought to be confined, is the art of compofing melody or harmony agreeably to the laws prefcribed by any particular key, that of changing the key, or of regularly and legitimately paffing from one key to another. In what remains to be faid upon the fubject we follow Rouffeau.

Modulation (fays he) is properly the manner of afcertaining and managing the modes; but at this time the word moft frequently fignifies the art of conducting the harmony and the air fucceffively through feveral modes, in a manner agreeable to the ear and conformed to rules.

If the different modes be produced by harmony, from thence likewife muft fpring the laws of modulation. Thefe laws are fimple in conception, but difficult in practice. We proceed therefore to fhew in what they confift.

To modulate properly in the fame tone, it is neceffary, 1. To run through all the founds of it in an agreeable air, frequently repeating the founds which are moft effential to it, and dwelling upon thefe founds with the moft remarkable emphafis; that is to fay, that the chord containing the fenfible notes, and that of the tonic, fhould frequently be heard in it, but under different appearances, and obtained by different procedures to prevent monotony. 2. That repofes or cadences fhould only be eftablifhed upon thefe two chords: the greateft liberty, however, which ought to be taken with the rule is, that a cadence or repofe may be eftablifhed on the chord of the fubdominant. 3. In fhort, that none of the founds of the mode ought ever to be altered; for without quitting it, we cannot introduce a fharp or a flat which does not belong to it, nor abftract any one which in reality does belong to it.

But paffing from one mode to another, we muft confult analogy, we muft confider the relations which a key bears to the other notes in the feries, and to the num-

number of founds common to both the modes, that from whence we pafs, and that into which we enter.

If we pafs from a mode major, whether we confider the fifth from the key as having the moft fimple relation with it except that of the octave, or whether we confider it as the firft found which enters into the harmonics of the fame key, we fhall always find, that this fifth, which is the dominant of the mode, is the chord upon which we may eftablifh the modulation moft analogous to that of the principal key.

This dominant, which conftituted one of the harmonics of the firft key, makes alfo one of its own peculiar key, of which it is the fundamental found. There is then a connection between thefe two chords. Befides, that fame dominant carrying, as well as the tonic, a perfect chord major upon the principle of refonance, thefe two chords are only different one from the other by the diffonance, which paffing from the key to the dominant is the fixth fuperadded, and when reafcending from the dominant to the key is the feventh. Now thefe two chords, thus diftinguifhed by the diffonance which is fuitable to each, by the founds which compofe them when ranged in order, form precifely the octave, or the diatonic fcale, which we call a *gammut*, which determines the mode.

This fame feries of the key, altered only by a fharp, forms the fcale belonging to the mode of the dominant; which fhows how ftriking the analogy is between thefe two tones, and gives the eafieft opportunity of paffing from one to the other by means of one fingle alteration alone. The mode then of the dominant is the firft which prefents itfelf after that of the key in the order of modulations.

The fame fimplicity of relations which we find between a tonic and its dominant, is likewife found between the fame tonic and its fub-dominant; for that fifth, in afcending, which is formed by the dominant with the tonic, is likewife formed by the fub-dominant in defcending: but that fub-dominant does not form a fifth with the tonic. except by inverfion; it is directly a fourth, if we take that tonic below, as it ought to be; and which fixes the degree of their relations: for in this fenfe the fourth, whofe ratio is as 3 to 4, immediately follows the fifth, whofe ratio is as 2 to 3. So that, if that fub-dominant does not enter into the chord of the tonic, in return the tonic enters into its perfect chord. For let *ut mi fol* be the chord of the tonic, that of the fub-dominant fhall be *fa la ut:* thus it is the *ut* which here forms the connection, and the two other founds of this new chord are exactly the two diffonances of the preceding. Befides, we need not alter more founds for this new mode than for that of the dominant; they are both in the one and the other quite the fame chords of the principal mode, except one. Add a flat to the fenfible note *fi* or B, and all the notes in the mode of *ut* or C will ferve for that of *fa* or F. The mode of the fub-dominant then is fcarcely lefs analogous to the principal mode than that of the dominant.

It ought likewife to be remarked, that after having made ufe of the firft modulation in order to pafs from a principal mode *ut* or C, to that of the dominant *fol* or G, we are obliged to make ufe of the fecond to return to the principal mode: for if *fol*, or G, be the dominant in the mode of *ut* or C, *ut* is the fub-dominant in the mode of *fol:* thus one of thefe modulations is no lefs neceffary than the other.

The third found which enters into the chord of the tonic is that of third formed by its mediant; and, after the preceding, it is likewife the moft fimple of relations $\frac{2}{3}\frac{3}{4}\frac{4}{5}$. Here then is a new modulation which prefents itfelf, and which is fo much the more analogous, becaufe two of the founds of the principal tonic enter likewife into the minor chord of its mediant; for the former chord being *ut mi fol*, the latter muft be *mi fol fi*, where it may be perceived that *mi* and *fol* are common. But what renders this modulation a little more remote, is the number of founds which are neceffary to be altered, even for the minor mode, which is moft fuitable to this *mi*. In the article Music (234.) will be found a table for all the modes; and Rouffeau, in his Mufical Dictionary, has given the formula of a fcale both for the major and minor: now, by applying this formula to the minor mode, we find nothing in reality, but the fourth found *fa* heightened by a fharp in defcending; but in rifing, we find two others which are altered, *viz.* the principal tonic *ut*, and its fecond *re*, which here becomes a fenfible note: it is certain that the alteration of fo many founds, and particularly of the tonic, muft remove the mode and weaken the analogy.

If we fhould invert the third as we have inverted the fifth, and take that third below the tonic on the fixth note *la*, which ought here to be called a *fub-mediant*, or the *mediant below*, we fhall form upon this note *la* a modulation more analogous to the principal tone than that of *mi;* for as the perfect chord of this fub-mediant is *la ut mi*, there once more we find, as in that of the mediant, two of the founds which enter into the chord of the tonic, viz. *ut* and *mi:* and moreover, fince the fcale of this new key is compofed, at leaft in defcending, of the fame founds with that of the principal key; and fince it has only two founds altered in afcending, that is to fay, one fewer than the feries of the mediant; it follows that the modulation of this fixth note is preferable to that of the mediant; and by fo much the more, that there the principal tonic forms one of the founds effential to the mode; which is more proper for approximating the idea of the modulation. The *mi* may afterwards follow.

Here then are four founds, *mi fa fol la*, upon each of which we may modulate in paffing from the major mode of *ut*. *Re* and *fi* remain, which are the two harmonics of the dominant. This laft, as being a fenfible note, cannot become a tonic by any proper modulation, at leaft it cannot immediately become one: this would be an abrupt application of ideas too much oppofed to the fame founds, and would likewife be to give it a harmony too remote from the principal found. As to the fecond note *re*, we may likewife, by favour of a confonant procedure in the fundamental bafs, modulate upon it in a third minor; but this muft be only continued for an inftant, that the audience may not have time to forget the modulation of *ut*, which is itfelf altered in that place; otherwife, inftead of returning immediately to *ut*, we muft pafs through intermediate modes, where we muft run great hazard of deviation.

By following the fame analogies, we may modulate in the following order, to make our exit from a minor mode;

 mode; firſt upon the mediant, afterwards the dominant, next the ſub-dominant, then the ſub-mediant, or ſixth note. The mode of each of theſe acceſſory keys is determined by its mediant taken from the principal ſound. For inſtance, iſſuing from the major mode of *ut*, to modulate upon its mediant, we render the mode of that mediant minor; becauſe *ſol*, the dominant of the principal ſound, forms a third minor with that mediant, which is *mi*. On the contrary, in our egreſs from the minor mode of *la*, we modulate upon its mediant *ut* in the major mode; becauſe *mi*, the dominant of the tone from whence we iſſue, forms a third major with the key of that into which we enter, &c.

Theſe rules, comprehended in one general formula, import, that the modes of the dominant and of the ſub-dominant are like that of the tonic, and that the mediant and the ſixth note require a mode oppoſed. We muſt, however, remark, that, by the right which we have of paſſing from the major to the minor, and *vice verſa*, upon the ſame key, we may likewiſe change the order of modes from one key to another; but whilſt we thus remove ourſelves from the natural modulation, we muſt preſently think of our return: for it is a general rule, that every piece of muſic ought to terminate in that key with which it began.

In his Muſical Dictionary, plate B, fig. 6. and 7. Rouſſeau has collected in two examples, which are very ſhort, all the modes to which we may immediately paſs; the firſt, in paſſing from the major mode; and the ſecond, from the minor. Each note indicates a particular modulation; and the value of the notes in each example likewiſe ſhows the relative duration ſuitable to each of theſe modes, according to its relation with the principal mode.

Theſe immediate tranſitions from one mode to another, furniſh us with the means of paſſing by the ſame rules to modes ſtill more remote, and from thence to return to the principal mode, of which we never ſhould loſe ſight. But it is not ſufficient to know what courſe we ought to purſue; we muſt likewiſe be acquainted with the method of entering into it. A ſummary therefore of the precepts which are given in this department ſhall immediately follow.

In melody, in order to diſcover and introduce the modulation which we have choſen, nothing is neceſſary but to render perceptible the alterations which it cauſes in the ſounds of that mode from whence we iſſue, to make them proper for the mode into which we enter. Are we now in the major mode of *ut?* there needs no more than to ſound the note *fa* ſharp, that we may diſcover the mode of the dominant; or a *ſi* flat, that we may ſhew the mode of the ſub-dominant. Afterwards you may run over the ſounds eſſential to the mode in which you enter; if it is well choſen, your modulation will always be juſt and regular.

In harmony, the difficulty is a little increaſed: for as it is neceſſary that the change of modes ſhould be made at the ſame time through all the parts, care muſt be taken of the harmony, and of the air, that we may avoid purſuing different modulations at the ſame time. Huygens has happily remarked, that the prohibition of two fifths in immediate ſucceſſion proceeds upon this rule as its principal: in reality, between two parts it is ſcarcely poſſible to form a number of juſt fifths in uninterrupted ſucceſſion without operating in two different modes.

To introduce a mode, a great many pretend that it is ſufficient to form the perfect chord of its principal ſound, and this is indiſpenſable in order to produce the mode. But it is certain, that the mode cannot be exactly determined but by the chord containing the ſenſible note, or the dominant: we muſt then cauſe this chord to be heard when we enter into a new modulation. The moſt eligible rule would be, That in it the ſeventh, or minor diſſonance, ſhould always be prepared, at leaſt the firſt time in which it is heard: but this method is not practicable in every admiſſible modulation; and provided that the fundamental baſs proceeds by conſonant intervals, that the connection of harmony be obſerved, the analogy of the mode purſued, and falſe relations avoided, the modulation will always be approved. Compoſers preſcribe as another rule, That a mode ſhould not be changed except after a perfect cadence: but this interdict is uſeleſs, and no perſon obſerves it.

All the poſſible methods of paſſing from one mode to another, are reducible to five with reſpect to the major mode, and to four with reſpect to the minor; which, in the Muſical Dictionary, plate B, fig. 8. will be found implied in a fundamental baſs intended for each modulation. If there be any other modulation which cannot be reſolved into ſome one of theſe nine, unleſs that modulation be enharmonic, it muſt infallibly be illegitimate. See ENHARMONIC.

MODULE, in architecture, a certain meaſure, or bigneſs, taken at pleaſure, for regulating the proportions of columns, and the ſymmetry or diſpoſition of the whole building. Architects generally chooſe the ſemidiameter of the bottom of the column for their module, and this they ſubdivide into parts or minutes.

MOEBIUS (Godfrey), profeſſor of phyſic at Iena, was born at Lauch in Thuringia in 1611. He became firſt phyſician to Frederic William elector of Brandenburg, to Auguſtus duke of Saxony, and to William duke of Saxe-Weimar. He wrote ſeveral medicinal works, which are eſteemed; and died at Halle, in Saxony, in 1664.

MOENIUS (Caius), a celebrated Roman conſul, conqueror of the ancient Latins, 338 B. C. He was the firſt who hung up the prows, &c. of the galleys he had taken at the naval engagement of Actium, upon the place where the tribunes harangued the people; from whence it was called the *roſtra*.

MOFFAT, a village of Scotland, in the ſhire of Annandale, 36 miles ſouth-weſt of Edinburgh; famous for its ſulphureous waters; one of the ſprings being uſed for bathing, the other for drinking. Theſe waters are of great ſervice in gripings of the guts, colics, and pains in the ſtomach. Thoſe who are troubled with obſtructions, rheumatic pains, and aches, find great relief both from bathing and drinking. The water is alſo of great uſe in ſcorbutic and ſcrophulous caſes.

MOGULS, or MUNGLS, a celebrated nation of Aſia, whoſe conqueſts formerly were the moſt rapid and extenſive of any people recorded in hiſtory.

The origin of the Moguls, Tartars, and Turks, is univerſally allowed to be the ſame; and they are conſidered as the offspring of part of the ancient Scythians.

Moguls. thians. They themſelves deduce their origin from Japhet, or, as they call him, *Japhis*, the ſon of Noah.

1 Moguls deſcended from Japhet.

His ſon Turk, they ſay, was the firſt king, or khan, of thoſe nations who are now known by the ſeparate names of *Turks*, *Tartars*, and *Moguls*; and the Tartars eſpecially, aſſert that their proper deſignation is *Turks*. To this prince is attributed many of thoſe inventions which barbarous nations commonly aſcribe to their firſt ſovereigns. He was ſucceeded by Taunak; in whoſe reign the whole poſterity of Turk were divided into four large tribes, denominated the *orda's* of Erlat, Gialair, Kaugin, Berlas, or Perlas; of which laſt came the famons Timur Beg, or Tamerlane. From this time to that of Alanza Khan, we meet with nothing remarkable. In his reign the Turks being immerſed in all kinds of luxury, univerſally apoſtatized into idolatry. Having two ſons, Tartar and Mogul, he divided his dominions among them, and thus gave riſe to the two empires of the Tartars and Moguls.

The two nations had not long exiſted before they began to make war upon each other: and after long contention, the event at laſt was, that Il Khan, emperor of the Moguls, was totally overthrown by Siuntz Khan, emperor of the Tartars; and ſo great was the defeat, that the Mogul nation ſeems to have been almoſt exterminated.

2 Almoſt exterminated by the Tartars.

Only two of Il Khan's family ſurvived this diſaſter. Theſe were Kajan his youngeſt ſon, and Nagos his nephew, who were both of an age, and had both been married the ſame year. Theſe two princes, with their wives, had been taken priſoners by Siuntz Khan, but found means to make their eſcape to their own country. Here they ſeized upon all the cattle which had not been carried off by the Tartars; which was eaſily done, as having none to diſpute the property with them; then ſtripping ſome of the ſlain, they took their clothes, and retired into the mountains. They paſſed ſeveral mountains without much difficulty; but at laſt advanced to the foot of one exceedingly high, which had no way over it but a very ſmall path made by certain animals, called in the Tartar language *archara*. This path they found themſelves obliged to make uſe of, tho' it was ſo ſtrait, that only one could paſs at a time, and he was in the moſt imminent danger of breaking his neck at the leaſt falſe ſtep.

3 They arrive in a delightful valley.

Having aſcended the mountain on one ſide by this path, they deſcended by the ſame on the other ſide; and were agreeably ſurpriſed to find themſelves in a moſt delightful track, interſperſed with rivulets and charming meadows, abounding with a vaſt variety of delicious fruits, and incloſed on all ſides by inacceſſible mountains, in ſuch a manner as to ſhelter them from all future purſuits of the Tartars. Here they lived ſome time, and gave this beautiful country the name of *Irgana-kon*, in alluſion to its ſituation; *Irgana* ſignifying, in the old language of the Moguls, a "valley," and *Kon*, a "ſteep height."

In proceſs of time theſe two families very much increaſed. Kajan, whoſe poſterity was the moſt numerous, called his deſcendants *Kajath*: but the people ſpringing from Nagos were divided into two tribes; one of which received the appellation of *Nagoſler*, and the other that of *Durlagan*.

Theſe two Mogul princes and their deſcendants lived in this place for more than 400 years; but the latter then finding it too narrow for them, meditated a return to the country from which their forefathers had been driven. For ſome time, however, they found this impracticable, as the path that conducted their anceſtors had been long ſince deſtroyed. At laſt they diſcovered, that one part of the high mountain abovementioned was not very thick in a certain place; and alſo, that it conſiſted entirely of iron ore. To this, having before ſet fire to a layer of wood, and another of charcoal, laid along the foot of the mountain, they applied 70 large bellows, and at laſt melted the mountain in ſuch a manner, that an opening was made large enough for a loaded camel to paſs; and through this paſſage they all marched out with great joy.

4 From whence they at laſt iſſue, and defeat the Tartars.

The Moguls having thus iſſued as it were from a new world, overthrew the Tartars in their turn; and continued to be a very conſiderable nation till the time of their great hero Temujin, afterwards called *Jenghiz Khan*, whom they extol in the moſt extravagant manner. It is difficult, however, to ſay, at the time Temujin made his appearance, how far the dominions of the Moguls extended, or in what eſtimation they were held by their neighbours. It ſeems to be pretty certain, that great part of the vaſt region now known by the name of *Tartary*, was then in a ſtate of conſiderable civilization, and likewiſe extremely populous, as we find mention made of many cities which the Moguls deſtroyed; and the incredible multitudes whom they ſlaughtered, abundantly ſhew the populouſneſs of the country.

5 State of Aſia at the time of Jenghiz Khan.

On the eaſt, the country of the Moguls and Tartars had the great deſart which divides Tartary from China; on the weſt, it had the empire of Karazm, founded by Mahmud Gazni; and on the ſouth were the countries now known by the name of *Indoſtan*, *Siam*, *Pegu*, *Tonquin*, and *Cochin-China*. Thus it comprehended the eaſtern part of modern Tartary, and all Siberia. This whole region was divided among a great number of *Aymacks*, or *tribes*; who had each one or more khans, according as it was more or leſs numerous, or divided into branches. Among theſe, that of the *Kara-its* was the moſt powerful: their prince aſſumed the title of *Grand Khan*, and among the reſt the Moguls were tributary to him; but, according to the Chineſe hiſtorians, both the one and the other were tributary to the emperor of Kitay or Katay. China was divided into two parts: the nine ſouthern provinces were in the hands of the Chineſe emperors of the Song dynaſty, who kept their court at Hang-chew, the capital of the province of Chekyang: the five northern provinces, excepting part of Skenſi, were poſſeſſed by the Kin, a people of Eaſtern Tartary, from whom are deſcended the Manchew Tartars, at preſent maſters of China. This vaſt dominion was named *Kitay*, or *Katay*, and was divided into two parts: that which belonged to China, was properly called *Kitay*; and the part, which belonged to Tartary, was called *Karakitay*; in which ſome even include the territories of the Moguls, Karaits, and other tribes, which are the ſubject of the preſent hiſtory. The weſtern part of the empire of Kitay was poſſeſſed by a Turkiſh prince, who had lately founded a new kingdom there, called *Hya*; whoſe capital city was Hya-chew, now Ninghya in Shenſi, from whence the kingdom took its name. To the weſt of Hya lay Tangut; a country of great extent, and formerly very powerful; but at that time reduced to a low ſtate, and di-

divided among many princes; ſome of whom were ſubject to the emperor of Hya, and others to the emperor of China. All Tartary to the weſtward, as far as the Caſpian ſea, with the greater part of Little Buckharia, which then paſſed under the general name of *Turkeſtan*, was ſubject to Gurkhan, Khurkhan, or Kavar Khan; to whom even the Gazni monarchs are ſaid to have been tributary. This Ghurkhan had been prince of the Weſtern Kitan or Lyau; who, driven out of Kitay by the King, ſettled in Little Buckharia, and the country to the north, where they founded a powerful ſtate about the year 1124.

6 Deſcent and birth of Temujin.

Thus the Moguls, properly ſo called, had but a very ſmall extent of empire which could be called their own, if indeed they had any, when Temujin made his appearance. This hero is ſaid by the Tartars to have been of divine origin, ſince his family could be traced no farther back than ten generations, the mother of whom was got with child by a ſpirit. The names and tranſactions of his predeceſſors are equally uncertain and unimportant: he himſelf, however, was born in the year 1163, and is ſaid to have come into the world with congealed blood in his hands; from whence it was prognoſticated that he would be a great warrior, and obtain the victory over all his enemies.

This prediction, if any ſuch there was, Temujin moſt literally fulfilled. At the time of his father's deceaſe, his ſubjects amounted to between 30,000 and 40,000 families; but of theſe two thirds quickly deſerted, and Temujin was left almoſt without ſubjects. When only 13 years of age, he fought a bloody battle againſt theſe revolters; but either was defeated, or gained an indeciſive victory; ſo that he remained in obſcurity for 27 years longer. His good fortune at laſt he owed to the friendſhip of Vang Khan, who ruled over a great number of Tartar tribes to the north of Kitay, and has been heard of under the name of *Preſter John* among the Europeans. This prince took Temujin under his protection; and a rebellion being afterwards raiſed againſt himſelf, Temujin was made his general, and the khan was kept in poſſeſſion of his throne; ſoon after which, Temujin ſubdued the tribes which had revolted from himſelf, treating them at the ſame time with the utmoſt barbarity.

7 Subdues his revolted ſubjects by means of Vang Khan.

8 Who becomes jealous, and contrives his deſtruction.

This happened in the year 1201; but Vang Khan, inſtead of continuing the friend of Temujin, now became jealous, and reſolved to deſtroy him by treachery. With this view he propoſed a marriage between Temujin's ſon Juji and his own daughter, and another between Temujin's daughter and his own ſon. Temujin was invited to the camp of Vang Khan, in order to celebrate this double marriage; but, receiving intelligence of ſome evil intention againſt him, he excuſed himſelf to Vang Khan's meſſengers, and deſired that the ceremony might be put off to ſome other time.

A few days after the departure of theſe meſſengers, Badu and Kiſhlik, two brothers, who kept the horſes of one of Vang Khan's chief domeſtics, came and informed Temujin, that the grand Khan finding he had miſſed his aim, was reſolved to ſet out inſtantly, and ſurpriſe him next morning, before he could ſuſpect any danger. Temujin, alarmed at this intelligence, quitted his camp in the night-time, and retired with all his people to ſome diſtance. He was ſcarce gone, when Vang Khan's troops arrived, and diſcharged an incredible number of arrows among the empty tents; but finding nobody there, they purſued Temujin in ſuch haſte that they fell into great diſorder. In this condition they were ſuddenly attacked and routed by Temujin, after which an open war with Vang Khan took place.

9 Temujin overcomes all his enemies.

By this quarrel almoſt all the princes of Tartary were put in motion; ſome ſiding with Tamujin, and others with Vang Khan. But at laſt fortune declared in favour of the former: Vang Khan was overthrown in a battle, where he loſt 40,000 men; and obliged to fly for refuge to a prince named *Tayyan Khan*, who was Temujin's father-in-law, and his own enemy, and by whom he was ungenerouſly put to death. Temujin immediately began to ſeize on his dominions, great part of which voluntarily ſubmitted: but a confederacy was formed againſt him by a number of Vang Khan's tributaries, at the head of whom was Jamuka, a prince who had already diſtinguiſhed himſelf by his enmity to Temujin; and even Tayyan Khan himſelf was drawn into the plot, through jealouſy of his ſon-in-law's good fortune. But Temujin was well prepared; and in the year 1204 attacked Tayyan Khan, entirely routed his army, killed himſelf, and took Jemuka priſoner, whoſe head he cauſed inſtantly to be ſtruck off; after which he marched againſt the other tribes who had conſpired againſt him. Them he quickly reduced; took a city called *Kaſhin*, where he put all to the ſword who had borne arms againſt him; and reduced all the Mogul tribes in 1205.

Temujin now, having none to oppoſe him, called a general diet, which he appointed to be held on the firſt day of the ſpring 1206; that is, on the day in which the ſun entered Aries. To this diet were ſummoned all the great lords both Moguls and Tartars; and in the mean time, to eſtabliſh good order in the army, he divided his ſoldiers into bodies of 10,000, 1000, 100, and 10 men, with their reſpective officers, all ſubordinate to the generals, or thoſe who commanded the bodies of 10,000; and theſe were to act under his own ſons. On the day of holding the diet, the princes of the blood and great lords appeared dreſſed in white. Temujin, dreſſed in the ſame manner, with his crown on his head, ſat down on his throne, and was complimented by the whole aſſembly, who wiſhed him the continuance of his health and proſperity. After this they confirmed the Mogul empire to him and his ſucceſſors; adding all thoſe kingdoms which he had ſubdued, the deſcendents of whoſe vanquiſhed khans were deprived of all right or title to them; and after this he was proclaimed emperor with much ceremony. During this inauguration, a pretended prophet declared that he came from God to tell the aſſembly, that from thenceforth Temujin ſhould aſſume the name of *Jenghiz Khan*, or *the Moſt Great Khan of khans*; propheſying alſo, that all his poſterity ſhould be khans from generation to generation. This prophecy, which was no doubt owing to Temujin himſelf, had a ſurpriſing effect on his ſubjects, who from that time concluded, that all the world belonged of right to them, and even thought it a crime againſt heaven for any body to pretend to reſiſt them.

10 Aſſumes the title of Jenghiz Khan.

Jenghiz Khan having now reduced under his ſubjection all the wandering tribes of Moguls and Tartars, began to think of reducing thoſe countries to the ſouth

Mogul. south and south-west of his own, where the inhabitants were much more civilized than his own subjects; and the countries being full of fortified cities, he must of course expect to meet with more resistance. He began with the emperor of Hya, whose dominions he invaded in 1209, who at last submitted to become his tributary. But in the mean time Jenghiz Khan himself was supposed to be tributary to the emperor of Kitay; who, in 1210, sent him an officer, demanding the customary tribute. This was refused with the utmost indignation, and a war commenced, which ended not but with the dissolution of the empire of Kitay, as mentioned under the article CHINA, n° 17—33.

11 Invades, Hya, China, &c.

In the year 1216 Jenghiz Khan resolved to carry his arms westward, and therefore left his general Muchuli to pursue his conquests in Kitay. In his journey westward he overthrew an army of 300,000 Tartars who had revolted against him; and, in 1218, sent ambassadors desiring an alliance with Mohammed Karazm Shah, emperor of Gazna. His ambassador was haughtily treated: however, the alliance was concluded; but soon after broken, through the treachery, as it is said, of the Karazmian monarch's subjects. This brought on a war attended with the most dreadful devastations, and which ended with the entire destruction of the empire of Karazm or Gazna, as related under the article GAZNA.

After the reduction of Karazm, part of the Moguls broke into Iran or Persia, where also they made large conquests, while others of their armies invaded Georgia and the countries to the west; all this time committing such enormities, that the Chinese historians say, both men and spirits burst with indignation. In 1225, Jenghiz Khan returned to Hya, where he made war on the emperor for having sheltered some of his enemies. The event was, that the emperor was slain, and his kingdom conquered, or rather destroyed; which, however, was the last exploit of this most cruel conqueror, who died in 1227, as he marched to complete the destruction of the Chinese.

12 Vast extent of his empire.

The Mogul empire, at the death of Jenghiz Khan, extended over a prodigious tract of country; being more than 1800 leagues in length from east to west, and upwards of 1000 in breadth from north to south. Its princes, however, were still insatiable, and pushed on their conquests on all sides. Oktay was acknowledged emperor after Jenghiz Khan; and had under his immediate government Moguleſtan, (the country of the Moguls properly so called), Kitay, and the countries eastward to the Tartarian sea. Jagatay his brother governed under him a great part of the western conquests. The country of the Kipjacks, and others to the east and north-east, north and north-west, were governed by Batu or Patu the son of Juji, who had been killed in the wars; while Tuli or Toley, another son of Jenghiz Khan, had Khorassan, Persia, and what part of India was conquered. On the east side the Mogul arms were still attended with success; not only the empire of Kitay, but the southern part of CHINA, was conquered, as already related under that article, n° 23—40. On the west side matters continued much in the same way till the year 1254, when Magu, or Menkho, the fourth khan of the Moguls, (the same who was afterwards killed at a siege in China *), raised a great army, which he gave to his brother Hulaku, or Hulagu, to extend his dominions westward. In 1255 he entered Iran; where he suppressed the Ismaelians or Assassins, of whom an account is given under the article ASSASSINS; and two years afterwards he advanced to Bagdad, which he took, and cruelly put the khalif to death, treating the city with no more lenity than the Moguls usually treated those which fell into their hands. Every thing was put to fire and sword; and in the city and its neighbourhood, the number of slain, it is said, amounted to 1,600,000.—The next year he invaded Syria; the city of Damascus was delivered up, and, as it made no resistance, the inhabitants were spared; but Aleppo being taken by storm, a greater slaughter ensued there than had taken place at Bagdad, not even the children in their cradles being spared. Some cities of this country revolted the next year, or the year after; but falling again into the hands of the Moguls, they were plundered, and the inhabitants butchered without mercy, or carried into slavery.

* See *China*, n° 36.

13 Bagdad reduced.

Hulaku died in 1264, and at his death we may fix the greatest extent of the Mogul empire. It now comprehended the whole of the continent of Asia, excepting part of Indostan, Siam, Pegu, Cochinchina, and a few of the countries of Lesser Asia, which had not been attacked by them; and during all these vast conquests no Mogul army had ever been conquered, except one by Jaloloddin, as mentioned under the article GAZNA.—From this period, however, the empire began to decline. The ambition of the khans having prompted them to invade the kingdoms of Japan and Cochinchina, they were miserably disappointed in their attempts, and lost a great number of men.—The same bad success attended them in Indostan; and in a short time this mighty empire broke into several smaller ones. The governors of Persia being of the family of Jenghiz Khan, owned no allegiance to any superior; those of Tartary did the same. The Chinese threw off the yoke: and thus the continent of Asia wore much the same face that it had done before Jenghiz Khan began his conquests.

14 It begins to decline.

The successors of Hulaku reigned in Persia till the year 1335; but that year Abusaid Khan, the eighth from Hulaku, dying, the affairs of that country fell into confusion for want of a prince of the race of Jenghiz Khan to succeed to the throne. The empire therefore was divided among a great number of petty princes, who fought against each other almost without intermission, till, in the year 1369, Timur Bek, or Tamerlane, one of these princes, having conquered a number of others, was crowned at Balkh, with the pompous title of *Saheb Karan*; that is, "the emperor of the age, and conqueror of the world." As he had just before taken that city, and destroyed one of his most formidable rivals who had shut himself up in it, the new emperor began his reign with beheading some of the inhabitants, imprisoning others, burning their houses, and selling the women and children for slaves.—In 1370 he crossed the Sihun, made war on the Getes, and attacked Karazm. Next year he granted a peace to his enemies; but two years after, he again invaded the country of the Gates, and by the year 1379 had fully conquered that country as well as Korazan; and from that time he continued to extend his conquests in much the same manner as Jenghiz

15 Tamerlane crowned emperor of Balkh.

16 Becomes a great conqueror.

Mogul. Jenghiz Khan had done, though with lefs cruelty. In 1387 he had reduced Armenia, Georgia, and all Perfia; the conqueft of which laft was completed by the reduction of Ifpahan, 70,000 of the inhabitants of which were flaughtered on account of a fedition raifed by fome rafh or evil-difpofed perfons.

After the reduction of Perfia, Timur turned his arms northward, and weftward, fubduing all the countries to the Euphrates. He took the city of Bagdad; fubdued Syria; and having ravaged great part of Ruffia, returned to Perfia in 1396, where he fplendidly feafted his whole army. In 1398 he invaded Indoftan, croffed the Indus on the 17th of September, reduced feveral fortreffes, and made a vaft number of captives. However, as he was afraid that, in cafe of any emergency, thefe prifoners might take part with the enemy, he gave orders to his foldiers to put all their Indian flaves to death; and, in confequence of this inhuman order, more than 100,000 of thefe poor wretches were flaughtered in lefs than an hour.

17 Invades and conquers Indoftan.

In the beginning of the year 1399, Timur was met by the Indian army; whom, after a defperate battle, he defeated with great flaughter, and foon after took the city of Dehli, the capital of the country. Here he feated himfelf on the throne of the Indian emperors; and here the fharifs, kadis, and principal inhabitants of the city, came to make their fubmiffion, and begged for mercy. The tame elephants and rhinocerofes likewife were brought to kneel before him as they had been accuftomed to do to the Indian emperors, and made a great cry as if they implored his clemency. Thefe war-elephants, 120 in number, were, at his return, fent to Samarcand, and to the province where his fons refided. After this, at the requeft of the lords of the court, Timur made a great feaft; at which he diftributed prefents to the princes and principal officers.

18 The city of Dehli deftroyed, and the inhabitants flaughtered.

Dehli at this time confifted of three cities, called *Seyri*, *Old Dehli*, and *Jehan Penah*. Seyri was furrounded with a wall in form of a circle. Old Dehli was the fame, but much larger, lying fouth-weft of the other. Thefe two parts were joined on each fide by a wall; and the third, lying between them, was called *Jehan Penah*, which was larger than Old Dehli. Penah had ten gates; Seyri had feven, three of which looked towards Jehan Penah; this laft had thirteen gates, fix to the north-weft, and feven to the fouth-eaft. Every thing feemed to be in a quiet pofture; when, on the 12th of January 1399, the foldiers of Timur being affembled at one of the gates of Dehli, infulted the inhabitants of the fuburbs. The great emirs were ordered to put a ftop to thefe diforders; but their endeavours were not effectual. The foltanas having a curiofity to fee the rarities of Dehli, and particularly a famous palace adorned with 1000 pillars, built by an ancient king of India, went in with all the court; and the gate being on that occafion left open for every body, above 15,009 foldiers got in unperceived. But there was a far greater number of troops in a large place between Dehli, Seyri, and Jehan Penah, who committed great diforders in the two laft cities. This made the inhabitants in defpair fall on them; and many, fetting fire to their houfes, burnt their wives and children. The foldiers feeing this confufion, did nothing but pillage the houfes; while the diforder was increafed by the admiffion of more troops who feized the inhabitants of the neighbouring places, who had fled thither for fhelter. The emirs, to put a ftop to this mifchief, caufed the gates to be fhut: but they were quickly opened by the foldiers within, who rofe in arms againft their officers; fo that by the morning of the 13th the whole army was entered, and this great city was totally deftroyed. Some foldiers carried out 150 flaves, men, women, and children; nay, fome of their boys had 20 flaves a-piece to their fhare. The other fpoils, in jewels, plate, and manufactures, were immenfe; for the Indian women and girls were adorned with precious ftones, and had bracelets and rings on their hands, feet, and even toes, fo that the foldiers were loaded with them. On the 15th, in Old Dehli, the Indians retired into the great mofque to defend themfelves; but being attacked by the Tartars they were all flaughtered, and towers erected with their heads. A dreadful carnage now enfued throughout the whole city, and feveral days were employed before the inhabitants could be made to quit it entirely; and as they went, the emirs took a number of them for their fervice. The artifans were alfo diftributed among the princes and commanders; all but the mafons, who were referved for the emperor, in order to build him a fpacious ftone-mofque at Samarcand.

After this terrible devaftation, Timur marched into the different provinces of Indoftan, every where defeating the Indians who oppofed him, and flaughtering the Ghebrs, or worfhippers of fire. On the 25th of March he fet out on his return, and on the 9th of May arrived at Samarcand. In a few months after his arrival, he was obliged to undertake an expedition into Perfia, where affairs were in the utmoft diforder on account of the mifconduct of his fon, whom he had appointed fovereign of that empire. Here Timur foon fettled matters; after which he again fet out on an expedition weftward, reduced many places in Georgia which had not fubmitted before, and invaded and conquered Syria. At the fame time he quarrelled with Bajazet the Turkifh fultan, then bufied in an enterprife againft Conftantinople, in which he would probably have fucceeded had not Timur interpofed. The caufe of this quarrel at firft was, that Bajazet had demanded tribute from a prince who was under Timur's protection, and is faid to have returned an infulting anfwer to the Tartar ambaffadors who were fent to him on that account. Timur, however, who was an enthufiaft in the caufe of Mahometanifm, and confidered Bajazet as engaged in the caufe of heaven when befieging a Chriftian city, was very unwilling to difturb him in fo pious a work; and therefore undertook feveral expeditions againft the princes of Syria and Georgia, in order to give the Turkifh monarch time to cool and return to reafon. Among other places, he again invefted the city of Bagdad, which had caft off its allegiance to him; and having taken it by ftorm, made fuch a dreadful maffacre of the inhabitants, that 120 towers were erected with the heads of the flain. In the mean time Bajazet continued to give frefh provocation, by protecting one Kara Yufef a robber, who had even infulted the caravan of Mecca; fo that Timur at length refolved to make war upon him. The fultan, however, forefeeing the danger of

19 Timur quarrels with Bajazet the Turkifh fultan.

of bringing ſuch a formidable enemy againſt himſelf, thought proper to aſk pardon, by a letter, for what was paſt, and promiſe obedience to Timur's will for the future. This embaſſy was graciouſly received; and Timur returned for anſwer, that he would forbear hoſtilities, provided Bajazet would either put Kara Yuſef to death, ſend him to the Tartar camp, or expel him out of his dominions. Along with the Turkiſh ambaſſadors he ſent one of his own; telling Bajazet that he would march into the confines of Anatolia, and there wait his final anſwer.

Though Bajazet had ſeemed at firſt willing to come to an agreement with Timur, and to dread his ſuperior power; yet he now behaved in ſuch an unſatiſfactory manner, that the Tartar monarch deſired him to prepare for war; upon which he raiſed the ſiege of

20 Bajazet defeated and taken priſoner.

Conſtantinople, and having met Timur with an army greatly inferior to the Tartars, was utterly defeated and taken priſoner. According to ſome accounts, he was treated with great humanity and honour; while others inform us, that he was ſhut up in an iron cage, againſt which he daſhed out his brains the following year. At any rate, it is certain that he was not reſtored to liberty, but died in confinement.

This victory was followed by the ſubmiſſion of many places of the Leſſer Aſia to Timur; the Greek emperor owned himſelf his tributary, as did alſo the ſultan of Egypt. After this Timur once more returned to Georgia, which he cruelly ravaged; after which he marched to Samarcand, where he arrived in the year 1405. Here, being now an old man, this mighty conqueror began to look forward to that ſtate which at one time or other is the dread of all living creatures; and Timur, in order to quiet the remorſes of his own conſcience, came to the following curious reſolution, which he communicated to his intimate friends; namely, that "as the vaſt conqueſts he had made were not obtained without *ſome violence*, which had occaſioned the deſtruction of a great number of God's creatures, he was reſolved, by way of atonement for his paſt crimes, to perform ſome good action; namely, to make war on the infidels, and exter-

21 Death of Tamerlane, and diſſolution of his empire.

minate the idolaters of China." This atonement, however, he did not live to accompliſh; for he died the ſame year of a burning fever, in the 71ſt year of his age and 36th of his reign.

On the death of Timur, his empire fell immediately into great diſorder, and the civil wars continued for five or ſix years; but at laſt peace was reſtored, by the ſettlement of Shah Rukh, Timur's ſon, on the throne. He did not, however, enjoy the empire in its full extent, or indeed much above one half of it, having only Karazm, Khoraſſan, Kandahar, Perſia, and part of Indoſtan. Neither was he able, though a brave and warlike prince, to extend his dominions, though he tranſmitted them to his ſon Ulug Beg. He proved a wiſe and learned monarch; and is famous for the aſtronomical tables which he cauſed to be compoſed, and which are well known at this day. He was killed in 1448 by his ſon Abdollatif, who ſix months after was put to death by his own ſoldiers. After the death of Abdollatif, Abdollah, a grandſon of Shah Rukh, ſeized the throne; but, after reigning one year, was expelled by Abuſaid Mirza, the grandſon of Miran Shah the ſon of Timur. His reign was one continued ſcene of wars and tumults; till at laſt he was defeated and taken priſoner by one Haſſan Beg, who put him to death in 1468. From this time we may look upon the empire of Timur as entirely diſſolved, though his deſcendents ſtill reigned in Perſia and Indoſtan. The hiſtory of the latter, which is ſtill known by the name of the *Mogul's empire*, we ſhall now give from the death of Abuſaid Mirza to the preſent time. 22

History of Indoſtan.

On the death of the abovementioned monarch, his ſon Babr, or Babor, ſucceeded him, but was ſoon driven out by the Uſbeck Tartars; after which he reſided ſome time in Gazna, whence he made incurſions into Indoſtan, and at length became maſter of the whole empire, excepting the kingdoms of Dekan, Guzerat, and Bengal. He died in 1530, and was ſucceeded by his ſon Hemayun; who in the beginning of his reign conquered the province of Guzerat, excepting a very few places, and in 1540 made himſelf maſter of Bengal alſo; but ſoon after he was driven out of his dominions by the Afghans, a people inhabiting the mountainous country between India and Perſia. In this diſtreſs he fled to the court of Perſia; and being aſſiſted by that monarch, recovered his kingdom; but three months afterwards was killed by an accidental fall in the year 1556, the 26th of his reign.

Hemayun was ſucceeded by his ſon Akbar, at that time only 13 years of age. He ſubdued Guzerat, Bengal, and Kabul, (a country lying beyond the limits of India Proper), and conquered ſeveral other countries; but proved unſucceſsful in his attempts on Dekan. He poiſoned himſelf by miſtake in 1605, having ſwallowed the doſe he had cauſed to be prepared for one of his principal lords; and was ſucceeded by his ſon Jehan Ghir. The reign of this prince was full of troubles, owing chiefly to his own miſconduct. He invaded Dekan without ſucceſs, and was four years a priſoner in the hands of one of his generals named *Mohabet Khan;* from whom, however, he at laſt found means to eſcape, and enjoyed his empire till the year 1627, when he died, and was ſucceeded by his ſon Shah Jehan.

The new emperor proved a very debauched and avaricious prince; which gave occaſion to one of his ſons named *Aureng-zib*, or *Aureng-zebe*, to dethrone him. This prince attained his end by a train of deep hypocriſy and diſſimulation; covering his ambition with a pretence of religion, and under that pretence committing the greateſt crimes. He defeated two of his brothers who oppoſed him, by unforeſeen accidents, when he himſelf ſeemed to be on the very brink of deſtruction; and when he attained ſufficient power, put them to death, and then lamented their misfortune. One of his brothers who aſſiſted him, he rewarded with perpetual impriſonment, and at laſt put him to death alſo. The hiſtory of the empire, after he began to reign, is very much unknown, becauſe Aurengzebe would not allow it to be written during his life. Neither do we meet with any thing of importance regarding this empire till the invaſion of Thamas Kouli Khan, or Nadir Shah, emperor of Perſia, which happened in 1739. 23

The empire invaded by Nadir Shah.

This conqueror did not invade India, as Jenghiz Khan and Tamerlane had done, with a view to plunder; though, after he became maſter of Dehli, he

Mogul. ſeems not to have been inferior in rapacity to any of his predeceſſors. He was invited, however, by ſome of the great men who were diſaffected to the emperor Naſroddin Mohammed Shah, in order to ſettle the affairs of the empire. Nadir was eaſily induced to accept the invitation, and ſet out from Kandahar with an army of 125,000 men, compoſed of many different nations, and, being all inured to hardſhips, were much more than ſufficient to have conquered the whole force of the effeminate Indians. Accordingly he defeated the forces ſent againſt him; after which he was viſited by the Mogul himſelf. Him he ſeverely reprimanded for his miſconduct. However, he told him, that as he was of the race of Timur, who had not offended the reigning family of Perſia, he would not take the empire from him; only as he had put him to the trouble of coming ſo far to ſettle his affairs, he inſiſted that his expences ſhould be paid. To this ſpeech the Mogul made no anſwer; however, Nadir Shah took care to enforce the latter part of it. Some days after the Mogul's return, the Perſian monarch went to his camp to pay him a viſit, where he ſeized 200 cannon, with ſome treaſure and other effects, ſending them off immediately to Kandahar. He then marched to Dehli, where a dreadful ſlaughter was made, owing to a mob which aroſe about the price of corn. Nadir Shah, endeavouring to quell it, narrowly eſcaped being killed by a muſket-ball ſhot purpoſely at him; which enraged him to ſuch a degree, that he gave orders for an indiſcriminate maſſacre. Theſe orders were obeyed with the utmoſt alacrity by his ſoldiers; and 120,000, ſome ſay 150,000, of the inhabitants periſhed at once. After this all the jewels, gold-plate, &c. which could be found were ſeized, and the Shah demanded a preſent of money amounting to about 25 millions ſterling; which was raiſed with ſuch rigour, that many choſe to put an end to their own lives rather than bear the torments which were inflicted on thoſe who could not pay the ſum at which they were aſſeſſed. At laſt, however, the ſum was made up; and Nadir Shah took leave of the Mogul, with all the marks of friendſhip. He put the crown on his head with his own hands; and after having given him ſome good advice concerning the regulation and government of the empire, ſet out from Dehli on the 6th of May 1739.

24 Inhabitants of Dehli ſlaughtered.

By this invaſion the empire ſuſtained a prodigious loſs. Since the arrival of Shah Nadir in the country, about 200,000 people had been deſtroyed, and the conquerors had carried off treaſure and goods to the amount of 125 millions Sterling. Neverthleſs even this dreadful calamity did not awaken the ſufferers to a ſenſe of their danger, nor was any ſtep taken to put the empire in a proper ſtate of defence; ſo that it ſtill continues a prey to every invader, and equally incapable of ſubduing its enemies, or of defending itſelf.

25 Deſcription of Hindoſtan.

Hindoſtan, or the empire of the Great Mogul, or Mogol, is bounded on the north by Great and Little Tibet; on the eaſt by Tibet, and the Farther Peninſula of the Indies; on the ſouth by the Hither Peninſula, part of the Indian Sea, and Bay of Bengal; and on the weſt by Perſia. It is ſituated between the 84th and 102d degrees of longitude, and between the 21ſt and 36th degrees of latitude; being in length about 1204 miles, and in breadth 960, though in ſome parts not near ſo much. Mogul.

Towards the north, Hindoſtan is very cold and barren; but towards the ſouth, very hot, and fertile in corn, rice, fruits, and other vegetables. The northern provinces are very mountainous and ſandy; while the ſouthern are for the moſt part level, and well watered with ſeveral rivers.

The moſt remarkable mountains are thoſe which ſurround it on three ſides. Thoſe on the weſt, ſeparating it from Perſia, called, in general, *Soleyman Kûy*, or *the mountains of Soleyman*, are of a vaſt height as well as breadth, and are only paſſable in certain places, through which roads have been made for the ſake of commerce. The chief are thoſe which lead to Kabul, Gazna, and Kandahar. This great chain of mountains is inhabited by different nations, the principal of which are the Afghans, or Patans, and the Baluches, who have extended themſelves on the ſide of India, as well as Perſia. The mountains on the north are called *Nagrakut*, *Hima*, or *Mûs Tâg*, which has an affinity with *Imaüs*, and by other names, which are given alſo in common to the mountains on each ſide, ſeparating Hindoſtan from Tibet. The very proſpect of theſe mountains is frightful, being nothing but hideous precipices, perpetually covered with ſnow, and not to be croſſed without the greateſt danger and difficulty.

The moſt remarkable rivers of Hindoſtan are the Indus and Ganges. The former is called by the orientals *Send*, *Sind*, or *Sindi*. It riſes in the mountains to the north, or north-eaſt, of Hindoſtan; whence, after a long courſe, firſt to the ſouth and then to the ſouth-weſt, it falls into the Perſian ſea, below Lower Bander, by ſeveral mouths. In its courſe it receives ſeveral other large rivers, as the Nilâh, Jamal, Behat, and Lakka.

The Ganges, called in the Indies *Ganga*, riſes in the kingdom of Tibet: entering Hindoſtan, about the 30th degree of latitude, it runs firſt ſouth-eaſtward by the cities of Bekâner, Minapor, Halabas, Benâres, and Patna, to Rajah Mahl, where it divides into two branches. The eaſtern having paſſed by Dâkka, the capital of Bengal, enters the gulph of that name about Chatigan. The weſtern, deſcending by Koſſum-Bazar and Hughley, falls into the gulph below Shandernagor, towards Pipeli.

Many of the Jews and ancient Chriſtians believed this river to be the Piſon, one of the four mentioned in ſcripture as the boundaries of the terreſtrial pararadiſe. The Indians retain the greateſt reverence for its waters, going in crowds from the remoteſt parts of the country to waſh in them, from a perſuaſion that they deface from all the ſpots of ſin. The reaſon of this is, becauſe they imagine this river does not take its ſource from the boſom of the earth, but deſcends from heaven into the Paradiſe of Devendre, and from thence into Hindoſtan. Nothing is more childiſh than the fables of the Bramins on this ſubject, yet the people ſwallow them all. The Mogul and prince of Golconda drink no other water than that of the Ganges: foreigners, on the contrary, pretend that it is very unwholeſome, and that it cannot be ſafely drank till it is firſt boiled. There are a great number of ſuperb pagodas on the banks of the Ganges, which are im-

 immenfely rich. At certain feftivals, there has been fometimes a concourfe of 100,000 people who came to bathe in it. But what principally diftinguifhes this river, befides its greatnefs and rapidity, is the gold it brings down in its fands, and throws on its banks; and the precious ftones and pearls it produces, not only in itfelf, but in the Gulph of Bengal, into which it difcharges its waters, and which abound therewith. The Chun, or Jemma, the Guderafu, the Perfilis, Lakia, and feveral other rivers, difcharge themfelves into it during its courfe.

The weather and feafons are, for the general, very regular in this fpacious country; the winds blowing conftantly, for fix months, from the fouth, and fix from the north, with very little variation. The months of April, May, and the beginning of June, till the rains fall, are fo extremely hot, that the reflexion from the ground is apt to blifter one's face; and, but for the breeze, or fmall gale of wind, which blows every day, there would be no living in that country for people bred in northern climates; for, excepting in the rainy feafon, the coldeft day is hotter there at noon than the hotteft day in England. However, very furprifing changes of heat and cold fometimes happen within a few hours; fo that a ftifling hot day is fucceeded by a night cold enough to produce a thin ice on the water, and that night by a noon as fcorching as the preceding. Sometimes, in the dry feafon, before the rains, the winds blow with fuch extreme violence, that they carry vaft quantities of duft and fand into the air, which appear black, like clouds charged with rain; but fall down in dry fhowers, filling the eyes, ears, and noftrils of thofe among whom they defcend, and penetrate every cheft, cabinet, or cupboard, in the houfes or tents, by the key-hole or crevices.

From Surat to Agra, and beyond, it feldom or never rains, excepting in one feafon of the year; that is, from the middle of June to the middle of September. Thefe rains generally begin and end with moft furious ftorms of thunder and lightning. During thefe three months it rains ufually every day, and fometimes for a week together without intermiffion: by this means the land is enriched, like Egypt by the Nile. Although the land looks before like the barren fands of the Arabian defarts; yet, in a few days after thofe fhowers begin to fall, the furface appears covered with verdure. When the rainy feafon is over, the fky becomes perfectly ferene again, and fcarce one cloud appears all the nine months: however, a refrefhing dew falls every night, during that dry interval, which cools the air, and cherifhes the earth.

The produce of Hindoftan is very rich in every kind, whether it be foffil, vegetable, or animal. Befides other precious ftones found in it, there is a diamond-mine at the town of Soumelpûr, in Bengal. Quarries of Theban ftone are fo plentiful in the Mogul's empire, that there are both mofques and pagods built entirely of it. Some travellers tell us, there are mines of lead, iron, and copper, and even filver; but thofe of the laft, if there be any, need not be opened, fince the bullion of all nations is funk in this empire, which will take nothing elfe in exchange for her commodities, and prohibits the exporting it again. They till the ground with oxen and foot-ploughs, fowing in May and the beginning of June, that all may be over before the rains, and reaping in November and December, which with them is the moft temperate months in the year. The land is no where enclofed, excepting a little near towns and villages. The grafs is never mowed to make hay, but cut off the ground, either green or withered, as they have occafion to ufe it. Wheat, rice, barley, and other grain, grow here in plenty, and are very good. The country abounds no lefs in fruits, as pomegranates, citrons, dates, grapes, almonds, and cocoa-nuts; plums, thofe efpecially called *mirabolans*; plantanes, which in fhape refemble a flender cucumber, and in tafte excel a Norwich pear; mangos, an excellent fruit, refembling an apricot, but larger; ananas, or pine-apples; lemons and oranges, but not fo good as in other countries; variety of pears and apples in the northern parts; and the tamarind-tree, the fruit of which is contained in a pod refembling thofe of beans. There are many other kinds of fruit trees peculiar to the country. But the valuable trees are the cotton and mulberry, on account of the wealth they bring the natives from the manufactures of callicoes and filks. They plant abundance of fugar-canes here, as well as tobacco; but the latter is not fo rich and ftrong as that of America, for want of knowing how to cure and order it.

Hindoftan affords alfo plenty of ginger, together with carrots, potatoes, onions, garlic, and other roots known to us, befides fmall roots and herbs for fallads; but their flowers, though beautiful to look at, have no fcent, excepting rofes, and fome few other kinds.

There is a great variety of animals in this country, both wild and tame; of the former are elephants, rhinocerofes, lions, tygers, leopards, wolves, jackals, and the like. The jackalls dig up and eat dead bodies, and make a hideous noife in the night. The rhinoceros is not common in the Mogul's empire; but elephants are very numerous, fome 12, 14, or 15 feet high. There is plenty of venifon, and game of feveral kinds; as red-deer, fallow-deer, elks, antelopes, kids, hares, and fuch like. None of thefe are imparked, but all in common, and may be any body's who will be at the pains to take them. Among the wild animals alfo may be reckoned the mufk-animal, apes, and monkeys.

Hindoftan affords variety of beafts for carriage, as camels, dromedaries, mules, affes, horfes, oxen, and buffaloes. Moft of the horfes are white, and many curioufly dappled, pied, and fpotted all over. The flefh of the oxen is very fweet and tender. Being very tame, many ufe them as they do horfes, to ride on. Inftead of a bit, they put one or two fmall ftrings through the griftle of the noftrils, and faftening the ends to a rope, ufe it inftead of a bridle, which is held up by a bunch of grifly flefh which he has on the forepart of his back. They faddle him as they do a horfe; and, if fpurred a little, he will go as faft. Thefe are generally made ufe of all over the Indies; and with them only are drawn waggons, coaches, and chariots. Some of thefe oxen will travel 15 leagues in a day. They are of two forts; one fix feet high, which are rare; another called *dwarfs*, which are only three. In fome places, where the roads are ftony, they fhoe their oxen, when they are to travel far. The buffalo's fkin makes excellent

 excellent buff, and the female yields very good milk; but their flesh is neither so palatable nor wholesome as beef. The sheep of Hindostan have large heavy tails, and their flesh is very good, but their wool coarse.

This country is much infested with reptiles and insects; some of a noxious kind, as scorpions, snakes, and rats; but the lizards, which are of a green colour, are not hurtful. Snakes and serpents, we are told, are sometimes employed to dispatch criminals, especially such as have been guilty of some atrocious crime, that kind of death being attended with the most grievous torture. The most troublesome insects in this hot country are flies, musketoes, and chinches, or bugs, the first by day, and the others in the night, when they offend no less by their stench than their bite.

26 Account of the inhabitants.

Hindostan is inhabited by several different kinds of people, as the Hindoos, the Pâtans or Afghans, the Baluchis, the Parsis, and the Moguls or Tartars, besides foreigners, especially Jews and Christians of various sects. The Hindoos are the ancient inhabitants; and though subject to the Moguls, are at least some hundreds to one, compared with all the rest. The Parsis are the descendents of the ancient Persians, who worshipped the fire. These fled from India to avoid the persecution of the Mahometans; and are settled on the western peninsula, chiefly about Surat. The Patans, or Afghans, for they seem to be the same people under different names, are those from whom the Moguls conquered Hindostan. They are still very numerous; chiefly in the mountains and north-west parts, towards Kabul, Gazna, and Kandahar, from whence in all probability they originally came. They are a fierce and warlike people, and have a great aversion to the Moguls for having dispossessed them of their territories. The Baluchis, a barbarous people, and much given to rapine, possess several parts of Hindostan to the west of the Indus, particularly the province of Hajakhan. Both they and the Afghans also possess several parts of Persia. The Moguls, or Jagatays, are the present lords of Hindostan, where they reign over the rest, for the most part, with an absolute sway. Of these several nations, the Hindoos and Parsis are Pagan; but excel all the rest in modest deportment and the practice of virtue. The Patans, Baluchis, and Moguls, are Mahometans; and the first and last pretty strict observers of the laws and the rules of justice, at least among themselves. It is rare to see a crooked or deformed person, an idiot, or natural fool, in Hindostan. As to the complexion of the natives, they are of a deep tawny or olive colour; their hair jet black, but not curled. They like not people who are very white or fair, because that is the colour of lepers, who are common in those parts. Most of the Mahometans, except their priests and ancient men, keep their chins constantly shaven, but let the hair on their upper lip grow very long. They shave their heads all over, leaving only a lock on the crown, by which they expect to be drawn up to heaven by their prophet Mahomet. Instead of hats or bonnets, they wear a kind of turban, consisting of a piece of narrow calico, wound several times about the head. The inhabitants, in general, are very civil and courteous, as well to strangers as one another. They salute by bowing the head or their body, laying the right hand on their breast, and uttering compliments as they pass. The meaner people salute their superiors in a very submissive manner, either by putting the right hand to the ground, and then laying it on their head; or else by falling on their knees, and then bowing their head to the earth. In their more familiar salutations, they take each other by the chin, or beard, and cry *Baba*, "father," or *Bij*, "brother." The dress of the inhabitants of Hindostan is all the same in great and small, rich and poor, differing only in cost; for they never alter their fashions. Their upper-coats, to the waist, fit close to their bodies, whence they hang loose a little below their knees. Under this out-coat, they usually wear another slight one of the same cloth, but shorter, in the nature of a vest. Some of the richer sort, in the cooler parts of the day, slip on loose coats over the other, made of quilted silk, or callico, or else of English scarlet-cloth, for that is the colour they most affect. Under their coats they wear a sort of trowsers, which fall down to their ancles, and ruffle on the small of their legs: for their feet are always bare in their shoes, but as clean as their hands. They have girdles, made of a long piece of cloth, which go twice at least about them, the ends hanging down.

The dress of the Mahometan women differs but little from that of the men; only they bind their hair with long fillets, which hang down behind, and wear on their heads mantles or veils of calico; all round their ears they wear small pendants, made of thin and narrow pieces of gold or silver, brass or iron, according to the quality of the person. The lower part of their left nostril is also pierced for putting in rings of those metals at pleasure; the ends of their gold rings meeting in a pearl, drilled for that purpose. Some of the better sort wear great hollow rings of gold enamelled, silver, or brass, upon their wrists and the small of their legs, two or three on each limb, which makes a tinkling noise when they move.

Although the Mahometans are allowed four wives, very few, and those only of the richer sort, take more than one. They are so jealous, that they will not suffer either father or brother to speak to their wives, unless in their presence. Adultery and fornication are reckoned in the highest degree criminal. Great men have eunuchs to guard their women. Common prostitutes are tolerated here; but they must be licensed, before they are at liberty to open a house.

The women are exceeding happy in this part of the world in having easy labours; for it is common to see them one day riding big with child, and the next day riding again with the infants in their arms. The children of the poorer sort go naked several years, only now and then their mothers cover them with a slight calico mantle.

The Mahometans bury not in their mosques or churches, but in some open place out of town.

Their mourning over the deceased is immoderate, especially at their graves; when they often ask the party, as if living, Why he would die, since he had such loving wives and friends, and other comforts, in this life? The men of the greatest quality often provide fair sepulchres for themselves and friends. There are also many handsome monuments erected in memory of such as they esteem pirs, or saints; which are much resorted to by devout people, having lamps continually burning in them, with votaries, who have salaries to attend

attend them. The Mahometans beſtow not ſo much coſt on any ſort of ſtructures as on ſepulchres.

The common language of the empire, called the *Hindûſtân*, has a great affinity with the Perſian and Arabic, but is more ſmooth, and very ſignificant and conciſe. Its characters are different from thoſe of the above languages, and written from the left hand to the right, like the European. All the learning of the Moguls conſiſts in reading and writing; however, the people themſelves are men of very ſtrong reaſon, and will ſpeak off-hand on any ſubject exceeding well. Their chief ſtudy is aſtrology, with the belief of which the generality are ſtrangly infatuated; the Great Mogul himſelf undertaking nothing of any moment without conſulting his aſtrologers. For an account of the different religions in this empire, ſee the articles MAHOMETANISM and GENTOO; and HINDOO in the APPENDIX.

MOHAIR, in commerce, the hair of a kind of goat frequent about Angria in Turkey; the inhabitants of which city are all employed in the manufacture of camblets made of this hair.

MOHAWK COUNTRY, a part of North America, inhabited by one of the five nations of the Iroquois, ſituated between the province of New York and the lake Ontario or Frontignac.

MOHILA, or MOELIA, one of the Comorra iſlands in the Indian ſea, between the north end of the iſland of Madagaſcar and the continent of Africa. The inland parts are mountainous and woody; but the lands adjoining to the ſea are watered by ſeveral fine ſtreams which deſcend from the mountains; and the graſs is green all the year, ſo that it affords a moſt delightful habitation. There are plenty of proviſions of all kinds; and the Eaſt India ſhips of different nations ſometimes touch here for refreſhment.

MOHILOF, a large and ſtrong city of Poland, in the province of Lithuania, and palatinate of Mſciſlau. It is well built, populous, and has a conſiderable trade. Near this place the Swedes obtained a great victory over the Ruſſians in 1707.

MOIDORE, a Portugueſe gold coin, value 1l. 7s. Sterling.

MOIETY, the half of any thing.

MOLA, an ancient town of Italy, in the kingdom of Naples, and in the Terra di Lavoro, where they pretend to ſhew the ruins of Cicero's houſe. It is ſeated on the gulf of Venice, in E. Long. 17. 50. N. Lat. 41. 5.

MOLARES, or DENTES MOLARES, in anatomy, the large teeth, called in Engliſh the *grinders*. See ANATOMY, n° 26, l.

MOLDAVIA, a province of Turkey in Europe, bounded on the north-eaſt by the river Nieſter, which divides it from Poland; on the eaſt, by Beſſarabia; on the ſouth by the Danube, which parts it from Bulgaria; and on the weſt, by Walachia and Tranſilvania; it being 240 miles in length, and 150 in breadth. It lies in a good air and fruitful ſoil, producing corn, wine, rich paſtures, a good breed of horſes, oxen, ſheep, plenty of game, fiſh, fowl, honey, wax, and all European fruits. Its principal rivers are the Danube, Neiſter, Pruth, Bardalach, and Ceret. The inhabitants are Chriſtians of the Greek church, and Jaſſy is the principal town. It has been tributary to the Turks ever ſince the year 1574; who appoint a prince who is a native of the country, but have no regard to his being of the principal families. They pay a large yearly tribute; beſides which, they are obliged to raiſe a great body of horſe at their own expence.

MOLE, a river in Surry, which has taken its name from running under ground. It firſt diſappears at Box-hill, near Darking, in the county of Surry, and emerges again near Leatherhead.

MOLE, in zoology. See TALPA.

Moles in the fields may be deſtroyed by taking a head or two of garlic, onion, or leek, and putting it into their holes; on which they will run out as if frighted, and you may kill them with a ſpear or dog. Or pounded hellebore, white or black, with wheat-flour, the white of an egg, milk, and ſweet-wine, or metheglin, may be made into a paſte, and pellets as big as a ſmall nut may be put into their holes: the moles will eat this with pleaſure, and will be killed by it. In places where you would not dig nor break much, the fuming their holes with brimſtone, garlick, or other unſavoury things, drives them away; and if you put a dead mole into a common haunt, it will make them abſolutely forſake it.

Or take a mole-ſpear or ſtaff, and where you ſee them caſt, go lightly; but not on the ſide betwixt them and the wind, leſt they perceive you; and at the firſt or ſecond putting up of the earth, ſtrike them with your mole-ſtaff downright, and mark which way the earth falls moſt: if ſhe caſts towards the left-hand, ſtrike ſomewhat on the right-hand; and ſo on the contrary, to the caſting up of the plain ground, ſtrike down, and there let it remain; then take out the tongue in the ſtaff, and with the ſpattle, or flat edge, dig round about your grain to the end thereof, to ſee if you have killed her; and if you have miſſed her, leave open the hole, and ſtep aſide a little, and perhaps ſhe will come to ſtop the hole again, for they love but very little air; and then ſtrike her again; but if you miſs her, pour into the hole two gallons of water, and that will make her to come out for fear of drowning: mind them going out of a morning to feed, or coming home when fed, and you may take a great many.

MOLE, in midwifery, a maſs of fleſhy matter, of a ſpherical figure, generated in the uterus, and ſometimes miſtaken for a child. See MIDWIFERY, chap. ii.

MOLE, or *Mark*. See NÆVUS.

MOLE is alſo a maſſive work of large ſtones laid in the ſea by means of coffer-dams; extending before a port, either to defend the harbour from the impetuoſity of the waves, or to prevent the paſſage of ſhips without leave.

MOLE-*Cricket*. See GRYLLOTALPA.

MOLESWORTH (Robert), Viſcount Moleſworth, an eminent ſtateſman and polite writer, born at Dublin in 1656, where his father was a merchant. He was attainted by king James for his activity on the prince of Orange's invaſion; but the latter, when he was ſettled on the throne, called up Mr Moleſworth into the privy-council, and ſent him envoy-extraordinary to the court of Denmark. Here he reſided above three years, and then returned upon ſome diſguſt, without an audience of leave. Upon his return, he drew up his Account of Denmark, a work well known, in which

which he reprefented that government as arbitrary; and hence gave great offence to George prince of Denmark. The Danifh envoy prefented a memorial to king William concerning it; and then furnifhed materials for an anfwer, which was executed by Dr William King. Mr Molefworth was member of the houfes of commons in both kingdoms: king George I. made him a commiffioner of trade and plantations, and advanced him to the peerage of Ireland, by the title of *Baron Philipftown*, and *Vifcount Molefworth of Swords*. He died in 1725. Befide his Account of Denmark, he wrote an addrefs to the houfe of commons, for the encouragement of agriculture; and tranflated Franco Gallia, a Latin treatife of the civilian Hottoman, giving an account of the free ftate of France, and other parts of Europe, before the encroachments made on their liberties.

MOLIERE (John Baptift), a famous French comedian, whofe true name was *Pocquelin*, which for fome reafon or other he funk for that of Moliere. He was the fon of a valet de chambre, and was born at Paris about the year 1620. He went through the ftudy of the claffics under the Jefuits in the college of Clermont, and was defigned for the bar; but at his quitting the law-fchools, he made choice of the actor's profeffion. From the prodigious fondnefs he had for the drama, his whole ftudy and application being directed to the ftage, he continued till his death to exhibit plays, which were greatly applauded. It is faid the firft motive of his going upon the ftage was to enjoy the company of an actrefs, for whom he had contracted a violent fondnefs. His comedies are highly efteemed. And it is no wonder he fo juftly reprefented domeftic feuds, and the torments of jealous hufbands, or of thofe who have reafon to be fo, it being afferted that no man ever experienced all this more than Moliere, who was very unhappy in his wife. His laft comedy was *La Malade imaginaire*, which was brought on the ftage in 1673; and Moliere died on the fourth night of its reprefentation; fome fay in acting the very part of the pretended dead man, which gave fome exercife for the wits of the time; but according to others, he died in his bed that night, from the burfting of a vein in his lungs by coughing. The king, as a laft mark of his favour, prevailed with the archbifhop of Paris to fuffer him to be buried in confecrated ground; though he had irritated the clergy by his *Tartuffe*. The moft efteemed editions of his works are that of Amfterdam, 5 vols 12mo, 1699; and that of Paris, 6 vols 4to, 1734.

MOLINOS (Michael), a Spanifh prieft, who endeavoured to fpread new doctrines in Italy. He was born in the diocefe of Saragoffa in 1627; and entered into prieft's orders, though he never held any ecclefiaftical benefice. He was a man of good fenfe and learning, and his life was exemplary; though, inftead of practifing aufterities, he gave himfelf up to contemplation and myftical devotion. He wrote a book intitled, *Il Guida Spirituale*, containing his peculiar notions, which was greedily read both in Italy and Spain. His followers are called *Quietifts;* becaufe his chief principle was, that men ought to annihilate themfelves in order to be united to God, and afterwards remain in quietnefs of mind, without being troubled for what fhall happen to the body. He was taken up in 1687; and his 68 propofitions were examined by the pope and inquifitors, who decreed that his doctrine was falfe and pernicious, and that his books fhould be burned. He was forced to recant his errors publicly in the Dominicans church, and was condemned to perpetual imprifonment. He was 50 years old when he was taken, and had been fpreading his doctrine 22 years before. He died in prifon in 1692.

MOLOCH, a falfe god of the Ammonites, who dedicated their children to him, by making them "pafs through the fire," as the fcriptures exprefs it. There are various opinions concerning this method of confecration. Some think, the children leaped over a fire facred to Moloch; others, that they paffed between two fires; and others, that they were really burnt in the fire, by way of facrifice to this god. There is foundation for each of thefe opinions. For, firft, it was ufual among the pagans to luftrate or purify with fire; and, in the next place, it is exprefsly faid, that the inhabitants of Sepharvaim burnt their children in the fire to Anamalech and Adrammelech; much fuch deities as Moloch of the Ammonitess

Mofes, in feveral places, forbids the Ifraelites to dedicate their children to this god, as the Ammonites did, and threatens death and utter extirpation to fuch perfons as were guilty of this abominable idolatry. And there is great probability that the Hebrews were much addicted to the worfhip of this deity; fince Amos, and after him St Stephen, reproaches them with having carried along with them into the wildernefs the tabernacle of their god Moloch.

Solomon built a temple to Moloch upon the mount of Olives; and Manaffeh, a long time after, imitated his impiety, by making his fon pafs through the fire in honour of Moloch. It was chiefly in the valley of Tophet and Hinnom, to the eaft of Jerufalem, that the Ifraelites paid their idolatrous worfhip to this falfe god of the Ammonites.

There are various fentiments concerning the relation which Moloch had to the other pagan divinities. Some believe he was the fame with Saturn, to whom it is well known that human facrifices were offered. Others fuppofe him to be Mercury; others, Mars; others, Mithras; and others, Venus. Laftly, others take Moloch to be the fun, or the king of heaven. Moloch was likewife called *Milkom;* as appears from what is faid of Solomon, that he went after Afhtaroth the abomination of the Zidonians, and Milkom the abomination of the Ammonites.

MOLOSSES, in commerce, the thick fluid matter remaining after fugar is made, like fyrup. In Holland moloffes are much ufed in the manufacture of tobacco, and by the poor people for fugar. A brandy is alfo diftilled from them, but it is faid to be unwholefome.

MOLOSSUS, in Greek and Latin poetry, a foot compofed of three long fyllables; as *delectent*.

MOLTEN-GREASE, in farriery. See there § xviii.

MOLUCCA ISLANDS, lie in the Eaft Indian fea under the line; of which there are five principal, namely, Ternate, Tydor, Machian, Motyr, and Bacchian. The largeft of them are hardly 30 miles in circumference. They produce neither corn, rice, nor cattle, except goats: but they have oranges, lemons, and other fruits; and are moft remarkable for fpices, efpecially

cially cloves. They have large fnakes, which are not venomous, and very dangerous land crocodiles. At prefent they have three kings; and the Dutch, who are very ftrong there, keep out all other European nations, being jealous of their fpice-trade. The religion is idolatry; but there are many Mahometans. They were difcovered by the Portuguefe in 1511, who fettled upon the coaft; but the Dutch drove them away, and are now mafters of all thefe iflands.

MOLWITZ, a town of Silefia, in the province of Grotfka, remarkable for a battle gained by the Pruffians over the Auftrians in 1741. E. Long. 16. 45. N. Lat. 50. 26.

MOLYBDIA, in natural hiftory, the name of a genus of cryftals of a cubic form, or compofed of fix fides, at right angles, like a dye.

MOLYNEUX (William), an excellent mathematician and aftronomer, was born at Dublin in 1656, and admitted into the univerfity of that city; which when he left, he carried with him, a teftimonial drawn up in an uncommon form, and in the ftrongeft terms, fignifying the high opinion conceived of his genius, the probity of his manners, and the remarkable progrefs he had made in letters. In 1675, he entered in the middle-temple, where he fpent three years in the ftudy of the laws of his country: but the bent of his genius lay ftrongly toward mathematics and philofophical ftudies; and even at the univerfity he conceived a diflike to fcholaftic learning, and fell into the methods of Lord Bacon. In 1683, he formed a fociety in Dublin, for carrying on the fame defign with the royal fociety in London. He foon got a few ingenious men to meet at ftated times under proper regulations. Their number immediately increafed; Sir William Petty was their firft prefident, and Mr Molyneux their firft fecretary. Their fociety continued to meet till 1688, when the confufion of the times difperfed them. Mr Molyneux's reputation for learning recommended him, in 1684, to the notice and favour of the firft and great duke of Ormond, then lord-lieutenant of Ireland; and chiefly by his grace's influence he was appointed, that year, with Sir William Robinfon, furveyor-general of his majefty's buildings and works, and chief engineer. In 1686, he was fent abroad by the government to view the moft confiderable fortreffes in Flanders. He travelled, in company with Lord Mountjoy, through that country, Holland, part of Germany, and France. Upon his return from Paris to London, in April 1680, he publifhed his *Sciothericum Telefcopium*, containing a defcription of the ftructure and ufe of a telefcopial dial invented by him. The feverities of Tyrconnel's government forced him, with many others, into England, where he fpent two years with his family. In this retirement he wrote his Dioptrics, dedicated to the royal fociety. A parliament being called in Ireland under Lord Sidney in 1692, Mr Molyneux fat in it as one of the reprefentatives of the univerfity of Dublin. Upon the clofe of the feffion, the univerfity honoured him with the degree of doctor of laws; and by the lord-lieutenant he was appointed one of the commiffioners for the forfeitures in Ireland, with a falary of 500l. *per annum*. The laft favour he entirely declined, as engaging him in an invidious work. Not long before he died, he publifhed "The Cafe of Ireland ftated, in relation to its being bound by Acts of Parliament made in England." Among many perfons with whom he maintained correfpondence and friendfhip, Mr Locke was in a particular manner dear to him, as appears from their letters. In 1698, he made a journey to England on purpofe to pay a vifit to that great man; and not long after his return to Ireland was feized with a fit of the ftone, and died in 1698.—His fon, Samuel Molyneux Efq; was born in 1689, and became fecretary to George II. while prince of Wales, and one of the lords of the admiralty; in which place he died. He was a gentleman of great learning, efpecially in mathematical and philofophical fubjects.

MOMBAZA, or MONBAZA, a town of Africa, in an ifland of the fame name, with a caftle and a fort; feated on the eaftern coaft, oppofite to the country of Mombaza in Zanguebar, 70 miles fouth of Melinda, and fubject to Portugal. E. Long. 48. 0. N. Lat. 44. 0.

MOMBAZA, a country of Africa, in Zanguebar, fubject to the Portuguefe, from whence they export flaves, gold, ivory, rice, flefh, and other provifions, with which they fupply the fettlements in Brafil. The king of this country being a Chriftian, had a quarrel with the Portuguefe governor, took the caftle by affault, turned Mahometan, and murdered all the Chriftians in 1631; but in 1729 they became mafters of the territory again.

MOMENT, in the doctrine of time, an inftant, or the moft minute and indivifible part of duration.

MOMENTUM, in mechanics, fignifies the fame with impetus, or the quantity of motion in a moving body; which is always equal to the quantity of matter multiplied into the velocity; or, which is fame thing, it may be confidered as a rectangle under the quantity of matter and velocity.

MOMORDICA, MALE BALSAM APPLE; a genus of the fyngenefia order, belonging to the monœcia clafs of plants. The moft remarkable fpecies are, 1. The balfamina, or male balfam apple. This is a native of Afia; and hath a trailing ftalk like thofe of the cucumber or melon, with fmooth leaves, cut into feveral fegments, and fpread open like a hand. The fruit is oval, ending in acute points, having feveral deep angles, with fharp tubercles placed on their edges. It changes to a red or purplifh colour when ripe, opening with an elafticity, and throwing out its feeds. 2. The elaterium, wild or fpurting cucumber, hath a large flefhy root, fomewhat like briony, from whence come forth every fpring feveral thick, rough, trailing ftalks, dividing into many branches, and extending every way two or three feet; thefe are garnifhed with thick, rough, almoft heart-fhaped leaves, of a grey colour, ftanding upon long foot-ftalks. The flowers come out from the wings of the ftalks: thefe are male and female, growing at different places on the fame plant like thofe of the common cucumber; but they are much lefs, of a pale yellow colour, with a greenifh bottom; the male flowers ftand upon thick, fhort, foot-ftalks, but the female flowers fit upon the young fruit; which, after the flower is faded, grows of an oval form, an inch and a half long, fwelling like a cucumber, of a grey colour like the leaves, and covered over with fhort prickles. This fpecies has one of its names from the property of cafting out its feeds, together

gether with the viscid juice in which the seeds are lodged, with a violent force, if touched while ripe.

Uses. The first species is famous in Syria for curing wounds: the natives cut open the unripe fruit, and infuse it in sweet oil, which they expose to the sun for some days until it becomes red; and then present it for use. Dropped on cotton, and applied to a fresh wound, the Syrians reckon this oil the best vulnerary next to balsam of Mecca, having found by experience that it often cures large wounds in three days. The leaves and stems of this plant are used for arbours or bowers. The elaterium of the shops is the fruit, or rather the inspissated fæcula, of the juice of the unripe fruit of the wild cucumber. It is usually sent us from Spain and the southern parts of France, where the plant is common. We receive it in small, flat, whitish lumps, or cakes, that are dry, and break easily between the fingers. It is of an acrid, nauseous, bitter taste, and has a strong offensive smell when newly made; but these, as well as its other properties, it loses after being kept for some time. It is a very violent purge and vomit, and is now but seldom used. From the property which the plant has of throwing out its seeds, it has sometimes been called *Noli me tangere.*

MOMUS, in fabulous history, the god of raillery, or the jester of the celestial assembly, and who ridiculed both gods and men. Being chosen by Vulcan, Neptune, and Minerva, to give his judgment concerning their works, he blamed them all: Neptune for not making his bull with horns before his eyes, in order that he might give a surer blow; Minerva for building an house that could not be removed in case of bad neighbours; and Vulcan, for making a man without a window in his breast, that his treacheries might be seen.

MONA, two islands of this name in the sea lying between Britain and Ireland. The one described by Cæsar, as situated in the mid-passage between both islands, and stretching out in length from south to north. Called *Monaæda,* (Ptolemy); *Monapia,* or *Monabia,* (Pliny). Supposed to be the Isle of Man. Another Mona, (Tacitus); an island more to the south, and of greater breadth; situate on the coast of the Ordovices, from whom it is separated by a narrow strait. The ancient seat of the Druids. Now called *Anglesey,* the island of the Angles or English.

Mona, an island of the Baltic-Sea, south-west of the island of Zealand, subject to Denmark. E. Long. 12. 30. N. Lat. 55. 20.

MONADELPHIA, (from μονος "alone," and αδελφια a "brotherhood,") a single brotherhood; the name of the 16th class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers; in which all the stamina, or male organs of generation, are united below into one body or cylinder, through which passes the pointal or female organ. See Botany, p. 1296.

MONACO, a small, but handsome and strong town of Italy, in the territory of Genoa, with a castle, citadel, and a good harbour. It is seated on a craggy rock; and has its own prince, under the protection of France. E. Long. 7. 33. N. Lat. 43. 48.

MONAGHAN, a county of Ireland, in the province of Ulster, 32 miles long and 22 broad. It is bounded on the north by Tyrone; on the east by Armagh; on the south by Cavan and Louth; and on the west by Fermanagh. It is full of woods and bogs, and a third part of it is taken up by Lough Earne. It contains 24 parishes, five baronies, one borough, near 10,000 houses, and sends four members to parliament. Some time ago there were discovered on the borders of this county, four teeth of a prodigious magnitude, which the royal society, upon comparing with some teeth which had been found in England, were clearly of opinion could be no other that those of the elephant.

MONANDRIA, (from μονος "alone," and ανηρ a "man or husband;") the name of the first class in Linnæus's sexual system; consisting of plants with hermaphrodite flowers, which have only one stamen or male organ.

MONARCHY, a government in which the supreme power is vested in a single person. See Government.

MONARDA, Indian horehound; a genus of the monogynia order, belonging to the diandria class of plants. The most remarkable species is the zeylanica, a native of the East Indies. It rises with an herbaceous, four-cornered, hoary stalk; and bears leaves that are entire, nearly heart-shaped, woolly, deeply notched on the edges, and having foot-stalks. The flowers, which are purplish and fragrant, surround the stalk in whorls, each whorl containing about 14 flowers; and are succeeded by four small kidney-shaped shining seeds, lodged in the bottom of the permanent flower-cup. The Indians superstitiously believe that a fumigation of this plant is effectual for driving away the devil, and from this imaginary property its name in the Ceylonese language is derived. Grimmius relates, in his *Laboratorium Ceylonicum,* that for taste and smell this species of horehound stands remarkably distinguished. A water and subtile oil are obtained from it, both of which are greatly commended in obstructions of the matrix. A syrup is likewise prepared from this plant, which is useful in the above-mentioned disorders as well as in diseases of the stomach.

MONARDES (Nicholas), an excellent Spanish physician of Seville, who lived in the 16th century; and deservedly acquired great reputation by his practical skill and the books which he wrote. His Spanish works have been translated into Latin by Clusius; into Italian by Annibal Brigantus; and those upon American drugs have appeared in English. He died about the year 1578.

MONASTERY, a convent, or house built for the reception and entertainment of monks, mendicant friars, or nuns, whether it be an abbey, priory, &c.

Monasteries are governed by different rules, according to the different regulations prescribed by their founders. The first regular and perfect monasteries were founded by St Pachomius in Egypt: but St Basil is generally considered as the great father and patriarch of the eastern monks; since, in the fourth century, he prescribed rules for the government of the monasteries, to which the Anachorets and Cœnobites, and the other ancient fathers of the desarts, submitted. In like manner St Benedict was styled the *patriarch of the western monks.* He appeared in Italy towards the latter end of the fifth century, and published his rule, which was universally received throughout the west.

St Auguftine being fent into England by St Gregory the pope, in the year 596, to convert the Englifh, he at the fame time introduced the monaftic ftate into that kingdom; which made fuch progrefs there, that, within the fpace of 200 years, there were 30 kings and queens who preferred the religious habit to their crowns, and founded ftately monafteries, where they ended their days in retirement.

MONASTIC, fomething belonging to monks. See MONK.

MONCAON, or MONZON, a town of Portugal, in the province of Entre-Douro-de-Minho, with a ftrong caftle. The Spaniards have feveral times attempted to take it, but in vain. W. Long. 8. 2. N. Lat. 41. 52.

MONCON, or MONZON, a ftrong town of Spain, in the kingdom of Arragon. It was taken by the French in 1642, but the Spaniards retook it the following year. It is feated at the confluence of the rivers Sofa and Cinca. E. Long. 0. 19. N. Lat. 41. 43.

MONDOVI, a confiderable town of Italy, in Piedmont; with a citadel, univerfity, and bifhop's fee. It is the largeft and moft populous town of Piedmont, and is feated in E. Long. 8. 15. N. Lat. 44. 23.

MONDAY, the fecond day of the week, fo called as being anciently facred to the moon; *q. d.* moon-day.

MONEMUGI, an empire in the fouth of Africa, has Zanguebar on the eaft, Monotapa on the fouth, Motamba and Makoko on the weft, and Abyffinia on the north and partly to the eaft, tho' its boundaries that way cannot be afcertained. It is divided into the kingdoms of Mujaco, Makoko or Anfiko, Gingiro, Cambate, Alaba, and Monemugi Proper. This laft lies in the middle of the torrid zone, and about the equinoctial line fouth of Makoko, weft of Zanguebar, north of Monomotopa, and eaft of Congo and of the northern parts of Monomotopa. To afcertain its extent, is too difficult a tafk, being a country fo little frequented. The country known, abounds with gold, filver, copper mines, and elephants. The natives clothe themfelves in filks and cottons, which they buy of ftrangers, and wear collars of tranfparent amber-beads, brought them from Cambaya: which beads ferve alfo inftead of money; gold and filver being too common, and of little value among them.

Their monarch always endeavours to be at peace with the princes round about him, and to keep an open trade with Quitoa, Melinda, and Mombaza, on the eaft, and with Congo on the weft; from all which places the black merchants refort thither for gold. The Portuguefe merchants report, that on the eaft fide of Monemugi there is a great lake full of fmall iflands, abounding with all forts of fowl and cattle, and inhabited by negroes. They relate alfo, that on the main land eaftward they heard fometimes the ringing of bells, and that one could obferve buildings very much like churches; and that from thefe parts came men of a brown and tawny complexion, who traded with thofe iflanders, and with the people of Monemugi.

This country of Monemugi affords alfo abundance of palm-wine and oil, and fuch great plenty of honey, that above half of it is loft, the blacks not being able to confume it. The air is generally very unwholefome, and exceffively hot, which is the reafon why no Chriftians undertake to travel in this empire. De Lifle gives the divifion of this country as follows: The Maracates, the Meffeguaries, the kingdom of the Buengas, the kingdom of Mafti, and that of Maravi. But we are not acquainted with any particulars relating to thefe nations or kingdoms.

MONEY, a piece of matter, commonly metal, to which public authority has affixed a certain value and weight to ferve as a medium in commerce. See COIN, COMMERCE, and MEDALS.

Money is ufually divided into *real* or *effective*, and *imaginary* or *money of account*.

I. Real money includes all coins, or fpecies of gold, filver, copper, and the like; which have courfe in commerce, and do really exift. Such are guineas, piftoles, pieces of eight, ducats, &c.

Real money, civilians obferve, has three effential qualities, viz. matter, form, and weight or value.

For the matter, copper is that thought to have been firft coined; afterwards filver; and laftly gold, as being the moft beautiful, fcarce, cleanly, divifible, and pure of all metals.

The degrees of goodnefs are expreffed in gold by carats; and in filver by penny-weights, &c. For there are feveral reafons for not coining them pure and without alloy, viz. the great lofs and expence in refining them, the neceffity of hardening them to make them more durable, and the fcarcity of gold and filver in moft countries. See ALLOY.

Among the ancient Britons, iron rings, or, as fome fay, iron plates, were ufed for money; among the Lacedæmonians, iron bars quenched with vinegar, that they might not ferve for any other ufe. Seneca obferves, that there was anciently ftamped money of leather, *corium forma publica impreffum.* And the fame thing was put in practice by Frederic II. at the fiege of Milan; to fay nothing of an old tradition among ourfelves, that in the confufed times of the barons wars the like was done in England: but the Hollanders, we know, coined great quantities of pafteboard in the year 1574.

As to the form of money, it has been more various than the matter. Under this are comprehended the weight, figure, impreffion, and value.

For the impreffion, the Jews, tho' they detefted images, yet ftamped on the one fide of their fhekel the golden pot which had the manna, and on the other Aaron's rod. The Dardans ftamped two cocks fighting. The Athenians ftamped their coins with an owl, or an ox; whence the proverb on bribed lawyers, *Bos in lingua.* They of Ægina, with a tortoife; whence that other faying, *Virtutem & fapientiam vincunt teftudines.* Among the Romans, the monetarii fometimes impreffed the images of men that had been eminent in their families on the coins: but no living man's head was ever ftamped on a Roman coin till after the fall of the commonwealth. From that time they bore the emperor's head on one fide. From this time the practice of ftamping the prince's image on coins, has obtained among all civilized nations; the Turks and other Mahometans alone excepted, who, in deteftation of images, infcribe only the prince's name, with the year of the tranfmigration of their prophet.

As to the figure, it is either round, as in Britain; mul-

Money. multangular or irregular, as in Spain; ſquare, as in ſome parts of the Indies; or nearly globular, as in moſt of the reſt.

After the arrival of the Romans in this iſland, the Britons imitated them, coining both gold and ſilver with the images of their kings ſtamped on them. When the Romans had ſubdued the kings of the Britons, they alſo ſuppreſſed their coins, and brought in their own; which were current here from the time of Claudius to that of Valentinian the younger, about the ſpace of 500 years.

Mr Camden obſerves, that the moſt ancient Engliſh coin he had known was that of Ethelbert king of Kent, the firſt Chriſtian king in the iſland; in whoſe time all money-accounts begin to paſs by the names of *pounds*, *ſhillings*, *pence*, and *mancuſes*. Pence ſeems borrowed from the Latin *pecunia*, or rather from *pendo*, on account of its juſt weight, which was about three pence of our money. Theſe were coarſely ſtamped with the king's image on the one ſide, and either the mint-maſter's, or the city's where it was coined, on the other. Five of theſe pence made their ſcilling, probably ſo called from *ſcilingus*, which the Romans uſed for the fourth part of an ounce. Forty of theſe ſcillings made their pound; and 400 of theſe pounds were a legacy, or a portion for a king's daughter, as appears by the laſt will of king Alfred. By theſe names they tranſlated all ſums of money in their old Engliſh teſtament; talents by *pundes;* Judas's thirty pieces of ſilver by *thirtig ſcillinga;* tribute-money, by *penining;* the mite by *feorthling*.

But it muſt be obſerved, they had no other real money, but pence only; the reſt being imaginary moneys, *i. e.* names of numbers or weights. Thirty of theſe pence made a mancus, which ſome take to be the ſame with a mark; manca, as appears by an old MS. was *quinta pars unciæ*. Theſe mancas or mancuſes were reckoned both in gold and ſilver. For in the year 680, we read that Ina king of the Weſt Saxons obliged the Kentiſhmen to buy their peace at the price of 30,000 manca's of gold. In the notes on king Canute's laws, we find this diſtinction, that *mancuſa* was as much as a mark of ſilver; and *manca* a ſquare piece of gold, valued at 30 pence.

The Danes introduced a way of reckoning money by ores, *per oras*, mentioned in Domeſday-book; but whether they were a ſeveral coin, or a certain ſum, does not plainly appear. This, however, may be gathered from the Abbey-book of Burton, that 20 ores were equivalent to two marks. They had alſo a gold coin called *byzantine*, or *bezant*, as being coined at Conſtantinople, then called *Byzantium*. The value of which coin is not only now loſt, but was ſo entirely forgot even in the time of king Edward III. that whereas the biſhop of Norwich was fined a bizantine of gold to be paid the abbot of St Edmund's Bury for infringing his liberties (as it had been enacted by parliament in the time of the conqueror), no man then living could tell how much it was; ſo it was referred to the king to rate how much he ſhould pay. Which is the more unaccountable, becauſe but 100 years before, 200,000 bezants were exacted by the ſoldan for the ranſom of St Lewis of France; which were then valued at 100,000 livres.

Though the coining of money be a ſpecial prerogative of the king, yet the ancient Saxon princes communicated it to their ſubjects; inſomuch that in every good town there was at leaſt one mint; but at London eight, at Canterbury four for the king, two for the archbiſhop, one for the abbot at Wincheſter, ſix at Rocheſter, at Haſtings two, &c. Money.

The Norman kings continued the ſame cuſtom of coining only pence, with the prince's image on one ſide, and on the other the name of the city where it was coined, with a croſs ſo deeply impreſſed, that it might be eaſily parted and broke into two halves, which, ſo broken, they called *half-pence;* or into four parts, which they called *fourthings*, or *farthings*.

In the time of king Rich. I. money coined in the eaſt parts of Germany, came in ſpecial requeſt in England on account of its purity, and was called *eaſterling money*, as all the inhabitants of thoſe parts were called *Eaſterlings*. And ſhortly after, ſome of thoſe people ſkilled in coining were ſent for hither, to bring the coin to perfection; which ſince has been called *ſterling* for *Eaſterling*. See Sterling.

King Edward I. who firſt adjuſted the meaſure of an ell by the length of his arm, herein imitating Charles the Great, was the firſt alſo who eſtabliſhed a certain ſtandard for the coin, which is expreſſed to this effect by Greg. Rockley, mayor of London, and mint-maſter.—"A pound of money containeth twelve ounces: in a pound there ought to be eleven ounces, two eaſterlings, and one farthing; the reſt alloy. The ſaid pound ought to weigh twenty ſhillings and three pence in account and weight. The ounce ought to weigh twenty pence, and a penny twenty-four grains and a half. Note, that eleven ounces two-pence Sterling ought to be of pure ſilver, called *leaf-ſilver;* and the minter muſt add of other weight ſeventeen-pence halfpenny farthing, if the ſilver be ſo pure."

About the year 1320, the ſtates of Europe firſt began to coin gold; and among the reſt, our king Edward III. The firſt pieces he coined were called *florences*, as being coined by Florentines; afterwards he coined nobles; then roſe-nobles, current at 6*s.* and 8*d.*; half-nobles, called *half-pennies*, at 3*s.* and 4*d.* of gold; and quarters at 20*d.* called *farthings of gold*. The ſucceeding kings coined roſe-nobles, and double roſe-nobles, great ſovereigns, and half Henry nobles, angels, and ſhillings.

King James I. coined units, double crowns, Britain crowns: then crowns, half-crowns, &c.

II. *Imaginary* Money, or *Money of Account*, is that which has never exiſted, or at leaſt which does not exiſt in real ſpecies, but is a denomination invented or retained to facilitate the ſtating of accounts, by keeping them ſtill on a fixed footing, not to be changed, like current coins, which the authority of the ſovereign raiſes or lowers according to the exigencies of the ſtate. Of which kind are pounds, livres, marks, mar avedis, &c. See the annexed Table, where the fictitious money is diſtinguiſhed by a dagger (†).

Moneys of Account among the Ancients.—1. The Grecians reckoned their ſums of money by *drachmæ*, *minæ*, and *talenta*. The drachma was equal to $7\frac{3}{4}$ l. Sterling; 100 drachmæ made the mina, equal to 3*l.* 4*s.* 7*d.* Sterling; 60 mina made the talent, equal to

 to 193*l.* 15*s.* Sterling: hence 100 talents amounted to 19,375*l.* Sterling.

The mina and talentum, indeed, were different in different provinces: their proportions in Attic drachms are as follow. The Syrian mina contained 25 Attic drachms; the Ptolemaic $33\frac{1}{3}$; the Antiochic and Eubæan 100; the Babylonic 116; the greater Attic and Tyrian $133\frac{1}{3}$; the Æginean and Rhodian $166\frac{2}{3}$. The Syrian talent contained 15 Attic minæ; the Ptolemaic 20; the Antiochic 60; the Eubæan 60; the Babylonic 70; the greater Attic and Tyrian 80; the Æginean and Rhodian 100.

2. Roman moneys of account were the *feftertius* and *feftertium.* The feftertius was equal to 1*d.* $3\frac{3}{4}$*q.* Sterling. One thoufand of thefe made the feftertium, equal to 8*l.* 1*s.* 5*d.* 2*q.* Sterling. One thoufand of thefe feftertia made the decies feftertium (the adverb *centies* being always underftood) equal to 8072*l.* 18*s.* 4*d.* Sterling. The decies feftertium they alfo called *decies centena millia nummum.* Centies feftertium, or centies HS, were equal to 80,729*l.* 3*s.* 4*d.* Millies HS to 807,291*l.* 13*s.* 4*d.* Millies centies HS to 888,020*l.* 16*s.* 8*d.*

Theory of Money.

1. *Of Artificial or Material Money.*

I. As far back as our accounts of the tranfactions of mankind reach, we find they had adopted the precious metals, that is, filver and gold, as the common meafure of value, and as the adequate equivalent for every thing alienable.

The metals are admirably adapted for this purpofe: they are perfectly homogeneous: when pure, their maffes, or bulks, are exactly in proportion to their weights: no phyfical difference can be found between two pounds of gold, or filver, let them be the production of the mines of Europe, Afia, Africa, or America: they are perfectly malleable, fufible, and fuffer the moft exact divifion which human art is capable to give them: they are capable of being mixed with one another, as well as with metals of a bafer, that is, of a lefs homogeneous nature, fuch as copper: by this mixture they fpread themfelves uniformly through the whole mafs of the compofed lump, fo that every atom of it becomes proportionally poffeffed of a fhare of this noble mixture; by which means the fubdivifion of the precious metals is rendered very extenfive.

Their phyfical qualities are invariable: they lofe nothing by keeping; they are folid and durable; and tho' their parts are feparated by friction, like every other thing, yet ftill they are of the number of thofe which fuffer leaft by it.

If money, therefore, can be made of any thing, that is, if the proportional value of things vendible can be meafured by any thing material, it may be meafured by the metals.

II. The two metals being pitched upon as the moft proper fubftances for realifing the ideal fcale of money, thofe who undertake the operation of adjufting a ftandard, muft conftantly keep in their eye the nature and qualities of a fcale, as well as the principles upon which it is formed.

The unit of the fcale muft conftantly be the fame, altho' realifed in the metals, or the whole operation fails in the moft effential part. This realifing the unit is like adjufting a pair of compaffes to a geometrical fcale, where the fmalleft deviation from the exact opening once given muft occafion an incorrect meafure. The metals, therefore, are to money what a pair of compaffes is to a geometrical fcale.

This operation of adjufting the metals to the money of account implies an exact and determinate proportion of both metals to the money-unit, realifed in all the fpecies and denominations of coin, adjufted to that ftandard.

The fmalleft particle of either metal added to, or taken away from, any coins, which reprefent certain determinate parts of the fcale, overturns the whole fyftem of material money. And if, notwithftanding fuch variation, thefe coins continue to bear the fame denominations as before, this will as effectually deftroy their ufefulnefs in meafuring the value of things, as it would overturn the ufefulnefs of a pair of compaffes, to fuffer the opening to vary, after it is adjufted to the fcale reprefenting feet, toifes, miles, or leagues, by which the diftances upon the plan are to be meafured.

III. Debafing the ftandard is a good term; becaufe it conveys a clear and diftinct idea. It is diminifhing the weight of the pure metal contained in that denomination by which a nation reckons, and which we have called the *money-unit.* Raifing the ftandard requires no farther definition, being the direct contrary.

IV. Altering the ftandard (that is, raifing or debafing the value of the money-unit) is like altering the national meafures or weights. This is beft difcovered by comparing the thing altered with things of the fame nature which have fuffered no alteration. Thus if the foot of meafure was altered at once over all England, by adding to it, or taking from it, any proportional part of its ftandard length, the alteration would be beft difcovered by comparing the new foot with that of Paris, or of any other country, which had fuffered no alteration. Juft fo, if the pound Sterling, which is the Englifh unit, fhall be found any how changed, and if the variation it has met with be difficult to afcertain becaufe of a complication of circumftances, the beft way to difcover it, will be to compare the former and the prefent value of it with the money of other nations which has fuffered no variation. This the courfe of exchange will perform with the greateft exactnefs.

V. Artifts pretend, that the precious metals, when abfolutely pure from any mixture, are not of fufficient hardnefs to conftitute a folid and lafting coin. They are found alfo in the mines mixed with other metals of a bafer nature, and the bringing them to a ftate of perfect purity occafions an unneceffary expence. To avoid, therefore, the inconvenience of employing them in all their purity, people have adopted the expedient of mixing them with a determinate proportion of other metals, which hurts neither their fufibility, malleability, beauty, or luftre. This metal is called *alloy;* and, being confidered only as a fupport to the principal metal, is accounted of no value in itfelf. So that eleven ounces of gold, when mixed with one ounce of filver, acquires, by that addition, no augmentation of value whatever.

This

This being the cafe, we fhall, as much as poffible, overlook the exiftence of alloy, in fpeaking of money, in order to render language lefs fubject to ambiguity.

2. *Incapacities of the Metals to perform the Office of an invariable Meafure of Value.*

I. Were there but one fpecies of fuch a fubftance as we have reprefented gold and filver to be; were there but one metal poffeffing the qualities of purity, divifibility, and durability; the inconveniencies in the ufe of it for money would be fewer by far than they are found to be as matters ftand.

Such a metal might then, by an unlimited divifion into parts exactly equal, be made to ferve as a tolerably fteady and univerfal meafure. But the rivalfhip between the metals, and the perfect equality which is found between all their phyfical qualities, fo far as regards purity and divifibility, render them fo equally well adapted to ferve as the common meafure of value, that they are univerfally admitted to pafs current as money.

What is the confequence of this? that the one meafures the value of the other, as well as that of every other thing. Now the moment any meafure begins to be meafured by another, whofe proportion to it is not phyfically, perpetually, and invariably the fame, all the ufefulnefs of fuch a meafure is loft. An example will make this plain.

A foot of meafure is a determinate length. An Englifh foot may be compared with the Paris foot, or with that of the Rhine; that is to fay, it may be meafured by them: and the proportion between their lengths may be expreffed in numbers; which proportion will be the fame perpetually. The meafuring the one by the other will occafion no uncertainty; and we may fpeak of length by Paris feet, and be perfectly well underftood by others who are ufed to meafure by the Englifh foot, or by the foot of the Rhine.

But fuppofe that a youth of 12 years old takes it into his head to meafure from time to time, as he advances in age, by the length of his own foot, and that he divides this growing foot into inches and decimals: what can be learned from his account of meafures? As he increafes in years, his foot, inches, and fubdivifions, will be gradually lengthening; and were every man to follow his example, and meafure by his own foot, then the foot of a meafure now eftablifhed would totally ceafe to be of any utility.

This is juft the cafe with the two metals. There is no determinate invariable proportion between their value; and the confequence of this is, that when they are both taken for meafuring the value of other things, the things to be meafured, like lengths to be meafured by the young man's foot, without changing their relative proportion between themfelves, change, however, with refpect to the denominations of both their meafures. An example will make this plain.

Let us fuppofe an ox to be worth 3000 pounds weight of wheat, and the one and the other to be worth an ounce of gold, and an ounce of gold to be worth exactly 15 ounces of filver: if the cafe fhould happen, that the proportional value between gold and filver fhould come to be as 14 is to 1, would not the ox, and confequently the wheat, be eftimated at lefs in filver, and more in gold, than formerly? Farther, would it be in the power of any ftate to prevent this variation in the meafure of the value of oxen and wheat, without putting into the unit of their money lefs filver and more gold than formerly?

If therefore any particular ftate fhould fix the ftandard of the unit of their money to one fpecies of the metals, while in fact both the one and the other are actually employed in meafuring value; does not fuch a ftate refemble the young man who meafures all by his growing foot? For if filver, for example, be retained as the ftandard, while it is gaining upon gold one fifteenth additional value; and if gold continue all the while to determine the value of things as well as filver; it is plain, that, to all intents and purpofes, this filver-meafure is lengthening daily like the young man's foot, fince the fame weight of it muft become every day equivalent to more and more of the fame commodity; notwithftanding that we fuppofe the fame proportion to fubfift, without the leaft variation, between that commodity and every other fpecies of things alienable.

Buying and felling are purely conventional, and no man is obliged to to give his merchandife at what may be fuppofed to be the proportion of its worth. The ufe, therefore, of an univerfal meafure, is to mark, not only the relative value of the things to which it is applied as a meafure, but to difcover in an inftant the proportion between the value of thofe, and of every other commodity valued by a determinate meafure in all the countries of the world.

Were pounds Sterling, livres, florins, piaftres, &c. which are all money of account, invariable in their values, what a facility would it produce in all converfions, what an affiftance to trade! But as they are all limited or fixed to coins, and confequently vary from time to time, this example fhews the utility of the invariable meafure which we have defcribed.

There is another circumftance which incapacitates the metals from performing the office of money; the fubftance of which the coin is made, is a commodity which rifes and finks in its value with refpect to other commodities, according to the wants, competition, and caprices of mankind. The advantage, therefore, found in putting an intrinfic value into that fubftance which performs the function of money of account, is compenfated by the inftability of that intrinfic value; and the advantage obtained by the ftability of paper, or fymbolical money, is compenfated by the defect it commonly has of not being at all times fufceptible of realization into folid property or intrinfic value.

In order, therefore, to render material money more perfect, this quality of metal, that is, of a commodity, fhould be taken from it; and in order to render paper-money more perfect, it ought to be made to circulate upon metallic or land-fecurity.

II. There are feveral fmaller inconveniencies accompanying the ufe of the metals, which we fhall here fhortly enumerate.

1mo, No money made of gold or filver can circulate long, without lofing of its weight, altho' it all along preferves the fame denomination. This reprefents the contracting a pair of compaffes which had been rightly adjufted to the fcale.

2do, Ano-

2do, Another inconvenience proceeds from the fabrication of money. Suppofing the faith of princes who coin money to be inviolable, and the probity as well as capacity of thofe to whom they commit the infpection of the finenefs of the metals to be fufficient, it is hardly poffible for workmen to render every piece exactly of a proper weight, or to preferve the due proportion between pieces of different denominations; that is to fay, to make every ten fixpences exactly of the fame weight with every crown-piece and every five fhillings ftruck in a coinage. In proportion to fuch inaccuracies, the parts of the fcale become unequal.

3tio, Another inconvenience, and far from being inconfiderable, flows from the expence requifite for the coining of money. This expence adds to its value as a manufacture, withing adding any thing to its weight.

4to, The laft inconvenience is, that by fixing the money of account entirely to the coin, without having any independent common meafure, (to mark and control thefe deviations from mathematical exactnefs, which are either infeparable from the metals themfelves, or from the fabrication of them), the whole meafure of value, and all the relative interefts of debtors and creditors, become at the difpofal not only of workmen in the mint, of Jews who deal in money, of clippers and wafhers of coin; but they are alfo entirely at the mercy of princes, who have the right of coinage, and who have frequently alfo the right of raifing or debafing the ftandard of the coin, according as they find it moft for their prefent and temporary intereft.

3. *Methods which may be propofed for leffening the feveral Inconveniences to which Material Money is liable.*

The inconveniences from the variation in the relative value of the metals to one another, may in fome meafure be obviated by the following expedients.

1mo, By confidering one only as the ftandard, and leaving the other to feek its own value like any other commodity.

2do, By confidering one only as the ftandard, and fixing the value of the other from time to time by authority, according as the market-price of the metals fhall vary.

3tio, By fixing the ftandard of the unit according to the mean proportion of the metals, attaching it to neither; regulating the coin accordingly; and upon every confiderable variation in the proportion between them, either to make a new coinage, or to raife the denomination of one of the fpecies, and lower it in the other, in order to preferve the unit exactly in the mean proportion between the gold and filver.

4to, To have two units and two ftandards, one of gold and one of filver, and to allow every body to ftipulate in either.

5to, Or laft of all, to oblige all debtors to pay one half in gold, and one half in the filver ftandard.

4. *Variations to which the Value of the Money-unit is expofed from every Diforder in the Coin.*

Let us fuppofe, at prefent, the only diforder to confift in a want of the due proportion between the gold and filver in the coin.

This proportion can only be eftablifhed by the market-price of the metals; becaufe an augmentation and rife in the demand for gold or filver has the effect of augmenting the value of the metal demanded. Let us fuppofe, that to-day one pound of gold may buy fifteen pounds of filver: If to-morrow there be a high demand for filver, a competition among merchants to have filver for gold will enfue; they will contend who fhall get the filver at the rate of 15 pounds for one of gold: this will raife the price of it; and in proportion to their views of profit, fome will accept of lefs than the 15 pounds. This is plainly a rife in the filver, more properly than a fall in the gold; becaufe it is the competition for the filver which has occafioned the variation in the former proportion between the metals.

Let us now fuppofe, that a ftate, having with great exactnefs examined the proportion of the metals in the market, and having determined the precife quantity of each for realifing or reprefenting the money-unit, fhall execute a moft exact coinage of gold and filver coin. As long as that proportion continues unvaried in the market, no inconvenience can refult from that quarter in making ufe of metals for money of account.

But let us fuppofe the proportion to change; that the filver, for example, fhall rife in its value with regard to gold: will it not follow, from that moment, that the unit realized in the filver, will become of more value than the unite realized in the gold coin?

But as the law has ordered them to pafs as equivalents for one another, and as debtors have always the option of paying in what legal coin they think fit, will they not all choofe to pay in gold, and will not then the filver coin be melted down or exported, in order to be fold as bullion, above the value it bears when it circulates in coin? Will not this paying in gold alfo really diminifh the value of the money-unit, fince upon this variation every thing muft fell for more gold than before, as we have already obferved?

Confequently, merchandife, which have not varied in their relative value to any other thing but to gold and filver, muft be meafured by the mean proportion of the metals; and the application of any other meafure to them is altering the ftandard. If they are meafured by the gold, the ftandard is debafed; if by filver, it is raifed.

If, to prevent the inconvenience of melting down the filver, the ftate fhall give up affixing the value of their unit to both fpecies at once, and fhall fix it to one, leaving the other to feek its price as any other commodity; in that cafe, no doubt, the melting down of the coin will be prevented; but will ever this reftore the value of the money-unit to its former ftandard? Would it, for example, in the foregoing fuppofition, raife the debafed value of the money-unit in the gold coin, if that fpecies were declared to be the ftandard? It would indeed render filver coin purely a merchandife, and, by allowing it to feek its value, would certainly prevent it from being melted down as before; becaufe the pieces would rife conventionally in their denomination; or an *agio*, as it is called, would be taken in payments made in filver: but the gold would

would not, on that account, rise in its value, or begin to purchase any more merchandise than before. Were therefore the standard fixed to the gold, would not this be an arbitrary and a violent revolution in the value of the money-unit, and a debasement of the standard?

If, on the other hand, the state should fix the standard to the silver, which we suppose to have risen in its value, would that ever sink the advanced value which the silver coin had gained above the worth of the former standard unit? and would not this be a violent and an arbitrary revolution in the value of the money-unit, and a raising of the standard?

The only expedient, therefore, is, in such a case, to fix the numerary unit to neither of the metals, but to contrive a way to make it fluctuate in a mean proportion between them; which is in effect the introduction of a pure ideal money of account.

The regulation of fixing the unit by the mean proportion, ought to take place at the instant the standard unit is affixed with exactness both to the gold and silver. If it be introduced long after the market-proportion between the metals has deviated from the proportion established in the coin; and if the new regulation is made to have a retrospect, with regard to the acquitting of permanent contracts entered into while the value of the money-unit had attached itself to the lowest currency in consequence of the principle above laid down; then the restoring the money-unit to that standard where it ought to have remained (to wit, to the mean proportion) is an injury to all debtors who have contracted since the time that the proportion of the metals began to vary.

This is clear from the former reasoning. The moment the market-price of the metals differs from that in the coin, every one who has payments to make, pays in that species which is the highest rated in the coin; consequently, he who lends, lends in that species. If after the contract, therefore, the unit is carried up to the mean proportion, this must be a loss to him who had borrowed.

From this we may perceive, why there is less inconvenience from the varying of the proportion of the metals, where the standard is fixed to one of them, than when it is fixed to both. In the first case, it is at least uncertain whether the standard or the merchandise species is to rise; consequently it is uncertain whether the debtors or the creditors are to gain by a variation. If the standard species should rise, the creditors will gain; if the merchandise species rises, the debtors will gain; but when the unit is attached to both species, then the creditors never can gain, let the metals vary as they will: if silver rises, then debtors will pay in gold; if gold rises, the debtors will pay in silver. But whether the unit be attached to one or to both species, the infallible consequence of a variation is, that one half of the difference is either gained or lost by debtors and creditors. The invariable unit is constantly the mean proportional between the two measures.

5. *How the Variations of the intrinsic Value of the Unit of Money must affect all the domestic Interest of a Nation.*

If the changing the content of the bushel by which grain is measured, would affect the interest of those who are obliged to pay, or who are entitled to receive, a certain number of bushels of grain for the rent of lands; in the same manner must every variation in the value of the unit of account affect all persons who, in permanent contracts, are obliged to make payments, or who are entitled to receive sums of money stipulated in multiples or in fractions of that money-unit.

Every variation, therefore, upon the intrinsic value of the money-unit, has the effect of benefiting the class of creditors at the expence of debtors, or *vice versa*.

This consequence is deduced from an obvious principle. Money is more or less valuable in proportion as it can purchase more or less of every kind of merchandise. Now, without entering anew into the causes of the rise and fall of prices, it is agreed upon all hands, that whether an augmentation of the general mass of money in circulation has the effect of raising prices in general, or not, any augmentation of the quantity of the metals appointed to be put into the money-unit, must at least affect the value of that money-unit, and make it purchase more of any commodity than before: that is to say, if 113 grains of fine gold, the present weight of a pound Sterling in gold, can buy 113 pounds of flour; were the pound Sterling raised to 114 grains of the same metal, it would buy 114 pounds of flour; consequently, were the pound Sterling augmented by one grain of gold, every miller who paid a rent of ten pounds a-year, would be obliged to sell 1140 pounds of his flour, in order to procure ten pounds to pay his rent, in place of 1130 pounds of flour, which he sold formerly to procure the same sum; consequently, by this innovation, the miller must lose yearly ten pounds of flour, which his master consequently must gain. From this example, it is plain, that every augmentation of metals put into the pound Sterling, either of silver or gold, must imply an advantage to the whole class of creditors who are paid in pounds Sterling, and consequently must be a proportional loss to all debtors who must pay by the same denomination.

6. *Of the Disorder in the British Coin, so far as it occasions the melting down or the exporting of the Specie.*

The defects in the British coin are three.

1mo, The proportion between the gold and silver in it is found to be as 1 to $15\frac{2}{10}$, whereas the market price may be supposed to be nearly as 1 to $14\frac{1}{2}$.

2do, Great part of the current money is worn and light.

3tio, From the second defect proceeds the third, to wit, that there are several currencies in circulation which pass for the same value, without being of the same weight.

4to, From all these defects results the last and greatest inconvenience, to wit, that some innovation must be made, in order to set matters on a right footing.

The English, besides the unit of their money which they call the pound Sterling, have also the unit of their weight for weighing the precious metals.

This is called the *pound troy*, and consists of 12 ounces,

ounces, every ounce of 20 penny-weights, and every penny-weight of 24 grains. The pound troy, therefore, consists of 240 penny-weights, and 5760 grains.

The fineness of the silver is reckoned by the number of ounces and penny-weights of the pure metals in the pound troy of the composed mass; or, in other words, the pound troy, which contains 5760 grains of standard silver, contains 5328 grains of fine silver, and 432 grains of copper, called *alloy*.

Thus standard silver is 11 ounces 2 penny-weights of fine silver in the pound troy to 18 penny-weights copper, or 111 parts fine silver to 9 parts alloy.

Standard gold is 11 ounces fine to 1 ounce silver or copper employed for alloy, which together make the pound troy; consequently, the pound troy of standard gold contains 5280 grains fine, and 480 grains alloy, which alloy is reckoned of no value.

This pound of standard silver is ordered, by statute of the 43d of Elizabeth, to be coined into 62 shillings, 20 of which make the pound sterling; consequently the 20 shillings contain 1718.7 grains of fine silver, and 1858.06 standard silver.

The pound troy of standard gold, $\frac{11}{12}$ fine, is ordered, by an act of King Charles II. to be cut into 44½ guineas; that is to say, every guinea contains 129.43 grains of standard gold, and 118.644 of fine gold; and the pound Sterling, which is $\frac{20}{21}$ of the guinea, contains 112.994, which we may state at 113 grains of fine gold.

The coinage in England is entirely defrayed at the expence of the state. The mint price for the metals is the very same with the price of the coin. Whoever carries to the mint an ounce of standard silver, receives for it in silver coin 5*s.* 2*d.* or 62*d:* whoever carries an ounce of standard gold receives in gold coin 3*l.* 17*s.* 10½*d.* the one and the other making exactly an ounce of the same fineness with the bullion. Coin, therefore, can have no value in the market above bullion; consequently, no less can be incurred by those who melt it down.

When the guinea was first struck, the government (not inclining to fix the pound Sterling to the gold coin of the nation) fixed the guinea at 20 shillings, (which was then below its proportion to the silver), leaving it to seek its own price above that value, according to the course of the market.

By this regulation no harm was done to the English silver standard; because the guinea, or 118.644 grains fine gold being worth more, at that time, than 20 shillings, or 1718.7 grains fine silver, no debtor would pay with gold at its standard value; and whatever it was received for above that price was purely conventional.

Accordingly guineas sought their own price until the year 1728, that they were fixed a-new, not below their value as at first, but as what was then reckoned their exact value, according to the proportion of the metals, *viz.* at 21 shillings; and at this they were ordered to pass current in all payments.

This operation had the effect of making the gold a standard as well as the silver. Debtors then paid indifferently in gold as well as in silver, because both were supposed to be of the same intrinsic as well as current value; in which case no inconvenience could follow upon this regulation. But, in time, silver came to be more demanded; the making of plate began to prevail more than formerly, and the exportation of silver to the East Indies increasing yearly, made the demand for it greater, or perhaps brought its quantity to be proportionally less than before. This changed the proportion of the metals; and by slow degrees they have come from that of 1 to 15.2 (the proportion they were supposed to have when the guineas were fixed and made a lawful money at 21 shillings) to that of 14.5, the present *supposed* proportion.

The consequence of this has been, that the same guinea which was worth 1804.6 grains fine silver, at the time it was fixed at 21 shillings, is now worth no more than 1719.9 grains of fine silver according to the proportion of 14½ to 1.

Consequently debtors, who have always the option of the legal species in paying their debts, will pay pounds sterling no more in silver but in gold; and as the gold pounds they pay in, are not intrinsically worth the silver pounds they paid in formerly according to the statute of Elisabeth, it follows that the pound sterling in silver is really no more the standard, since nobody will pay at that rate, and since nobody can be compelled to do it.

Besides this want of proportion between the metals, the silver coined before the reign of George I. is now become light by circulation; and the guineas coined by all the princes since Charles II. pass by tale, tho' many of them are considerably diminished in their weight.

Let us now examine what profit the want of proportion and the want of weight in the coin can afford to the money-jobbers in melting it down or exporting it.

Did every body consider coin only as the measure for reckoning value, without attending to its value as a metal, the deviations of gold and silver coin from perfect exactness, either as to proportion or weight, would occasion little inconvenience.

Great numbers indeed, in every modern society, consider coin in no other light than that of money of account; and have great difficulty to comprehend what difference any one can find between a light shilling and a heavy one, or what inconvenience there can possibly result from a guinea's being some grains of fine gold too light to be worth 21 shillings standard weight. And did every one think in the same way, there would be no occasion for coin of the precious metals at all; leather, copper, iron, or paper, would keep the reckoning as well as gold and silver.

But although there be many who look no farther than at the stamp on the coin, there are others whose sole business it is to examine its intrinsic worth as a commodity, and to profit of every irregularity in the weight and proportion of metals.

By the very institution of coinage, it is implied, that every piece of the same metal, and same denomination with regard to the money-unit, shall pass current for the same value.

It is, therefore, the employment of money-jobbers, to examine, with a scrupulous exactness, the precise weight of every piece of coin which comes into their hands.

The first object of their attention is, the price of the metals in the market: a jobber finds, at present, that with 14.5 pounds of fine silver bullion, he can buy one

one pound of fine gold bullion.

He therefore buys up with gold coin all the new ſilver as faſt as it is coined, of which he can get at the rate of 15.2 pounds for one in gold; theſe 15.2 pounds ſilver coin he melts down into bullion, and converts that back into gold bullion, giving at the rate of only 14.5 pounds for one.

By this operation he remains with the value of $\frac{7}{10}$ of one pound weight of ſilver bullion clear profit upon the $15\frac{1}{2}$ pounds he bought; which $\frac{7}{10}$ is really loſt by the man who inadvertently coined ſilver at the mint, and gave it to the money-jobber for his gold. Thus the ſtate loſes the expence of the coinage, and the public the convenience of change for their guineas.

But here it may be aſked, Why ſhould the money-jobber melt down the ſilver coin? can he not buy gold with it as well without melting it down? He cannot; becauſe when it is in coin, he cannot avail himſelf of its being new and weighty. Coin goes by tale, not by weight; therefore, were he to come to market with his new ſilver coin, gold bullion being ſold at the mint price, we ſhall ſuppoſe, viz. at 3*l.* 17*s.* $10\frac{1}{2}$*d.* Sterling money *per* ounce, he would be obliged to pay the price of what he bought with heavy money, which he can equally do with light.

He therefore melts down the new ſilver coin, and ſells it for bullion, at ſo many pence an ounce; the price of which bullion is, in the Engliſh market, always above the price of ſilver at the mint, for the reaſons now to be given.

When you ſell ſtandard-ſilver bullion at the mint, you are to paid in weighty money; that is, you receive for your bullion the very ſame weight in ſtandard coin; the coinage coſt nothing: but when you ſell bullion in the market, you are paid in worn out ſilver, in gold, in bank-notes, in ſhort, in every ſpecies of lawful current money. Now all theſe payments have ſome defect: the ſilver you are paid with is worn and light; the gold you are paid with is over rated, and perhaps alſo light; and the bank-notes muſt have the ſame value with the ſpecie with which the bank pays them; that is, with light ſilver or over-rated gold.

It is for theſe reaſons, that ſilver bullion, which is bought by the mint at 5*s.* 2*d.* *per* ounce of heavy ſilver money, may be bought at market at 65 pence the ounce in light ſilver, over-rated gold, or bank-notes, which is the ſame thing.

Further, we have ſeen how the impoſition of coinage has the effect of raiſing coin above the value of bullion, by adding a value to it which it had not as a metal.

Juſt ſo, when the unit is once affixed to certain determined quantities of both metals, if one of the metals ſhould afterwards riſe in value in the market, the coin made of that metal muſt loſe a part of its value as coin, although it retains it as a metal. Conſequently, as in the firſt caſe it acquired an additional value by being coined, it muſt now acquire an addititional value by being melted down. From this we may conclude, that when the ſtandard is affixed to both the metals in the coin, and when the proportion of that value is not made to follow the price of the market, that ſpecies which riſes in the market is melted down, and the bullion is ſold for a price as much exceeding the mint price as the metal has riſen in its value.

If, therefore, in England, the price of ſilver bullion is found to be at 65 pence the ounce, while at the mint it is rated at 62; this proves that ſilver has riſen $\frac{3}{65}$ above the proportion obſerved in the coin, and that all coin of ſtandard weight may conſequently be melted down with a profit of $\frac{3}{65}$. But as there are ſeveral other circumſtances to be attended to which regulate and influence the price of bullion, we ſhall here paſs them in review, the better to diſcover the nature of this diſorder in the Engliſh coin, and the advantages which money-jobbers may draw from it.

The price of bullion, like that of every other merchandiſe, is regulated by the value of the money it is paid with.

If bullion, therefore, ſells in England for 65 pence an ounce, paid in ſilver coin, it muſt ſell for 65 ſhillings the pound troy; that is to ſay, the ſhillings it is commonly paid with do not exceed the weight of $\frac{1}{65}$ of a pound troy: for if the 65 ſhillings with which the pound of bullion is paid weighed more than a pound troy, it would be a ſhorter and better way for him who wants bullion to melt down the ſhillings and make uſe of the metal, than to go to market with them in order to get leſs.

We may, therefore, be very certain, that no man will buy ſilver bullion at 65 pence an ounce, with any ſhilling which weighs above $\frac{1}{65}$ of a pound troy,

We have gone upon the ſuppoſitiou that the ordinary price of bullion in the Engliſh market is 65 pence *per* ounce. This has been done upon the authority of ſome late writers on this ſubject: it is now proper to point out the cauſes which may make it deviate from that value.

I. It may vary, and certainly will vary, in the price, according as the currency is better or worſe. When the expences of a war, or a wrong balance of trade, have carried off a great many heavy guineas, it is natural that bullion ſhould riſe; becauſe then it will be paid for more commonly in light gold and ſilver; that is to ſay, with pounds Sterling, below the value of 113 grains fine gold, the worth of the pound Sterling in new guineas.

II. This wrong balance of trade, or a demand for bullion abroad, becoming very great, may occaſion a ſcarcity of the metals in the market, as well as a ſcarcity of the coin; conſequently, an advanced price muſt be given for it in proportion to the greatneſs and height of the demand. In this caſe, both the ſpecie and the bullion muſt be bought with paper. But the riſe in the price of bullion proceeds from the demand for the metals and the competition between merchants to procure them, and not becauſe the paper given as the price is at all of inferior value to the ſpecie. The leaſt diſcredit of this kind would not tend to diminiſh the value of the paper; it would annihilate it at once. Therefore, ſince the metals muſt be had, and that the paper cannot ſupply the want of them when they are to be exported, the price riſes in proportion to the difficulties in finding metals elſewhere than in the Engliſh market.

III. A ſudden call for bullion, for the making of plate. A goldſmith can well afford to give 67 pence for an ounce of ſilver, that is to ſay, he can afford to give one pound of gold for 14 pounds of ſilver, and perhaps for

for lefs, notwithftanding that what he gives be more than the ordinary proportion between the metals, becaufe he indemnifies himfelf amply by the price of his workmanfhip; juft as a tavern-keeper will pay any price for a fine fifh, becaufe, like the goldfmith, he buys for other people.

IV. The mint price has as great an effect in bringing down the price of bullion, as exchange has in raifing it. In countries where the metals in the coin are juftly proportioned, where all the currencies are of legal weight, and where coinage is impofed, the operations of trade make the price of bullion conftantly to fluctuate between the value of the coin and the mint-price of the metals.

Now let us fuppofe that the current price of filver bullion in the market is 65 pence the ounce, paid in lawful money, no matter of what weight or of what metal. Upon this the money-jobber falls to work. All fhillings which are above $\frac{1}{65}$ of a pound troy, he throws into his melting pot, and fells them as bullion for 65d. *per* ounce; all thofe which are below that weight he carries to market, and buys bullion with them at 65d. *per* ounce.

What is the confequence of this?

That thofe who fell the bullion, finding the fhillings which the money-jobber pays with perhaps not above $\frac{1}{66}$ of a pound troy, they on their fide raife the price of their bullion to 66 d. the ounce.

This makes new work for the money-jobber; for he muft always gain. He now weighs all fhillings as they come to hand; and as formerly he threw into his melting-pot thofe only which were worth more than $\frac{1}{65}$ of a pound troy, he now throws in all that are in value above $\frac{1}{66}$. He then fells the melted fhillings at 66 d. the ounce, and buys bullion with the light ones at the fame price.

This is the confequence of ever permitting any fpecies of coin to pafs by the authority of the ftamp, without controlling it at the fame time by the weight: and this is the manner in which money-jobbers gain by the currency of light money.

It is no argument againft this expofition of the matter to fay, that filver bullion is feldom bought with filver coin; becaufe the pence in new guineas are worth no more than the pence of fhillings of 65 in the pound troy: that is to fay, that 240 pence contained in $\frac{20}{21}$ of a new guinea, and 240 pence contained in 28 fhillings of 65 to the pound troy, differ no more in the intrinfic value than 0.83 of a grain of fine filver upon the whole, which is a mere trifle.

Whenever, therefore, fhillings come below the weight of $\frac{1}{65}$ of a pound troy, then there is an advantage in changing them for new guineas; and when that is the cafe, the new guineas will be melted down, and profit will be found in felling them for bullion, upon the principles we have juft been explaining.

We have already given a fpecimen of the domeftic operations of the money-jobbers; but thefe are not the moft prejudicial to national concerns. The jobbers may be fuppofed to be Englifhmen; and in that cafe the profit they make remains at home: but whenever there is a call for bullion to pay the balance of trade, it is evident that this will be paid in filver coin, never in gold, if heavy filver can be got; and this again carries away the filver coin, and renders it at home fo rare, that great inconveniencies are found for want of the leffer denominations of it. The lofs, however, here is confined to an inconvenience; becaufe the balance of trade being a debt which muft be paid, we do not confider the exportation of the filver for that purpofe as any confequence of the diforder of the coin. But befides this exportation which is neceffary, there are others which are arbitrary, and which are made only with a view to profit of the wrong proportion.

When the money-jobbers find difficulty in carrying on the traffic we have defcribed, in the Englifh market, becaufe of the competition among themfelves, they carry the filver coin out of the country, and fell it abroad for gold, upon the fame principles that the Eaft India company fend filver to China in order to purchafe gold.

It may be demanded, What hurt this trade can do to Britain, fince thofe who export filver bring back the fame value in gold? Were this trade carried on by natives, there would be no lofs; becaufe they would bring home gold for the whole intrinfic value of the filver. But if we fuppofe foreigners fending over gold to be coined at the Englifh mint, and changing the gold into Englifh filver coin, and then carrying off this coin, it is plain that they muft gain the difference, as well as the money-jobbers. But it may be anfwered, That having given gold for filver at the rate of the mint, they have given value for what they have received. Very right; but fo did Sir Hans Sloane, when he paid five guineas for an overgrown tod: he got value for his money; but it was value only to himfelf. Juft fo, whenever the Englifh government fhall be obliged to reftore the proportion of the metals, (as they muft do,) this operation will annihilate that imaginary value which they have hitherto fet upon gold; which imagination is the only thing which renders the exchange of their filver againft the foreign gold equal.

But it is farther objected, that foreigners cannot carry off the heavy filver; becaufe there is none to carry off. Very true; but then they have carried off a great quantity already: or if the Englifh Jews have been too fharp to allow fuch a profit to fall to ftrangers, (which may or may not have been the cafe,) then this diforder is an effectual ftop to any more coinage of filver for circulation.

7. *Of the Diforder in the Britifh Coin, fo far as it affects the Value of the Pound Sterling Currency.*

From what has been faid, it is evident, that there muft be found in England two legal pounds Sterling, of different values; the one worth 113 grains of fine gold, the other worth 1718.7 grains of fine filver. We call them different; becaufe thefe two portions of the precious metals are of different values all over Europe.

But befides thefe two different pounds Sterling, which the change in the proportion of the metals have created, the other defects of the circulating coin produce fimilar effects. The guineas coined by all the princes fince K. Charles II. have been of the fame ftandard weight and finenefs, $44\frac{1}{2}$ in a pound troy of ftandard gold $\frac{11}{12}$ fine: thefe have been conftantly

wearing ever ſince they have been coined; and in proportion to their wearing they are of leſs value.

If, therefore, the new guineas are below the value of a pound Sterling in ſilver, ſtandard weight, the old muſt be of leſs value ſtill. Here then is another currency, that is, another pound Sterling; or indeed, more properly ſpeaking, there are as many different pounds Sterling as there are guineas of different weights. This is not all; the money-jobbers having carried off all the weighty ſilver, that which is worn with uſe, and reduced even below the ſtandard of gold, forms one currency more, and totally deſtroys all determinate proportion between the money-unit and the currencies which are ſuppoſed to repreſent it.

It may be aſked, how, at this rate, any ſilver has remained in England? It is anſwered, that the few weighty ſhillings which ſtill remain in circulation, have marvellouſly eſcaped the hands of the money-jobbers: and as for the reſt, the rubbing and wearing of theſe pieces has done what the ſtate might have done; that is to ſay, it has reduced them to their due proportion with the lighteſt gold.

The diſorder, therefore, of the Engliſh coin has rendered the ſtandard of a pound Sterling quite uncertain. To ſay that it is 1718.7 grains of fine ſilver, is quite ideal. Who are paid in ſuch pounds? To ſay that it is 113 grains of pure gold, may alſo not be true; becauſe there are many currencies worſe than the new guineas.

What then is the conſequence of all this diſorder; What effect has it upon the current value of a pound Sterling? And which way can the value of that be determined?

The operations of trade bring value to an equation, notwithſtanding the greateſt irregularities poſſible; and ſo in fact a pound Sterling has acquired a determinate value over all the world by the means of foreign exchange. This is a kind of ideal ſcale for meaſuring the Britiſh coin, altho' it has not all the properties of that deſcribed above.

Exchange conſiders the pound Sterling as a value determined according to the combination of the values of all the different currencies, in proportion as payments are made in the one or the other; and as debtors generally take care to pay in the worſt ſpecies they can, it conſequently follows, that the value of the pound Sterling ſhould fall to that of the loweſt currency.

Were there a ſufficient quantity of worn gold and ſilver to acquit all bills of exchange, the pound Sterling would come down to the value of them; but if the new gold be alſo neceſſary for that purpoſe, the value of it muſt be proportionally greater.

All theſe combinations are liquidated and compenſated with one another, by the operations of trade and exchange: and the pound Sterling, which is ſo different in itſelf, becomes thereby, in the eyes of commerce, a determinate unit; ſubject, however, to variations, from which it never can be exempted.

Exchange, therefore, is one of the beſt meaſures for valuing a pound Sterling, preſent currency. Here occurs a queſtion:

Does the great quantity of paper-money in England tend to diminiſh the value of the pound Sterling?

We anſwer in the negative. Paper money is juſt as good as gold or ſilver money, and no better. The variation of the ſtandard, as we have already ſaid, muſt influence the intereſts of debtors and creditors proportionally every where. From this it follows, that all augmentation of the value of the money-unit in the ſpecie muſt hurt the debtors in the paper money; and all diminutions, on the other hand, muſt hurt the creditors in the paper money as well as every where elſe. The payments, therefore, made in paper money, never can contribute to the regulation of the ſtandard of the pound Sterling; it is the ſpecie received in liquidation of that paper money which alone can contribute to mark the value of the Britiſh unit; becauſe it is affixed to nothing elſe.

From this we may draw a principle, "That in countries where the money-unit is entirely affixed to the coin, the actual value of it is not according to the the legal ſtandard of that coin, but according to the mean proportion of the actual worth of thoſe currencies in which debts are paid.

From this we ſee the reaſon why the exchange between England and all other trading towns in Europe has long appeared ſo unfavourable. People calculate the real par, upon the ſuppoſition that a pound Sterling is worth 1718.7 grains troy of fine ſilver, when in fact the currency is not perhaps worth 1638, the value of a new guinea in ſilver, at the market proportion of 1 to 14.5; that is to ſay, the currency is but 95.3. *per cent.* of the ſilver ſtandard of the 43d of Eliſabeth. No wonder then if the exchange be thought unfavourable.
